"I want all of you to see one man before we release him from the army," Major Shumate told the dispensary heads. "I worked as a private dermatologist in New York for years, and I've never seen a case of impetigo contagiosa as severe as this one." Shumate explained the man's history. He had been hospitalized nine times with the condition. Each time it ran its course of thirty to thirty-six days, gradually clearing up, only to flare up again within days. Specialists from the eastern United State's most prestigious hospitals had treated the man with every known remedy, but nothing had worked.

With that, Shumate opened the door and gestured for the soldier, who was ushered in under guard. The other dispensary heads gasped with horror when they saw the soldier, whose head had been shaved as much as possible. Wherever the stubble of hair grew, the man's scalp was covered with a crusty scab nearly an inch thick.

Ray had treated quite a few cases of impetigo, but never one this bad. As he visually examined the man, he muttered, quietly, "What a beautiful case of impetigo!"

Shumate, who overheard his remark, slapped him on the shoulder good-naturedly. "You must be a natural doctor," he told Ray. "That's just how I see it, as one of the most amazing things I've ever seen. But, unfortunately, we have to release this man from the army ."

At that the soldier, who had maintained a demeanor of embarrassed silence, spoke up with passion. "I object to that!" he cried. "I came into this army a clean man. I caught this thing while I was here," he said, pointing at his blackened, crusty scalp. "Now you're asking me to take this filth home to my wife and children. I won't do it!"

"I'm sorry, but there's nothing more we can do," Shumate responded, quietly.

"We've done everything possible. We've used every cure medical science has to offer, and nothing has worked. We have to give you a release, but we'll make it an honorable discharge." "Wait," Ray interjected. "That man can be healed." Shumate whirled to face Ray. "Not some of your blasted herbs!" he spewed, and the other dispensary heads rolled their eyes and started to laugh.

"I should have something to say about this," the soldier cried. "I don't care if he puts horse manure on my head, as long as he heals me!"

Shumate paused, studied the man's scalp again, and agreed that Ray could try his treatment if the soldier agreed to sign legal papers releasing the government and the army from any liability. With papers signed, the soldier was checked into Ray's dispensary and placed under twenty-four-hour military police surveillance to guard against escape. As the meeting broke up, the other dispensary heads were curious.

"When will the big unveiling be?" one of them jeered. "Monday morning!" Ray snapped back, without even thinking. Then reality settled in—he had a week. Just one week. He was far from home, impossibly removed from the herbs he usually used. And in that week far from home, he had to heal the worst case of impetigo he'd ever seen.

Immediately he called a friend in Salt Lake City, a professor at the University of Utah whose backyard was sheltered by the spreading branches of a majestic black walnut tree. Ray explained his dilemma, and, even though the ground was covered with a blanket of snow, the professor agreed to gather the husks, take them to the army air depot, and have them transported overnight to Fort Lewis.

The next morning Ray cradled the walnut husks as if they were pure gold. They were sopping wet when they arrived—not the best situation. That wasn't the only handicap Ray faced. He had to put them in a base of 70 percent rubbing alcohol, because grain alcohol was not available through the army medical system. And that's not all. Instead of allowing the tincture to age for fourteen days, as he had been taught, he figured he only had about forty-eight hours.

He made the best of it, shaking the tincture vigorously every time he walked past it during those two days.

At last, he strained the tincture and made a compress that fit over the soldier's head like a football helmet. He secured the compress with adhesive tape. Then he instructed his aides that the compress had to be kept wet with the black walnut tincture twenty-four hours a day for the rest of the week. He wrote out a prescription, this time to the mess sergeant, that prescribed wholesome foods for the soldier to eat.

Monday morning arrived all too quickly, and with it one of the most harrowing times of Ray's life. The commanding officers and the dispensary heads met, and they sat on the edges of their seats, ready to ridicule the failure they knew would meet their eyes.

"Everybody ready?" Shumate asked in a mocking tone. He turned to Ray and asked, "Are you ready to show us your miracle?"

"I'm ready," Ray responded with quiet determination. "I haven't seen him yet, but we'll take a look."

The soldier was ushered in again by the guards, and Ray worked quickly but carefully to cut away the adhesive tape. As he lifted the compress off, the scab came off with it, and the soldier's scalp was as clean and pure as a baby's. The impetigo was gone, and had left no scarring.

The men gasped loudly. Major Shumate struggled to catch his breath. "I've never seen anything like this in all my days of practicing medicine," he cried. As the soldiers crowded around to get a better look, he took Ray aside.

"I've misjudged you. Private Christopher," he admitted. "From this day on, you have my permission to use herbs. In fact, you can set up a laboratory here. You're free to do anything you want with herbs as long as you are under my jurisdiction at Fort Lewis." With that proclamation, Ray became the only practicing herbalist in the United States Army during World War II.

Ray's black walnut tincture gained a widespread reputation, and he continued to use it to treat impetigo. He also used it in the treatment of two other stubborn conditions—fungus infection and jungle rot.

When word spread that Private Christopher knew how to cure jungle rot, his patient load multiplied tenfold. Ray eventually found that the black walnut hulls exacted an almost miraculous cure against a variety of other stubborn conditions, including scrofula, eczema, ringworm, shingles, and chronic boils.

From those experiences he created one of the most miraculous of his formulas, BF&C. In it, he combined comfrey leaves with white oak bark, black walnut hulls, gravel root, marshmallow root, mullein leaves, wormwood, lobelia, and skullcap. He formulated it in both capsule and ointment form so that healing could take place both internally and externally.

And the healing did occur. Besides the black walnut hulls, which he had already proven, Dr. Christopher used herbs in the formula that dissolve calcium buildup, reverse the process of gangrene, and promote healing. Other herbs in the formula provide an excellent source of protein for tissue repair and other herbal "foods" for the entire system. Still others relieve pain and prevent infection, and skullcap helps tone and rebuild the nerves and spinal cord. The comfrey Dr. Christopher used in the formula causes rapid cell growth and repair of injured tissues.

Enthusiasts who began using the formula found that it was excellent for a variety of minor problems. It relieves and heals minor burns, prevents infection and heals cuts and abrasions, heals bruises and rebuilds hemorrhaging areas, relieves sore gums, and takes the pain out of bunions and corns.

A number of people, including Dr. Christopher himself, who have tried the formula on more serious conditions have found it remarkably effective against problems that traditionally resist treatment. It removes calcium deposits from around joints, relieving arthritis. A nurse in California used it to dissolve a bone spur on her heel, avoiding surgery. It heals skin cancers. It heals eczema, psoriasis, and other chronic skin conditions. It was such a case that led Dr. Christopher to initially create the formula.

Ray spoke of it often: a woman seized with panic came to his office early one morning. Hours earlier, she had thwarted her fourteen-year-old daughter's suicide attempt. In desperation, she had left the girl at home under the supervision of several neighbors while she came to Dr. Christopher for help.

The case she described was baffling. Almost three years earlier, the girl had developed a severe dermatitis characterized by thick, heavy scales that covered her face and neck, her arms and hands, and her legs and feet. The battalion of physicians, dermatologists, and allergy specialists

who had reviewed her case were stumped—none had been able to even find a name for the condition, let alone a treatment. In her despair, the young girl began gorging herself with food. Her weight skyrocketed, and she believed that her only option was to end her own life.

Ray listened intently to the mother's story. As happened so often in his service to others, he found himself faced with an emergency. This mother, and her distraught child, did not have weeks to spare while he experimented on herbal combinations in a laboratory. He offered a quick, silent prayer for help, and, as he related it, "a formula came immediately to my mind." He hastily penned out the ingredients and sent the mother to an herb shop with instructions to combine them into both fomentations and a tea. As she left, clutching the written formula in her hand, he felt confident enough to promise good results.

Those results came. Four days after the frantic mother first came to his office, Ray received the first report— the scabs and scales were gone, and the girl's skin had what the mother described as a "healing glow." Six months later, she was a cheerleader at school and was enjoying all the social activities typical of girls her age.

Perhaps the most valuable aspect of BF&C is its ability to heal wounds, even surgical incisions that have failed to heal. One middle-aged California woman took the capsules and applied the ointment to an abdominal surgical wound that had been draining for more than three years, and within seven days, it healed.

Not only does it heal, but BF&C has been shown to actually rebuild and regenerate tissue. One of the first demonstrations Ray witnessed involved his own nephew. The five-year-old boy was a passenger in a car accident, and diligent relatives were able to hold onto him and keep him from falling completely out of the car. As the car skidded to a halt, however, he was dragged along the hot asphalt, and his small fingers were scraped to stubs as far as his first knuckles.

Ray gave the child capsules of BF&C, and instructed his parents to make the herbals prepared with honey and wheat germ oil and apply generously to the fingers. Within two months, the fingers had healed; perfectly formed fingernails graced the tips of each one. When Ray next saw the little boy, he ran toward him and threw his arms around Ray's legs in a tight hug. "Look, Uncle Ray!" he shouted, spreading his hands out in front of him. "My fingers grew back!"

His was not an isolated incident. As Ray manned a booth at a convention in the northwest, a beautiful young woman approached him and said, "How do you like my fingers?" Ray admired her soft hands with their well-manicured nails. "Can you tell which finger was cut off?" she asked him.

Even with close scrutiny, he could see no difference, nothing that made one finger stand out over the rest. As she pointed it out, she told her story. Her finger had been amputated below the knuckle. She had used BF&C, and the knuckle had regenerated. Gradually, all the bone and flesh filled in, and even the fingernail grew back, perfectly formed.

One of the most dramatic cases in Ray's career involved the main herbs in BF&C and their unparalleled healing power. Two ten-year-old boys were playing with matches and gasoline when the innocent-looking puddle at their feet ignited and roared into flame. Both boys were severely burned. The surgeon who examined the boys at the hospital gave each set of parents the identical prognosis: the hands would either have to be amputated at the wrist and iron claws attached to both arms, or the boys could endure several years of painful skin graft surgeries. The surgeon was not encouraging, and even with years of skin graft surgery, he pronounced, they boys would have nothing better than mummified claws. While the iron claws could simulate finger movement, the mummified skin claws could never move like fingers.

One set of parents told the surgeon to keep the boy and begin operating; they wanted him to have at least a chance at "normal" hands, even if it took years.

The other set of parents shook their heads, told the surgeon they wanted to seek a second opinion, and left the hospital with their son.

They sought out Dr. Christopher. As he removed the gauze bandages that swathed the bums, he cringed at the sight of the badly charred skin, tendons, muscles, and nerves. Instead of concurring with the surgeon's opinion, however, he gave the anxious parents a thick herbal salve based on one of the primary herbs found in BF&C— comfrey. He instructed the parents to keep a thick layer of salve, which also contained wheat germ oil and honey, spread over the burned area.

Within a week, the parents took their son to see the surgeon. He was dumbfounded as he examined the boy's hands. Less than a week earlier, they had been virtually destroyed by third-degree burns; now the surgeon classified the bums as first degree.

"What on earth have you been using on this boy's burns?" the surgeon queried. When the parents quietly told him that they had used an "old-fashioned remedy," he was emphatic. "I don't care what you've been using," he told them, "keep on using it. I don't think there's any need for surgery or skin grafting. I can't believe it, but I'm pretty certain that the hands will heal very well without any residual scar tissue."

The eventual outcome of the two cases confirmed Ray's belief in the power of herbal treatment. A year after the fiery flames of gasoline had licked at his hands, the first boy remained in the hospital. His parents had invested hundreds of thousands of dollars on extensive surgeries and skin graftings, and as the surgeon had predicted, he bore two mummified, unbending claws that were so unsightly he wore gloves to hide them.

The boy whose parents patiently spread the herbal salve over his burned hands had healed completely. The tendons, nerves, muscles, and flesh had been renewed, without any scar tissue. Even the fingernails had been restored. And their total investment was less than twenty dollars for the herbal salve that had promoted the healing.

There were other lessons that Ray learned as he served his country in the crowded dispensary at Fort Lewis. One was the love of his fellow man and the deep compassion that became an earmark of his later practice.

In particular, he felt tremendous sorrow at the way black soldiers were treated at the dispensaries. Hatred ran so rampant that these men often suffered physical agony in silence rather than endure the emotional pain of visiting the dispensary. Ray hadn't been at Fort Lewis long before word started to spread—he loved all people, and he treated blacks with the same tender compassion he showed to every soldier who passed through the dispensary. Within months he was seeing dozens of black soldiers every day, men who were blessed with relief for conditions that had plagued them for months.

Still other lessons were learned in the laboratory. With an endless supply of patients and the blessings of Major Shumate, Ray was able to discover first-hand the healing properties of many of the herbs he had until then only read about. It was at Fort Lewis, too, where he began combining various herbs into "formulas"—powerful mixtures that could be used to heal specific conditions. His formulas eventually became part of the singular legacy that he left mankind.

It was at the dispensary that he was able to spend quiet hours in the laboratory experimenting, and it was there where he began to discover the herbal combinations that could relieve his own serious health problems. One of the most dire was his high blood pressure and hardening of the arteries, conditions he had developed during adolescence that would normally have shaved years from his life.

From Ray's intent studies at the dispensary, he knew that his body was laced with thousands of miles of capillaries that branched from just more than a thousand miles of arteries and veins. With that knowledge, he started his search for an herbal food that could best nourish and rebuild his circulatory system.

That herb was cayenne. High in calcium and vitamin C, cayenne is one of the best foods for the heart. It helps restore and retain the elasticity of blood vessels, correcting or preventing hardening of the arteries and preserving the health of the circulatory system. Cayenne also works to equalize blood circulation and adjust blood pressure to normal.

Ray found that cayenne was even powerful enough to stop a heart attack in progress. In the more than thirty-five years that he toted his herb-filled black bag on house calls, he never lost a patient to a heart attack.

He remembered one woman who had suffered from an eighteen-year heart problem that had required powerful heart medication for more than seven years. She agreed to take the pungent cayenne that Ray offered her, and within months she was able to stop all medications. Even her stubborn varicose veins completely cleared.

Cayenne became the base for BPE, a formula that equalizes blood pressure and builds the health of the circulatory system. To cayenne, Ray added ginger, a second powerful stimulant. To these, he brought a combination of herbs that normalize blood pressure—parsley, golden seal, garlic, and Siberian ginseng root.

Ray himself provided one of the most dramatic examples of the effectiveness of BPE.

As mentioned, he was diagnosed early in life with hardening of the arteries and dangerously high blood pressure. Several doctors who examined him rendered the bleak prognosis that he would

not survive beyond his early thirties. But he used BPE faithfully, as he did many of his formulas, and continued to eat the healthy diet he had prescribed for himself.

At the age of forty-five, a full decade beyond his predicted life expectancy, he was required to undergo a physical examination in order to enhance his life insurance coverage. The doctors who conducted the physical were astounded. Despite his early history, he had the blood pressure of a healthy teenager. Almost three decades later, just a few years before his death, a physician who examined him proclaimed that at seventy years of age he had the blood pressure and circulatory system of a vibrant young man in his twenties.

At last Ray's military obligation was over and, despite an invitation from Major Shumate to spend another tour of duty in the dispensary and to let the Army pay for his medical education, he declined and eagerly headed home to Olympia, Washington, to join his wife. John Raymond Christopher took with him a distinguished service record and the proud knowledge that he had helped countless soldiers who had been failed by the orthodox medical community. He also brought home with him the determination to learn all he could about herbs, and to make the practice of herbology his life's profession.

## Chapter 3

### After the War; There Were Weeds: Harvesting Herbs at Dawn

His military service behind him, Ray was at last free to pursue the dream of his childhood—he wanted to become a doctor, the kind of gentle practitioner who crossed his mother's threshold the year he was sixteen. He had used natural methods of healing in the dispensary at Fort Lewis. He knew they worked. He had seen their healing power in the faces of countless soldiers who had come to him for help after word of his treatments filtered through the rank and file of the army. He wanted more than anything to learn all he could about herbs, and to use his knowledge to bless others.

With the full support of his young wife, he stuffed a few possessions into a canvas bag and traveled to Canada, where he studied under the renowned herbalist Dr. H. Nowell at Dominion Herbal College. After earning his Master Herbalist Degree, he returned to Olympia and set up practice in the midst of Washington's verdant orchard country.

The war eventually came to its explosive halt with the terrifying detonation at Hiroshima, and a battered world struggled to begin the lengthy process of rebuilding. During those final war years and the agonizing time of recovery, Ray found that it was more than a simple challenge to practice as an herbalist.

First, there was the unrelenting demand of providing a living for his small family. Jobs were scarce, and many who provided employment lacked the cash to pay wages, and plenty of men traded labor for goods. Then there was the task of getting the herbs themselves. It was virtually impossible to order the herbs through wholesale houses. The influence of the war was felt in all of the nation's communities, and thousands of once-thriving businesses had closed their doors as a result.

But John Raymond Christopher was never one to take defeat gracefully. He met his challenge head-on. He secured a job weeding gardens each morning that provided cash, however meager. Each morning as the sun first touched the branches of the apple trees in the surrounding orchards, Ray moved deftly from one garden to another, pulling the tender young weeds from the fertile soil. Each day, just as other workers were first buttoning up their shirts against the misty Washington morning, Ray was collecting his pay and hauling the weeds away in large burlap bags.

At home, Ray would spread his morning's harvest across the tidy counter tops in their small kitchen. Then he would begin the painstaking process of washing each weed, rinsing the clumps of soil from each lobed leaf and each maze of roots. Fingering the clean weeds, he would sort them into careful categories and would prepare to use them that afternoon for the group of patients who pressed into his waiting room. It was a two-fold blessing—Ray had enough cash to sustain his family, and he also had the freshest herbs he could ever desire.

It was in Olympia, surrounded by the heady fragrance of apple blossoms and sustained by the "weeds" he harvested each morning, that Ray set up a thriving practice and began to see the astounding healings that were possible through herbal medicine.

It was in Olympia, too, that Ray proved he was practicing because he loved mankind, and not because he wanted to line his wallet. He taught his patients how to harvest their own herbs and treat themselves from the bounties in their own backyards.

One of the most powerful healing agents was, fortunately, one of the most abundant in the humid, fertile valleys of Washington. Ray knew that plantain, which had been used from the days of Galen and Pliny, was a powerful blood purifier with the ability to kill infection rapidly. He also knew that it immediately relieves the blood poisoning that can follow cuts, slivers, bites, and stings. In some of the most dramatic cases he treated in Olympia he used plantain, the herb later

### Chapter 6

A Legacy of Courage

became the base for INF, his infection-fighting formula. In one astonishing case, a man had slipped while at work and driven a chisel deep into his palm.

He couldn't afford to take any time off, nor could he afford a doctor's bill, so he had grabbed a dirty rag and wrapped it around his hand to stop the bleeding. With the help of his crude bandage, he had finished his day's work and had even worked for a few additional days.

By the time he arrived at Ray's office, his hand was swollen and feverish, a red streak ran from the badly infected hand up his arm. A painful lump the size of a baseball in his armpit prevented him from dropping his arm to his side. The man was seized with pain and obviously frightened at the severity of his condition.

As Ray examined the wound, he asked the man why he had not seen his doctor more promptly when the signs of blood poisoning began to develop. "I just couldn't!" he cried. "This same thing happened to a friend of mine, and the infection was so bad that the doctor amputated his arm. I want to keep my arm! I heard about you. Isn't there something that can be done?"

Ray led the man out to the front yard of his office and pointed out a stand of plantain. "Oh, that!" the man laughed. "It's all over my yard. We've all been digging it up, trying to keep it from taking over!"

"Well, keep digging it up," Ray admonished him, "but this time rinse it off well and crush it." Ray then told him to put the crushed plantain directly over the wound and to bandage it in place, adding fresh bruised herb to the poultice each time it began to dry out. He also instructed his patient to brew some of the "weeds" into a tea and to drink at least three cups a day. The man offered to come back the next day, but Ray refused him. "I've given you a do-it-yourself method of healing your hand" he explained. "Just follow the directions, and you'll have no need for a follow up call."

A few days later the man did return-this time to pay for his office call and report what happened. He himself described the chain of events as "miraculous." Within thirty minutes after he applied the poultice, the excruciating pain and throbbing were relieved. Within a few hours, the red streak started to fade and the swelling in his armpit began to reduce. By evening, evidence of healing was strong. And now, as he stood in Ray's office, the hand was healed without heavy scarring. He had full use of his hand and arm, and was able to continue making a living to support his family.

In a similar case, a young girl had cut her foot on the jagged edge of a shell while clam hunting at the beach. Oblivious to the pain or the wound, she had continued to run in the sand for the rest of the afternoon, wading with friends in the shallow pools that lingered as the tide ebbed out to sea. By morning, the foot and leg were swollen and feverish, and an angry red streak crept toward her groin.

When her anxious mother phoned Ray, he repeated the same instructions regarding the plantain poultice. The next day, the child skipped into Ray's office and pressed several bills into his palm. Examining the money, he protested, "This is too much. Your mother has sent the full amount of a house call. You didn't even come to the office. I can't accept this much." "Yes, it's the right amount," the girl told him. "Mama told me to bring you this much because my foot healed so quickly." As it turned out, Ray was paid many times over for the help he offered by phone. The girl's family owned a smorgasbord in Spokane, and were some of the few people in the area who were able to get butter and other fresh produce because of wartime rationing. Throughout the remainder of the war, they always saw to it that the Christophers had a little butter and some fresh fruits and vegetables as a token of their appreciation.

Plantain flourishes during the growing season, but dies along with other vegetation during the chill of winter. As soon as he recognized the value of plantain for his patients, Ray began to concoct concentrates, tinctures, and ointments that he could keep on hand year-round. He remembered one situation in which the ointment proved valuable. A mother called in the spring, before the plantain in Ray's yard had leafed out. Her ten-year-old son had been stung by a wasp. His hand was severely swollen, she said, and he had passed out as a result of the pain.

Ray tucked ajar of plantain ointment into his bag and left on one of his legendary house calls. When he arrived, the child was still unconscious and his hand was swollen to twice its normal size. Ray quickly spread a thick layer of plantain ointment over the sting in a circle about the size of a silver dollar, covered the ointment with a gauze patch, and then used a gauze bandage to hold the patch in place.

"Is that all you're going to do?" asked the alarmed mother. "That's all that needs to be done" Ray smiled, explaining that the ointment would draw the poison from the sting and relieve the pain

and swelling. As they stood and briefly talked, the boy regained consciousness and sat up. Within half an hour, the pain was significantly relieved. By the next afternoon, his hand was back to normal and he was out at the street's edge, playing baseball with his friends.

Plantain's value prompted Ray to develop INF, a formula designed to kill infection and to capitalize on the benefits of plantain, no matter what the season. He began with a base of plantain. Next, he added black walnut hulls, which he knew could kill infection, destroy worms and parasites, and relieve the infection of poisonous snakebite or rabid animal bites. He completed the formula with calendula flowers, marshmallow root, golden seal root, and bugleweed, herbs that help to kill infection and clear toxins from the lymph system.

Because infection thrives on toxins and wastes, and because impure blood fosters disease and infection, Ray hoped to team INF with a formula that could purify the bloodstream and remove any infection that circulated throughout the body. The result of his quest was his Red Clover Combination, a purifying formula of red clover blossoms, chaparral, licorice root, peach bark, Oregon grape or barberry root bark, poke and stillingia or echinacea, cascara sagrada bark, sarsapa-rilla root, prickly ash bark, burdock root, and buckthorn bark.

As with all of his formulas, Ray chose each ingredient with care and with keen insight into the properties of each herb. He began with red clover blossoms, an herb that gradually alters and corrects deficiencies or infections in the bloodstream. Besides purifying and cleansing the bloodstream, red clover blossoms remove any obstructions in the bloodstream, nourish and build the tissues of the circulatory system, and reduce any spasms or irritability in the blood vessels.

He chose chaparral for its ability to clear even stubborn infections. He had seen it heal boils, abscesses, carbuncles, and other severe infections by purifying the bloodstream. Ray had used it to completely clear up several severe cases of acne within six weeks because of its power to purify the bloodstream.

Echinacea was added to the formula because Ray knew it was the herb of choice for clearing blood poisoning. He had used it with success in clearing up the infection associated with gangrene, ulcers, and cancers. Echinacea has also been proven in scientific studies to kill both the staph and strop bacteria through stimulation of the immune system, and by adding it to the Red Clover Combination, Ray knew the formula could be used to clear up staph infection of the bloodstream.

To this he added two of the most powerful purifiers in nature-burdock root and buckthorn bark.

Ray's successes with the Red Clover Combination came quickly, and many were profound. One of the most dramatic cases involved a forty-five-year-old man who had developed severe sepsis, a system-wide infection. He had been ravaged; he had lost his hair and his fingernails. His eyes were ulcerated. He had even developed the signs and symptoms of leprosy. The infection had so debilitated him that he had suffered extreme weight loss; he looked more like a skeleton than a man. Ray gave him the Red Clover Combination along with some sound nutritional guidelines, and within six weeks, he had gained back his weight and there was no sign of infection.

Used together with a proper diet, the Red Clover Combination can even be used to clear cancer. A middle-aged woman Ray treated provided the perfect example of what can be accomplished by purifying the bloodstream with herbs and keeping it clean with proper diet. Her doctor had offered a dim prognosis and had sent her home to die of cancer.

Ray started her on the Red Clover Combination, and asked her to take it faithfully for the period of several months. He also advised a sound diet of fresh fruits, vegetables, grains, seeds, and nuts, and he asked her to avoid hard water, processed foods, sugars, and cholest-erol-containing foods. Finally, he prescribed a three-day juice cleanse once a month, advising the woman to take only distilled water and carrot, celery, or grape juice during the cleanse.

Several months later, after following Ray's suggestions carefully, she sat on her doctor's examining table draped with a pale blue cotton gown. Much to his astonishment, the cancer was gone.

A few months earlier, he had been helpless against what he believed to be a terminal disease. That afternoon, he pronounced her cured.

As he used the Red Clover Combination in his practice, he found that it had powers that surprised even him. One of these was the ability to reverse the Rh factor in the bloodstream, long considered a genetic trait that could not be "cured" or reversed. A baby born to an Rh-negative mother and an Rh-positive father develops severe complications, extensive liver damage, and life-threatening blood clotting if not treated immediately. Traditionally, the only "treatment" was

complete draining of the baby's blood followed by total blood transfusion. Sometimes the treatment is successful, but in some cases the baby dies or develops permanent complications.

A woman in Brigham City, Utah, was an excellent example of both the problem and the proper treatment. She had borne three children, all of whom had inherited the Rh factor problem, and all of whom had narrowly escaped death as they struggled through the blood transfusion at birth. When she underwent open-heart surgery a few years later, her obstetrician gave her the stem warning that another pregnancy would very probably kill both her and her baby. She and her husband yearned for a large family, however, and approached Dr. Christopher's study group with a plea for help.

Ray started her on a basic program that included a sound diet. That's not all. He asked her to drink at least a gallon of steam-distilled water each day, and at least a quart of red raspberry tea each day. He advised a three-day juice cleanse once each month, and prescribed daily doses of the Red Clover Combination.

After a time on the program prescribed for her, the woman became pregnant. She adhered to the program Ray prescribed for her throughout the pregnancy, and she suffered no complications. At its culmination, she delivered a strong, healthy baby completely free of the Rh factor. During the ensuing years, she and her husband became the parents of two more Rh-free babies.

Many of the experiences Ray had in Olympia shaped the direction of his career and led to the development of a number of his formulas. He often remembered one woman who came to him in despair. In the years since she had married she had gained almost a hundred pounds.

Her husband was threatening to leave her, and she herself was discouraged and felt defeated from her many unsuccessful attempts to lose weight.

Ray started with nutrition. He instructed the woman to faithfully adhere to the mucusless diet, a program of fruits, vegetables, grains, nuts, and seeds, it calls for avoidance of foods that cause the body to produce mucus. He also prescribed a three-day juice cleanse once a month. Ray promised the woman that if she was faithful to the program, she would lose weight- not rapidly, but in a gradual, healthy way.

Months after her initial visit to him, he received a jubilant phone call. She had lost all the weight she had gained, and wanted him to bring his family to a dinner of celebration. After they finished a glorious vegetarian dinner, Dr. Christopher and his family were beckoned to the backyard. Ray was puzzled as he took his seat in one of the chairs that had been carefully arranged around a freshly dug grave. As he saw the array of bright wild flowers that were scattered over the mound of fertile soil, he imagined that they must be planning to bury a beloved family pet.

Suddenly the children began carrying from the house pots and pans of expensive aluminum. They placed each one carefully in the grave. Without saying a word, they marched to the outside cellar and hauled up slabs of bacon and large smoked hams, each to be buried with the pots and pans. At a time of rationing and severe economic depression, their act was one of special sacrifice, and an inspiration for another of Dr. Christopher's formulas.

Wanting to help those who struggled with weight control. Dr. Christopher formulated CSK Plus, a product to be used in conjunction with the mucusless diet for safe, effective weight loss without robbing the body of essential nutrients. To help appease the appetite and encourage weight loss, he combined chickweed, safflower flowers, burdock root, parsley, Norwegian kelp, licorice root, fennel seed, echinacea, black walnut hulls, papaya leaves, and hawthorn berries.

Throughout the years he practiced he saw people experience astonishing results with CSK Plus. The licorice root and fennel seed both curb appetite and relieve cravings.

The ancient Greeks nibbled on fennel seeds to control hunger during periods of fasting. From his studies, Ray knew that the body stubbornly holds on to fat reserves if it is not getting all the trace elements it needs, and the natural foods that enrich CSK Plus enable the body to release excess fatty tissue. Other herbs in the formula feed the adrenal and thyroid glands and help regulate metabolism for permanent weight control.

The formulation of CSK Plus was only one example of Ray's compassion toward people with conditions that were usually ridiculed. Another was the sensitivity he demonstrated when a family, weary from the struggle, brought in a fifteen-year-old boy ravaged with epileptic seizures. The boy, who regularly suffered as many as twenty-five seizures in a single day, could not be left unattended, and family members had hired a staff of nurses to watch him night and day. The epilepsy created a roaring cacophony of noise inside his head, and in an attempt to quiet it, the boy pounded his head against the walls until blood poured from his ears, nose, and mouth.

Doctors throughout Washington were helpless to relieve his condition, specialists called in merely shook their heads with weak apologies. The boy could not talk and had never attended school. Medical authorities proclaimed him severely retarded and told the family to institutionalize him. Instead, they came to Dr. Christopher in a desperate last attempt for help.

