

Readme Pole Shift Applicability (13 April 2010)

Carbon Arc lighting will not be practical for the majority that find themselves in a primitive environment. It takes lots of power and carbon (graphite) to make electrodes. If these are plentiful then it is doable provided electrodes can be made. The subject is included for the time frame in rebuilding when it would become practical for a small town or large group to be able to rediscover the technology-art of making electrodes.

Those reading this that are preparing for the pole shift, I recommend skip this subject and spend time on LED (efficient), Sodium (low cost/efficient), and florescent (very common and efficient) lighting.