Help the boy he did. Ray began by giving his parents strict nutritional guidelines, and next used therapeutic massage. Finally, he gave the boy two herbal combinations designed to build and strengthen the tissues of the nervous system. Ray showed the boy's parents how to brew them into soothing teas that he could sip through parched lips.

Within six months, the boy that had been labeled retarded was speaking, and the family brought in tutors twice a week to begin the arduous task of teaching him. Instead of being handicapped as the doctors had determined, he was instead brilliant! Within a few months of tutoring, he was at the normal grade level for a fifteen-year-old. He enrolled in school, free of the seizures that had once completely crippled him.

The herbal combinations Ray used to help the boy became B&B, MEM, and Relax-Eze, all formulated to heal the nervous system. MEM, a blend of blue vervain, blessed thistle, gotu kola, ginger root, cayenne, and Brigham tea, cleans and heals the tissues of the nervous system, restores memory, and strengthens the thought processes.

A combination of skullcap, wood betony, black cohosh root, hops flowers, valerian root, and cayenne, Relax-Eze also feeds and rebuilds the nerves. Especially rich in calcium and phosphorous, the herbs in Relax-Eze repair and nourish the spinal cord, the nerve sheath, and the capillaries of the nervous system. That's not all. The herbal combination helps reduce irritation of the nervous system, soothes spasms and tics, and relieves pain.

As a base for the formula, Ray used skullcap, an herb with the power to feed, regulate, strengthen and rehabilitate nerve cells without the side effects often caused by pharmaceutical nerve medications. Skullcap is naturally calming, especially for those troubled by worry or emotional distress. Ray watched it induce quiet, natural sleep in hundreds of his patients over the years. He often remembered one woman who had been troubled throughout her life with chronic insomnia, and for years she had never succeeded in sleeping for more than thirty minutes at a time. After sipping a tea brewed from Relax-Eze, she slept soundly throughout the night.

It was also in Olympia that Dr. Christopher developed two career trademarks. The first were his famous house calls. His wife stood in the doorway on many a chilly night, their children gathered around her skirts as she waved goodbye to the dedicated herbalist who never considered the hour or the weather above the needs of his patients. He often traveled more than fifty miles one way through thick darkness and over orchard-lined roads to ease the suffering of a caller he'd never met.

The second trademark was his unwavering willingness to meet the challenge of conditions usually considered incurable by the orthodox medical establishment. On one of his famed house calls in Washington, he entered the home of a man stooped with the pain and paralysis of arthritis. Shifting slightly in his wheelchair and speaking through the grimace of excruciating pain, he turned to Ray and said, "Please, please help me."

"No one has been able to help me yet. I have tried every doctor available, but nothing has worked."

With a final burst of strength, he told Ray that the ineffective medical treatments had completely obliterated his financial resources. He had nothing left.

"Don't worry," Ray assured him, stroking the man's gnarled hand. "You don't need money to pay me. Let's see what we can do for you."

From his bag Ray took his morning's harvest of burdock. The first burdock of the season, it had firm roots and fresh, tender leaves. Ray chopped the roots and brewed burdock tea, and instructed the man to drink as many cups as day as he could tolerate. Then he fashioned the tender burdock leaves into poultices, which he gently placed over the locked, painful joints. As he taught the man how to make his own poultices, he prescribed a healthy diet and quarts of fresh juices.

Within weeks, the man's joints began to loosen, and for the first time in years, he was able to stand. As the healing continued, he was able first to walk, then to run. Eventually, he was completely healed, a stranger to the wheelchair that had held him prisoner for so many years. Only a few months after he first saw Dr. Christopher he was back on the job as a night watchman, walking his rounds without difficulty.

Ray's knowledge of the gripping pain of arthritis came first-hand. As mentioned, he was born with rheumatoid arthritis, a disease marked by joint swelling, debilitating pain, and the destruction of bone, cartilage, and joints. Much of his dietary knowledge came, too, from experimentation with his own disease. When he enjoyed fruits, vegetables, grains, nuts, and seeds, coupled with daily doses of olive oil or wheat germ oil, he scarcely noticed his arthritis. But if he ate breads or pastries, he needed a cane to walk. If he ate sweet foods laced with sugar, he became crippled. And if he ate red meat, he was relegated to his wheelchair within forty-eight hours.

He knew first-hand, too, the healing benefits of burdock root, which works a chemical reaction on the calcified joints of arthritis. He treasured it as one of the ingredients of AR-1, a formula he designed to reverse arthritis and rheumatism.

To the burdock root he added yucca stalk, wild yam root, hydrangea, Brigham tea, chaparral, black walnut hulls, black cohosh root, wild lettuce leaves, sarsaparilla root, valerian root, and cayenne -herbs that detoxify and cleanse the body, remove calcium deposits, relieve pain, and kill infection.

Over the years of his practice. Dr. Christopher saw remarkable and complete healing of even the most advanced arthritis. He always warned patients that healing would not be immediate, there was much rebuilding and healing to be accomplished. In addition to AR-1, he suggested that his patients use hot fomentations over extremely painful joints, a quart or two of kidney bean pod tea daily, faithful adherence to sound nutritional guidelines, and daily use of his BF&C formula.

Dr. Christopher found that people stricken with an "incurable" condition were often the ones most willing to try natural herbal remedies. There seemed to be a pervading attitude that I've tried everything else... I guess herbs won't do any harm. It was just such a man that called him one blustery autumn day in Olympia.

A veterinarian doctor, he had contracted undulant fever fourteen years earlier in the packing houses where he had walked up and down the rows of carcasses, inspecting meats for the federal government. Despite advanced medical treatments by some of the nation's foremost experts, his condition had gradually deteriorated.

By the time Ray arrived at the house, the man was completely helpless. Attendants had to roll him over to prevent bedsores, and he couldn't sit up or feed himself. As Ray was introduced, the man gazed at him desperately. "I've never tried herbs, but I'm at the end of my rope!" he explained. "I've been given only days to live. Please help me- I want to live!"

Ray knew that the answer was a thorough cleansing, and he knew he didn't have much time to accomplish the task. He prescribed herbs to purify and cleanse the blood. He prescribed juices. And then he prescribed a combination of herbs that became one of his best-known and most effective-a formula designed to cleanse the bowels and colon. The veterinarian, near death, followed the prescriptions faithfully and, within six weeks, he was out mowing the lawn.

Neighbors who passed were astounded. "I thought you were dead!" they would call out to him. "No, sir! I've turned to herbs. And if you want to feel this great, you should see Dr. Christopher yourself!" From him and many like him, word spread of the herbal practitioner, filling the waiting room of Ray's office each morning.

The formula Ray gave the dying veterinarian was Fen LB, a combination he tailored over the years as patients gave him feedback. The product of extensive trial and error. Fen LB evolved as Ray's practice evolved. He carefully assessed patients; when one complained of cramping, he added ginger; when one complained that the formula made her nauseated, Ray added raspberry leaves.

When another complained of too much gas while using the formula, Ray added fennel to prevent gas and ease colic.

The importance of Fen LB is perhaps due to the fact that more than 90 percent of all disease is caused by congestion in the colon. The commonplace American diet of processed foods causes the bowel to weaken, creating pockets and balloons filled with old fecal matter. Dried, compacted matter builds up on the walls of the colon, becoming hard incrustations that soak up fluid; most people have pounds of this matter, which interferes with the body's ability to absorb nutrients. And the problem doesn't stop there. The toxins of "constipation" back up into the blood vessels, the lymph system, and even the body cells.

Ray knew that commercial laxatives were not the answer to the problem. They further weaken the bowel and cause it to lose its peristaltic action. Instead, he sought an herbal food that could tone, rebuild, and strengthen the colon while breaking loose the impacted matter on its walls.

The herbal food that Ray formulated works not only as a natural laxative, but it prevents toxic buildup in the bowel and works to tone, strengthen, and rebuild. He began with barberry bark, which stimulates the flow of bile and acts as a non-habit-forming laxative. He added cascara sagrada bark, a food for the peristaltic muscle that also works as a non-habit-forming laxative; cayenne, which stimulates the cells of the bowel and stops bleeding caused by irritation;

Ginger, which relieves gas and stops pain and cramping; lobelia, which acts as a catalyst and which prevents spasms and cramping; nausea-relieving red raspberry leaves, which restore iron and essential acids; turkey rhubarb root, a pure, mild laxative herb; fennel, which relieves gas; and golden seal root, which heals, rebuilds, and prevents infection.

As designed by Dr. Christopher, the formula works on both the small and large intestine, and is a combination of bowel "foods" that work compatibly together as a healing laxative.

Fen LB enabled Ray to help patients by getting to the source of their problems instead of treating mere symptoms. His credo was to work on pain without working on the cause is leaving the job undone, and he liked to remember many patients whose seemingly unrelated symptoms cleared once they started taking Fen LB.

One in particular was a woman who came to him because of severe pain in her shoulders which was so intense that she could not even lift her arms. After examining her briefly, Ray determined that she had a large pocket of fecal matter trapped at the ascending transverse junction of her colon. Toxic waste had drained through her bloodstream, irritating the nerves of her shoulder and eventually causing excruciating pain.

Ray began by massaging the reflexology point on her foot that corresponded to the ascending transverse junction of the colon. As he described it, she "screamed with pain" as he kneaded the spot. By the time the pain in her foot had eased, so had the pain in her shoulders. Ray followed the reflexology treatment with Fen LB, and she suffered no further recurrence of the shoulder pain.

Word of successes like these spread rapidly throughout the forested countryside surrounding Olympia, and Ray's practice grew rapidly, composed of the townspeople who worked the logging industries and apple orchards of the area. But while his practice was satisfying, there was something missing. Ray and Delia both loved the sunshine and the Olympia countryside was almost always blanketed with clouds or murky fog. Rarely did they feel the warm caress of the sun. They longed, too, for family.

Ray had grown up without the association of aunts, uncles, or cousins, and yearned for the rich companionship of his in-laws. Many times he remarked that had he been given the chance to pick any family in the world, he could not have done better than the Walker family.

And so the Christophers closed the practice nestled among the apple orchards of Olympia, satisfied with the knowledge that Ray had changed the lives of many who had waited on the wooden chairs outside his office. With their worldly possessions carefully packed and securely tied, they returned to their beloved Salt Lake City and to the waiting arms of eager family members.

## Chapter 4

### Without Honor in His Own Country: The Return to Salt Lake City

For all practical purposes, John Raymond Christopher should have been welcomed back to Salt Lake City with open arms.

Settled by Mormon pioneers in the mid 1800's, the parched desert valley was the cradle of herbology in the western United States. The Mormon Church itself had strong ties to the practice of herbal medicine. Church founder Joseph Smith recalled gathering golden seal and other healing herbs on the family farm in upstate New York. And Brigham Young, the evangelist and statesman who led bands of weary pioneers across this nation's prairies, planted medicinal herbs in fragrant patches behind his pale adobe house on South Temple Street.

A hundred years later as John Raymond Christopher and his young family set down roots in the peaceful valley sheltered by towering peaks, however. Salt Lake City was no longer the cradle of herbal medicine. With several major teaching and research hospitals scattered over its avenues, it had become instead a respected center of medical science. Townspeople weren't ready to accept the notion of natural healing.

Ray and Delia were surrounded by the family that loved them. They basked in the brightness of Utah's sunlight. They had a comfortable home, and two sweet children to share their lives. But Ray was unable to support his growing family with his herbal practice. In order to make ends meet, he started selling, often traveling out of state.

As he traveled, he seemed drawn to people who needed his help, and he always offered it freely. While he did not find a ready clientele in Salt Lake City, the time he spent in the loving embrace of family members was nevertheless a time of growth in many ways. (It was only after he moved to Wyoming and then again returned to Utah that he was able to establish his first multidisciplinary clinic, staffed by fourteen professionals, the clinic offered masseurs, zonal therapists, and a chiropractor. At its peak, the clinic staff treated between thirty and forty patients a day.)

During the time he was in Salt Lake City he also found the precious time needed to advance his education. Over the years he was able to juggle clinic and family commitments with the completion of a naturopathy degree from Iowa's Institute of Drugless Therapy and an herbal pharmacist degree from the Los Angeles Herbal Institute.

And it was in Salt Lake that he began laying the groundwork for his School of Natural Healing. Established in 1953 as a way of sharing his knowledge with students interested in practicing natural healing, it was eventually also established in England.

But the greatest highlights of his time in Salt Lake City, as with his time anywhere he established a practice, were his patients and the impact he had on their lives. He loved to remember one family he met in Great Falls, Montana, while selling encyclopedias. Blessed with eight children, the family was crowded into a small frame house, and what they lacked in space, however, they seemed to more than make up for in love. Her frantic telephone call one afternoon was fraught with despair.

"Oh, Dr. Christopher, please help me!" she cried. "There's a terrible intestinal flu running rampant through our area. Whole families are coming down with it. In some cases it's lasting five or six weeks! Two of our children have come home with it, and I know we'll all be infected before it's over. Oh, please, tell me what to do!"

As he considered an answer, a smile crept slowly over Ray's lips. Was she more concerned with how to take care of all those sick people, or with the fact that the family shared a single bathroom?

Remembering a thick patch of red raspberries along the family's back fence, Ray instructed the

worried mother to gather as many raspberry leaves as she could, bushels if possible, taking care not to strip more than a third of the leaves from any one bush. He then told her how to brew a tea from the harvested leaves.

"Give your two sick children nothing but raspberry tea," he instructed. "Give them all they can drink, and nothing else. When the other members of the family get home, give them tea, too. That's all they should eat or drink until the flu has cleared up" And, with a reassuring promise, Ray told her the family should be fine by morning if they followed his instructions carefully.

A few days later he received the happy report: the two sick children were fine by morning (instead of suffering for several weeks, as had their classmates). No one else in the family got ill.

Ray followed the family with interest over the years. After bearing sixteen children, the mother graduated from Brigham Young University as a registered nurse. At her graduation ceremony, she was honored by University President Ernest L. Wilkinson and recognized with a standing ovation from her classmates. Over the years as she practiced nursing she quietly helped patients by recommending herbal remedies.

While medical science stubbornly insisted that there was no cure for the flu or the common cold. Dr. Christopher heartily disagreed. He knew the family in Great Falls had cured a viral flu with the savory tea of red raspberry leaves, and he knew that other herbal remedies worked just as well.

He combined some of those remedies in Garlic, Rosehips, & Parsley, his formula for colds and flu. He started with a base of garlic, known throughout the ages for its ability to kill infection. He added rose hips, parsley, watercress, and rosemary leaves. He formulated the combination in both tablets and capsules and advised patients to take each with a cup of steam-distilled water. Garlic, Rosehips, & Parsley capsules could also be opened and brewed into a soothing tea for even faster relief.

Another malady physicians shrugged their shoulders over was the seasonal affliction of hay fever. While most who attempted to treat it relied on chemical remedies. Dr. Christopher formulated SHA, a combination based on a natural plant extract of pseudoephedrine. The product was manufactured in an herbal base of Brigham tea, marsh-mallow root, burdock root, parsley, cayenne, chaparral, golden seal root, and lobelia.

Used in conjunction with a mucusless diet of fruits, vegetables, grains, nuts, and seeds, SHA feeds and strengthens the pulmonary organs. Dr. Christopher chose each herb in the formula with care. Together, they ease nasal and respiratory congestion, working as a natural decongestant and antihistamine.

For people with an especially stubborn case of hay fever. Dr. Christopher advised another natural remedy to be used with SHA; he advised patients to thoroughly chew and swallow a thick pulp of chopped horseradish root and apple cider vinegar three times a day.

One of Dr. Christopher's trademarks was his deep sensitivity for his patients, and many of his formulas were developed in direct response to their requests for help. During his practice in Salt Lake, he was called on to treat many whose bodies had been battered by the physical effects of stress. Searching for a way to heal and rebuild the adrenal glands-the front-line soldiers in the body's stress response- he developed Adrenetone.

He began with a base of mullein leaves, long considered the perfect "gland food." To that he added licorice root, which directly supplies the adrenal glands with the nutrients they need for healthy function. The next ingredients in Adrenetone were gotu kola, which relieves fatigue and stimulates function of the adrenals; cayenne, which brings oxygen and other nutrients to the glands; and ginger root, which helps flush out congested capillaries. He rounded out the formula with Siberian ginseng, successfully used to ease stress and boost endurance among USSR athletes, and hawthorn berries, which tone the heart and reduce its load during periods of stress.

Another formula developed in response to patient request was Prospallate, a combination of herbs that dissolves kidney stones, kills infection, and clears sedimentation in the prostate gland. Through extensive patient use. Dr. Christopher discovered that the formula consisting of cayenne, uva ursi leaves, parsley, golden seal root, gravel root, juniper berries, marshmallow root, ginger root, and Siberian ginseng, was an effective remedy for gonorrhea. Pro<sup>o</sup>allate works even better when taken with parsley tea.

With Fen LB to tone and rebuild the bowel. Dr. Christopher next turned his attention to a system equal in importance to the intestinal tract-the urinary tract-which pumps, filters, and eliminates the more than 60 quarts of fluid that pass through normal kidneys in a single day. Of the 60 quarts

of fluid that are extracted by the kidneys each twenty-four hours, approximately two quarts are eliminated as urine; the rest is filtered and returned to the bloodstream for circulation throughout the body.

The kidneys-each containing two to four million filter mechanisms-filter approximately a quart of blood every minute. That means all the blood in the body passes through the kidneys once every seven minutes. To accomplish this task, the kidneys need to be in premium health.

To help patients troubled by incontinence, bedwetting, kidney stones, or bladder/urinary infection. Dr. Christopher developed Juni-Pars, an herbal combination specifically designed for the kidneys and bladder. As a base he used two of the most effective and fastest-acting natural diuretics-juniper berries and parsley. Juniper berries also correct problems in voiding urine, and parsley is one of the best-known herbs for rebuilding urinary tissues. Dr. Christopher liked to remember one woman in Chicago who lay dying from severe edema. After only four days of parsley tea and parsley fomentations, she was healed.

To the juniper berries and parsley. Dr. Christopher added ginger root, which stimulates all the herbs to work together; uva ursi leaves, which dissolve kidney stones and other inorganic calcifications; marsh-mallow root, which acts as a soothing and healing emollient to ease the flow of urine; cramp bark, which relieves spasms; and golden seal root, which kills infection and heals tissues.

Numerous patients who were given Juni-Pars were able to overcome incontinence and chronic urinary tract conditions.

Despite the love of family members and the comfort of being "home" again, Ray was frustrated and discouraged in the Salt Lake Valley. He could not become licensed in the state of Utah; one of the city's naturopaths suggested that he move to Evanston, Wyoming, to become licensed. Once he was licensed in Evanston, the naturopath assured him, he could return to Utah and set up practice there.

So Ray approached Delia with the idea, and the Christophers again tucked their belongings into boxes tied with string.

It was then that they fully realized the financial hardship they had endured for so long in Salt Lake, for twenty miles from their destination in Evanston, they ran out of gas. With no money to buy more, Ray trudged along the roadside until he spotted a rustic farmhouse surrounded by fields of winter wheat. Told of the family's plight, the farmer gave Ray gasoline from the tank of a rusted green tractor. On borrowed fuel, but plenty of hopes and dreams, the Christophers arrived in Evanston.

## Chapter 5

### "We Missed That One Day of Summer": The Chilly Town of Evanston

Fueled by the gasoline from the rusty green tractor outside of town, the Christophers arrived at the comfortable place they'd call home. With a spacious office at the front, it had cozy living quarters in back roomy enough for Ray, Delia, and their children. With nothing to live on but the few boxes of food they had tucked into the car, they hung out a sign announcing their arrival, and waited for the patients to come.

Townpeople passing on the wide sidewalk in front of the office eyed the sign with suspicion. They'd never even seen a naturopath before. No one was quite sure what a naturopath was. All the practitioners who had settled in Evanston's high country had been orthodox medical physicians; the town didn't even have a chiropractor.

Just when Ray was afraid they'd starve, a few patients started trickling in, most from curiosity, and most for minor ailments like athlete's foot or a sprained ankle. Even those few weren't quite enough to sustain the Christophers, as they were having a rough time putting food on the table and paying their monthly bills. When circumstances reached their most dire, the Christophers got the chance to receive the blessings that come from sacrifice.

It all started with a phone call. Delia's sister Jane, a model who was working part-time in California to build a career in film, decided she wanted to serve a mission for the Church of Jesus Christ of Latter-day Saints. Her voice sang over the telephone wires as she told them, "You know that father can't support me. But if I can find someone who will, the Church will let me serve a mission."

"We'll be glad to send you on a mission," Ray responded without hesitation. "And we'll keep you on your mission for two years."

As they said their good-byes and Ray replaced the black phone in its cradle, his eyes met those of his wife. How would they manage? They were scarcely able to eat for lack of funds, and there were times when the two of them shared a paltry amount so their sweet children could be filled. But they shared something besides their meager meals, they shared a faith in the Lord and an attitude of thanks for the many times He had helped them. Somehow, they'd manage.

As Jane prepared to enter the mission home, she asked her benefactors where they wanted her to serve. Ray, remembering the people who had left him at the orphanage in Salt Lake City so many years earlier, said, "My father was from Paris, and my mother was from Switzerland. I would love to see you serve in the French-Swiss Mission!" Then, catching himself, he told her, "Tell them to send you where they need you the most."

The Christophers borrowed money against the naturopathic equipment in the Evanston office to purchase the clothing and supplies Jane would need for her two-year mission. With the last of their funds, they boarded the train to travel with her to Salt Lake City.

The line of hopeful missionaries was long that afternoon, and church authorities shook each eager hand, giving each man or woman an assignment in some corner of the globe. When they reached Jane, one paused. "Where would you like to go?" he asked.

"I want to go where you need me most," she replied, echoing the words of her brother-in-law.

After a pensive moment he announced, "The place you are needed most is in the French-Swiss Mission." Ray's heart soared. He had the chance of sending a missionary to the land of his ancestors.

As Ray and Delia made the weary journey back to Evanston, they reflected on what they had just done. Early in the morning, as the frost etched graceful designs on the windows of the passenger car, Ray fingered the coins in his pocket. Hungry and tired, he and Delia spent their last few dollars on a meal in the dining car, and prayed for their family's future.

Hanging over the wide sidewalk, Ray's sign swung silently in the frosty breeze. As he turned the

doorknob to enter his office waiting room that morning, he gasped.

It was filled. Patients sat in every available space, waiting for appointments to see the new naturo-path in town. From that day forward, his practice grew. There was money enough not only to keep Jane on her mission, but to feed his family again!

The patients themselves were the best advertisements Dr. Christopher could hope for.

Word-of-mouth recommendations came from people who had suffered for years, unable to get relief from the orthodox medical community. There was the woman whose arthritic joints were at last freed, the asthmatic whose airways were finally opened, and perhaps most astonishing to the residents of Evanston, the polio victim who at last walked.

Ray remembered the case fondly. The man arrived at the office in a wheelchair, bearing his doctor's pronouncement that he would never walk again. He had accepted with sorrow his fate, but was hoping to find some relief from the pain that accompanied his condition.

"I know I can relieve your pain," Ray told the afflicted man. "And if you'd like to walk again, I think I can help you do that, too." Given a program of herbal foods and dietary guidelines, the man left the office with new hope. Within a few months, he cast aside his wheelchair and walked around town, telling others about Dr. Christopher.

Although their business flourished, the Christophers had a hard time adjusting to the cold climate of Evanston. One of their favorite jokes was the sentiment that "we missed that one day of summer - we were in Salt Lake that day!"

From the time he was a young boy playing in the gardens along Highland Drive, Ray had loved the sight of a tender mother cradling her precious infant. Life was sacred to him. Throughout his practice he opposed birth control and refused to assist in abortion.

He remembered the chilling example of one belligerent young woman who was led into his office seeking an abortion. Although his patient schedule was relentless, he counseled her for almost an hour regarding the sanctity of life. "This baby has been sent for your enjoyment," he concluded. "Let it corner give it life; take care of it and love it."

Jumping from her seat, she screamed, "I hate you! If I had a gun, I would kill you!

I'm going to get rid of this baby, and if you won't do it, I'll get another doctor to do it!" As she ran from the office, he pleaded with her to remember the things he had told her.

About a year later, the woman came to the office again, this time bearing a sweet baby in her arms.

"I want to thank you," she said, stroking the infant's soft cheek. "I told you I hated you, that I wanted to kill you, but you made me think. I went to three other doctors seeking an abortion. Each time as I sat in their waiting rooms, I heard your voice. I never went through with it. This baby has changed my life, and she is the most beautiful thing I could ever have been given."

It was while in Evanston that Dr. Christopher had some of his greatest opportunities to help mothers and their babies. On one memorable occasion, the jangling of the telephone line cut through the heavy morning air. A frantic woman announced that she was hemorrhaging rapidly and about to lose her baby. "I've lost babies before," she cried, "and I want to save this one! Please, can you help me?"

Dr. Christopher instructed her to stay in bed until he arrived. He worked quickly to fill his bag with the herbs he knew would help. Just as he was about to press open the door against the frigid Evanston morning, the phone rang again. This time the message came from a small frame house on the opposite side of town, but the words were the same: another frightened woman was hemorrhaging rapidly and losing her baby. She, too, pleaded for help, and was also instructed to stay in bed until Dr. Christopher arrived. He paused long enough to stuff more herbs into his bag before racing into the not-yet-warm morning.

Each woman was given the same instruction: half a cup of false unicorn tea every half hour until the bleeding stopped, then half a cup every hour. They were to continue with half a cup of tea three times a day, enhanced with plenty of fresh juices and total bed rest.

Within months each of the women traveled the wide sidewalk in front of Dr. Christopher's office, each carrying a perfectly formed baby in the soft folds of a pastel blanket.

Dr. Christopher valued false unicorn so much that he used it in two formulas especially designed for women. The first is Nu-Fem; formulated to help rebuild a malfunctioning reproductive system, it contains golden seal root, blessed thistle, cayenne, uva ursi leaves, cramp bark, false unicorn root, red raspberry leaves, squaw vine, and ginger root.

One of his most versatile formulas, Nu-Fern was recommended by Dr. Christopher to women with a wide array of problems, ranging from menstrual cramping and flooding to infertility. Because blessed thistle provides a natural source of estrogen, Nu-Fem corrects the estrogen imbalance that is at the source of many female problems.

Ray's files were filled with letters from hundreds of women who used the formula with success. He found that it relieves cramps, pain, and flooding due to menstruation, reducing the flow without stopping it. The powerful uterine sedative in cramp bark helps relax the uterus and ovaries, resulting in painless periods. Other herbs in the formula promote a regular menstrual cycle.

Ray remembered a seventeen-year-old Texan whose menstrual cycles were so physically devastating that she was hospitalized each month for dehydration and excessive vomiting. Nu-Fem alleviated her problems.

A woman that Ray met while practicing in Evanston had suffered from agonizing menstrual periods for more than ten years, typically being bedridden with severe pain for a week each month. She had invested tens of thousands of dollars on specialists from coast to coast without avail. After using Nu-Fem for only ninety days, she experienced no pain or flooding with her periods, and had a twenty-eight-day cycle for the first time in her life.

In addition to easing cramping, the cramp bark in Nu-Fem helps rebuild the reproductive organs and correct the position of the uterus. An Ohio woman who had suffered severe pain from a tipped uterus was scheduled for a hysterectomy when she appealed to Dr. Christopher for help. After taking Nu-Fem for five days, her pain was eased. Within several weeks, her physician was astonished to find that the uterus was no longer tipped.

Because Nu-Fem provides a natural source of estrogen, delivers healing foods to the reproductive organs, and rebuilds organs that are immature or damaged, it also aids in conception and makes normal pregnancies possible. Ray liked to remember a couple who used the formula and conceived a child after fourteen years of desperate longing. Their success came after using Nu-Fem in conjunction with a proper diet, plenty of distilled water, wheat germ oil, and Fen LB.

A forty-one-year-old Portland woman who asked for Dr. Christopher's help had suffered nine miscarriages in the twenty years of her marriage. All had occurred during the second or third month of pregnancy, stealing with them her dreams of wading with a fair-haired child at the ocean's edge. Nu-Fem restored her reproductive system, and with it her dreams, as she successfully bore a child.

Even those who are pregnant reap the benefits of the herbal foods in Nu-Fem. Red raspberry leaves calm nausea and morning sickness, quiet false labor, assist contractions, check hemorrhage during labor, aid in rapid and safe delivery, relieve after-pains, and enrich mothers milk. Cramp bark aids in proper positioning of the fetus and prevents painful leg cramps during pregnancy. Squaw vine was widely used by the North American Indians to promote easy delivery; for centuries, they were back in the fields working the same day they gave birth. Cayenne improves strength and endurance during labor as well as stopping hemorrhage following delivery.

The other formula Ray based on false unicorn was Changease, a natural source of precursors to hormones needed by both men and women of all ages. He recommended it to many of his patients during puberty, pregnancy, nursing, and menopause, and used it in treatment of "male menopause" as well. To false unicorn was added black cohosh root, sarsaparilla root, Siberian ginseng root, licorice root, blessed thistle, and squaw vine.

The herbs in Changease help the body maintain the proper balance of hormones because they provide precursors to hormones. As such, the body has to do very little to convert them to estrogen and other hormones, which are easily assimilated and excesses naturally eliminated by the body. Dr. Christopher taught his students that synthetic hormones (such as those used in hormone replacement therapy) cannot be completely assimilated by the body.

The excess is stored by the body, builds up in body tissues, and eventually causes potentially serious side effects.

Changease eases the physical problems associated with puberty, provides quick relief for menstrual pain, acts as an outstanding pregnancy "food," and relieves hot flashes and other symptoms associated with menopause. Because both men and women need varying amounts of female hormones, Changease is also an excellent remedy for hormonal imbalance in men.

Blessed thistle, one of the herbs in both Nu-Fem and Changease, had special significance for Dr. Christopher: throughout the years of his practice, he used it to help many women nurse their

babies, even those who had adopted.

Historically, blessed thistle was known as the "holy herb." Legend has it that the French Emperor Charlemagne once found his army threatened with destruction by an epidemic of bubonic plague. An angel instructed him to shoot an arrow from his crossbow into the air - and that it would fall upon a plant that would cure the disease. The arrow fell on a blessed thistle plant, which eventually became the emblem of France's fourteenth-century Order of the Thistle.

Dr. Christopher's use of blessed thistle was not nearly as dramatic as that of an emperor seeking an angel's intervention on behalf of his dying army, but his endorsement of the humble herb saved untold numbers of innocent babes. He remembered one mother who lost her milk supply for more than two months. Her baby, who could not digest commercial formulas or animal milks, wasted away to the very brink of death. Sipping the blessed thistle tea she was given by Dr. Christopher, she was once again able to nurse her baby, who thrived and grew to play among the wild flowers that dotted the mountain meadows.

Another mother was ordered by a doctor to wean her three-month-old baby to a bottle. Her milk supply was insufficient, he said, and the baby was beginning to fail. Blessed thistle endowed her with a good supply of rich milk, enough to sustain her baby well. Still another mother of a large family grew fatigued and began to lose her milk supply, and just two capsules of blessed thistle each night restored so much milk that her nightclothes were wet with it.

But perhaps the most moving experiences for Ray involved women who breast-fed babies they adopted through love and charity. When one young mother was tragically killed in an automobile accident, her seventeen-year-old sister brought the blue-eyed baby girl to Dr. Christopher. The baby had been thrown clear of the car and was miraculously uninjured in the accident, but could not digest formula or cow's milk. As she cradled the baby to her shoulder, the young woman asked if she might nurse it. After a few days on blessed thistle tea, the seventeen-year-old had an ample supply of rich, nutrient-dense mother's milk. She reared the baby girl until she was weaned.

An unforgettable incident occurred shortly before his retirement when a tall, blond woman came to Dr. Christopher's office in Orem, Utah. With a proud smile, she told him, "I'm going to adopt a baby." Then, without hesitation, she leaned forward. "I've heard you have a program that will help me breast feed my baby. This is our fourth adopted child, and I haven't been able to breast feed any of them."

Prescribing a sound diet, plenty of fresh juice, and quarts of distilled water each day, Ray advised that she drink a cup of blessed thistle tea at least three times a day.

A few months later the same woman came through the doorway of his Orem office, draped like royalty in a deep purple robe trimmed with white fur. She threw the robe aside, and there, against the stark whiteness of her breast, nursed a chubby brown Navajo baby. Tears welled in her eyes as she gazed down at the suckling infant. "I love each of my four children so much," she whispered, "but I feel so close to this one. He is blood of my blood."

The practice in Evanston grew steadily, and eventually the small waiting room was filled to capacity each day long before most people in Evanston finished their morning chores. Some people came to be treated themselves, others brought loved ones or family members who needed the help that holistic healing could offer. Some needed only simple treatment, others presented problems that were so complex they had been abandoned by the medical community. Some even suffered from mental as well as physical illnesses.

One such woman came to the Evanston office one winter morning with her sixteen-year-old daughter. A victim of Down's syndrome, the girl had been institutionalized in Lander at the state's mental hospital (an "insane asylum," as they called it then). The girl walked slowly around the office, gazing intently at the equipment and the clear glass jars of dried herbs. Her face was brightened with a sweet smile, but she could not speak. Occasionally she uttered a guttural sound, but nothing was recognizable.

"I have fought to have my daughter at home for the next three months," the mother explained, never diverting her gaze far from the girl who wandered about the office. "Can you help me?"

Outlining a strict program of holistic healing, Dr. Christopher sent them back into the snowy Evanston morning. He checked on the child frequently, stopping to visit whenever he could find the time. By the end of the three months, her mind seemed quicker and brighter. She responded better to instructions. Best of all, she was speaking simple sentences that could be clearly understood by any who listened. Officials at the hospital were amazed with her progress when the child returned at the end of only ninety days.

As happened wherever Dr. Christopher practiced, the people in Evanston benefited from his unusual understanding of the human body and his inspired and unique formulas, combinations of herbs designed to build and heal. One particular patient arrived at the door of Ray's house well past midnight. Ray had just returned to his cozy home from making house calls, and was ready to settle wearily beneath the hand-stitched quilts, when there came a frantic pounding at the door.

Pulling his robe over his shoulders, Ray threw open the door. Leaning against the door frame were two young men, each supporting a wizened old man who was struggling for every breath of air. Ray recognized the wheezing sounds of asthma. The man who leaned on the others for support was probably one of the sickest and most pathetic Ray had ever seen.

"Please!" cried one of the young men. "Our regular doctor is out of town, and we can't find his assistant. Can you help keep Pap alive?" Ray nodded as he ushered the three out of the night air. As he settled the gasping old man into a chair and prepared a cup of peppermint tea, Ray listened to the tale of the old man's illness.

He had been stricken with asthma for twenty-six years, for twenty of those it had been so severe that he could not hold a job. It had been more than twenty years since he had reclined in bed, for if he lay down, he choked up so severely he risked death. His sons had built him a special chair in which to sleep at night.

Both sons were working full-time to meet the family's expenses. It wasn't just a matter of keeping a roof over their heads and food on the table, one explained-their father's medical care had devastated their savings and nearly ruined them financially.

The asthma was now so severe that he required shots, respiratory therapy, and oxygen treatments, often more than twice a week.

Dr. Christopher knelt by his side and helped him sip the steaming peppermint tea. Ten minutes later, he administered a full teaspoon of tincture of lobelia. Ten minutes later, as the four of them talked. Dr. Christopher spooned in another measure of tincture of lobelia, and ten minutes later, he swallowed the third teaspoonful. Then Dr. Christopher quietly began gathering pots, pans, and buckets.

Suddenly the man began vomiting. From two until five that morning he threw up, and with it came the thick, stifling, blackened phlegm that had choked his airways. Because he had sipped the cup of peppermint tea, his muscles were relaxed, he suffered no soreness from the hours of heaving.

Just after five o'clock, well before the morning sun began peeking over the mountainous horizon. Dr. Christopher turned to the boys. "You can take your father home now; he is finished with the treatment. He is fine now."

As the two rushed to their father's aid, he waved them aside with a brush of the hand. "You don't have to help me, boys," he said. "I'll walk." After seeing them out into the early morning. Dr. Christopher finally settled into bed for an hour's rest before the patients began filling his waiting room again.

He wasn't the only one who settled into bed that night, as the two young men signaled for their father to sit in his chair, he shook his head. "Put me to bed, boys" he insisted. "I'm going to sleep in a bed tonight" "You can't. Pap!" one argued. "It will kill you!"

But there was no persuading the man, who was gulping the fresh Evanston air as if it were a feast. He settled into bed and fell into a heavy sleep and slumbered deeply for thirty hours. Finally, he arose from his bed, filled his chest with oxygen for the first time in twenty years, and announced, "I'm healed. I'm going out to get a job"

Years later, a tall, handsome young man stopped Dr. Christopher on the street in Salt Lake City. "Do you remember the time we woke you in the middle of the night when my dad was having that asthma attack?" Dr. Christopher smiled at the memory. "Well, it's been years now, and he's never had another attack. He got a job as a gardener, and he's never lost a day's work. He sleeps in a bed every night. We don't know how to thank you"

For others who suffered from asthma, as well as any respiratory condition. Dr. Christopher developed Resp-Free, a formula of chick-weed, marshmallow root, mullein leaves, comfrey leaves, and lobelia. He chose all of the herbs in the formula for their ability to rebuild the lungs and expel the thick mucus secretions that accompany so many respiratory conditions. Some also soothe inflamed tissue, relieve pain, and heal hemorrhaging tissues in the lungs. In addition to Resp-Free, Dr. Christopher recommended a sound diet, plenty of steam-distilled water, [oil](#)

[massage](#), and external application of BF&C ointment.

One of the most valuable herbs in the formula is chickweed. It soothes, softens, and reduces irritation of the mucous membranes while relieving the cough of colds, influenza, and bronchitis. It activates the liver to eliminate the toxins related to these conditions. A powerful expectorant, it increases the secretions of the broncho-pulmonary membrane, facilitating the discharge of mucus.

While Resp-Free enabled some to partake of the breath of life, another of Dr. Christopher's formulas gave others the precious gift of sight. Herbal Eyebright is formulated around the eyebright herb, so named because early herbalists discovered that it helped heal the eyes. Along with the other herbs in the formula - golden seal root, bay-berry root bark, red raspberry leaves, and cayenne -it feeds the cell structures around the eyes. Dr. Christopher used it on many occasions to help restore sight to those who could not see.

Herbal Eyebright is usually brewed into a tea and applied to the eye externally in an eye cup as well as taken internally. Dr. Christopher used it to heal the eyes and relieve the pressure of glaucoma, to remove scar tissue on the cornea caused by infection, and to remove cataracts. An elderly man in Fort Worth, Texas, who suffered from both glaucoma and rapidly-growing cataracts healed both with the formula. A Michigan woman used Herbal Eyebright for ten days and removed cataracts on both eyes. A woman in Covington, Kentucky, who had suffered an 80 percent loss of vision due to subretinal hemorrhage had her sight completely restored with Herbal Eyebright.

Some of the cases seemed to defy possibility. A woman in California had the beginnings of cataracts when the jell broke in both her eyes. Her vision failed, and her eyes were so dry that she had to lift her eyelids with her fingers each morning. With continual use of Herbal Eyebright, her eyes healed and her cataracts dissolved.

But perhaps the most remarkable stories were those involving the gift of sight. An elderly woman who had lived in the dark loneliness of blindness for many years had her sight completely restored. A young man whose eye had been injured and without sight for ten years was able to see again. Two young adults, blind since birth, used the formula and saw the radiant hues of purple crocus nestled against the crisp white snow.

Two of Dr. Christopher's most touching patients were babies, and both involved the use of Herbal Eyebright. One story was told in the careful pen of a writer from Missouri. Her child had been born with Coloboma; one eye was smaller than the other. Three leading specialists examined the child and proclaimed that his blindness was permanent. She began patiently using Herbal Eyebright with a drop-per, placing the healing drops in each of his eyes. Within three months, the baby who was supposed to be blind was reaching for objects. By the age of three, he ran with excitement through the Missouri cornfields, his vision perfect. His mother concluded her tender note, "What a joy! Thank you."

Dr. Christopher remembered, too, the young couple who approached his lectern one night. "Our baby was born without optic nerves," the sweet mother explained. "Is it possible for us to help him? Can we help restore his eyesight?"

Ray was pensive as he considered an answer. To promise eyesight to one born without optic nerves was almost impossible! It would be like asking someone without ears to listen to the haunting strains of a Beethoven symphony, or like asking someone without legs to run through the fallen leaves along an autumn lane.

"I can't promise that your little boy will ever see" Dr. Christopher finally replied, "but I can recommend some herbal foods that will harm him in no way" With that, he recommended Herbal Eyebright dropped in the eyes and given internally, and B&B Tincture dropped in the ears and given orally.

Six months later the same couple trembled with excitement as they again approached Ray before a lecture. Tears streamed down this mother's cheeks as she told him that their toddler chased balls across the room and picked them up, engaged in the playful games all little boys love.

As his practice in Evanston drew to a close, and Dr. Christopher moved his young family back to the warmer climate of Salt Lake City, he left behind a tremendous legacy for the people of the small Wyoming community. One of the things he was most famous for was his great understanding of nutrition. He was well ahead of his time in many of his teachings. For example, he advocated the use of cruciferous vegetables, especially cabbage and broccoli, for healing and prevention decades before the American Cancer Society gave its famous endorsement. He promoted carrots as one of the most valued foods. He encouraged all he met to till the soil, plant a

garden, and harvest fresh produce. If anyone dared to protest that crops didn't do well in his area, Dr. Christopher never hesitated to tell the tale of his own father, who against all odds grew almonds and sugar maples in Salt Lake City.

He was an early proponent of a low-fat, high-fiber diet. He discouraged the use of processed foods, and encouraged people to instead eat the fresh fruits, vegetables, and grains harvested in their own backyards. He warned against the dangers of refined sugars and starches, and encouraged people to avoid meat.

And wherever he went he prescribed plenty of steam-distilled water and juices made from raw fruits and vegetables.

He often laughed about an experience he had while in Evanston. He was called to a sprawling farmhouse in Woodruff, Utah, a forty-mile journey from his small office in Wyoming. Inside he found the rancher and his entire family all weak and listless from an undiagnosed sickness.

As Ray quizzed the rancher and his wife, she described the ailment that afflicted them. "I'm so weak, I have to rest before I can even clear away the breakfast dishes. Then, after I've washed half of them, I have to rest again before I can finish." Her husband and children weren't any better off. The fences were in need of repair, the outbuildings needed a fresh splash of paint, homework wasn't being done, and grades were plummeting.

Ray stroked his chin thoughtfully. "What are you eating?" he asked.

"Oh, we eat well!" the rancher assured him. "I just stored up a thousand pounds of white flour, and we have plenty of canned goods, plenty enough to see us through the winter." "Have you ever considered whole wheat flour?" Ray asked.

"You could never force that down me!" the rancher jeered. "I don't believe in it. There's no common sense to it at all."

With his characteristic wit, Ray prepared to make his point with clarion brilliance. "Now, you're a rancher," he mused, "and you've got some prize cattle and quarter horses out there. Do you feed them carrots?"

"You bet!" the rancher smiled. "I've got about half a ton of carrots out there!" "Do you ever eat them?" Ray asked.

"Naw..." the rancher drawled. "They're just for the horses-you know, to keep them in good condition." "What about grains?" Ray continued. "I've got coarse-ground grains in the shed for the cattle." Then Ray proposed a daring experiment. "You bring in from the shed a thousand pounds of those coarse-ground grains. Prepare it over low heat until it is soft and chewy, stir in a little honey or some fresh-diced fruit. You eat that. Then take your thousand pounds of white flour, and give it to the cattle"

"What?" the man spouted with anger. "That horrible white flour would kill my prize cattle!"

Electrified silence filled the air. The rancher's face reddened as he realized the folly of his words. At last, he began to laugh. "You caught me" he smiled. "All right. I'll do it your way" Do it they did, and within just a few weeks of following the gentle doctor's orders, they knew the strength and vitality of health.

## Chapter 6

### A Legacy of Courage

As John Raymond Christopher took down the neatly lettered sign in front of his Evanston office and turned the key in the lock for the last time, he concluded not only a rural practice, but a significant chapter in his life. As he steered his family along the desolate wind-swept roads toward their native Salt Lake City, he probably had little idea of the trials that awaited him there.

As always, Ray was at peace in the bosom of his family. He was a tender father, a favored uncle. He cherished the association with those who understood him and his chosen trade. Perhaps it is well that he spent those difficult final years surrounded by his loved ones, for they gave him much of the strength he needed to carry on.

Established again in the valleys nestled between Utah's majestic Wasatch and her copper-studded Oquirrhhs, Dr. Christopher hung out his shingle and set about the task of healing those who sorrowed. If his was a privileged profession, there was no privilege attached, and the cold nights he spent alone in jail cells were little reward for his unselfish gift of time and talent. Because despite the naturopath's earlier promise, Ray was not licensed in the state of Utah, even though he had fulfilled the requirement of first being licensed in Wyoming.

Years before when he had struggled to establish a practice, he had nearly starved for lack of patients. This time it was different. Again he struggled to establish a practice, and far too few patients sought his help. But this time people didn't cast herbs aside as being worthless. This time people believed herbs to be harmful, and they vowed to prosecute any who prescribed their use. Legal harassments began. The few faithful patients who still made their way to Dr. Christopher were themselves suspect.

One day, a young man and his sister called Dr. Christopher to their home. Lying in bed was their mother, deep pain was etched across her ashen brow. Ray could almost taste death as he stood above her.

The children explained that she was riddled with cancer and had been given only hours to live. "But she wanted to die at home," they explained, "and we love her so. We wanted her here, too. Now we are afraid. Can you do anything to ease her pain until she passes?"

Ray had been warned against visiting the woman, warned that there would be legal ramifications if he attempted to treat her. But seeing her wrenching pain, he could not turn his back on her. His mighty compassion rose to the surface and spilled over to the brave victim who waited for death to carry her from pain and disease.

He leaned close to her and took her hand. "I don't know how long you'll be with us," he began, choosing his words with the utmost care. "But if you will follow this program for a few days, you will be free of pain. And I believe you will enjoy ease until your time comes." She nodded, the effort of a weak smile spreading across her drawn lips. He left the family with dietary instructions and a handful of herbal formulas. As he bid them farewell on their covered porch, he noticed neighbors peering out from behind heavy lace curtains in the house across the street.

He visited her several times after that, curious to note her condition. She was able to get out of bed. She was able to take short walks among the gardens she had so faithfully tended. A painless smile graced her lips, and she was able to share the association of her beloved children.

One morning a few months later, she gathered her children around her and bid them goodbye, telling each how much she loved them, then she closed her eyes and died peacefully, without pain. When they phoned Ray with the news of their mother's passing, her children expressed their gratitude to him for her final few months of joy and companionship.

It was a bitter victory for Ray. A few days later the police came to his house, handcuffed him, arrested him for murder, and transported him to jail. The neighbors across the street, the ones who had peered out from behind the heavy lace curtains and had done nothing to help their friend,

had noted Ray's license plates and filed charges against him when she died.

It was lunacy at its height! Here was a woman, sentenced to death by the ravages of cancer and the proclamations of the orthodox physicians who had treated her. Yet Ray, who possibly prolonged her life by a few weeks, and who definitely gave it quality, was the one who paid the price. It was so, in the words of the prosecuting attorney, because he was an "unorthodox physician." Unbelievably, Ray's attorney shook his head. He wasn't sure Ray could avoid a prison term.

It was the beloved children who first summoned Ray to their mother's bedside that offered his greatest defense. After answering the attorney's interrogation, the angry young man insisted on giving his own statement. When the judge consented, all eyes were on the witness stand.

"My sister and I called this man to our home with our mothers approval," he began, obviously nervous at his duty. "She had been sent home from the hospital to die, and she was in excruciating pain. Her doctors told us she would only live a few hours. We didn't ask Dr. Christopher to heal her, we asked him to help relieve her pain until she died. The pain was so fierce that we suffered with her, and we feared we were not equal to the task."

A hush fell over the courtroom as the impassioned young man continued his testimony.

"We did what Dr. Christopher told us to do," he explained. "Within forty-eight hours, my mother was free of pain. Instead of dying that day, or even the next day, she lived for several months. Most important, she lived for several months without pain. She got out of bed. She walked around. She was happy, and so were we. He changed her life, and all our lives."

With a sharp rap of the gavel against the fine-grained wood of the stand, the judge announced, "Case dismissed." Ray always believed that the Lord was in court with him that day -- and that the Lord's blessings kept him from behind prison bars.

Unfortunately, there were many more times when the cold steel of handcuffs slapped around Ray's wrists, and many times when his family had to post bail to free him from unfair imprisonment. It is a tribute to his wife that her support never waned. Through arrests and trials and imprisonments, her belief in him remained firm. Toward the end, they had a private joke between them. As he'd leave the house each morning to attend to the sick, he'd call back over his shoulder. "I'll phone you when I get to jail tonight!" he'd promise, and they'd both smile as they waved goodbye. Sadly, his prediction too often proved right.

The persecutions became almost unbearable at the end, but in his characteristic style, Ray never showed bitterness or retaliation. National Health Federation official Clinton Miller recalled at Ray's funeral one of the trials in which he was accused. According to Miller, Ray was "sitting there with no anguish in his face -- no concern, no bitterness, just beauty."

The legal battles continued, and at last the war was won. Some would say that the persecutors won the fight, as legislation directed specifically against Dr. Christopher was introduced to the Utah Legislature and was passed into law. After decades of practicing his healing art, he was forbidden. His hands were tied. To go against the mandates of law would mean an indefinite prison term.

But did the persecutors really win? Those who knew Dr. Christopher best know they did not. He was the real victor. Why?

Because when he could no longer treat the patients he so loved, he did the only other thing he knew to help-- he began teaching. At his peak, he lectured in more than 120 cities a year. His lecture halls were filled to capacity. Eager students stood in the aisles and lined the walls, straining for the chance to learn from the master herbalist. In 1979, he began publication of a newsletter. Headquartered from his office in Springville, Utah, it went to an international audience, spelling out the art of using herbs for healing. Until the accident that caused his death, he continued to teach in his School of Natural Healing. Once the law "stopped" him, he reached tens of thousands more people than he ever could in his humble practice.

And John Raymond Christopher won the battle, too, because of the person he was. He never took credit for a miracle. There were plenty of healings, and some of them defied science. There were many that were, indeed, miracles. But Ray never took the credit, and he told any who would listen that he never cured anyone (not even himself).

He instead gave credit to the efforts of his patients, to the herbs that came forth from the rich soil, and to the Lord. Throughout his practice and his writings, he always used the plural "we," remembering the Lord in all he did.

He won, too, because the work did not stop with him. Those who visited his infirmary at Fort Lewis and who filled his waiting room in Evanston and who met him at the roadside on his house calls went on to help others. Scores of his patients became herbalists. Many of his students practice today. Even the rancher in Woodruff who refused to feed his prize cattle white flour bought a fruit farm, learned reflexology, and works as a full-time herbalist.

He won because he practiced without guile, with selfless concern for his patients. He never hoarded secrets or held back information for monetary gain; he freely shared any information he thought could help someone else. He took people into their yards and taught them to use the common "weeds" that grew in abundance, when he easily could have bottled them himself and exacted a handsome profit. The more than fifty formulas he created were not to make money, but to impart blessings to others.

And he won because through everything he endured -- crippling arthritis, the death of his devoted mother, separations from his family, and cruel persecutions--he maintained the wonderful sense of humor that endeared him to so many. Most who have heard him lecture remember one of his favorite stories, because he repeated it often.

An elderly man was hospitalized, and doctor's orders called for an enema. The nurse administered the enema, but was called away on an emergency before she could record the enema on his chart.

A second nurse entered the room and administered a second enema, despite the old man's protests. She, too, was suddenly called from the room before she could record it on his chart.

Amazingly, a third nurse did the same.

When the exasperated man heard a knock on his door, he called out, "Who goes there? Friend or enema?"

Wherever he went in those final years, the eyes of the world followed. In 1975, a Canadian news editor wrote that "when he said he took a drink of cayenne pepper each morning, I nearly dropped my pen. Admittedly, I am not too familiar with cayenne...how could anyone consider taking a tablespoonful in a glass of water and dashing it back? Well, the good doctor wasn't kidding." She summed up with a description of Dr. Christopher mixing three tablespoons of cayenne in a tumbler of water. According to the editor, he "downed the whole thing and came up smacking his lips."

San Francisco Recorder editor Paul Speegle, commenting on one of Ray's arrests and the accompanying \$50,000 bond, asked, "Where hardened criminals, guilty of crimes of violence and threats to society, are given low bail, some members of the legal profession are requesting that an investigation be made to determine what prompted such an excessive bail in this case. Could this be a ploy to take the heat off the doctors in the current malpractice mess by making it unpleasant for acupuncturists, herbal, and natural healers? Just asking!"

And, though he is gone, his words live on. He was prolific in his final years, adding eight works to his original booklet on the Word of Wisdom. Those interested in the art he practiced can read his words in Dr. Christopher's Three-Day Cleansing Program and Mucusless Diet, Rejuvenation Through Elimination, The Cold Sheet Treatment and Aids for the Common Cold, The Incurables, The School of Natural Healing, Herbal Home Health Care, Capsicum, and Regenerative Diet. At the time of his death, he had begun work on several other volumes. His family is working to finish them in his memory.

The "Doc," as he was affectionately called, touched all of us. He healed many of us. His legacy is his students, his formulas, and the love he left behind. With uncommon valor and unequalled compassion, he gave himself to all of us...and we, with him, are the winners.

# Welcome to Herbal Legacy.com

HerbalLegacy.com is sponsored by [Christopher Publications](#). HerbalLegacy.com is **not** sponsored nor endorsed by Dr. Christopher's Original Formulas. We are an **educational** site only.

HerbalLegacy.com was created as a way for people to find out more information on the formulas created by Dr. John R. Christopher, and how they were originally intended for use. One of Dr. John R. Christopher's goals was to have an Herbalist\* in every home, and a Master Herbalist\* in every community. Through HerbalLegacy.com, we hope to further the knowledge of Dr. Christopher by offering detailed information on his formulas, and natural healing programs. We also detail other information that people might find useful, including various healing programs put together by Dr. Christopher.

The name HerbalLegacy was chosen because of the rich legacy passed on by Dr. Christopher. Please see the biography, An [Herbal Legacy of Courage](#), written by his son [David Christopher BA MH AHG](#), to find out more about his legacy.

At HerbalLegacy.com you will find a great deal of information on all of Dr. Christopher's Formulas, Cleansing Programs, Recipes to ensure your good health, and various writings by him. In addition there are testimonials from people who have used these methods successfully. You **will not** be able to purchase any herbal supplements from this site. This site is intended to **educate** people in the correct usage of herbs and nutrition.

**New!!** Sign up for our *free* newsletter! Each month we will be sending out a newsletter with new information on ailments, Dr. Christopher's Formulas, or other health topics. [Sign up now!](#)

Towards the bottom of this page, you will find a section titled "[New Additions](#)". This section contains a list of everything recently added to HerbalLegacy.com. Be sure to [Bookmark Us Now](#) so you can easily return for these new additions.

If there is an ailment you do not find on HerbalLegacy.com, or a section that you feel needs clarification, please e-mail [requests@herballegacy.com](mailto:requests@herballegacy.com). We are **unable to respond to individual questions**, but will continue to add useful information to the site.

\* Want to know how to become an Herbalist or Master Herbalist? Check out [The School of Natural Healing](#).

---

**Herbal Education:** Your source for a Complete Herbal Education. The School of Natural Healing was established by Dr. John Christopher in 1953 and has been dedicated to providing quality herbal education ever since. Learn more today.

**Book Store:** Visit our book store to find various books written by Dr. Christopher and many others that compliment his teachings.

**Ailments:** This portion of the site lists many different health Conditions, Definitions, Symptoms, Causes, and Herbal Aids.

**Formulas:** This section describes the different Formulas created by Dr. Christopher. It covers Usage, Dosage, Ingredients, and Testimonials.

[Links](#)[History](#)[Testimonials](#)[Feedback](#)[AHY Radio](#)[What's New](#)

**[Programs](#)**: This area outlines the processes Dr. Christopher recommended for over 30 different ailments.

**[Recipes](#)**: We have put together a number of tasty items that you can make at home to enjoy. Not only are they good, but they are good for you. We hope that you enjoy these as much as we do.

**[Herbs](#)**: Learn more about Cayenne and Comfrey in our new Single Herbs section.

**[Links](#)**: These are some sites that we feel are worth a look.

**[Literature](#)**: Here you can read selected writings by Dr. John Christopher, a biography of Dr. Christopher written by his son David, and other interesting topics.

**[History](#)**: Contains the biography of David Christopher, Master Herbalist and son of Dr. John Christopher who continues the work of his father.

**[Testimonials](#)**: We love to learn what herbs and natural healing methods have done for you and your loved ones. This area is for just that. These stories are some GREAT examples of what herbs are doing for people everyday.

**[Feedback](#)**: In this portion of the site you can send us your herbal success stories that can be used to help educate others in similar situations.

### Health Alert Topics:

**[Anthrax](#)**: Due to the recent terrorist activities and focus on Anthrax, we decided to add valuable information about this bacteria, including information on what to do to combat it.

**[Smallpox](#)**: Due to some debate over whether or not Smallpox could be used as a weapon as a result of recent events, we wanted to help you stay informed.

**[Fluoridation of our Water Supply](#)**: Utah and other areas of the world are currently debating putting Fluoride into the public drinking water. This area discusses the health problems with water Fluoridation. -- Contact your [Utah county House of Representatives](#).

## Welcome to The School of Natural Healing

The School of Natural Healing was founded in 1953 by Dr. John R. Christopher. Since that time, thousands of students have taken classes with us. This site gives information on the various correspondence courses offered by The School of Natural Healing. These courses now include: Herbology, Iridology, Reflexology, and our new Aromatherapy Program. Here at Snh.cc, you will find information on what our courses are all about. We have detailed information about each level, and the materials that come in each program. You can even register for classes via our secure server! Snh.cc is also home of The School of Natural Healing's on-line [Community](#). Students and non-students are encouraged to use our chat room and bulletin board to discuss different health topics. We also have [links](#) to other informational sites to help our students with their studies.

To get a free brochure about The School of Natural Healing, fill out our [brochure request form](#), and don't forget to [Bookmark Us Now](#).

### [Family Herbalist Program](#)

The introductory course in our program. This course is a pre-requisite for the Master Herballiast, Reflexology, Iridology, and Aromatherapy programs.

### [Available Courses](#)

At The School of Natural Healing, you can learn many things including: Iridology, Reflexology, Aromatherapy, and how to become a Master Herbalist.

### [About Us](#)

Become a Master Herbalist through our Home Correspondence Courses at The School of Natural Healing, founded by Dr. John R. Christopher, M.H., N.D.

**New!** Subscribe to our *free* bimonthly e-mail newsletter. It includes exciting updates on the School, herbal and health information, and special offers for subscribers only.

Welcome to The Herb Shop Connection

We are the Official Internet site of Dr. John R. Christopher Original Formulas. We believe totally in Dr. John R. Christopher's philosophy and support his works. We work very closely with the Christopher Family to maintain the highest level of trust with our customers. We are approved by the Christopher Original Formula Company and the Christopher Family. We Feature Over 500 Dr. Christopher products as well as many other top name alternative health care products.

We purchase directly from the manufacturer service and pass the savings directly to you. Because of our "just in time" inventory control we provide our customers with the freshest products available. We also offer unique products you can not purchase anywhere else in the world.

Dr. Christopher's products are now available in most retail stores yet many of our 30,000 customers appreciate the convenience of online ordering. The best part to ordering on the Internet is we offer you a 5% everyday online discount plus additional discounts on a wide variety of products.

We are one of the few companies on the Internet that has not forgotten the importance of live communication. If you decide you want to call and speak to a customer care representative, we are here for you during business hours and you don't have to jump through hoops to get a real person on the phone. 1-888-235-3265

### ***A Healthier You Audio Newsletter with David & Fawn Christopher***

Master Herbalists David and Fawn Christopher offer monthly herbal information on audio cassette via our "A Healthier You" Audio Newsletter. These informative audio cassettes are select recordings from the popular radio show "A Healthier You", now in its tenth year of broadcasting. Each 60 minute cassette offers up-to-date information and common sense regarding a variety of current health topics, herbs, natural treatments and therapies.

These newsletters are available in a monthly subscription or you may order any of our back-issue cassettes single or in sets of 12. You will receive your first cassette at the beginning of the month following our receiving your subscription, and you will receive a new cassette each month

You can also listen to the "A Healthier You" Live Radio Broadcast online now. It is broadcast LIVE at 9:00 AM in *Mountain Standard Time*. You will need to adjust the time that you tune in appropriately. The link to tune in is on the home page.

## Streaming Help

Please make sure that you have one of the players downloaded and installed from the [Streaming Audio Player Download](#) page.

If the link from the main page doesn't work for you, then you have a few options.

### Option 1.

Go to <http://live365.com> and do a search for AHY. This will give you a link to listen from there.

### Option 2.

#### Step 1.

Open WinAmp and Press Ctrl + L

---- Or ----

Right Click on the WinAmp Title Bar (this will give you a quick menu for WinAmp) and point to **Play**, then click on **Location...**

#### Step 2.

Now in the box, type 66.28.48.77:10416 (*it is very important that you type it in EXACTLY as it is here*) and click OK, you should be listening in a moment.

### Option 3.

#### Step 1.

Download one of these files. If the first file doesn't work for you, then try the other one. (In Internet Explorer, click on it and choose save this file to disk. In Netscape, Right click it and choose Save Link As... Make sure that you remember where you save it.)

[Play\\_AHY.pls](#)

63 bytes

[AHY\\_Radio.m3u](#)

189 bytes

#### Step 2.

Find the file that you just saved and double click it.

#### Step 3.

Listen and enjoy. You should now be listening.

## Streaming Audio Player Download

To listen to the A Healthier You Live Radio Broadcast, you will have to first have a streaming MP3 player installed on your computer. If you don't already have one, we have provided a couple of links here to get you up and running.

After installing one of these players, come back and click on the link to tune in and listen to the Live Broadcast.

[WinAmp](#)

[RealPlayer](#)

---

Our Favorite player is WinAmp and you can download it for **free**. Click on the button below (*it will open in a new window*) to go to WinAmp's download page and get it from there. Follow the directions after downloading to install it and then come back here to listen to the live broadcast.

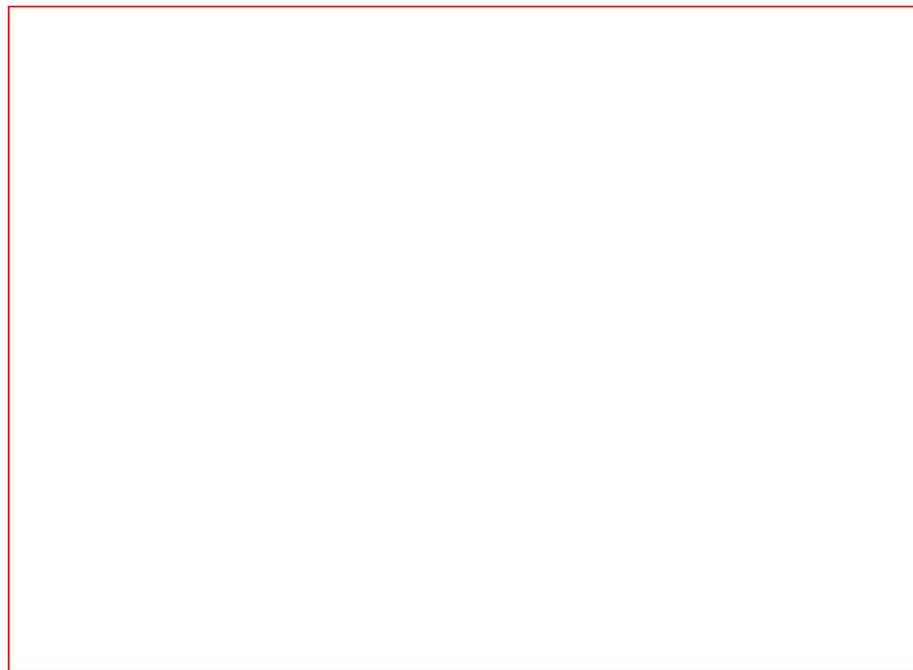

After Downloading and installing, you may need to Configure your Browser:

The following instructions assume you have at least Winamp version 2.05+ installed on the system you are attempting to configure for

listening.

### ***Internet Explorer 4.x / 5.x***

Upon clicking to start the broadcast, the following window will appear.

Make sure that "Open this file from its current location" option is selected and that the "Always ask before opening this type of file" checkbox is unchecked, once the options agree with those specified here, press OK. Upon pressing the OK button, it will open Winamp and connect to the stream automatically. By doing this you have told Internet Explorer that from that moment on, you wish to automatically open the application associated with the .pls extension rather than prompt you to download the file.

### *Netscape Communicator / Navigator 4.x*

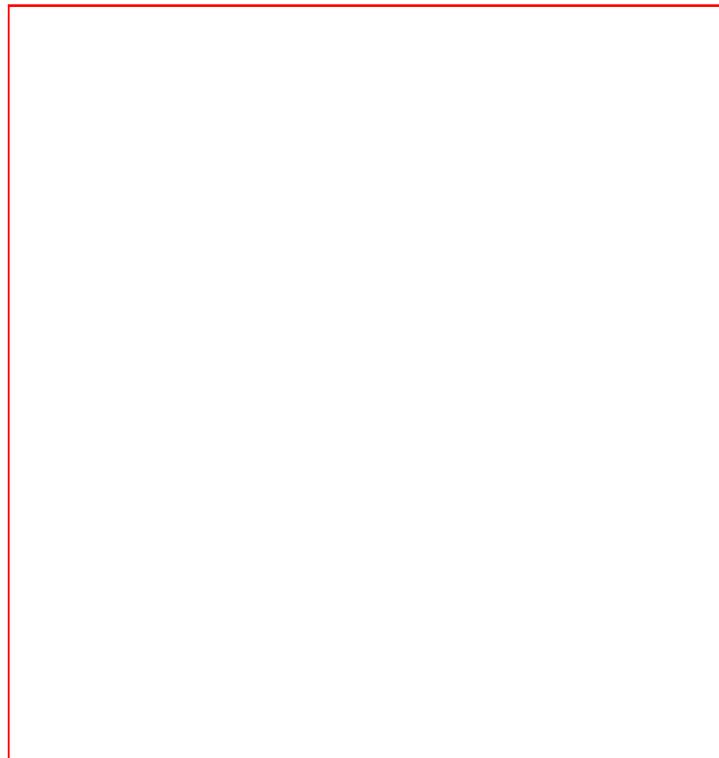

To configure Netscape Navigator, after clicking to start the broadcast, Navigator would indicate that the .pls extension isn't associated with a Navigator via a helper application. Immediately after, the following window would be displayed:

To proceed, click on the "Pick App..." button to indicate which application you wish to use to open the SHOUTcast streams from that moment on. Once you click the "Pick App..." button, the following window would popup:

Simply click on the "Browse..." button and navigate to the folder that contains the Winamp.exe executable. (Usually located in C:\Program Files\Winamp\Winamp.exe) Once you locate the executable(Winamp.exe), you would select it and press the "Open" button. This would place the path to the "Winamp.exe" executable in the field below the "Browse..." button. To complete associating the SHOUTcast stream file with Winamp, press "OK". A new window would appear immediately after pressing "OK". This window will give you the option to enable Winamp to always open a SHOUTcast streams without prompting you for action. The window should appear like the one seen directly below:

To complete the process, make sure that the "Open it" option is selected and that there is no check next to the "Always ask before opening this type of file" option. Press "OK" and the SHOUTcast stream should automatically begin playing with Winamp. From that point on, every stream you click to listen to, you should no longer be prompted for action, and automatically begin playing it with Winamp.

Congratulations, you can now listen to the "A Healthier You" Live Radio Broadcast every saturday morning.

Welcome to Newton Homeopathy

Newton Homeopathic complexes are the simplest way to care for your health. Newton makes easy to use formulas, promoting health and wellness for the entire family, pets included. Our remedies are safe, effective, have no side effects, and are economical.

If you have questions about any of our products, contact us at:  
**1-800-448-7256** from **9am - 5pm (Eastern Time)**, Monday through Friday or  
e-mail us at: [info@newtonlabs.net](mailto:info@newtonlabs.net) .

Our website is designed to provide you with our product information and is not meant to be used in place of medical advice, instruction and/or treatment. If your symptoms persist or worsen, please consult your health care professional.

The Newton line of homeopathic remedies are handmade and are available in liquid (low certified organic alcohol) and pellets (no alcohol). Our products consist of the highest quality ingredients found in nature. Newton makes your choice of remedy simple by combining the most appropriate homeopathic single remedies together for you. If you are not sure where to start, follow the simple method known as the [Jump-Start Your Health healing system](#).

Comments or questions? We'd like to hear from you! [info@newtonlabs.net](mailto:info@newtonlabs.net)

## What is Homeopathy?

Homeopathy is a 200 year old well-established system of medicine based on unchanging principles. The basic principle is LIKE CURES LIKE. A substance that causes specific symptoms when taken in its raw form will alleviate those same symptoms when taken in its homeopathic form. Rather than focusing on the disease and trying to combat it, as is the case with conventional medicines, homeopathy works to encourage the body's natural healing mechanism.

The substances used in homeopathic remedies come from various plant, mineral and animal sources. Most have been used for centuries, yet discovery and development in homeopathy is an ongoing process.

Besides being completely natural many homeopathic remedies can be self administered and are

available in over the counter form. Most importantly, all homeopathics are free from harmful side effects.

### III. SMALLPOX (Variola)

An acute infectious disease characterized by pronounced skin eruptions. The eruptions have four stages: papule, vesicle, pustule, and crust. When the crust forms, it comes off, leaving a pit in the skin. In confluent types of the disease the scar is most pronounced, sometimes destroying otherwise good features.

**Etiology.**--Smallpox is considered one of the most virulent of contagious diseases, and it is generally believed that persons exposed are almost invariably attacked, unless protected by vaccination. This is one of the most stupendous exaggerations to be found in medical literature. My experience has been that very few people take it when exposed to it.

I remember quite a number of years ago being connected with a pest-house, where I was appointed physician and spent two hours a day with confluent smallpox for three months, without taking the disease. It is true I had a vaccination scar from childhood, but I have long since given up the opinion that that afforded me any protection. With me in that epidemic was a thirteen-year-old girl, who was caught and held there by the health authorities. She waited upon the sick people, and in all that time did not spend one hour outside of the house except in the small yard. She never had been vaccinated, and she failed to contract the disease. I could give many instances of personal experience where many were exposed without a single development. In this particular epidemic two German nurses took down, in spite of the fact that they had been vaccinated and re-re-vaccinated in the old country, where they do the work "just right."

**Age.**--The disease is common to all ages, and is very fatal to the extremely old and young. The unborn child may be attacked, but only when the mother develops the disease. It is said that in the case of twins only one may be attacked, thus showing that there is an immunity without vaccination.

**Race.**--It is said that the aboriginals suffered terribly from smallpox. Why? Because it is a disease of filth. The uncivilized people are just filthy enough to be good subjects for this disease. It is said that, when it was first introduced into America, the Mexicans died by the thousand. They yet suffer very greatly. Only a few years ago I was corresponding with a physician, located in Mexico, whose function was to take care of the miners for a large corporation. He gave me much information in regard to the severity of the disease among the natives. It is said the North American Indians have been decimated by this disease. The negroes are especially susceptible, and the mortality among them is great, being about forty-two per cent, against twenty-nine for whites.

**Variation in the Virulence.**--Sydenham states that smallpox has its peculiar kinds, taking one form during one series of years and another during another; which means that the severity of the epidemic probably varies with the atmospheric and local conditions. There is no question but that perfect sanitation has almost obliterated this disease, and sooner or later will dispose of it entirely. Of course, when that time comes, in all probability the credit will be given to vaccination; but if we could drop back to the aboriginal condition and do away with sanitation generally, smallpox would return with all its virulence.

**Prevalence.**--In the United States there has been a steady decrease.

When receiving orthodox treatment, pustules sometimes make their appearance on the tongue and throat and in the rectum. The disease has also been known to pass down the esophagus, and even down into the stomach. In decidedly severe cases of confluent smallpox it would be hard to say

what part of the anatomy is not affected. There is no disease so dreadful as the worst types of smallpox. That mortality should be great in this disease is obvious; for the entire surface of the body is involved to such an extent that radiation of heat must be sadly interfered with.

**Symptoms.**--Smallpox is divided into three forms: discrete, confluent, and the hemorrhagic variety. The discrete form is where the pustules are isolated and do not run together. The confluent form is where the surface is a mass of pustules all run together. The hemorrhagic variety is called black smallpox, because the hemorrhage into the skin turns it black. When receiving proper treatment only the first form develops.

There is a modified smallpox known as varioloid. This is supposed to be modified by vaccination, but I have seen cases of pronounced types of discrete smallpox that had no modification by vaccination, and the patients were not prostrated nor confined to the bed to exceed twenty-four hours. They were around, reading, doing chores, while the pustules were forming and drying up. The semi-confluent and confluent smallpox is a disease to be dreaded; but the force of the disease is undoubtedly being controlled by sanitation. In fact, the disease is one of filth, not only on the outside of the body, but also on the inside of the body. When people learn to live correctly, and domestic and civic sanitation is what it should be, it will be impossible for this disease to get a foothold even in the lightest form.

When a physician is called to see a case of smallpox, the patient may be complaining of headache; certainly a decided backache and bone-ache--in the olden times it was called the "breakbone fever." A never-failing symptom is a feeling of shot under the skin. By passing the hand gently over the forehead, cheeks, or arms--or, in fact, any part of the body--long before the skin is reddening there will be shot-like projections felt just beneath the skin. There is nothing about the early symptoms of smallpox that is so positively diagnostic as those symptoms. Some of these very discrete cases will have one or two pox in the roof of the mouth. The first twenty-four hours there will be heavy aching in the back, and perhaps vomiting and headache. After that, unless it is a case of confluent smallpox, the patient will be comfortable for the remainder of the sickness--that is, if the case is properly nursed and treated.

**Desiccation.**--The pustules terminate by either breaking and drying up, or drying up without breaking, and forming a crust. This takes place about the third week. In confluent smallpox the crust adheres for a long time. The reason for it is that the inflammation dips deep and leaves a permanent scar.

**Complications.**--Complications may set up in any of the mucous membranes, the lungs, bowels, or eyes. Pericarditis is a serious complication. Bright's disease may follow. Inflammation of the reproductive organs of both male and female may result. It is not my intention to give anything but a very short sketch of this disease. Those who would like to know its history, complications, variations--in fact, give exhaustive study to the subject--I would recommend to read Osler's "Practice of Medicine." There will be no complications if the patient is treated properly. Complications are made by regular practice.

**Treatment.**--Patients should be separated as widely as possible. It is very dangerous to bring two cases of confluent smallpox together in what might be called a large room; indeed, a large drawing-room is small enough for one case. Huddling such cases together will cause great mortality. The disease should be treated in tents, and out in the open as much as possible. Some authorities recommend opium to relieve the pain in the back. I think this is the worst kind of malpractice. The hot bath will relieve the pain, put the skin in as comfortable a condition as possible, and certainly will be a safe remedy to relieve all suffering. The baths should be continued long enough to relieve the pain. The bowels should be washed out every night regularly, using two quarts of water.

The patient should be given all the water desired, but positively no food of any kind. By some authorities it is recommended to give barley water, oatmeal water, lemon juice, etc. Until the temperature has been reduced to the normal, the patient should be given plenty of cold water, and nothing else. In case of diarrhea, a small opiate, such as paregoric, has been recommended; but there will be no diarrhea unless the patient is fed. The patient should be kept as clean as possible around the eyes, nose, ears, and the outlets of the body. If the bathing is kept up often enough to give full relief from suffering, this, in addition to applying a little olive oil to the skin, will keep the surface more pliable, and prevent discomfort and stiffness of the skin. In convalescence a patient should be warned not to eat too heartily the first week, After that, if convalescence is fairly rapid, by the second week the patient may eat moderately of all the food given to a well person.

# Hepatitis epidemic in Egypt caused by injection campaign

<http://www.timesofindia.com/110300/11hlth16.htm>

PARIS: A massive campaign in Egypt to eradicate a blood parasite went disastrously wrong, causing an epidemic of hepatitis C that infects up to a fifth of the country's population, a research released on Thursday said.

US and Egyptian epidemiologists, in a report to be published in Friday's edition of the British Medical weekly - The Lancet, said the hepatitis was transmitted across the Egyptian population through unsterilised needles and reused syringes that were used to combat a blood fluke.

This is the world's biggest case of blood-borne viruses being spread by a medical campaign, they said.

The anti-fluke campaign, called Parenteral Antischistosomal Therapy (PAT), was conducted across Egypt from the 1950s to the 1980s.

It entailed giving between 12 and 16 intravenous injections of an antimony salt, tartaremetic, to each patient over a short period, the study said.

However, the injections were often administered by reusable syringes and needles that were either not sterilised properly or used for multiple doses for a number of people in one sitting.

The injection campaign ended when a cheap, oral medication became available, but by that time, there had been an "epidemic spread" of hepatitis C, and many people had probably become contaminated with hepatitis B as well, the researchers said.

Between 15 and 20 percent of Egypt's population of 63.3 million have antibodies to hepatitis C, meaning they have been infected by the virus but may not necessarily have symptoms of the illness, they said.

# Vaccine syphilis

## Vaccine disease

### Quotes

[Chapter 6 of The Poisoned Needle by Eleanor McBean](#)

[INCREASE OF INFANT SYPHILIS by Dr Hadwen MD](#)

[COW-POX AND VACCINAL SYPHILIS--William Tebb](#)

[DR. M. D. MAKUNA'S MEDICAL VACCINATION CENSUS--William Tebb](#)

From The Family Doctor, March 1, 1883

The fearful affair at Algiers, again, has opened the eyes of the public to the frightful nature of the danger incurred by vaccination. From reports which have reached this country, it appears that the young soldiers of the garrison of Algiers, who had not already been vaccinated, were conducted to the Dey Hospital to be operated upon in accordance with the military regulations. They were vaccinated from two children in good health (apparently). Those vaccinated from one of the children presented no special incident, but the fifty-eight who were vaccinated from the other child *all to a man* broke out within a week with syphilis. The men were so bad that they were ordered into hospital. The names and regimental numbers of these unfortunate mortals are all recorded in *La Science Libre*, where they may be seen by anyone at any time. That syphilis may be, and frequently is, introduced into the system by vaccination, no one will deny, and therefore our duty is to ascertain whether the protective properties of vaccination from small-pox are sufficiently substantiated to warrant our adopting such a precaution at the fearful risk of contracting such a dire malady as syphilis. 'We have no hesitation in replying to this in the negative, and in declaring that if vaccination really does procure any immunity from small-pox, the remedy would be far worse than the disease itself, if any syphilitic virus were introduced into the system. Who would not rather run his chance with small-pox than syphilis?

"The tragedies attending Vaccination are not confined to any particular class or country, and although, doubtless, as much care is exercised in the selection of vaccine virus for recruits in the army as anywhere, yet the cases of injury are frequent and distressing. Many of them have been subjected to much artful smothering, with the praiseworthy design of keeping the Jennerian prophylactic in creditable odour; but the facts have been too terrible to admit of the attempted suppression, for "murder will out." In December, 1880, fifty-eight young men joined the 4th Regiment of Zouaves, at Algiers. In compliance with the rules of the service, they were vaccinated by the military surgeons, and the whole 58, without exception, were infected, and physically ruined by inoculation with the most terrible of all diseases. The details were published in *Le Petit Colon*, of Algiers, and in the *Paris Journal d 'Hygiene* for June 30th and August 25th, 1881, edited by Dr. DE PIETRA SANTA, a scientific gentleman, eminent alike for his ability and courage. This case was also briefly alluded to by the Paris Correspondent of the *Daily News*, and reproduced in the *Vaccination Inquirer* for August and October. The fullest details, however, appeared in *La Science Libre*, published at Nice, from the pen of an eyewitness, residing on the spot, Dr. P. A. DESJARDINS, after a careful medical examination of the unfortunate youths. From this narrative, it appears that on the 30th of December, 1880, the recruits in the 4th Regiment of Zouaves were conducted to the *Hôpital du Dey*, Algiers, to be vaccinated according to the regulations of the service. Two military surgeons operated, the vaccine being extracted from a couple of infants under

two years old, apparently, in excellent health, in whom the lymph appeared to be genuine and normal. Those vaccinated from one child displayed no special incident calling for remark; but the 58 youths (says this medical authority writing from personal observation) who were vaccinated from the Spanish child, developed in a few weeks all the characteristics of syphilis. The marks on the arm were disquieting, and the symptoms so threatening, that the infected youths were, some ten weeks after the operation, sent to hospital. In a month, all but six were dismissed, but they were soon compelled to return, as it was discovered that the terrible disease had infected their constitutions. Dr. DESJARDINS further says: " Some had ulcers, others affections of the palate; some shewed discoloration of the skin; affections of the teeth, gums, and joints, also presented themselves to my observation, in addition to the usual symptoms of this dangerous and disgusting malady. I also noticed decay of the hair, eyebrows, and eyelashes!" Then follows a list of the names and regimental numbers of these unfortunate young men, whose health and future prospects have been fatally blighted by this State-enforced operation."--[William Tebb](#)

DR. R. T. TRALL, New York, 1855.

Physicians are not at all agreed as to the propriety of resorting to vaccination as a protection from small-pox. There is no question that it is, to a great extent, a protection from the virulence and danger of the natural smallpox; at the same time, there is danger of inoculating the patient with some loathsome, and even worse disease, as syphilis or scrofula, from the impossibility of always getting a supply of matter from healthy constitutions. In either way there is a risk to incur, and it is a delicate matter for a physician to advise on a subject when both sides are hazardous. I am fully convinced, that if people could bring up their children in strict physiological habits, the non-vaccinating plan would be altogether the best; but in a city this seems next to impossible, and in the country it is pretty generally neglected. Children reared healthily in relation to food, exercise, and ventilation, have little to fear from any disease, however contagious; they may have this (small-pox), but it will not endanger life, nor produce much deformity, nor serious injury. I have seen within the last year a most horridly loathsome case of scrofulous disease, in which the patient literally rotted alive at the age of 15, from unhealthy virus received when he was but three years of age. Parents often find some of their children tainted with morbid humours, unlike any other member of the family, and which they are wholly unable to account for, except on the supposition of foul matter taken into the system by vaccination. My own practice would be to keep children as healthy as possible; and if the small-pox happen, let it have its natural course.—*Hydropathic Encyclopedia* p96

DR. LEVER, Physician to Guy's Hospital, London.

I have known syphilis communicated to a child by the hand of a legally educated medical practitioner.—*Reply to Circular of Medical Officer Of Privy Council* 1856.

PROFESSOR RICORD, M.D., Paris.

My position is simply this—I suspect that isolated examples of syphilitic infection through vaccination are much more common in this country than is generally admitted. For the chance of the

occurrence of such isolated cases is infinitely greater than that of a wholesale outbreak of vaccinal syphilis, and when such wholesale outbreaks have been noted, I cannot help feeling certain that many isolated cases of infection have occurred without their nature being detected or admitted.—Letter to MR. W. HUME-ROTHERY, December 24th, 1879.

DR. O. KRATZ, Surgeon, Confederate Army, U.S.A.

After reporting cases of vaccine syphilis, says, "I have seen one case, where the product of vaccination was *Surpetigo rodent*, a frightful disease of, I believe, a cancerous character. Some cases had herpes exedens, as the result of vaccination on their arms.—Confederate States Medical and Surgical journal, pp 104, Vol. i. 1864.

DR. BALLARD, now one of Her Majesty's Vaccine Inspectors,

Summed up the evidence as follows:—

1. There are numerous cases on record to prove that the vaccine virus and the syphilitic virus may be introduced at the same spot by the same puncture of the vaccinating lancet.
- 2.—From several instances on record, there can remain no reasonable doubt that the vaccine virus and the syphilitic virus may both be drawn at the same time, upon the same instrument, from one and the same vesicle.
- 3.—The vesicle which is thus capable of furnishing both vaccine and syphilitic virus may present, prior to being opened, all the normal and fully developed characters of a true Jennerian vesicle, as ordinarily met with.—*Essay on Vaccination*. Pimblished 1868.

PENNSYLVANIA MEDICAL JOURNAL, Sep. 1871.

American mothers at last are no more free from the plague of "vaccination" than are British parents. What a prospect for humanity is this propagation of loathsome, contagious diseases! National virusation by a staff of State officers to "preserve" the public health. All the vaccine virus now sold in Alaska-street, Philadelphia, is obtained from children suffering under the influence of scrofula, syphilis, or some kindred pestilence. The vaccine station is neither more nor less than a cesspool of germinal horrors.

Dr. HEIM, Public Vaccinator, Wurtemberg,

Says :—That the most expert diagnostician will not always be able to detect dyscrasy in children of the vaccination age, and that he himself has transplanted syphilis from a child which seemed to him perfectly healthy.—*From Horrors of Vaccination*. P. 26.

JOSEF HAMERNIK, M.D, Professor of the

## University of Prague, Bohemia.

Some years since, some terrible cases came to light, which were falsely registered as an epidemic, and which were caused by one vaccinator infecting a whole district with syphilis by vaccination.

In the beginning of this year a similar misfortune occurred in the neighbourhood of Melnik, when a number of children in several districts got syphilis by vaccination, and several died of it.

Such epidemics probably occur more frequently than they are described as doing. In the earlier times of the practice of vaccination, no one dared to write anything against it, and thus no means existed of obtaining a correct knowledge of conditions like these.

One would naturally suppose that a single case of the transmission of syphilis by vaccination, incontestably proved, would result in the immediate abandonment of the practice of vaccination, in the instant withdrawal of the Government grant for its support, and in advising the people as to the dangers of vaccination, and showing the impossibility of any but misguided or self-interested physicians advocating its continuance. — *The History of Small-pox and Vaccination*. Prague, 1872.

DR. J. EMERY CODERRE, Professor of Materia Medica, University, Montreal, Canada.

Vaccination has made victims among us; some have contracted small-pox in consequence of the inoculation of the vaccine; others have been attacked with gangrenous ulcers, syphilitic sores, &c., resulting from the introduction of this virus into the constitution.— *From a paper read before the Medical Society*, .Montreal, January 31st, 1872.

DR. STARTIN.

Believed in 30 years he had seen about thirty cases of syphilis communicated by vaccination. He had seen hundreds of cases of spurious vaccination, where contagious porrigo had been inoculated. He had seen scabies vaccinated on more than one occasion. When DR. SIMON sent out his circular, in 18566, he (Dr STARTIN) collected several cases, giving the names and addresses of the patients, but no notice had been taken of them. They were undoubtedly cases where the children had been perfectly healthy, as well as their parents and nurses.—*Discussion at the Royal Medico-Chirurgical Society*, June, 1872.

WILLIAM HITCHMAN, M.D., D.C.L.

I have been acquainted with the morbid effects of vaccination for nearly 40 years, and have witnessed crowds of cases, both in hospitals and private practice, analogous to the Guy's Hospital model; but lest my testimony may not be deemed sufficiently impartial or unbiassed, I shall quote from the records of the Smallpox Hospital, to prove that pure lymph, even in the hands of MR. MARSON himself, is occasionally attended with very impure consequences. M. A. W., aged 4, a fine child, was vaccinated by MR. MARSON in five places on the left arm, the poor child at the time being in perfect health, on the 19th May. The arms soon became severely inflamed, and spots

of purpura appeared on the face. The vesicles on the eighth day appeared dark and filled with blood, and numerous effusions were dispersed over the entire body. The areola assumed a mahogany appearance. In fact, the vaccine vesicles were jet black with fearful blotches—worse, I think, than the eruption of small-pox itself—dispersed (as I have said) over the whole body of this unhappy child thus "protected" by a paternal Government from disease; more especially involving the face, neck, and arms, and over the skin, together with bleeding from the left ear and nostril. Enough, and to spare, of these morbid phenomena now propagated by Acts of Parliament.—The Anti-Vaccinator, Oct. 7th, 1871.

As for time children recently vaccinated in Liverpool, I may say, from my own private observation, *without reference to the many thousands I have seen at the hospital for skin diseases*, that the health of hundreds has been thereby permanently affected with intractable forms of cutaneous eruption: emphatically have I seen strumous ulcers rapidly developed, acute ophthalmia, chronic enlargements of the cervical glands, diseases of the scalp, purulent discharges, foetid abscesses, and gangrenous inflammation of parts, followed by sloughing, while the throat, especially, of many such miserable sufferers *according to Act of Parliament*, together with the palate, uvula, and tonsils, are periodically covered with dark livid incrustations, more difficult to heal than those of small-pox itself, inasmuch as they owe their disgusting origin to the foul exudations of that indefinite, nameless, hideous thing now in course of active propagation throughout the land, *yclept vaccino-syphilis*.—From the Anti-Vaccinator, Dec. 16th, 1872.

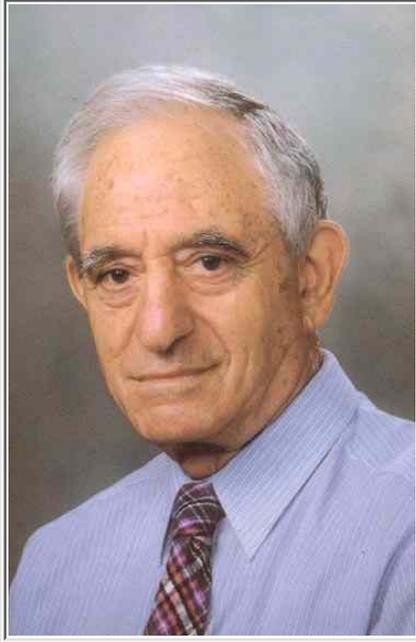

#### MEDICAL TIMES & GAZETTE, February 1st, 1873.

The important subject of vaccinal syphilis came again before the Medico-Chirurgical Society on Tuesday evening, when a paper was read by Mr. HUTCHINSON, detailing two new cases. He also drew some general deductions from the facts as already ascertained, which, together with others elicited in the course of the discussion that followed, constitute the most important practical suggestions yet made with regard to this most unsatisfactory subject. That syphilis could be communicated by vaccination was, though admitted abroad, long disputed in this country. Since the publication of MR. HUTCHINSON'S paper, and a communication by MR. THOMAS SMITH to the Clinical Society, where the patient was exhibited, it can no longer be so. We have now emerged from the region of doubt, to one of belief in the possibility of such an untoward occurrence; and, in accordance with the practical turn which most professional discussions sooner or later take in this country, we have promptly begun to seek a remedy for the possible evil.

Heretofore, as we have said, it has not been admitted that, if due care be taken, syphilitic infection by vaccination is possible. Especially has this been urged by the Crown officers when asked to encourage heifer vaccination. The facts flow before the public will tend to rouse them, if they have not been roused already, from the false security into which they have been lulled. And, as was stated at the meeting, it is plain that Our compulsory vaccination laws cannot be maintained unmodified.

## Dr Archie Kalokerinos, M.D.

Dr. Archie Kalokerinos took his medical degree from Sydney University in 1951 and then spent six years in England. On his return to Australia he was appointed Medical Superintendent of Collarenebri Hospital where he served until 1975. He is a Life Fellow of the Royal Society for Health, a Fellow of the International Academy of Preventive Medicine, Fellow of the Australasian College of Biomedical Scientists, Fellow of the Hong Kong Medical Technology Association, and a Member of the New York Academy of Sciences. In 1978 he was awarded the A.M.M. (Australian Medal of Merit) for 'outstanding scientific research'. Dr. Kalokerinos has authored a book with profound orthomolecular medicine implications entitled 'Every Second Child', as well as many scientific papers. He is also author of two books on the subject of opal, on which he is considered to be an international authority. Currently he is working as a general practitioner at Bingara, New South Wales, where he is in charge of the local hospital. He is also the Honorary Medical Advisor for Aboriginal Health.

[Compulsory Vaccination in England by William Tebb](#)

[\[Vaccination\]](#) [\[Smallpox\]](#)

Letter to William [Tebb](#)

"BROOKLYN, NEW YORK, *May 7th*, 1883.

"DEAR SIR,—I found the Vaccination tyranny much more than sentiment on board the *Adriatic*. Aboard-ship, as everywhere, it has attained terrible proportions, which makes it probable that, in the near future, it will become The Great Terror that shall 'cause that as many as will not worship the image of the beast shall be killed,' and that 'no man may buy or sell save he that has the mark of the beast.'

"The first intimation I had that Vaccination was a requisite for free travel in America was an 'Important Notice' on the stairway to the effect that passengers not provided with certificates of Vaccination were liable to be detained in quarantine on arrival, and that the ship's medical officer was prepared to give certificates to those unprovided on showing marks of successful Vaccination.

"In a few days, I heard of this ship's medical officer magnifying his office down among the women and children. I conversed with one young woman who had submitted to the great ordinance, and, after characterising the whole business as the most idiotic folly of the times, I begged of her to suck the poison out of her arm. But many hours had elapsed, and the endeavour failed. Day by day she had to carry her burden of pain until she landed. Whether she is now rejoicing in enhanced health as a consequence of the small-pox proofing process, or whether she is suffering from the weary illness that is often its 'accident' I have no means of knowing.

"The bulk of the passengers were Irish, German, and Welsh ; there were very few English. I held many small indignation meetings, and did all in my power to enlighten them as to the filth, fraud, and folly of Vaccination. I trust I did a little good, and sowed a little seed that may some day and somewhere produce fruit.

"I was anxious to know to what extent the immigration Vaccination law was enforced at New York, and had a chat on the subject with the chief steward. His information was terrifying. Said he, 'When we get to New York the doctor comes aboard, with half-a-dozen policemen, and you have to be vaccinated.' 'But,' said I, 'suppose you refuse to be vaccinated, what then?' 'Then they'll sling you into the tender, and clap you in jail till you submit.' 'But I won't be vaccinated. I'll stay out of New York for ever first.' He replied, 'No use; you'd have to be. Five of our crew, once, refused to be done; but they just put 'em into quarantine and kept 'em there until they came to. They might as well have been done first as last; they only delayed the vessel.'

"I tell you, I felt bad after this recital, and came to the conclusion that America was closed against the unvaccinated anti-vaccinator, and that he was fast falling into the condition of the American negro-slave who was hunted down everywhere by everybody.

"One morning it was rumoured that the doctor was coming to examine the passengers, and I went with two friends to the surgery to state our objections. I told him that we had been vaccinated, if that fact would let us pass without further trouble, we could satisfy him; but if not, vaccinated we would never be. Like most doctors, he was without capacity to understand our conscientious objections, and the degradation involved in submission to the rite. He curtly told us the law was not his; it was the United States law. He should come forward at two o'clock, and if we shewed him that we had been vaccinated, he would give us a certificate, and, if not, he would vaccinate us if we chose; if not, we must take the risk of passing the doctor at the port. It mattered nothing to him.

"About two o'clock there was a great commotion for'ard. Such a stripping of clothes, rolling up

of sleeves, and searching for 'marks.' Some were craning their necks over their shoulders in a half-hopeless search after obliterated or invisible scars; some calling in the help of a neighbour to make them out; and some raising an excited discussion as to whether an indentation was a vaccination mark, or forgotten boil, and going into an ecstasy of satisfaction when they had settled it was exactly what was wanted.

Others, in despair of vaccination marks, recollected that they had had small-pox, and set up a search for pox-marks. Some, after a protracted quest for marks, vaccine or variolous, put on their coats sadly, with the air of criminals about to be hanged. It was a sight to make men blush with shame for the devilish superstition that has taken possession of the Christian civilization of the nineteenth century.

"By-and-by came the doctor in his gold-laced cap, with his bottle of 'lymph,' pure from the sores of children or heifer's buttock, and commenced operations. First a rope was stretched from a post, and held by two stewards in a horse-shoe form, and into this enclosure passed, one by one, the victims of an insane medical legislation, and bared their arms to the Medical Ignoramus, who stood on the other side. If he there saw the orthodox scars, he forthwith bestowed a ticket like this:--

WHITE STAR LINE  
S.S. Adriatic  
VACCINATED  
C.S. MURRAY  
Surgeon  
14<sup>th</sup> April 1883

Which further had this exhortation on the back:--

PASS  
Keep this card to avoid detention at  
quarantine, and on railroad in the  
United States.

"If a poor wretch could not show vaccine or pock marks, he got no ticket, and was asked whether he would be vaccinated, or risk being stopped at landing. All preferred the first alternative as the lesser evil. The doctor, dipping his lancet in the bottle of mystery, wiped it on a spot on the arm, and cut and cross-cut the skin, and then, after rapidly stretching and closing the incisions with his thumbs, gave the wretch his ticket and passed him on. Such was the ordinance of Vaccination—a sight not to be forgotten. A crowd of hundreds passing forward to prostrate their conscience or manhood, or lack of them, at the shrine of the most outrageous humbug of these latter days! A mixed crowd of big and little, fat and lean, dirty and clean, reputable and disreputable, sober and drunken, healthy and diseased, all ground down to the dead level of VACCINATED. There was nothing in common among them save their degradation, and, as I thought, the most degraded of the lot was the Vaccinator. How a man with any sense of decency and the congruity of things could, for mere pay, consent to the folly that the individuals of such a heterogenous crowd were *all alike liable* to small-pox, and were *all alike saved* by his performance, passes my understanding. It is hard to believe in a man's sincerity in view of such absurdity; and yet he may be sincere. When a lie is

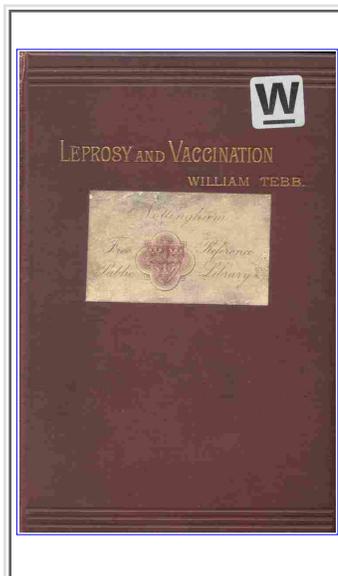

taught, and still more when a lie is practised, it confounds the intellect, and is ultimately taken for the truth of truth.

"I am fain to believe that not much harm was done to those vaccinated. After the operation, there was a mighty scuttling off into secret corners, with sucking and spitting. Happily I had a store of borax, and dispensed it liberally with energetic advice. Anyhow, I heard little of the Vaccination 'taking.' Perhaps the 'matter' was not good, but it mattered not.

"Yours truly, "F. SCRIMSHAW."

"To Mr. WILLIAM TEBB."

HUMAN AND Bovine Tuberculosis.—At a meeting of the National Veterinary Association, on May 8, in a paper written by Mr. J. K. Cox, of the Army Veterinary Department, several cases were cited where the milk from "wasting cows " was used for food, and those using the milk were attacked with phthisia and died. Apparently there is no question among veterinarians that tuberculosis is communicable in the milk and flesh of animals to man; and if thus communicable in the process of digestion, how much more must it be communicable when the products of disease from tuberculous animals are inoculated in the blood under the euphemism of "pure lymph from the calf!" . ## M. Beddow Bayly M.R.C.S., L.R.C.P.

"Perhaps the greatest evil of immunization lies in its diversion of public attention from true methods of disease prevention. It encourages public authorities to permit all kinds of sanitary defects and social problems to remain undressed, particularly in schools. It ignores the part played by food and sunlight and many other factors in the maintenance of health. It exaggerates the risk of diphtheria and works upon the fear of parents. The more it is supported by public authorities, the more will its dangers and disadvantages be concealed or denied." M. Meadow Bayly, M.R.C.S., 1944

The Case Against Vaccination - Beddow Bayley

*The same applies to the development of vaccination<sup>1</sup> and all the fundamental drugs like digitalis, strophanthine, atropine, iodine, quinine, nitro-glycerine, radium, penicillin. Not one single important therapeutic discovery is due to vivisection, whereas books can be filled with the cases where animal experimentation has indisputably spelled disaster for humanity, besides misleading or retarding clinical research."*

([Hans Ruesch](#), **Slaughter of the Innocent**, page 198, also M. Beddow Bayly, M.R.C.S., L.R.C.P., **Clinical Medical Discoveries**.)

A glimpse at the overwhelming evidence from medical practitioners reveals the falsity of claims made in [Animal Research Saves Lives](#) that life-saving surgical techniques were founded on vivisection. As shown in **Clinical Medical Discoveries**, Dr M. Beddow Bayly documents the many surgical advances which owing nothing to vivisection but were discovered and pioneered through clinical research. These advances being supremely valuable to the benefit of human beings and animals it is the practice of those who set out to support and defend vivisection, and their jobs, to distort historical facts and thereby create the impression in the minds of the public that such advances were the result of vivisection. Dr Beddow Bayly, in dispelling these claims also outlines the inadequacies and grossly misleading results arising from vivisection. His views are openly shared by hundreds of medical doctors whose opinions are concisely documented in [Hans Ruesch's One Thousand Doctors \(and many more\) Against](#)

[Vivisection.](#)

Dr Fadali's evidence is borne out by medical historian Dr M. Beddow Bayly in **Clinical Medical Discoveries** who writes:

*"As for bypass surgery, animal research actually retarded this therapy for humans. Because a dog's clotting characteristics and coronary valves are so different from ours, the initial human patients died. The first success was Dr Kunlin's work in France. Dr Kunlin's work was clinical and had nothing to do with animal research."*

Beddow Bayly, author of the book "The Case Against Vaccination" said: "After vaccination was introduced, cases of aseptic meningitis were more often reported as a separate disease from polio, but such cases were counted as polio before the vaccine was introduced. The Ministry of Health admitted that the vaccine status of the individual is a guiding factor in diagnosis. If a person who is vaccinated contracts the disease, the disease is simply recorded under a different name." (6)

THE FABLE  
OF THE  
SMALL-POX HOSPITAL NURSES  
SAVED FROM  
SMALL-POX  
BY  
RE-VACCINATION

LONDON SOCIETY FOR THE ABOLITION OF COMPULSORY VACCINATION, 1882

PREFACE TO THE FOURTH EDITION.

The persistent attempts that are now being made to create panic over the increase of small-pox in London have so far met with little success. What evidently is wanted is to drive the people in flocks to the doctors for re-vaccination. The "roaring trade" that was done during the epidemic of 1871 is remembered with fervour, and such another "good time" is earnestly prayed for. It is lucrative work vaccinating troops of terrified middle and upper class Londoners. They hear of "carefully selected vaccine" with touching simplicity; drop their guineas with grateful alacrity; and retire persuaded that they are fortified for at least seven years from possibility of infection. Here we see old sorcery and witchcraft under new forms without essential difference.

One of the fictions resorted to by the Medical advisers of the Local Government Board, echoed with parrot-like simplicity and persistency by the Press, and blindly accepted as Gospel truth by Boards of Guardians, is the oft-repeated tale of the immunity of the Small-Pox Hospital Nurses; as glaring a specimen of the "*suggestio falsi*" as was ever promulgated, which the compiler of the following pages has endeavoured to expose, with the aid of truth, and well attested facts.

London, 1882.

**THE SMALL-POX HOSPITAL NURSES AND RE-VACCINATION**

THE oft repeated argument respecting the immunity from small-pox enjoyed by the nurses at the Small-pox Hospitals, owing to re-vaccination, is the sheet anchor of the vaccinators' logic. Without any attempt at verification, without any suspicion of subjacent fallacy, this argument has been adopted with unquestioning faith and published with amazing industry by the leading dailies, weeklies, and monthlies throughout the country.

In 1871 the College of Physicians put it thus :—" For more than thirty years all the nurses and servants at the Small-pox Hospital, *who had not previously had smallpox*, have been re-vaccinated before entering on their duties; and not one case of small-pox has occurred among these persons, although living in an atmosphere of concentrated infection."

The *Times* of the 26th September, 1878, expresses itself as follows :—" From the foundation of the first Small-pox Hospital till now there has not been a single instance of a nurse contracting the disease."

Mr. Ernest Hart in his "Truth about Vaccination," speaks of the "absolute protection afforded by re-vaccination to nurses of the Small-pox Hospital."

Dr. W. B. Carpenter, writing to the *Spectator*, April 23rd, 1881, remarks on "the absolute security afforded by thorough re-vaccination," and observes that "*not one* of the re-vaccinated nurses was attacked by small-pox."

A card issued at public vaccination stations to mothers, by order of the Local Government Board, says, "The nurses of the Small-pox Hospitals are always re-vaccinated before commencing their work. This has been the rule for over fifty years. None of them have taken small-pox since this rule has been observed."

Having thus enunciated the proposition we propose to examine it more closely.

**I.** —Is it true? Have the re-vaccinated nurses at the Small-pox Hospitals enjoyed complete immunity from the disease? And the answer is No.

At the Stockwell Hospital three of the re-vaccinated nurses and attendants contracted smallpox (*Pall Mall Gazette*, April 23rd, 1877.)

At the Fulham Hospital three of the re-vaccinated attendants under Dr. Makuna took smallpox (Smallpox and Vaccination. Dr W.T. Iliff, Pp 10) and, the same hospital, Dr Sweeting recently stated in public that four of his re-vaccinated nurses had taken the disease.

At the Deptford Hospital one attendant took small-pox eight days after re-vaccination.

At the Halifax Hospital, in April, 1881, the matron and a nurse contracted small-pox from a patient; (British Medical Journal, May 7<sup>th</sup>, 1881) the matron had been previously vaccinated, while the nurse had been re-vaccinated only a week before she was taken ill.

At the Sheffield Small-pox Hospital the medical officer and an attendant, both previously vaccinated and re-vaccinated, took the disease.

At the Lewes Fever Hospital a nurse who had been vaccinated and re-vaccinated suffered from an attack of smallpox in November, 1881.

Dr. Bakewell, of the Trinidad Hospital, took small-pox after he had been re-vaccinated six times. So that the allegation of absolute immunity is proved *in limine* to be absolutely false.

**II.**—Is there no underlying fallacy which vitiates the conclusions drawn respecting the alleged immunity of the nurses? Is there no disturbing cause? Is no other explanation possible? Now it has frequently been asserted that many of the small-pox nurses have had the disease before they are engaged, nay, are frequently patients retained after recovery, and this assertion is in great measure true, especially of the old Small-pox Hospital at Highgate. Mr. Marson, the Resident Medical Officer, thus expressed himself before the Select Committee of 1871 :—

Q4218. "Have any of the nurses in your hospital had smallpox before they have been engaged as nurses? Some of them."

Q. 4225. "As to your answer to the Right Hon. Member for New Shoreham, with reference to some of the nurses having had small-pox before you engaged them, will you explain that statement which has been made to the Committee, that some of the nurses of the Small-pox Hospital have been seen to be marked with small-pox? Yes; but that very nurse that was alluded to was a person who had remained with us after being a patient." Question (4226): "That case was the case of a person coming in as a patient, and engaged as a nurse after she recovered? Yea, she came in as a patient, and she was for some years the matron's housemaid. She left us for a short time, and came back again, and is now our head nurse. *We never had so many employed in the hospital as we have at this time who came in as patients, for, in consequence of the want of nurses, we have employed those who have come in as patients, and were willing to stay.*"

And, again, in answer to Q. 4220: "Do you consider that small-pox itself is as great a protection as vaccination?" he said—" Yes, much greater, as you see from the returns. There are a few cases of persons who have had small-pox after small-pox; and in the first tables which I gave, the number was less than 1 per cent, of small-pox after small-pox, whereas it was 53 per cent, of smallpox after vaccination."

At a lecture at the Eleusis Club, Chelsea, April 18th, 1881, a nurse from the Fulham Hospital confessed that she herself had contracted small-pox, although vaccinated, and had become a nurse after convalescence in Highgate Hospital, and further admitted that many hospital nurses had, like herself, been hospital patients.

Then, again, at the Hampstead Hospital no less than 50 of the employees, and at the Fulham Hospital 23, had previously had small-pox.

Hence it follows that the *relative* immunity from smallpox among hospital nurses is in part, at least, due to antecedent small-pox, which, on Mr. Marson's showing, is a much greater protection than vaccination.

**III**—It is found that where vaccination is neglected, the same immunity is found, the following cases furnish us with purely differential evidence.

Dr. Porter in the *Medical Press and Circular*, No. 1729, March 27th, 1872, observes :—" 'With reference to re-vaccination, I have no faith in it. Not one of the 36 attendants at the South Dublin Union sheds has taken small-pox. *Only 7 of the number were re-vaccinated, and as the remaining 29 enjoy the same immunity, wherein is the necessity of the operation?* I have known gouty inflammation, abscess of the breast, and augioleucitis to result from the operation. I cannot, in the face of such facts, approve of it, and moreover the sense of the profession is against it. It is only to be employed when there is no evidence of the success of infantile vaccination, and even then it seems to do more harm than good, at least, so far as I have seen."

And again :—" The personnel of Bicetre (where 8000 soldiers, suffering from smallpox, were treated), nearly two hundred in number, suffered little from small-pox, one only dying from it. Of forty medical attendants none took the disease, *in spite of the negligence of most of them with respect to vaccination*". Still more remarkable was the complete exemption of forty nurses, who lived in the centre of the hospital and attended the patients day and night." (*Medical Times and*

*Gazette*, October 18th, 1873.)

Dr. Borel, of Neufchatel, in a medical paper printed in the "Correspondent Blatt fur Schweizer Aertzte (Corresponding Journal for Swiss Medical men)," published at Basle, on July 1st, makes the following remarks :—" It is impossible to deny acclimatisation; or to explain myself more clearly, the special disposition acquired by those who are constantly exposed to the same infectious agents; the *immunity* for example, which, undeniable though doubtless relative, *protects all persons occupied in pathology*. All evidence is in favour of such a phenomenon of acclimatisation. My two friends, Professors Kleinwachter and Jirus, assured me that they had frequently observed during their sojourn –as house surgeons in the small-pox ward of the Prague Hospital, that the nurses and hospital attendants, who had been some time in the service, *never caught small-pox*, although *not protected by previous artificial vaccination*."

Then, again, it is extremely rare for visitors to patients in small-pox hospitals to contract the disease, in spite of neglecting re-vaccination, and taking only rational precautions against infection.

Dr. Bridges, in his Report, observes that "of 796 visitors who paid 1118 visits, only 3 were afterwards admitted into the hospital with small-pox."

Mr. Sweeting, of the Fuiham Hospital, writes :—" 33 patients were visited by 48 persons, who made altogether 76 visits; only one of the visitors was afterwards admitted with small-pox." (*Report for the year 1880*.)

Dr. Bernard, of the Stockwell Hospital, writes :—" 1056 visits were paid into the wards of the hospital. It is interesting to be able to say that, as far as I have heard, no one caught small-pox thereby ;" the following rules are observed:

1. Not to enter any of the wards when in a weak or exhausted state. 2. To partake of food before entering the hospital 3. To avoid touching the patient or exposing themselves to his breath, or to the emanations from his skin. 4. To sit on a chair at the bedside, at some little distance from the patient (*Annual Report for 1880*)

**IV.** The relative immunity of nurses and doctors from infection is proverbial, and has been observed in diseases other than smallpox and in smallpox before vaccination was in vogue.

This immunity, whether due to so-called seasoning, or to that remarkable condition of insusceptibility, otherwise known as health, is so well recognised as hardly to need evidence in support of it; but the following may be cited for the sake of the sceptical :—"This well known phenomenon attending small-pox will appear less singular when we reflect that the same observation has been made respecting the plague, a more virulent contagion, the history of which shows, in every invasion of that dreadful malady, that many escape, though constantly employed about the sick, or infants sucking their infected mothers." (*Small-pox*. R. Walker, M.A., London, 1790.)

Nurses being generally advanced in years, habituated to fatigue, and little liable to worry of spirits, do not readily receive infection." (*Instructions relative to Contagious Diseases*, London, 1801.)

Dr. Lionel S. Beale in his work on "Disease Germs," 2nd edition, pp. 322 and 323, says :—"The fact of the escape of the attendants of the sick, in spite of their continual exposure, ought to suffice

to relieve the alarm of the most timid, and prove to them that exposure does not imply contraction of disease. The body in its normal state of health has the power of resistance; and the fact that many members of the medical profession and nurses, although exposed time after time to the influence of contagious disease, reach old age without having suffered from a single attack, ought surely to encourage and afford a justification to those who, having determined to devote themselves to the service of the sick, must be continually exposed to contagion."

Wilson Philip, M.D., in his "Treatise on Fevers," 4th edition, page 177, says:

"One powerful means of fortifying the body against infection, on many accounts deserves attention, viz., the frequent exposure to contagion. It is well ascertained that those who are frequently exposed to contagion become at length, in some measure, hardened against its effects. *Thus nurses and physicians often escape infection.*"

Lord Bacon says :—" The plague is not easily received by such as are continually about them that have the plague, as keepers of the sick and physicians."

Miss Florence Nightingale, in her Notes of Nursing, observes :—" True nursing ignores infection, except to *prevent* it. Cleanliness, fresh air from open windows, are the only defence a true nurse either asks or needs."

V. —if, however, Re-vaccination is so eminently protective in the atmosphere of a small-pox hospital, it seems strange that its saving power should fail so conspicuously under the less severe test of the outer world. Small-pox after re-vaccination is of common occurrence. Dr. Copland says,--- "Re-vaccination has been adopted in many places, and has often failed, natural small-pox having notwithstanding appeared in the re-vaccinated, both in those in whom the measure appeared to have succeeded, and in those in whom it failed." (*Dictionary of Practical Medicine*, pp. 829.)

The report of the Deptford Hospital for 1879, gives notes of 10 cases of small-pox after re-vaccination, one of whom died of black small-pox, while another was in hospital nearly a year with a severe confluent attack; and the superintendent, Dr. M'Combie, gracefully adds :—"It would appear from this, then, that cases of small-pox do occasionally occur after apparently successful re-vaccination."

Every soldier and sailor is re-vaccinated, and yet from 1859 to 1876, there were 1306 cases of small-pox in the army with 94 deaths, and 686 cases in the navy with 42 deaths. (*Vide Appendix to "The Truth about Vaccination."*) If re-vaccination will not protect the general public, the army and the navy, is it re-vaccination that protects the nurses?

The foregoing premises warrant the following conclusions:—That some re-vaccinated nurses do take small-pox, though many, whether from a process of seasoning or mental and-bodily vigour arising from due regard to healthy regimen, or some other cause, resist it altogether, and that the same immunity is observed where re-vaccination is neglected, while not a few of the nurses have received the additional protection which an attack of small-pox affords. This fashionable action, then, of absolute immunity of the hospital nurses owing to re-vaccination, is both false in its statement and fallacious in its reasoning.

[\[Vaccination\]](#) [\[Smallpox\]](#)

Tuesday, December 21, 1937

**Address of William Howard Hay, M.D., Pocono, PA., on June 25, 1937, before The Medical Freedom Society**

MR. BURDICK. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following address by William Howard Hay, M.D., of Pocono, PA., on June 25, 1937, before the Medical Freedom Society on the Lemke bill to abolish compulsory vaccination:

I was glad to hear the Honorable Mr. Lemke's presentation of the subject matter of his bill. I have thought many times of all the insane things that we have advocated in medicine, that is one of the most insane—to insist on the vaccination of children, or anybody else, for the prevention of smallpox, when, as a matter of fact, we are never able to prove that vaccination saved one man from small-pox. Naturally not. When you have protected anybody, as we denote protection in medicine, you have at the same time destroyed your evidence. If that man doesn't take the disease against which he is supposed he be protected, how can you ever know he would have taken it if he hadn't been protected? We have destroyed the evidence.

As a matter of fact, perhaps it is safe to say that not more than 10 per cent of the people ever would take smallpox if sleeping in the same bed with an infected smallpox victim. We know there is a large immunity to smallpox. Very few people are subject to it, and these usually in the filthiest surroundings. Now, if we carry that natural immunity to smallpox as we do other diseases, and we have been protected by vaccination and then we are exposed to smallpox and don't take it, don't you see there is no proof there? We may be carrying a natural Immunity. If one case that has been successfully vaccinated afterwards develops smallpox, that is proof that it isn't protection, now, isn't it?

I know of one epidemic of smallpox comprising nine hundred and some cases in which 95 per cent of the infected had been vaccinated, and most of them recently. I have had in my own experience one very small epidemic comprising 33 cases, of which 29 had vaccination histories a "good" scar, and some of them vaccinated within the last year. There was no protection there.

Among these was one girl who was not vaccinated, never had been, who had five cases of smallpox in the family, nursed those cases that were ill, a baby among the others, the worst case of small-pox among them, refused vaccination and was never infected at all—a natural immunity.

What is true of smallpox is true of every other disease. We are not all equally subject to all the diseases that occur. We know that king. an

epidemic of influenza sweeps over the country. Why doesn't everyone have it? The germ, if it is a germ, and we don't know that it is, is ubiquitous. They are everywhere. You can't hide from them. And yet perhaps but 10 per cent of the population of any region will be infected. What protects the 90 per cent? Natural immunity.

We may have natural immunity this year and we may not have it next year, but we can't create it artificially by using a so-called immune serum. As I say, when we do use an immune serum we have destroyed every possibility of using that case as evidence, because we have no way of knowing whether it would ever have been infected.

We have always recognized the fact that but 15 per cent of children are subject to diphtheria, no matter how thoroughly they are exposed. Statistics of every epidemic of diphtheria in every section of the country, if averaged, will show that average, with 85 per cent who are not infected. We have taken diphtheria antitoxin, we have used toxin-antitoxin and toxoid, and if we found a susceptibility or reaction to this, we have immunized that case against diphtheria by a series of three injections of anti diphtheric serum. We have to admit 15 per cent of the children are still unprotected because they take diphtheria. Isn't that the same 15 per cent? We have no way of proving it isn't.

A number of years ago when we were just beginning to study diphtheria antitoxin minutely, Cook County, Ill., hospital decided to immunize one-half of the nursing staff and not the other half. Diphtheria broke out soon afterward among the immunized cases, not the others. It invaded both halves, both the immunized and the unimmunized, and the total of cases was much higher among the supposedly immunized cases than among those not immunized. We didn't do much for those nurses.

When we took over the management of the Philippines and all of its destinies, we announced to the bloomin' cockeyed world we were going to dean up smallpox in the Philippines. Well, we waited a few years but we did make a serious effort. In fact, in a population of 10,000,000 people we consummated 30,000,000 vaccinations within a period of 6 years. The Province of Rizal, of which Manila was the center, was the most accessible, of course; the little rascals couldn't get away there, we could catch them, and did, and some of them were vaccinated three and four and five and six times in the 6 years. We were going to make it thorough. In Mindanao and some of the other more outlying provinces, more mountainous, we couldn't catch the little rascals, so there was a smaller percentage of vaccinations in the outlying districts. Rizal had to take it.

Within 6 years of that time the Philippines suffered the worst attack of

smallpox, the worst epidemic three times over, that had ever occurred in the history of the islands, and it was almost three times as fatal. The death rate ran as high as 60 per cent in certain areas where formerly it had been 10 and 15 per cent, and the thing that climaxed the whole point was this: In Rizal we had the highest incidence and the highest mortality of any part of the Archipelago. The Navy reported that vaccination of the sailors went on as regularly as drills, every so often they were vaccinated, but they had their usual percentage of smallpox, and yet they were protected!

Now we are asking in many States to have the privilege of deciding whether we will be vaccinated or not. No one wishes to deny his brother the privilege of being vaccinated if he has any faith in it, but here is the ridiculous thing about it: The ones who are objecting to abolishing the law and who are insisting on vaccination are the ones who are afraid. that they will take smallpox if their brothers are not vaccinated. Now if you are vaccinated, you are protected, aren't you? What are you afraid of? Suppose your next-door neighbor does get smallpox because he was not vaccinated; that is his business; he has a right to have smallpox if he wants to; he can't give it to you if you have been vaccinated, so what are you worrying about? Let him do as he pleases. That is all we are asking; we are not asking that they forbid vaccination. Let everyone have what he wants, but let us not compel those to have vaccination who know there is nothing in it, who know it is not a protection.

It is now 30 years since I have been confining myself to the treatment of chronic diseases. During those 30 years I have run against so many histories of little children who had never seen a sick day until they were vaccinated and who, in the several years that have followed, have never seen a well day since. I couldn't put my finger on the disease they have. They just weren't strong. Their resistance was gone. They were perfectly well before they were vaccinated. They have never been well since. Now you can't record those as deaths from vaccination because they are still alive; but in England, where statistics are a little more frank than they are with us, where they are kept a little more accurately, a little more aboveboard than in this country, the actual official records show three times as many deaths directly from vaccinations as from smallpox for the past 21 years. If they record three times as many deaths, I will guarantee, you that there are three times as many deaths that were not recorded that are directly traceable to vaccination. That doesn't take into account the many, many cases of encephalitis or sleeping sickness, of this or that form of degeneration, that occur as a direct result of vaccination. That case is still alive. It hasn't entered here the mortality records yet, but it is suffering and has suffered ever since vaccination.

And if you have been dealing, as I have, with the derelicts from all over the world for 30 years, you would find an almost fatal relationship between this history of vaccination and some failing that follows this for many years that has kept a person from being as well as he should have been.

It is nonsense to think that you can inject pus—and it is usually from the pustule of the dead smallpox victim; that is the basis of it; we used to think it was from cowpox, but the manufacturers deny that and say the most reliable form originates in the pustule of someone who had died from smallpox—it is unthinkable that you can inject that into a little child and in anyway improve its health.

What is true of vaccination is exactly as true of all forms of serum immunization, so called. There is no such thing as immunization, but we sell it under the name, “immunization”. We jab a needle full of pus germs, we will say the streptococcus, for instance, in attenuated form so it won’t pollute too badly, and we increase the dose or potency of that little by little until we build up what we call a resistance to it. You can do the same thing with the rattlesnake venom. You can be bitten just a little by a rattlesnake and not die, and if you are bitten often enough, you can be bitten in a vital part and not die; you have built up a resistance to the venom of the rattlesnake, but have you improved your physique by doing so? If we could by any means build up a natural resistance to disease through these artificial means, I would applaud it to the echo, but we can’t do it. The body has its own methods of defense. These depend on the vitality of the body at the time. If it is vital enough, it will resist all infections; if it isn’t vital enough, it won’t, and you can’t change the vitality of the body for the better by introducing poison of any kind into it.

## PREFACE

WHEN I UNDERTOOK to write a short booklet to replace the late Miss Lily Loat's *The Truth About Vaccination and Immunization*, written over twelve years ago, I saw that, as the latter dealt only with smallpox and diphtheria, it was obviously necessary to bring the subject of so-called "immunization" up to date. It would be useless to describe all the vaccines that are now being thrust upon the public, and quite impossible to give intelligible information as to how they are made or what they really contain. Are they ever the same for two weeks running?

We have all been told repeatedly that Prof. Ramon's toxoid (anatoxine) "practically wiped out diphtheria in Britain"; yet the *compulsory* use of the same stuff at the same time in France showed very different results. In Britain, with mass inoculations, there was an increase in cases and deaths for several months, but in France, with compulsory inoculations, the increases were much greater and lasted for many years.

Why was Prof. Ramon fired from the Pasteur Institute? What did British officialdom do about this—apart from suppressing all mention of the scandal? Was Prof. Ramon's toxoid not quietly changed in celebration of the event?

In his book, *Pour La Libere*, M. Marcel Lemaire reminds us of the almost forgotten fact that the great Pasteur Institute was founded solely to sell rabies vaccines and thus save (perhaps!) about 30

lives per annum in France. It seems almost incredible that, in spite of the subsequent increase in rabies deaths, the Institute went from strength to strength financially. After such a promising start, it is little wonder that it now makes vaccines for everything and thousands of millions of francs by selling them. The Pasteur Institute also seems to make its own laws, and, never having registered as a business firm it dodges all taxation on its turnover and profits, which the less privileged firms have to pay. When, moreover, the politicians have made each new vaccination compulsory see how the prices go up! In 1935 3 ampoules of diphtheria and tetanus toxoid were sold for 12 francs, by 1951, they cost 510 francs! The price of tuberculin also rose to over 40 times its original price

This kind of thing goes on all over the world and no body seems to care, but surely, if a chemical firm can make something—a synthetic hormone, for instance—at \$30 per pound and sell it to the public at \$50,000 per pound, that is all we need to know. We do not have to eat the whole of a bad egg to know that it is bad, but it is more than a one man job to change such an appalling international situation

The best that can be done in a short booklet is to cover the principal vaccine rackets as lucidly as possible, and say things which need to be said about them much of which has not been widely published if at all

One reason for this new booklet is to tell readers more about Miss Loat's work than she said about it herself

## INTRODUCTION

*Medical Protection Selling—How it Really Began and Grew*

"By the historical method alone can many problems in medicine be approached profitably.

"This dictum has gained added force since Osler uttered it." (*The Lancet*, December 1st 1962).

## VACCINATION v. SMALLPOX INOCULATION

The history of vaccination in text-books for medical students, nurses, etc., often consists of little more than the three words: ". . . since Jenner's day . . ." It is taken for granted that all good children have learnt the pretty fairy story at their mother's knee of "Jenner's great discovery" of the fact that cowpox protects against smallpox. This is called "one of the greatest discoveries of modern medicine".

Yet, if one tries to take it seriously as an important step in medical progress, the whole silly, dirty stunt stands out like a sore thumb, and it becomes plain that the great Dr. Charles Creighton was meticulously accurate in calling it "a grotesque superstition".

Anyone who reads Jenner's alleged *Inquiry* can see for himself that his specific was not cowpox, but horsegrease transferred to the cow by the hands of a dirty milker. Ordinary cowpoxes were "spurious". It was the London doctors, Pearson and Woodville, who forced the spurious cowpox on the public and on Jenner. They knew the smell of horsegrease and would not touch it with the end of a bargepole.

The person who provided the alleged cowpox lymph which was sent out all over this country and abroad from Woodville's Inoculation Hospital, King's Cross, was a young woman of twenty, Ann Bumpus, who had 310 pustules on her body. Other victims of this alleged cowpoxing experiment had many more—even 700; so it was not surprising to find that this lymph produced an infectious disease. It was quite obviously mainly smallpox pus. Thus did "vaccination" triumph over smallpox inoculation and eventually make it illegal!

The story is hardly dignified: it is too true to be good; and so, for broadcasting purposes, it has to be boiled down to the charming fairy-tale of "Jenner and the dairymaids", and no one must be allowed to escape it.

While the people are being lied to in every known language, and drugged and inoculated for the benefit of the huge chemical combines who own the Press and the Radio, it is obviously necessary to hit back with the truth. Nevertheless, it is quite common to find people, and even journalists, who have never even heard of the National Anti-Vaccination League, and who cannot understand why anybody should bother to fight vaccination when, since 1948, nobody in England has been compelled to be vaccinated— at least, there is no legal compulsion.

Only those who come up against the blackmailing methods of the vaccinators in relation to employment, education, travel, etc., will "have another think". The late Miss Loat herself had no delusion that the battle was over when the compulsory vaccination law was abolished. She knew that its repeal was a strategic move, for the vaccine industry knew very well that people who are not forced to bother about a tyranny are far easier to fool than those who are. In fact, they knew that, with the Press and the Radio, not to mention the Government, still in their pockets, they could expect to sell more vaccines by blatant advertising *at the public's own expense*, than they could dispose of by force, and this has proved to be true.

The BBC calls this type of propaganda "news"—to save themselves from the charge of illegal advertising. They do not fool us, but they do fool the public at large. Answering back is impossible. That is what makes the radio so dangerous.

What can one do, for instance, about the idiotic boost which vaccine was given when a news bulletin included a story of how, when the drains in Tobago were damaged by hurricane "Flora", a typhoid epidemic was averted by mass immunization, "which seems to have been successful"—this, if you please, only about four days after the damage? We know that typhoid fever takes from 7 to 14 days to incubate, and the "shots" take from 10 to 20 days to "take" properly! If a real epidemic had begun in Tobago and lasted as long as the Zermatt incident in 1963, would the BBC have told us so, or, would they have observed an eternal silence out of respect for the dead? It seems that drastic powers will be needed to stop this constant stream of idiotic and gratuitous poison-plugging, which is obviously considered to be top priority in all radio news services, dramas, talks, etc.

After fighting our battle for nearly fifty years, Lily Loat knew well enough that the propaganda methods of the whole vaccine industry had undergone a marked change. They no longer consisted of playing a polite parlour-game called statistics, compiled and edited by themselves. That game was almost played out and was only a bore. In fact, the way in which the figures were recorded in some hospitals years ago, and the astonishing differences in such figures, made it quite impossible, if not downright wicked, to trust such figures. Some hospitals, for example, gave a complete record of the vaccinal condition of each patient, while others, a few years later, showed more than half the

cases as "doubtful" or "unknown". We need say no more about this farce now; except that the wonderful statistics of the past defeated their own ends by "proving", with overwhelming success, things which are now known to be absurdly untrue.

Lily Loat, being the Secretary of a League, had always to steer clear of libel actions. The fact that she did so was no small achievement, because telling the truth about really big villainy is always dangerous. Also, it was one of the marvels of her career that she always managed to confound the enemy, even with nothing to rely on but their own figures.

Whenever she set out to prove that vaccination was killing more people than smallpox, she always did so, even under the handicap of having to treat the official record of vaccination deaths as if it were really true! Even today, there is no obligation to report such deaths properly, and Miss Loat knew that the official mortality figures represented probably not one-tenth, possibly not one-hundredth, of the true number. As Bernard Shaw put it, the true figures, "could they be ascertained, would probably horrify Herod".

Another thing that Lily Loat always did with uncanny success was to prove from the official records that whenever any infectious disease, such as diphtheria, for instance, was being "conquered" by a vaccine, the other infections, for which there was no so-called "immunization", were declining just as fast or faster. Have we ever known the Radio or the Press to tell us anything like that? If ever we do hear the Radio telling such truths to the schools several times a week, or broadcasting them to the world in every language, then we shall know that Mankind deserves to survive. In the meantime, we must do our best to further that object in spite of the big wholesale poisoners.

How often have we heard that "diphtheria in Britain has been practically wiped out by immunization"? Has it once been broadcast that the compulsory inoculation of the same toxoid at the same time in France was followed, in the six years of 1941-6, by 150,000 serious cases, with 15,000 deaths, *over and above the average figures*, or that Sweden, without this wonderful toxoid, had no diphtheria deaths in 1937 or 1938?

People who study medical statistics will find the subject full of traps for the unwary. They should be used as a means of discovering facts, not proving them. It is admitted that *post hoc* figures and arguments prove nothing, and yet the public are being constantly fed with them. On the other hand, very large and very long-term figures can mean a very great deal. This is why the contrast between Australia and the Philippines during this century has to be studiously ignored in all vaccination propaganda. We give the figures elsewhere.

Our loudspeakers keep telling us that vaccination rid Britain of smallpox. Other media do the same, but the real epidemiologists would not dare to say such a thing; in fact, if they mention this subject at all, they say the very opposite.

How can any sane person possibly believe that it was a pure accident that we had our biggest smallpox epidemic after about 16 years of compulsory vaccination and lost our smallpox altogether only when, thanks to the conscience clause, fewer than half of the children were vaccinated and our population had more than doubled?

Most people can be fooled easily with sorted statistics, because they do not realise that an epidemic of any real size or duration is not a static thing and cannot be illustrated by a simple table of figures. It is easy enough to demonstrate this.

Suppose, for example, you have a street or village with 100 unvaccinated people in it, and a smallpox case is imported (probably well vaccinated, as usual). The case is notified, and the B.B.C. gets busy. The 100 are all vaccinated. There may be, let us say, 10 contact cases, though that number would be very exceptional; all the cases would be isolated and everything would be disinfected, so that there would be no further risk of smallpox infection. At the end of the scare the statistics would prove that 10 per cent were unvaccinated at the time of infection and all got smallpox; 90 per cent were vaccinated and all escaped! One more triumph for Jenner, Marconi—and statistics!

The trick works even better in regard to diphtheria "immunization". The source of infection is traced and cleared away. A lot of radio listeners get their "shots", spread over several weeks, and they are not officially "immune" until three months later; therefore, the "immunized" will run no risk whatever of being infected, if the sanitary authorities have done a really good job.

The idea that it takes several weeks, or even several months, to develop immunity, but only a few hours or days to develop a disease, was put out by Pasteur when he was trying to save the face of his rabies vaccines, even though in the cases he treated the tedious inoculations could be carried on until the patient was thought to be out of danger. Immunity was not officially considered to be complete until a fortnight after the last of the many injections. The Pasteur Institute was founded solely to sell these rabies vaccines; so a truly heroic bluff of this kind was of vital importance at the time. In the great science of medical apologetics, the principle, with modern extensions and improvements, survives to this day.

## ANTIBODIES

If one reads the medical journals every week, it does not take long to discover that the supposed efficacy of a vaccine is "proved" by the antibody response of the vaccinated human or animal. This might seem to be scientific if antibodies did in fact bear any noticeable relationship to immunity, but this is much more easily disproved than proved (*see* Medical Research Council Report 272, May 1950). As long as we know that, we can leave the experts to stew in their own abominable juices. To nature cure enthusiasts, however, fruit and vegetable juices are safer.

## CHAPTER ONE

### THE WIND OF CHANGE

FORTUNATELY, the official attitude towards compulsory or mass vaccination has begun to change. The officials of the Ministry of Health, as well as the public, know quite well that an epidemic of vaccination always causes a lot of deaths, to say nothing of other permanent mental and physical injuries.

It is not so well known, however, that mass vaccination also causes a big increase in the number and severity of smallpox cases. This is no new discovery. Vaccination during epidemics was banned in some places more than a century ago because it was known to increase the number of deaths.

Things do, however, seem to be improving suddenly. During the Brighton smallpox outbreak (1950-51), the usual BBC encephalitis campaign opened with an anonymous doctor assuring the world, with authoritative emphasis, that "smallpox is the most infectious disease known to Man"! The BBC had evidently never heard of influenza. During the smallpox outbreak of 1961-2, on the

other hand, we heard medical officers of health saying on the radio such things as, "After all, smallpox is not such a very infectious disease." This would have been held to be pure blasphemy only a few years ago. May the good work go on!

A great deal remains to be done, however. The radio advertising of commercial vaccines, especially with public money, is the greatest enemy we have to fight. This dishonest propaganda is incessant, and it is impossible to be forewarned against it. It crops up on every possible and impossible occasion. Sometimes it is too conspicuously silly to be very dangerous, but we are always defenceless if we cannot hit back, and one cannot measure its total effect. The radio has often been proved to be a dangerous fomentor of panic.

### POISON-PLUGGING BY RADIO

The art of lying by radio is not quite as easy to master as it may seem. Bernard Shaw said very truly that if you tell a lie the microphone gives you away hopelessly. Probably the TV makes matters worse. That is why, when the pretty legends about Jenner and Pasteur have to be pumped into immature minds, announcers must be found who really believe these stories. The essence of a lie is the intent to deceive, and so the radio deceiver must seem to have no such intent.

Nevertheless, the TV can sometimes fool the public by showing pictures or documents to "prove" things which no one would dare to utter. The really expert technique is to tell nothing but the truth, *but to omit part of it.*

A perfect example of this occurred in a BBC TV extravaganza, "Matters of Medicine", which was designed to boost the terrors of poliomyelitis. The TV screen showed one page from a parish register, dated 1773, stating that about 7 or 8 out of every 10 deaths were due to smallpox. We need hardly say that the year 1773 just happened to be the very worst in that century for London smallpox. The purpose of the programme was to prove that, before vaccination began (a farmer named Jesty really began it in 1774), smallpox was a merciless scourge which threatened the very existence of the British race until Jenner, in 1796, began saving the usual "millions of lives".

We may suspect that that dramatic page mentioned above records the output from a local fever hospital, but we know that what was studiously omitted from the broadcast was the all-important fact that we had our biggest smallpox epidemic in 1871-3, not in 1773, and that we had 44,000 smallpox deaths after 16 years of compulsory vaccination whereas, in 1773, only about 2 1/2 per cent of Londoners got smallpox, and *only one-half of one per cent died from it.*

Is there any reason why the BBC should not be charged with fraud if they encourage the use of commercial vaccines by misrepresenting the facts of history? The Postmaster General would, in such an event, be perfectly justified in withdrawing its licence for causing a public mischief— even, in fact, for committing multiple murder.

By the terms of the Licence granted by the Postmaster General, the BBC . -.

"shall, whenever so requested by any Department of Her Majesty's Government in the United Kingdom of Great Britain and Northern Ireland, at the Corporation's own expense, send from all or any of the stations any announcement (with visual image of any picture or object mentioned in the announcement if sent from the television station or any of them) which such Department may request the Corporation to broadcast: and shall also, whenever so requested by any such Department

in whose opinion an emergency has arisen or continues, at the like expense send as aforesaid any other matter which such Department may request the Corporation to broadcast: Provided that the Corporation when sending such an announcement or other matter may at its discretion announce or refrain from announcing that it is sent at the request of a named Department."

That is the background to the incessant disguised advertising on the air of dangerous commercial vaccines, at public expense.

What can the public do about it?

It would seem that the National Anti-Vaccination League and all the A-V societies will have to be nationalised and turned into a Government Department before they have the least chance of a fair and equal hearing on the radio.

Could they not be called the Ministry of Truth and attached to the Fraud Squad of Scotland Yard? The latter would have to be much enlarged, of course, but, then, it would have a lot of work to do.

### **NO TIME TO WASTE**

Polite appeals to authority have been tried in vain. An impressive deputation of anti-vivisectionists, who are bound to be also anti-vaccinationists because of the foul cruelties inflicted upon millions of animals every year by the vaccine trade, went up to the BBC before World War II. It was led by Miss Lind of Hageby and the Dowager Duchess of Hamilton, and included several qualified doctors. They were politely received by the schools broadcasting officials, and the promise was duly given that their appeal for fair play would be given serious consideration. We have no doubt that it was—with the result that most of the participants in this conference, including all of the doctors, have since died without anything effective being done, except that, of course, a constant stream of vaccine-and-panic-boosting has been kept going in about 72 languages, day and night, ever since!

In fact, the Ministry of Health itself has become slightly more enlightened than the radio mugwumps, though that is not saying much.

### **A BELATED EFFORT**

The Ministry has made one hesitant attempt to mitigate the mischief done by the radio advertisers of vaccination.

When five Pakistanis brought smallpox to England and started the outbreak of 1961-2, it was known they all had valid certificates of revaccination, showing more than one dose; but this fact was published only after, instead of before, the Press and Radio had started playing the fool as usual, and spreading panic and pox all over the country. The Ministry knew that this would cause more death and injury than a few smallpox cases. The five Pakistanis themselves had already proved that vaccination is a dangerous fraud, and so the injections had to be restricted to contacts only.

The purely commercial dogma that the whole world can be rid of smallpox by maintaining a high level of vaccination could never have survived till now if the real truth had always been told about epidemics. Modern epidemiologists know that vaccinations cannot prevent the spread of any disease whatever, but they are seldom quoted in the Press, even when they cling to the idea that vaccination

can protect the individual, just as drowning men clutch at straws. Both Press and Radio continue to preach that smallpox is a terribly infectious and deadly scourge. They never tell us that " - . - provided no mischief be done either by physician or nurse, it is the most safe and slight of all diseases". (Dr. Thomas Sydenham, 1688).

All of us, except a few cranks, are brought up to believe that every unvaccinated person is bound to get smallpox in a serious outbreak. Business is business! The truth is that it would be very rare for even one in ten to contract the disease even in the worst years in the worst places, such as London was in 1773, when only one-half of one per cent died of it.

That would, no doubt, have been hailed as a 99 1/2 per cent triumph if there had been any vaccinators at that time and any BBC and Press barons to lick their boots for them!

## CHAPTER TWO

### THE CHANGE OF WIND

THE VACCINATORS can no longer claim to be able to prevent epidemics. They now have to depend on the great drama of "conquering" them, usually with vaccines rushed by air with all the familiar ballyhoo. Not having enough vaccine to cope with smallpox in the very places where one would expect to find plenty of both is the recognised prescription for "stamping out" an epidemic. By the time mass vaccinations have been organised, the worst will be over; most of the contacts will already have been exposed and will, as usual, have resisted infection or will have had "subclinical" attacks. These people are obviously the best prospects for showing the wonderful "modifying" or "protective" effect of vaccination in each of the affected localities, and the doctors can be forgiven for forgetting that epidemics always die out anyway.

One doctor, sent out on such a mission with a colleague, claimed to have seen several thousand people die of smallpox. Possibly they were not all vaccinated—not by him, at least—but, as to stamping out the outbreak, this allopath freely admitted that his colleague, a homoeopath, presumably using an oral prescription, was every bit as successful as he himself. This is worth noting (particularly by advocates of "horrific" vaccinations with virulent lymph), because the homoeopathic method is so much less dangerous than the usual one. The travelling public should agitate for its universal recognition. It would be a big step forward—for them, at least.

Mass vaccination frightens the Ministry of Health more than it does the radio-doped public; and, in the opinion of Prof. C. W. Dixon, as expressed in his big book, *Smallpox*, 1962, and in his letters to the medical papers, what is needed is not mass vaccination but only "horrific" vaccination with "virulent" lymph for contacts only.

### VACCINE LYMPH

This raises the eternal and unanswerable question:

"What is vaccine lymph?"

The National Anti-Vaccination League always tries to be up-to-date on this repulsive matter, and when they wrote to the fountain-head, the Lister Institute, in June 1962, to ascertain the official source of the current issue of the "true life-preserving fluid", they received the solemn reply that" . . . the seed virus used for the production of smallpox vaccine is derived neither from cowpox nor from

smallpox matter, but is a recognised strain known as *pox-virus officinale*".

So now we know! Poor old Jenner!

Surely it is time to face up to the question of what the lymph is rather than what it is called. The only possible, true, scientific description of vaccine lymph is that it is something which Nature, or Providence, in its wisdom, considers too filthy to be allowed to pollute the tissues of any animal and therefore expels with contempt. But for that, we should never have had any vaccine lymph. It is evident, however, that if it is not smallpox virus in any form it cannot be a real vaccine.

## THE ELECTRON MICROSCOPE

The electron microscope has come into the picture only after all kinds of theories and guesses have been discussed for more than 160 years. In the last century, Antoine Be-champ and Lionel Beale recognized certain minute living particles as being the active agents in vaccine lymph; Monckton Copeman, much later, regarded the similarity in size and appearance of such particles in smallpox pus and vaccine lymph as presumptive proof of a common origin. Béchamp would not have jumped to such a conclusion, but, without the electron microscope, no one could see the viruses of these diseases. What, then, were they looking at? One can only suppose that it was microzymes or micrococci infected with virus.

The general question of the connection between germs and viruses is a very complex one. We have to wait for scraps of truth to escape from the laboratories, as they sometimes do, almost invariably by accident or by indiscretion. It is amusing to hear that the makers of electron microscopes have promised the laboratories almost any degree of magnification (or resolution) that they want. It appears, however, that they have already got a bit more than they can handle.

It is curious to find that few of the animal viruses have been studied until fairly recently. The scientists, very naturally, were fascinated by the virus of tobacco mosaic, the first filterable virus discovered, and by other plant viruses. Then came the bacteriophages, which infect and kill bacteria. Human and animal virus diseases were almost ignored for years.. The fact is that plant viruses are far easier to obtain pure than the viruses from infected animals. Something like 85 per cent of the juice of an infected tobacco plant may be tobacco mosaic virus (TMV); some potatoes are crammed with virus which does no harm to them; if, however, one smears their juice on the leaves of other plants, it may start a virus disease.

Such facts are not only very interesting, they are clearly of immense general importance. They compel us to realise that all life on this planet has always depended upon the integrity of living cells which have adapted themselves to their food and environment. We are apt to forget this fact because it is by no means a simple one. It is, however, a very obvious one.

'We know that if we try to grow foods in new and unsuitable soil they are at once attacked by pests, fungi or viruses. The indiscriminate use of new and deadly poisons is not the real answer to the problem. We are all getting countless poisons in the air we breathe, the food we eat, the water we drink, and on almost everything we handle. Our hospitals are plague-spots because of the deluge of antibiotics, and we are now being told that it is impossible to clean them out properly because they are being kept too busy! No wonder!

When will our Government be made to realise that the enormous increase in degenerative disease is

the inevitable result of the ever-increasing number of poisons thrust upon us all for the sake of commercial profit?

The more new poisons we have, the more impossible it becomes for us to get used to them, or to identify any particular one of them as the cause of any particular disease, or of different diseases in different people.

"Whom the Gods would destroy they first make mad."

Let us get back to sanity while there is yet time and stop this commercial villainy altogether, *especially the injection of blood-poisons through the skin and thus bypassing the natural defences of the body.*

When people have to travel overseas they are often in holiday mood and are a notoriously easy mark for confidence tricks. The oldest of the witch-doctors' tricks is to do things which are so repulsive and unnatural that the wide-eyed public will say: "These clever devils would never dream of doing such awful things if they were not necessary; therefore they must be really necessary." It is the oldest trick in the bag, and it still pays enormous dividends.

Thus, innocent travellers are persuaded that "shots" for several diseases are a necessary but quite trivial nuisance. No vaccination can be really trivial unless it is faked. We ask everybody to remember that it was the commercial success alone of smallpox vaccination which led to this huge trail of corruption, not only of public health but of the Press, the Radio and most of the government departments in the world.

In Britain, thanks very largely to the late Miss Lily Loat, we have had no compulsory vaccination since 1948; but there is a large amount of pigheaded tyranny on the subject in the Services and in schools and institutions; furthermore, a lot of stuffed-shirt societies and councils, and completely uneducated and unauthorised educational authorities, exert pressure which is far more difficult to resist than any law from which exemption can be claimed.

Anti-vaccinationists are almost invariably referred to as "ignorant cranks" by the popular publicists of the poison-plugging profession. They are ridiculed for making an unholy fuss about the "supposed" dangers of all vaccinations and medications. In truth, it is the poisoners themselves who do all the high-voltage scaremongering. They still speak of smallpox as a scourge which, but for Jenner's "great discovery", would have solved all the world's feeding problems by killing off all the surplus millions.

What Jenner discovered, though hardly original in its general principle, was that it pays far better to scare 100 per cent of the fools in the world—the vast majority—into buying vaccine than it does to treat the small minority who really get smallpox and who cannot afford to pay anything. It was indeed a very great discovery—worth thousands of millions. That is why this kind of blackmail is still kept going.

When the Philippines were taken over by the U.S.A., in 1898, they became a shop-window for the sale of vaccine. They had had plenty of vaccination, of course, under Spanish rule, but the Americans began to clean the place up, and the smallpox figures took a big dive, as might have been expected—and the vaccinators took the big bows, as usual.

The sale of vaccine was enormous. The health reports prove this—an account rendered for the taxpayers to pay. When, however, the inevitable epidemic came, in 1918-20, it is worth noting that, out of a population of 10,000,000, the huge total of 71,000 deaths was more than equalled by several other epidemics during the same three years. Malaria took 93,000, influenza 91,000, tuberculosis 80,000, while dysentery, cholera and typhus together took another 70,000. It will be seen, therefore, that, during one of the very worst epidemics in all history, the deaths from smallpox were well below 1 per cent of the population. Yet we are always being told of the millions of lives saved by the noble work of Jenner and his prosperous followers.

We also hear of the noble work of Father Damien among the lepers of Hawaii, but we are not told that there was not one leper in the whole of the Hawaiian Islands before the noble work of Jenner reached them. By the 'nineties, 10 per cent of the natives were lepers.

### CHAPTER THREE

#### BROADCASTING v. LIBERTY

THE EXTREME danger of a biased, monopolistic broadcasting system was well illustrated during the smallpox scare of 1961. In two consecutive "Any Questions?" programmes, *eight popular broadcasters in a row all demanded the return of compulsory vaccination*, apparently on the grounds that "we are getting slack about it".

*Who is getting slack about what?*

Did these hand-picked BBC brains never learn that the first trial of compulsory vaccination, beginning in 1853, was followed, in the four years of 1870-73, by Britain's biggest smallpox epidemic, with 46,000 deaths? Since then, our population has more than doubled; so, if "like causes produce like results", do we want about 100,000 smallpox deaths in a few years' time? If not, why ask for it? Evidently, the price of liberty and health is eternal vigilance, not eternal listening.

All of these popular speakers, one of whom is a clergyman, agreed that people should be allowed to escape vaccination on religious grounds. What do they really believe in—religion or vaccination?

No official broadcaster has ever been allowed to hint that there are the strongest possible intellectual reasons, and many of them, for rejecting every kind of preventive vaccination. The Radio, in peddling its garbled stories of Jenner, Pasteur and company to the schools, etc., always omits to mention that when the first scientific attacks on vaccinationists began, the antis were led by serious scientists all of whom had been brought up to believe in the sacred rite, but who, for one disinterested reason or another, had studied it closely, rejected it completely and had the courage to say so.

Dr. Charles Creighton, Alfred Russel Wallace, William White, Prof. Edgar Crookshank, William Tebb, Dr. Scott Tebb, Dr. William J. Collins and his father, of the same name, who had been a public vaccinator for 20 years and had renounced the practice, were all head-and-shoulders above their opponents, both in intellect and in integrity. They may therefore never be mentioned on the radio, nor may their history.

This omission is undoubtedly intended to imply that the principle of blood-poisoning for health has been established beyond all reasonable doubt. History has consistently proved the utter futility of

vaccination as well as its manifold dangers, and we must remind the radio mugwumps that they cannot fool all of the listeners all of the time, even by hand-picking their broadcasters and ruthlessly firing any one of them who dares to question the divine right of the blood-poisoners, let alone laugh at them like Commander Campbell.

In the meantime, we have to put up with perpetual propaganda glorifying Jenner and Pasteur. It would be difficult for any child to pass an examination in general knowledge without having absorbed most of it. On the chapel wall by Pasteur's tomb, for instance, we can read:

"1865: The Silkworm Diseases." What this means is that in that year Pasteur began trying to save the silkworm from the ravages of *pebrine* and *flacherie*. His triumph has to be taken for granted—on the radio, anyway. What is missing, however, is the official record of the output of silk before and after Pasteur's genius was brought to bear upon the problem. In the last broadcast we heard on this subject, the ending was abrupt: ". . . and so, Pasteur saved the silkworms." Just like that! Here are the figures, in kilogrammes of cocoons:

1850, when the industry was prospering: 30,000,000.

1866, when Pasteur had begun saving it: 15,000,000.

1873, when he had officially triumphed: 8,000,000.

1886, the output fell almost as low as: 2,000,000.

At the time of his triumph, Pasteur was awarded a pension of 12,000 frs. We imagine that this figure was well maintained.

In the case of the silkworm diseases, as in that of anthrax in cattle, despite all Pasteur's conjuring-tricks and salesmanship, the people professionally concerned had to solve their problems for themselves, as usual. Do we hear this from the radio?

The best antidote to Pasteurian propaganda is the book by E. Douglas Hume, *Bechamp or Pasteur?* (Daniel). It will disillusion anyone who really wants to be disillusioned.

### WHO WANTS TO BE DISILLUSIONED

Most people cherish their delusions even more than their other ailments. As Thomas Edison was fond of saying:

"There is no expedient to which Man will not resort to avoid the hard work of thinking."

The germ theory and the idea that germs can be conquered by vaccines was one of the most greedily grasped of all such expedients. It was so much more modern and scientific than the fuddyduddy idea of mending our ways or atoning for past errors. Man wants to believe that the maladies he brings upon himself are all due to those terrible germs, which, being unable to sue for libel, are the ideal scapegoats. What a tremendous debt we owe to Louis Pasteur, the Microbe Man!

And yet Pasteur himself, at the end of his life, was quoted by his old friend, Prof. Renon, who attended him in his final illness, as having said:

"Bernard was right. The germ is nothing. The soil is everything."

It cannot be believed that this final scientific utterance of Pasteur's is not authentic, but it is not inscribed on the wall of his tomb, nor have we ever heard it quoted on the radio.

The germ theory means big money. The show must go on! The Press seldom mentions any mysterious, infective or degenerative disease without holding out the hope that if we give enough millions to the millionaire laboratories to enable them to plague millions of animals for years, then a vaccine will be "discovered", millions of lives will be saved and all will be well—for the laboratories, at least

The mere fact that compulsory vaccination in any country is always followed by more and worse smallpox must be sternly suppressed. So must the fact that the least vaccinated country in the world, Australia, has had fewer than one smallpox death per annum throughout her whole history and only three deaths among children under the age of five. The one Australian victim during the last 43 years—a hospital nurse—was infected by a woman who was landed at Fremantle with smallpox after two vaccinations during the previous six months—as usual, we must add. At one time, the infant vaccination figure was below 1 per cent, but it has lately been raised, possibly by the pretty fairy story about Jenner and the dairymaids, which we have heard broadcast from Melbourne by voices which do not sound Australian.

It would seem that International Blood-Poisoners Unlimited have decided to remove the Australian thorn from their side, and so they have refused to allow Australia to subscribe to the International Sanitary Conventions. They try to pretend that Australia has always been very strict about vaccination, and -will not let anyone enter the country without proof of having paid tribute in cash to the Golden Calf. They are actually trying to make vaccination compulsory in Australia. Can they give the smallest excuse for not letting well alone? Of course not—but the mere truth does not pay them well enough.

It is certain that if the Australians are all compulsorily poisoned with real vaccine they will eventually enjoy the biggest smallpox epidemic they have ever known, but by that time, no doubt, the vaccine promoters will have found new fields to conquer, as happened in the case of the Philippines scandal.

## CHAPTER 4

### DO ANTIBODIES REALLY PROTECT?

FROM REPEATED medical investigations, it would seem that antibodies are about as useful as a black eye in protecting the victim from further attacks. The word "antibody" covers a number of even less intelligible words, quaint relics of Erlich's side-chain theory, which the greatest of experts, McDonagh, tells us is "essentially unintelligible". Now that the old history, mythology and statistics of vaccination have been exploded by experience, the business has to depend more upon verbal dust thrown in the face of the lay public. The mere layman, assailed by antibodies, receptors, haptophores, etc., is only too pleased to give up the fight and leave everything to the experts. This is just what they want, especially when he is so pleased that he also leaves them lots and lots of real money.

The whole subject of immunity and antibodies is, however, so extremely complex and difficult, *especially to the real experts*, that it is a relief to be told that the gaps in their knowledge of such

things are still enormous.

We can obtain some idea of the complexity of the subject from *The Integrity of the Human Body*, by Sir Macfarlane Burnet. He calls attention to the fact—the mystery—that some children can never develop any antibodies at all, but can nevertheless go through a typical attack of, say, measles, make a normal recovery and show the normal continuing resistance to reinfection. Furthermore, we have heard for years past of attempts made to relate the amount of antibody in patients to their degree of immunity to infection. The, results have often been so farcically chaotic, so entirely unlike what was expected, that the scandal has had to be hushed up—or put into a report, which is much the same thing (*vide* M.R.C. Report, No. 272, May 1950, *A Study of Diphtheria in Two Areas of Great Britain*, now out of print). The worse scandal, however, is that the radio is still telling the schools that the purpose of vaccinating is to produce antibodies. *The purpose of vaccinating is to make money!*

Another equally authentic report is worth noting, more particularly because of its source—the Pasteur Institute at Teheran (*see* W.H.O. Bulletin, 1955, Vol. 13, No. 5). The laboratory report on five cases out of 17 all of whom were badly bitten by a really big bad wolf which also bit 12 other persons, 6 cows and a horse in one night, and was presumably not quite normal, is clear and concise. The purpose of the whole report was to advertise a new serum, and so the 17 worst cases, with head injuries, were divided into three groups. Six patients were given two or more shots of the new serum; none died. Six others got only one shot; one died. The remaining five got no serum; three died. Needless to say, all the cases were treated surgically and with antibiotics, etc., and *all had 21 days of the Pasteur vaccines.*

The report might be said to make out a case for the new serum as a protection against the Pasteur vaccines, although we could suggest a better, cheaper and quicker way of dealing with them. This, however, is what it says about the five patients whose fate had to depend on them:

*"Series C.—The five patients in this series received a course of vaccine but no serum, and none showed antibodies before the 19th day. However, three developed definite titres between the 21st and 25th days. Two of these three patients died. Two other patients failed to develop any demonstrable antibody during the period of observation. One of these died of rabies; the other survived. The two highest levels of antibody in this group were obtained from fatal cases shortly before death."*

That should be enough about antibodies!

## REAL IMMUNITY

It may be true to say that our lymphocytes and mesenchymal cells form a large part of our natural defences, and that these cells are produced in enormous numbers and stored at strategic points, the main depots in the alimentary tract being the tonsils and the appendix!

How often is the appendix solemnly called "the nuisance organ" by those who, at no loss to themselves, remove thousands of appendices every year, a majority of two-thirds of them being in fact quite normal and useful? The real doctors who still retain some respect for the wonderful complexity of the human organism, at the risk of being called "dangerous cranks", should really get together with the business-surgeons and discuss this subject—on TV, please!

When we learn that something like 500,000,000,000 lymphocytes die and are replaced in a human body every day, not to mention all the other "immunologically competent" cells, we cannot help feeling that it is grossly impertinent to add to the complexity of the situation by squirting people full of other cells and viruses which can multiply to an utterly unpredictable extent. No wonder there are often complications!

### **HOW MANY VACCINES DO WE NEED?**

When a full inquiry had to be made into the alarming amount of cross-infection in our hospitals, it did not take long to discover several thousand strains of antibiotic resistant germs, particularly of the *staphylococcus aureus*. Must every hospital patient therefore have several thousand new vaccines pumped into him, three shots of each, and a booster dose some months later if he is still living? If not, why not? The reason is that the public—even the viewers and listeners—would begin to see that the whole idea of vaccinating, if carried to its logical conclusion, is a vast, grotesque, commercial racket which can never produce a healthy race or even allow anyone to enjoy real health. Of course, the real, hospital-prone patient will try anything once. He might be willing to settle for a single new multimillivalent vaccine from the Salk Institute. Who can tell?

### **WHAT IS A VIRUS?**

The electron microscope has focused attention upon what are all-too-loosely called viruses. The word virus used to mean any kind of foul and poisonous matter; but now the notion is being encouraged that a virus particle, whether called an "intact", "living" or "whole" virus, is merely a very small kind of germ, too small to have been seen by Pasteur with the optical microscope.

A virus is a nucleic acid, a chemical chain or pattern. The excuse for regarding it as being alive is that it can multiply itself by getting into a cell and causing it to produce a lot more of the same virus—even a thousand times as much in a few minutes. We can grasp the idea more easily if we remember that a poisonous lie, a mere chain of letters, can get into a newspaper, be multiplied millions of times and spread all over the country in a few hours.

This is obviously a very different thing from simply dividing as bacteria do. The main difference is the amazing speed of virus multiplication. A bacteriophage, for instance, which can infect a bacterium and make it produce more than a thousand new virus particles exactly like itself in 20 minutes, has a potential breeding rate of one-thousand million times per hour for as long as it gets enough cell to infect. These figures come from *The Times Science Review*, Autumn 1959.

### **CRIMINAL NEGLIGENCE**

What a splash the journalists could have made with this sensational figure if only they had had the courage to warn the mothers of the world, with banner headlines, never to have viruses pumped into their defenceless babies or fed to them in pink cocktails! Unfortunately, they missed their glorious opportunity. The matter was never fully discussed and many very important questions are still unanswered

What is really meant, for example, by the expression "living virus"? Is there such a thing as a dead one? How do the real virologists talk about this when they "let their hair down", if they have any?

Commenting upon the first of the CIBA Foundation Lectures, Study Group No. 4, Dr. H. G. Pereira,

a very well recognised virologist, of the National Institute for Medical Research, Mill Hill, London, said: —

"The position is even more difficult now since it has been shown that the nucleic acid by itself, e.g., that of poliovirus, will infect many different tissues which are quite resistant to the whole virus."

When we know that the word "infect" means that the nucleic acid (the virus) multiplies enormously, and that "whole virus" simply means a tiny spot of virus coated with protein derived from an infected cell, we can appreciate the fact that sometimes a "whole" virus cannot infect, while a decoated, or "killed", virus always can *if it is a real virus*. The reason is that all cells have to feed through their walls and can absorb free virus in the same way, *after which they can "replicate infectious virus"*.

In the second lecture, given by Prof. H. R. Morgan, of Rochester, New York, the above facts were confirmed with regard to type I poliovirus, which can infect chick-embryo cells only after being deprived of its protein covering.

Most of the world must have read several times about the huge sums paid out by the Cutter Company, of California, to the victims of their Salk polio vaccine. The total amount was over \$3,000,000, only \$2,000,000 of which was covered by insurance. The facts which have been given already about "living" virus particles should have been known well before the claims were settled. The jury, or 11 out of the 12, awarded these huge sums on the grounds that the Salk vaccines had contained "living virus particles".

Would it be going too far to guess that the vaccinemongers—those directly or indirectly concerned—preferred to pay up and shut up rather than have the scandal discussed for several more months, or even years, through an Appeal to the Supreme Court on the grounds that the cases were tried, as they seem to have been, on a completely false basis?

The whole thing must surely seem a little queer to the intelligent layman, especially when he knows that the Sabin vaccines are deliberately made to contain living viruses. Naturally, it is hard to get any real sense out of all this, because there never was any real sense in it!

What the intelligent doctor thinks is seldom published in the popular newspapers, but when the writer remarked to the late Dr. Beddow Bayly, very shortly before his death, that he had concluded that the difference between a living virus and a dead one was twelve minutes, Dr. Bayly laughed, in evident agreement, and said these memorable and forceful words:

"You need not be afraid that they would use real viruses in all these vaccines. They simply would not *dare* to! *The whole thing is absolute humbug!*"

This final dictum by Dr. Bayly sums up the position with his usual meticulous accuracy. It does not, however, answer all the questions that are being asked about the latest vaccines, though it covers the subject well enough

The latest virus vaccines, whether oral or inoculated, are said to be made with "modified" viruses, regardless of the fact that real viruses have a way of unmodifying themselves with alarming and sometimes fatal results. Very frequently, even in medical journals, they are oh-so-reassuringly called "inactivated" viruses, vaccines, etc. In plainer English, they do not work!

Now, surely, to vaccinate with an inactivated virus is about as foolish, not to say unethical, as it is to travel with an expired season ticket. Even when the latter has been scientifically modified by partial or complete lysis of the date, its use can prove to be a badly miscalculated risk.

As to "modified" viruses, however, Dr. John Kendrew, F.R.S., in his series of BBC TV lectures on "The Thread of Life", stated that it had been proved in the laboratory that a virulent virus (that of virus pneumonia), if placed side by side with a "variant", can "take over" the variant, restoring its virulence, and make it "breed true". Viruses can, in fact, infect one another! Another revelation comes from *The Genetics of Bacteria and their Viruses*, by Willam Hayes, in which, on pp. 365-6, he classifies these viruses as "virulent" and "temperate" and says that the change from one class to the other can be made in a single mutation in response to altered environmental conditions. Furthermore, these viruses, in their temperate mood, do not kill their host cells. They allow them not only to go on living but to breed offspring which continue to reproduce virus as well as themselves.

These facts would seem to explain a vast host of disasters, from single cases to world pandemics. They show the risk of vaccinating with modified viruses, especially when virulent ones are present. They overwhelmingly endorse the late Dr. Beddow Bayly's resounding dictum, quoted previously.

As to smallpox vaccines, it has always been impossible to define them. Jenner could hardly have known that almost any foreign matter, applied with skill and an impressive air, can produce a festering sore on the skin. Case No. 5 in his famous Inquiry—a gentlewoman who acquired "cowpox" through handling dairy utensils—may well have been an early case of vaccination with milk or cream, but not the last one by any means. Jenner would have been shocked by this idea, no doubt, because he did not think of it himself.

Any mixture of chemical and biological refuse can be called a vaccine, and, with enormous free advertising by Press and Radio, it can be sold, but, if it does not cause specific infection, it is not a real vaccine. The latest smallpox vaccines appear to be more infectious than smallpox itself. These mysteries are seldom fully discussed or explained, but there can be little doubt that the smallpox vaccines used in the U.S.A. and our own true British *pox- -virus officinale* contain traces of human smallpox virus.

In the light of what is now known about viruses, it is not surprising that the most vaccinated populations have always had the worst record for smallpox. The Philippines, for example, had 163,000 cases, with 71,000 deaths, in 1918-20, after 20 years of compulsory poisoning with "modified" smallpox lymph. The Mexicans were the most thoroughly vaccinated people on earth from 1876 onwards (with compulsory vaccination within four months of birth, revaccination at least once every five years and every time there is a local outbreak), and yet, until about 1935, they had the worst record in the world for smallpox, the death rate being between 2 1/2 and 3 1/2 times higher than that of India! The League of Nations were blowing them up about it. They could hardly recommend more vaccine, of course, but there has been some improvement since then in Mexico, due, no doubt, to other factors of a more general environmental nature.

## CHAPTER FIVE

### INTERNAL SANITATION

**WE ASSOCIATE** epidemics generally with poverty-stricken and dense populations, and with

insanitation, but it is noteworthy that the worst pandemic ever known, the influenza of 1918-19, which is believed to have infected half the human race and caused 25,000,000 deaths—some say twice as many—has never been fully and honestly reported. Of course, the epidemiologists tried to trace it to its source, and it seems to be generally agreed that the virus took on its terribly virulent form in certain American army camps on the eastern side of the U.S.A. Why, though, has this matter never been properly investigated? Is it a medical secret? (There was a rumour that one of the typhoid vaccines had "gone wrong".)

It is quite certain that those camps were not the most insanitary places in the world—very far from it—nor were the men underfed, but it is certain that they were about the most inoculated, i.e., internally insanitary, people on earth at the time, and the mortality among such men, when the infection spread, was many times higher than among civilians of the same age-groups. One may suspect that most of the "immunologically competent" cells in those army men were exhausted through working overtime against all the vaccines forced upon them. The general fatality rate was very low, and if the patients had all been properly treated by Nature Cure methods it is unlikely that any would have died. This fact is not yet universally accepted, and if we get 'flu vaccines on sale everywhere, it will no doubt be sternly suppressed.

It is obviously impossible to vaccinate in advance against new strains of influenza virus, and they are the only ones that matter. Apparently we are all already full of the older ones; vaccinating against them would therefore be equally futile, to say nothing of the possibility of "boosting" them and thereby causing "provocation cases".

The virologist whom we have quoted above, Dr. H. G. Pereira, Director of the World Influenza Centre, Mill Hill, London, said in an interview in the *London Times*, 13<sup>th</sup> February 1963, that "the Asian influenza virus was now seeded in the population. It was there all the time and could appear when conditions were favourable".

This idea that basic viruses, whether spread naturally or pumped into everybody for money, can lie dormant and then be aroused to renewed activity would seem to explain quite satisfactorily why, some years after a large population has been subjected to compulsory vaccination, it always gets the worst smallpox epidemic it has ever known. We in England began it. The 1871 epidemic was not only the biggest but one of the very worst, according to contemporary opinions. It also explains why it is so dangerous to vaccinate during epidemics and thus add a lot of "provocation cases" to the general total.

All these things have happened so consistently, in so many countries throughout the world, that they cannot be all due to pure coincidence. They are the facts of history, and they cannot be brushed aside as "yesterday's news".

### **DISEASE FOR ALL**

In spite of a reward of \$15,000 having been offered, apparently without response, to anyone who will prove that the Salk polio vaccines are not fraudulent, a huge Salk Institute is now being established on 27 acres at San Diego, California, the alleged object of which is to provide ideal as well as practical opportunities for scientists—even real ones—to work without hindrance or financial worries.

Needless to say, the vaccine industry has already got more than one foot in the door, but Dr. Jonas Salk will not be the only man there. Some quite important and humane thinkers have already been invited to join the happy band, It will be very interesting to see how the members react upon each other!

One object—presumably a "top priority"—mentioned in connection with this ambitious set-up is that of concocting, or "discovering", a single vaccine to protect everybody from everything—except, presumably, the vivisecting, vaccinating, chemists, the Press and the Radio.

At present, however, an "absolutely safe" vaccine against some 10, 50 or 100 virus diseases is all that is modestly envisaged; surely, however, when we read of the vast number of viruses that exist in the world, and of the fantastic speed with which they can vary and multiply, a mere hundred of them would seem hardly to be worth bothering about.

The fact that the antibiotics have encouraged the bacteria to turn our happy hospitals into plague-spots should make us apprehensive about what the viruses may do in reply to new vaccines. California has had one Salk disaster already.

*The British Medical Journal*, of 1st June 1963, has mentioned varieties of the *staphylococcus aureus*, coliform bacilli and poor little TB germs which cannot even live without streptomycin, the antibiotic commonly used in fighting TB. What are we supposed to think about this kind of thing—or aren't we?

We can be sure, at least, that the proposed wonder vaccine, if and when it arrives, will be hailed by the Press and the Radio, with flags flying, church bells ringing, sirens wailing, etc., and advertised with public and "charity" money, with no financial restrictions whatever—and without mercy.

### VETERINARY VACCINES

As there is no public registration of births and deaths for animals, their vaccinators can say almost anything they like about the triumphant progress of vaccination against all animal diseases. The Radio never ceases to proclaim it. Its complete and universal efficacy must be swallowed whole because such propaganda helps to sell all vaccines.

Listeners, however, should always remember that all pedigree animals are selected, bred, fed and experimented upon just as laboratory animals are. They are not so much vaccinated as *tested* with vaccines. When distemper vaccines began to kill dogs or give them nervous disorders, the worst cases were obviously not sold but destroyed. This principle cannot be applied to human babies, at least, not officially, and so there is no real comparison between humans and domestic animals, especially those which are allowed to live only for a few months anyway.

It must be clearly understood that it is always possible that a strain of rapidly breeding animals may adapt themselves to a certain treatment, and may eventually become unable to do without it—like the germs that pine for antibiotics. This provides limitless opportunities for the manufacturing chemists, but is not so good for anyone else.

If the human race wants to be turned into a lot of laboratory freaks, with no health or integrity whatever, and dying from degenerative diseases at an ever-increasing rate—well, are we not more than halfway there already?

Our air, food and water are being increasingly poisoned with hundreds of new chemicals. No one can escape them. Atomic fall-out is a trivial red herring by comparison. It is difficult to travel the world without being converted into a walking cesspool of biological refuse, germs and viruses of every kind.

Is there not one really self-governing, self-respecting and independent nation that will make a stand and refuse to admit any person who has recently been vaccinated or inoculated against anything? Even Britain refused at one time to admit dogs which had been vaccinated against rabies without adding an extra three months to the usual six months' quarantine, knowing the vaccination to be an added danger. If one country, Australia, perhaps, would set the example by banning all immigrants who had been poisoned by vaccines, the subject would have to be fully and publicly discussed for the first time. What matters more than anything else is that the freedom of the Press and of Radio should be strictly enforced by international law, with no censorship by militarism, medicine or money.

### **INTERNATIONAL SANITARY CONVENTIONS**

About the middle of the last century, some seventy nations contributed to a meeting held in Paris to frame rules for the control of epidemics, for there was an obvious need for agreement upon such things as health inspection of immigrants, quarantine regulations, etc. Since then however, it appears that the vaccine salesmen, as might have been expected, have moved in and taken control of everything—except, of course, the epidemics.

No members of the public are admitted to the Conventions to hear what is being cooked up for them or what is said by the real doctors who are present, if any. Consequently, the ridiculous pretence is still kept up that a certificate can disinfect a person, inside and out, with all clothing and personal effects. Could humbug possibly go further? We constantly see the fatal results of this official imbecility. It must be cured.

An International Certificate of Vaccination proves nothing except that somebody's money has had to be spent on vaccine—in other words, that the love of money is the root of all evil.

### **"AUTOIMMUNE" DISEASES**

This strange name has been given recently to a number of well-known degenerative diseases of unknown origin, such as rheumatoid arthritis, Hashimoto's disease of the thyroid, and a growing list of others. The feature common to all of them seems to be that certain cells which are not normally in direct contact with the blood stream, become damaged or exposed; they are attacked as strangers by the lymphocytes, plasma cells, etc., antibodies appear in the blood, a vicious circle is set up and the battle continues until the offending cells are destroyed.

In fact, it would seem that all who die of "natural causes" or "senile decay" really die of "autoimmune" disease.

We very strongly suspect that this new name, completely unintelligible to the layman, has been adopted to obscure the fact that all these troublesome and incurable diseases really ought to be classed as "autogenous vaccinations", but the word "vaccination" has to be kept out of it at all costs.

The National Anti-Vaccination League, however, will be neither surprised nor depressed to be told

that, if nothing else kills us first, we all die from vaccinations in the end. We shall strive, like others, to put off the end as soon as possible, and to do our best to protect everybody from being systematically poisoned with antigens and antibodies for money, sometimes even before they are born.

We like to believe that if the original inoculators had had the faintest idea of what they were doing, in their impudence, or of the fantastic tangle of vicious circles and chronic diseases they were bound to create, the whole dirty business, in spite of its giving full employment to doctors and colossal profits to the chemical industry, *might* never have been started.

We have always held that the zymotics tend to cure themselves if properly treated, but that the effects of vaccination are incurable and often disastrous. We must therefore resist all vaccinations. We would rather be cranks than crocks.

The present official advice as to the "safest" age for primary vaccination puts it at "after 1 year", which amounts to admitting that most of the world's statute laws on this matter have always been pure criminal lunacy (as if we didn't know!). We believe that all vaccinations should be voluntary and should be strictly forbidden before the age of 150, after which anyone who still believes in vaccination deserves to be treated as a guinea-pig. He ought to be happy, anyway, to die crammed full of beautiful, healthgiving antibodies, like other people.

## CHAPTER 6

### THE VACCINATION CONTROVERSY

ALTHOUGH, IN THIS short history of medical protection-selling, we must confine ourselves mainly to its present and maybe future aspects, it would be ungrateful not to remember those great fighters in the past, especially the medical men, including public vaccinators of long experience, who studied the subject honestly, saw right through it and bravely told the truth about the whole repulsive racket, often at great cost to themselves, They began doing this more than a century ago.

Who can dispute the opinion that Dr. Charles Creighton was the greatest of these doctors? His *History of Epidemics in Britain*, in two volumes, 1891 and 1894, was justly called "the greatest medical work ever written by one man". Having previously written for the *Encycloptedia Britannica*, he was asked to contribute the article on vaccination for the Ninth Edition. Its appearance, in 1888, was such a profound shock to the advocates of, and vested interests concerned in, vaccination that Creighton's article was replaced as soon as possible by what was little more than an advertisement for glycerinated calf lymph written by one of its promoters. Creighton, perhaps the greatest medical mind of the last century, was virtually turned out of his profession.

The fact that such a disgraceful thing was ever allowed to happen appears to have been taken as a precedent, which has been religiously followed by most publishers ever since. Vaccination is big-money business; so is the publication of school text-books. No medical text-book telling the truth about the vaccine industry would ever reach the printers.

In addition to those previously mentioned, who had a lot to lose and little to gain by denouncing the fraud of vaccination, there were many others who were scandalised by it; for example, Alfred Russel Wallace wrote a lot against it and said that he considered this work the most important that he ever did, in spite of his writings on natural selection.

William White wrote a very good book, *The Story of a Great Delusion*, 1885, the first of the larger works exposing Jenner, but, unfortunately, he made one error in misinterpreting some of Dr. Farr's statistics; this error is all that a medical student is required to know about the contents of this book of over 600 pages.

Creighton may have been too irritated by Jenner's style of writing to be quite fair to his essay on the cuckoo, submitted to the Royal Society, but he expressly disclaimed being a naturalist himself; after all, the only important thing about Jenner's cuckoo, "the bird that laid the vaccination egg", was that it got Jenner an F.R.S. Apparently, the Royal Society failed to notice that it was the cuckoo that was the genius, and not Jenner. Where Jenner obtained his information about the cuckoo is of no importance whatever, but even the recent big book, *Smallpox*, by Prof. C. W. Dixon, has to seize the opportunity to justify Jenner's paper and to dismiss Creighton as an "armchair critic". Prof. Dixon even calls him a "syphilophobe". The excuse for implying that he was morbidly afraid of syphilis is presumably that, in his small book, *Cowpox and Vaccinal Syphilis*, he tried to explain to doctors certain outbreaks of supposed syphilis in recently vaccinated groups of children. His theory was that the trouble had been caused by taking the lymph too late, which, in a series of arm-to-arm vaccinations, had allowed the cowpox to revert to its original virulence, the affinity of cowpox being to the great pox rather than to the smallpox.

Considering that almost nothing has been published about the real nature of cowpox, we may indeed wonder why it is that modern medical dictionaries tell us quite dogmatically that it is "a virus disease of cattle". Is this definition really true or is it just commercially convenient? Also, what has become of the bacillus of smallpox and also that of influenza, both quite real to Prof. W. M. Crofton? Are they brushed aside as mere minor inconveniences? In short, it is wiser to be sceptical about all opinions about bacteriology in the early part of this century, when little was really known and no one could distinguish between a virus particle and the filterable form of a bacillus. Creighton was obviously a sceptic to the end of his life. Prof. William Bulloch, after Creighton's death, said, "He was the most learned man I ever knew." He could speak six or seven European languages fluently and could read many more. Was this all for fun? Did he go to India in a Sedan chair to study leprosy and plague?

Dr. Walter Hadwen, "the terrible Hadwen", as Shaw called him, is not mentioned in Prof. Dixon's terse account of the Gloucester smallpox, in 1895-6. Hadwen replied shatteringly and completely to the official Report prepared for the Royal Commission on Vaccination, which, however, was not prepared to wait for it, and ended its seven years of sessions before the Report appeared. The whole outbreak was probably spontaneous and due to blocked sewers and polluted water. If it were not, why did the authorities have to spend thousands in putting these things right? The stinking manholes leading to the sewers may well not have been noticed by the official reporter, because they had been sealed up before he ever got there. Prof. Dixon sneers at the local antis, meaning the phoney ones, of course. We heard of one man who championed the antis' cause because he edited a local paper and wanted to improve its circulation. He went to Cheltenham and had himself secretly vaccinated. Are dishonest journalists so very rare, however?

One genuine citizen of Gloucester had a wife and children who were never vaccinated; a servant girl, who was living in the house and who had been vaccinated, contracted smallpox, and the father of the family allowed his wife and four children to sit by the girl's bed and cheer her up. None of them became ill. They were badly brought up and lacked faith in the official propaganda, no doubt.

We cannot, of course, recommend this kind of conduct, but Prof. Dixon's readers may as well have the whole truth, and not just garbled and twisted bits of hostile local gossip, especially if they are asked to pay £6 10s. 0d. for his book.

It is impossible to review all the old books, papers and reported speeches on this controversy. The modern reader has to be content with a brief summary of it all, and he must make up his own mind as to which kind of evidence he can accept as genuine. On the one hand, we have statistics compiled behind closed doors by medical wags who knew what the bosses wanted and who had been brought up on the vivisectors' slogan, "The end justifies the means". Were they not on the side of the angels? Why shouldn't they lie like hell?

These people have to be a little more astute today than the wags of the last century who proved such wonderful things that we can only laugh at them (such as, for example, a case mortality of 71 per cent among the unvaccinated, and one of only 1.3 per cent among the vaccinated cases). When we know that, before the cowpoxing ever began, the smallpox case mortality was only about 18 per cent in England, we know what to think about the miracles performed by vaccination in the glorious days of the Victorian era—or, should we say, by statistics?

On the other hand, we have the example of the brilliant minority of really honest men who risk their own professional advancement by fearlessly telling the truth as they see it with their own eyes—men of long experience and of the highest integrity. Their testimony, as might be expected, flatly contradicts and exposes everything that was claimed by Jenner and his prosperous followers.

The late Major Reginald Austin, of the Royal Indian Army Medical Corps, was one such man. No one who knew him could possibly doubt his word for a moment. When the writer showed him some official figures about smallpox in the Army in India, Major Austin's exact words (with emphasis) were these: —

"Why do *you* take the *slightest notice* of their statistics? You don't know the people who compile them. I do: I've *seen them at it*. They are all the most unconscionable LIARS!"

After 20 years in India and Burma, treating the Army men and the followers, Major Austin knew what he was talking about and meant what he said. Of course, he did not publish such things about his professional colleagues, but he did tell them what he thought of them. Presumably they replied by calling him a crank and giving him that reputation. That is the usual official routine.

Carlo Ruata, Professor of Materia Medica, at the University of Perugia, was obviously another fearless champion of the truth; and it is very important to remember that all such men make themselves personally responsible for what they say and write; they do not hide in the herd and quote figures for which no one would dare to admit personal responsibility.

In a letter to the *New York Medical Journal*, published 22nd July 1899, Prof. Ruata wrote a shattering rebuke to Dr. Joseph M. Mathews, who, in his Presidential Address to the American Medical Association, had called the antivaccinationists "mad" and "misguided". The letter is too long to quote in full, but he deals with the smallpox in Calabria, Sardinia and Sicily during the epidemic of 1887-9.

After showing that Italy was about the most vaccinated country in the world (the Army call-up showed that 98.5 per cent of the men had been vaccinated already, and they were then

revaccinated), he shows that smallpox deaths were exactly divided between the sexes before the call-up age of 20, but that afterwards the revaccinated men were hit much more than the women. He gives a lot of figures from the worst places hit by the epidemic. The gem of his collection was: Vittoria, Sicily, population 2,600: deaths from smallpox 2,100! And he adds:

"Can you cite anything worse before the invention of vaccination? And the population of these villages is perfectly vaccinated, as I have proved already; .....I obtained from the local authorities a declaration that vaccination has been performed twice a year in the most satisfactory manner for many years past."

Incidentally, it is interesting to note that the lymph used in Italy at that time was the animal lymph such as was afterwards adopted by the British Government to replace arm-to-arm vaccination. The excuse for the change was that animal lymph could not transmit syphilis, leprosy or other human diseases. The real, commercial reason was, of course, that animal lymph has to be purchased from the firm's which produce it, instead of being obtained by private arrangement with doctors, vaccinifers, etc.

### **WHAT IS THE PRESENT POSITION?**

We have no space here in which to pay tribute to all the people who have been fighting for truth and justice, not only in Britain but all over the world. Unlike the World Health Organisation, the National Anti-Vaccination League is not subsidised. It has no multilingual secretariat, and it cannot hope to support such a thing by voluntary contributions from that very small percentage of the public which really cares even twopence for the truth about anything (the so-called "cranks").

The high-minded Victorians who supported our cause made the tragic mistake of thinking that, when we had "knocked the bottom out of a grotesque superstition", as Creighton put it, the battle was almost over, and very few of them made any attempt to endow the League with substantial capital or even permanent headquarters. These honest people could hardly have foreseen such horrible, costly follies as two World Wars and the atombomb—or that the Jenner-Pasteur business would become an enormously wealthy international protection-selling racket, which, in spite of its universal failure, has the power to monopolise the Press and the Radio almost completely, to use large sums of public and "charity" money to advertise its abominable wares and even to capitalise their manufacture, which inflicts cruelty upon countless millions of animals every year. The optimism of the Victorians was tragic, but only an extreme pessimist could have imagined what was to follow.

As to the present, we are aware of the efforts of those in other countries—France, for example, where M. Lemaire and M. Hoffet, whose son was killed by BCG vaccine, have been leading a brave fight to get compulsion taken out of the whole vaccine trade. There are many French doctors who would make all vaccinations illegal. There is no doubt that they soon would be if free discussion on the Radio were possible; at present it is simply not allowed. Only the feeblest pretence at fair play for both sides has ever been made in Britain, the opponents of vaccination being granted only a very few minutes in a year—with luck, and then without being given any warning or allowed time for adequate preparation. There is invariably a very long interval between one such concession and the next. The anti will be lucky to get from two to five minutes in which to demolish a mountain of lies which have been piling up for a century. His broadcast will probably be made from a provincial

station, lest the heart of the British Commonwealth should die from shock, He will be up against maybe half-a-dozen opponents, each of whom will be given exactly the same time as he on the air, just to ensure scrupulous fairness. Furthermore, if the programme is filmed and so can be edited, his most telling facts and figures will be cut out by one of the anonymous broadcasting house-surgeons. If, in spite of all this, he manages to get any real information to the listeners, the scandal has to be given several months to blow over.

Even that excellent broadcaster, Bernard Shaw, we recall, had to be cut off in a hurry when, in an interview, he was casually referring to Jenner and Pasteur as if they were mere mortals. Shaw really studied the vaccination controversy and said many trenchant things about it, but his writings are still available and so need not be quoted here.

## LILY LOAT

In modern times, the one person who did more than anyone else to restore our right to choose whether or not we should be poisoned with commercial inoculations was the late Miss Lily Loat. The fact that she received no obituary notices whatever from our national newspapers was the highest compliment they could pay her. The only radio tribute to her great work was an oblique smear in a Granada TV serial. It showed two police officers looking with horror under a blanket at the corpse of an old woman recluse who had died of smallpox and who was said to have been a notoriously eccentric crank. Later in the episode, the junior officer remarks that at one time she had "actually started a league for the abolition of compulsory vaccination"; his Chief Inspector replies: "Oh, so it caught up with her!"

We need hardly say that the original society was for the Abolition of Compulsory Vaccination and that it became the N.A.V.L. in 1896, or that Miss Loat was inseparably identified with it for about 50 years. Incidentally, she did *not* die of smallpox.

Probably, mothers will be telling their children for years to come that is what happened to the founder of the League. It was God's will—they saw it on the TV. Such is the kind of publicity we get from the ignorant and unscrupulous powers-that-be. A printed protest sent to them received no reply.

The late Dr. Killick Millard, who wrote so much against mass vaccination, told the writer that he admired Miss Loat so much that he hoped to survive her so that he could write her biography, but that was not to be. What would he have said about that typical TV tribute to her work—the only one of any kind from the Radio?

Miss Loat was not herself a doctor, but there are many medical members of the League and she always had the benefit of their help and advice. The doctor who might have been the Chief Medical Adviser to the Ministry of Truth was the late Dr. M. Beddow Bayly. He did so much work, writing books, pamphlets and leaflets against vaccination and other allied rackets, that he left little for others to do. His opponents could not answer him, because, as he used to say with a gleeful chuckle, he hardly ever quoted any evidence against them except what they had themselves said or written. His works are still available to the serious student, and they are very valuable for their wealth of information and quotations.

The average person, however, cannot be expected to want to be dragged backwards through the whole history of the controversy, or through Hansard. Nevertheless, the experience would reveal

that the mainstay of the vaccine tyranny has always been the conceit, credulity and intolerance of people in high places. We well remember the tumult in the House, in November 1942, when one M.P. who had obviously read Dr. Beddow Bayly's big booklet on diphtheria "immunization", as the minister of Health to hold an inquiry into its safety and its efficacy, and to appoint a committee upon which both sides should be represented. His arrest was at once demanded by an indignant medical M.P. for "causing the deaths of innumerable children through this agitation".

In Parliament such idiocies can be answered at once by any M.P. with a brain, but protests to the Press or the Radio bosses can be suppressed. One advertising agency actually sent out a circular letter to its members warning them not to accept advertisements for Dr. Bayly's booklet. One of these members was also a member of the N.A.V.L., and so we were able at once to advertise this piece of backstairs thuggery without charge. Another example of this criminal conspiracy to stifle the truth was that, when Dorothy Lamour, Mickey Rooney and Orson Welles had been made seriously ill by inoculations, we tried to get small advertisements into several popular film papers, simply offering to inform travelling film artists as to their legal rights on the subject; all these papers refused to insert them. Incidentally, the papers no longer exist.

As Dr. John Rowan Wilson tells us, however, in *Margin of Safety*, "The Anti-Vaccinationists are still in existence, though their influence now is negligible". If this is so, the world has at least the right to know why—and the duty to do something about it. We can assure the world that the blood-poisoners are also still in existence and, even though they no longer dare to use real vaccines, their corrupting influence on public health and public life is extremely costly; the world can no longer afford their rapacious rule (*see* Dr. Wilson's book).

The worst threat to human welfare is monopolised Radio. The most infectious disease in the world is insanity, and the Radio is the principal carrier of it. Its evil power spreads so far and so fast that something more than the slow, cumbersome and expensive laws of libel is absolutely essential for its control. The Radio lie gets a 12,500 miles start. This is infinitely worse than the proverbial 12 hours. The truth never overtakes it, because it never gets started at all.

## CHAPTER SEVEN

### THE DELUGE OF VACCINES

IT IS OBVIOUSLY due to the commercial profits from cowpox, to the £30,000 paid to Jenner and to the official prestige bound up with this, that a continuous deluge of vaccines began to descend upon Mankind. Pasteur saw the enormous possibilities of extending the vaccine business to cover every known kind of infectious disease. To him, germs were the cause of all such diseases. Fight the germs and save Humanity.

We now know that the cell is not the unit of life, which it was believed to be at that time by Pasteur and most others, except Béchamp and a few more with greater scientific insight. Every kind of living cell, in fact, contains many elements which can multiply, perform fermentations, and even act as viruses, but the old fear of germs is still being commercially exploited to sell vaccines, serums, antibiotics and disinfectants.

The principal commercial vaccines which have been thrust upon the public, more or less in their historical order, are those for smallpox, rabies, typhoid, cholera, tetanus, diphtheria, whooping-cough, tuberculosis, plague, yellow fever, poliomyelitis and influenza.

Sometimes, as with diphtheria, for example, a serum is made first, but when it fails to reduce or even increases the mortality a vaccine is sure to follow.

However, serum can only be sold to people who are under treatment for some reason, whereas a dozen vaccines can be sold to everybody, even to those that are whole and "need not a physician". If everybody is made chronically ill by them, so much the better for the chemists—and even the physicians. No wonder the Press and the Radio never let us forget the vaccine cult.

## SMALLPOX VACCINES

Vaccination was introduced *not* as a "great discovery", but as a makeshift substitute for the much more plausible and excusable smallpox inoculation, which had proved ineffective and too difficult to handle. What was wanted was something to save the faces and the pockets of the medical men, and anything that did not cause an infectious disease was good enough for that. Jenner's notions about horse-grease were not good enough for London, so the "spurious" cowpox had to be elected.

We need not try to give the history of all the lymphs that were used in the arm-to-arm days of years gone by, because Prof. Crookshank did all that for us. His *History and Pathology of Vaccination* deserves to be called a classic, because he had the luck to go to the Royal College of Surgeons' Library just when Jenner's original writings were rediscovered. They had lain there unheeded for years, without even being catalogued. When the present writer went to the British Museum to read Crookshank's works, he had to cut some of the pages in order to do so; obviously, they had never been opened, although the book had been in the Reading Room for 34 years. It is evident that the usual expedient for avoiding the hard work of thinking is to leave it to others.

It is impossible to tell the public what vaccine is, because so many different strains are used, and none is likely to remain the same for long. If a strain becomes weak, it is made virulent, or dirty, again by "passing it through" a series of wretched animals. It is then tested on rabbits' eyes for its destructive power, or possibly by some other vile method.

The subject has been covered fairly fully in the earlier pages of this booklet, but, as to the future, it seems likely that the theory of vaccination and the idea of producing antibodies will be quietly abandoned, while the business of inoculating will continue, mainly because it is very big and very profitable.

We shall deal with the voodoo or witchcraft aspect of vaccination more especially when we discuss rabies vaccines, because that is the right place for it, but it is obvious that some people benefit from the "placebo" effect of a vaccine. Most of us, however, are more sceptical than formerly about vaccines in general. There can be very few large families that have not had some experience of the blasting effects that can follow inoculations.

Encephalitis has been well publicised, even in the Press; although the worst examples of its results are seldom kept alive in the public mind, such as that of incurable and progressive insanity leading to violence, even murder, sometimes several murders—as in the case of the wretched man of whom one of the BBC brains-trusters said that he should have been hanged for strangling three little girls. We do not consider it fair to hang a man merely because his family believed in vaccination.

Smallpox vaccination is known to be by far the most common cause of this encephalitis, although

other inoculations can also cause it—diphtheria toxoid, whooping-cough vaccines, etc. Two women died from it after having the Pasteur rabies vaccines. They had not even been bitten, but only frightened, by a savage dog—and by Pasteur, of course. These deaths, and very many others, show how far the inoculators will go in pushing their profitable trade—just to be on the safe side!

### WHAT ABOUT TREATMENT?

Does one ever learn anything from the Press or Radio as to the proper way to treat a smallpox case? The textbooks evade the issue by saying that "there is no specific treatment". Nature Cure advocates would agree that the proper treatment of fevers does not have to be specific, but it can be very effective indeed. In fact, the "orthodox" school would never dare to face fair competition with them. It would be practically impossible to arrange such a contest, but, then, fair play was never a laboratory product.

The N.A.V.L., of course, cannot sponsor treatments or preventives, for that is not their job; they are, however, interested in results. If, for instance, magnesium chloride prevents and cures diphtheria and also poliomyelitis, as Prof. Lépine, of the Pasteur Institute, now appears to admit, and if the new drug, N-methylisatin b-thiosemicarbazone ("compound 33T57", or "Marboran"), is several times better than vaccination for the protection of smallpox contacts (*vide The Lancet*, 7th September 1963) we shall be glad to see them triumph over their dirty and dangerous rivals. We must admit, however, that we do not quite see how *marboran* can be several times more effective than recent vaccination if the latter gives 100 per cent certain protection, as we are told so often from our radio. We would rather trust *The Lancet* than the Radio, however.

Nature Cure does not approve the use of drugs, of course, but all those who travel abroad often would be glad to avoid repeated inoculations by carrying, instead of certificates, a box of pills or cachets *without any obligation to swallow them*, of course. It is up to them to worry their M.P.s to that end.

### VACCINAL INJURIES

It is impossible to deal adequately with this subject in anything less than an enormous illustrated encyclopedia. We cannot go into hospitals and photograph the patients, but the horrors of badly treated smallpox can be photographed by the doctors for propaganda purposes, and this is done frequently. There is no denying, however, that vaccination can cause death and permanent injuries, blindness, insanity, maiming, etc. We do not wish to dwell upon the subject, but it must be pointed out that the long-term results of vaccination cannot be shown in the Registrar General's returns. Vaccination may, for example, cause cancer to start up or flare up, and deaths from this cause will never be the subject of an inquest. As to blood diseases, there are many of unknown origin, such as leukemia. Who knows who has been poisoned by vaccine and who has not? Not long ago, a child was born covered all over with vaccinia eruptions. The mother had not, during the pregnancy, been vaccinated, but there was another child in the house who had been, and so the vaccinia must have spread from this source. This illustrates the general complexity of the whole subject. It is quite certain, however, that vaccines will always be given the benefit of any doubt, whereas the public will not.

### RABIES VACCINES

We need not deal at length with Pasteur's rabies vaccines, made from allegedly rabid rabbits' spinal

cords. The manner in which Pasteur made rabbits "rabid" by boring holes in their skulls and inserting filth into their brains was not science but simply brutal quackery. Pasteur cannot be proved to have saved a single life with his vaccines, but it is quite certain that many people died from his treatment of them, even when the dogs that had bitten them remained perfectly well—like the ones that Dr. Lutaud kept as pets in his house for years to prove that they were not rabid. The reader who wants a fuller account of all this should read Lutaud's *Pasteur and Rabies*, and other contemporary reports.

The most important fact revealed by this history is that, once an ambitious mountebank has successfully fooled himself and a lot of important people, such as the Tsar of Russia, or any royal family, he is more or less immune from public criticism or ridicule. This fact has always been traded upon by the most successful quacks. Innocent royalties, popular film, TV or stage stars, presidents, etc., are always dragged into the game at the earliest possible moment. The financial backers are usually astute enough to get out at a profit before the crash comes, but the other brilliant people may not be so lucky.

The newspapers depend upon the advertising chemists for much of their profits, and only the most sensational vaccine disasters—those which are too big to be suppressed—are likely to be mentioned. Rabies disasters are naturally sporadic and they seldom involve many people, but, in Fortaleza, Brazil, in November 1960, some 22 deaths (later reduced to 16 by the familiar process called "reclassification") resulted from rabies inoculations in about two days. This was reported by Reuters and the U.P.I., and so almost any paper in the world could have made a splash with the news, and yet only one British provincial paper published the story, and only two small items, both from Detroit, seem to have mentioned the matter in the American Press. Some French and Belgian papers, however, made a big thing out of it. It is true that the original story in the Brazilian Press was grossly sensationalized, but the deaths were real enough. In short, how do the vaccine-pluggers manage to run the entire English-speaking Press and Radio news to suit themselves? The public should be told *how* the trick is done. We know *why*.

When Stephen Leacock, the economist with a sense of proportion, called Pasteur the man who "brought rabies within the reach of all", he said all that we really need to know about such a very rare disease—and about Pasteur.

The dramatic and sensational nature of rabies, and the folklore associated with it, made it eminently suitable to the furtherance of Pasteur's ambitious. Rabies, in fact, built the Pasteur Institute, which was founded solely to make and sell rabies vaccines and thus (perhaps) save about 30 lives per annum in France. This can be seen from the Articles of the Institute, published in M. Marcel Lemaire's recent book, *Pour la Liberté*.

We need not discuss the subject further here, but this is the right place for something to be said about the voodoo and witchcraft element in selling "protection" to all who can be scared into buying it—especially at public expense.

The reason why the subject is ignored in all the literature of vaccino-apologetics is that it cannot be dealt with by statistics, even when their compilation is entirely in the hands of the medicine men. The element of suggestion, and especially of conviction, is, however, so extremely important, both in resisting infection and in recovering from it, that not to consider them at all is entirely unscientific, in fact, absolutely insane.

We have all heard or read innumerable stories of death following the breaking of some taboo, or prayer of death or ritual curse. Most white folk like to think that only the primitive "natives" can be killed in this way, but that is not true. It seems that a real conviction that death will come is enough to cause it.

One typical case, reported by a missionary's wife, was that of a healthy young man, just about to marry a girl working at the mission, who sent a message to say that it was no good going on with the wedding preparations as he would be dead in two days. He had been told by a local witch doctor that this would happen if he saw a white crocodile. A white doctor tried to convince the boy that what he had seen from his boat was only a dead crocodile turned over in the water and exposing its white underside. But the boy's mind had been made up for him and he died.

A more impressive story was that of the fate of eleven African native soldiers who were guarding some land against poachers. They shot one young poacher and, in celebrating their victory, they got drunk and, reverting to their tribal custom, they also ate him, after which they got more drunk and openly boasted of their triumph. The victim's father heard of this and he publicly cursed the men, declaring that they would all die within three weeks—and they did; the Army doctor who reported this incident performed autopsies on three of the men himself and could find no natural cause of death. It seems obvious that when the first of the men died, the weakest link in the chain, the others would be almost certain to follow suit.

The last case we wish to mention was that of a young Maori woman singer, whom the writer met years ago. When several years later, he met Maggie Papakura, the well known guide to the show places of New Zealand, he asked her what had become of that young woman and was told "Oh, I'm sorry, but I'm afraid she's dead. . . - No, she wasn't old: she just sat down and died." What did that mean? "Oh, we Maoris can do that, you know."

It seems clear that this young singer, a Maori "princess" was able to do this because she knew that it was in keeping with an old and revered tribal tradition. It is plain that in this case there was no element of fear, nor of any curse nor of the breaking of any Maori *tapu*. The West has still a lot to learn. Even Sir Bernard Spilsbury had to put a warning notice on the door and turn on the gas when he felt that his usefulness was at an end.

We have devoted a page or two to this subject because we are sure that in rabies, tetanus, polio, pneumonia and any other condition where life may be in the balance, the mental state of the patient is of paramount importance to resistance or recovery.

Major Reginald Austin, R.I.A.M.C., said that he saw 20 men die of "rabies" at Kasauli, and he was sure that "they all died of pure fright and nothing else", because the Pasteur vaccine salesmen got at them and told them that the dogs that bit them were "very mad".

It is always held that if the symptoms of rabies start to develop, the fate of the patient is sealed, except in cases of "laboratory rabies" caused by the vaccines, in which paralysis may be confined to the injected limb. If, however, the vaccines can produce the smallest sign of tetanus or paralysis, they must therefore be extremely dangerous; if they cannot do even that much, then they are probably useless at best.

The value of rabies antibodies has already been dealt with (*see* page 58). We must stress the fact

that the mortality in any outbreak or scare about rabies depends almost entirely upon the panic it arouses. When Pasteur, on 4th May 1886, was advertising his vaccines at the Academy of Medicine, he said that the mortality could be "even 100 per cent". While this panic propaganda was going on, five workers coming into Paris were all bitten by one "mad dog". They all died of "rabies". There is your 100 per cent; but can anyone believe that they would all have died if they had not been reading the papers?

Perhaps the most significant "rabies" incident in modern times occurred during World War I, in Cairo, when a number of Anzacs were injured in a serious brawl. Those who were afterwards in hospital were told by somebody with more imagination than sense that they were in danger of getting rabies. This was probably due to a common misunderstanding of the expression, "street virus". The dust of the Cairo streets was alleged to be systematically sprinkled with the saliva of a horde of rabid pariah dogs. The unfortunate victims of the dusty street brawl were also tactfully persuaded that they must on no account be silly enough to develop rabies, because there were no Pasteur vaccines on hand! It is certain that no one was infected with rabies, but this did not prevent several of the men from dying after going raving mad. Naturally, the details were medical secrets and were not officially published, but one report numbered the deaths at twenty; even if they were fewer, however, the lesson is the same. The men should have been told that the term "street virus" is only used to distinguish it from the "fixed virus" which Pasteur made more and more virulent by inoculating it upon a series of wretched animals—the old laboratory trick. "Street virus" has nothing to do with street dust: it only means the ordinary virus coming from a rabid animal.

With no rabies and no Pasteur vaccines, this whole incident proves the extreme danger of witchcraft and panic-mongering. An official estimate for Australia is that well over 100 people there are killed by witchcraft every year, which makes it several hundred times more deadly than rabies or smallpox. In any emergency, panic-mongering is a much more serious crime than looting, and it should be dealt with as promptly.

The number of people killed by Press and Radio panic-propaganda, to sell vaccines and other poisons, must far exceed the total due to all the other professional murderers put together.

## **TYPHOID AND CHOLERA VACCINES**

It is well known that typhoid and cholera are both due to sewage-contaminated food or water. By means of sanitary improvements, Britain got rid of all of its cholera and most of its typhoid without any vaccines; and officials who now recommend their use must be suspected of having dirty, stupid and slipshod minds and dealt with accordingly.

It was a great pity that the "Old Tiger", Sir Almroth Wright, who did such great service to all by turning Listerian surgery out of every hospital in the civilised world, should have spoilt his record by making one of the most hated and dangerous vaccines known to Man. Since very few doctors have much faith in it, we can be brief about it. The story of its use in the Boer War, its rejection and restoration, has been told repeatedly already. The real Press publicity that it got during World War I, however, was an example of how a vaccine can do nothing but harm and yet appear to be an enormous boon. We were told that Wright's vaccine practically banished typhoid from the Gallipoli campaign. We know that when men got typhoid after vaccination it was called "paratyphoid". Then, in the same way, came the other paratyphoids, A, B, etc., and if the campaign had lasted long

enough, the statisticians would have saved their faces with a whole alphabet of paratyphoids. Many people, old enough to know better, were fooled by this kind of thing, but the main fact—and one which must be taken seriously—is that 96,684 men were invalided out from Gallipohi with enteric disease, which means that the health of the troops was many times worse than it was during the Boer War. Insanitation (including vaccination) was, of course, entirely responsible for this.

As to typhoid "carriers", we remember the fuss made about Typhoid Mary, but relatively few people know that it had to be allowed to die down when it was found that from 3 to 10 per cent of the dairy workers in New York State were potential Typhoid Marys. Even the official health authorities could see that Americans would not submit to having tens of millions of innocent citizens kept in prison permanently, or allowed to go free only if they had their gall-bladders removed. The whole thing had to be allowed to fizzle out, but it was a cruel and disgusting story while it lasted. If it still survives, it is only in the pages of children's books or the more incorrigible newspapers.

A point of historical interest and importance about the typhoid vaccine is that when Wright published his opinion that "serum therapy rests upon a foundation of sand", the Pasteur Institute naturally felt obliged to hit back by proving from the hospital records of France and North Africa that Wright's typhoid vaccine was quite useless. As mere lay observers, we do not feel that we need say any more about it except that, in its deadly, or health-shattering, effects it has proved to be one of the very worst. Wright's most loyal and famous pupil, Sir Alexander Fleming, was not the only victim of it. Ask the troops!

### **WHOOPING-COUGH VACCINE**

Vaccines for whooping-cough seem to be especially liable to provoke encephalitis, etc. At present there are at least four strains of virus to be dealt with, so that a quadruple vaccine has to be smuggled into babies with diphtheria and tetanus toxoids. It would be hard to guess how two germ poisons and four viruses manage to get along together. We can only recommend readers to leave them alone to settle it among themselves.

### **DIPHTHERIA VACCINE**

Diphtheria fluctuates very greatly in its incidence and mortality, from time to time and from place to place. The word "immunization" is a fraudulent trade term; "inoculation" should always be used instead. As usual, it is impossible for the public to know what any diphtheria vaccine contains or what it will do. Even the makers do not know (*see* page 19). One thing is certain: the toxoid now being used, if we can trust the description of it in recent books and journals, is very different from the stuff that was used when the mass inoculations began in Britain with Prof. Ramon's toxoid (anatoxine).

Six years after compulsory poisoning with it began in France, on 1st January 1941, Prof. J. Tissot, of the National Natural History Museum, Paris, wrote to the Minister of Public Health, in May 1947, informing him that diphtheria bacilli could be cultured from the saliva of every child inoculated with Ramon's toxoid if tests were made from two to five days later. Every doctor in France was challenged to make the tests for himself. Very naturally, the Minister passed the letter to the Pasteur Institute—and then "the balloon went up". The Board decided that Ramon would have to go, and he was barred from his laboratory, but, as they did not dare to give any reason publicly,

they had to wait until Ramon had made rude remarks about their commercialism and their ingratitude for his past services, before they fired him in the following January.

We can appreciate the position in which the Institute was placed. It was founded solely to boost the terror of germs and sell protection against them, and here was Prof. Tissot, a champion of Béchamp, the man who opposed Pasteur, virtually accusing them of causing, in the six years, 1941-46, 150,000 serious cases of diphtheria, with 15,000 deaths (over and above the average figures). They saw themselves being sued by 15,000 bereaved parents, for all they were worth—and a great deal more! Obviously, they, of all people, could not say that the terrible figures were merely coincidental, or that *post hoc* arguments prove nothing.

Needless to say, our own Ministry of Health, the Press and the Radio poison-pluggers were too deeply committed then to be able to do anything but maintain a conspiracy of silence. Public interest must always come second to vaccine-mongering

The N.A.V.L., not being addicted to *post hoc* thinking, could only use the figures to prove that diphtheria had greatly increased in France in spite of compulsory inoculation. It seems fair to estimate, however, that perhaps 3 or 4 per cent of the increase in cases was due to "provocation cases"—a term now frequently used in connection with vaccination campaigns, as a warning against the well-known risk of making epidemics worse.

When the toxoid was first tried out in Alsace, in 1925, Dr. Zoeller inoculated 305 French Army recruits, leaving more than 730 of them uninoculated as controls. In 12 days, the usual incubation period, 11 inoculated men developed diphtheria, while the controls had only 1 case. The Pasteur Institute was equal to the occasion. The 11 cases were not immunised: they had only had 1 "shot"; they needed 3, properly spaced, of course, and then 6 months in which to develop immunity. So the 11 were dumped with the other case, making 12 cases in the "Un-inoculated" group.

We thus see the familiar pattern of the Pasteurian statistics which made the purchase of toxoid compulsory in France, and did great service in starting the polio industry in America. The great charm of the method is that the more infectious the vaccine the better the statistics! It should be obvious that, during the first few weeks of a mass campaign to inoculate with a poisonous vaccine, such as diphtheria toxoid or poliovirus, the one-shot victims will far outnumber those who have had a second shot, and they will also show a worse record for serious or fatal results, because the first shot is more likely to cause trouble than the second. This is taken to prove that two shots are better than one. At this point, somebody whispers that no one who has had three shots has had the disease in question in a serious or fatal form. The fact that no one has yet had three shots, because it takes seven months to give them, is ignored for the moment; the whisper soon becomes an official pronouncement, and the world rejoices. Medical M.P.s, Radio doctors and Ministers of Health revel in it, and vaccine shares reach their highest peak. When, a few months later, there is a growing list of hundreds of serious or fatal cases in "fully immunised" persons, the facts have to be recorded, of course; but the Reports will be marked "Confidential", if only to hide their source. If they are published at all, it will be by the anti-vaccinationists, whose "influence now is negligible".

In Britain, early in World War II, diphtheria had been declining for so long that a mass vaccination campaign was decided upon, lest, as in Sweden, there might soon be no more diphtheria to prevent. However, as we had about half-a-dozen vaccines competing with each other, the situation had to be cleaned up. It was obviously impossible to use public money or the BBC to advertise more than one

vaccine, so a foreign one was chosen—Ramon's toxoid— although the Ministry of Health obviously knew no more about it than Ramon did at the time.

The decline in cases and deaths was reversed for some months, but thereafter it resumed its former trend. If this toxoid does not still confer diphtheria bacilli upon its victims, then it must have been changed from its original prescription, although we still hear a lot about "carriers" wherever there is a local outbreak. If the toxoid has not been changed, why was the famous Prof. Ramon fired from the Pasteur Institute in 1948?

### TUBERCULOSIS (BCG) VACCINE

Tuberculosis is obviously one disease against which any vaccine must be useless, because TB itself does not immunise the patient who contracts the disease and then recovers; in fact, the reverse is true. Almost every large family must know this from experience. Any kind of inoculation may cause TB, but none can prevent it.

When a very pushing business salesman like Calmette wants to sell a vaccine, however, he sells a vaccine. What is to stop him? When Calmette and Guërin had obtained some filth from a tuberculous cow and cultured it on bile and potato, Sauton's medium, etc., for many generations, bacteriologically speaking, until it was too weak to give TB to some specially selected and obliging guinea-pigs, it was obvious that the "saving of millions of lives" by the "conquest" of human TB was "just around the corner", as usual.

Those who can remember 1930 will recall the disaster at Lubeck, where 73 children were killed by oral BCG vaccine in a few months. It was a big blow to the sale of BCG vaccine in any form, but we are now told, in *Margin of Safety* (Collins, London), that "a complete enquiry eventually exonerated the vaccine, on the grounds that accidentally a virulent strain had been substituted for BCG - . . ." Is that really true? We do know that two doctors went to prison—one of them committed suicide—as a result of the affair, but we regard them as scapegoats who were sacrificed in order to save the face of BCG. The idea that both of them could have mistaken a bottle of virulent TB germs from Kiel for the BCG culture which they had made themselves is impossible to believe, in spite of the wishful suggestion that the labels *might* have become detached, etc. The nearest that anyone got to proving that an error had been made was that one woman laboratory worker was bullied into admitting that a mistake *might* have occurred.

The late Lily Loat, who was for some time educated in Germany, read all the official reports, and she pointed out that the doctors were never charged with having made a mistake in the laboratory, and so they were never convicted of that, but only of failing to recall all the vaccine after it had come under suspicion.

Dr. K. Neville Irvine, in his book, *BCG Vaccination in Theory and Practice*, gives an account of the disaster, calling it by far the biggest of its kind. He makes no mention of the rumours of an even worse disaster in Madrid a year before, nor of an Association of Spanish pediatricians telling their members not to use BCG vaccine. We never had official and detailed reports of this matter, but it was much discussed at the time of the Lübeck trial, although nothing was said officially. If the rumours were true, the Madrid disaster was worse than anything that followed it. It may be very convenient to deal with one publicised calamity, explain it away and use two medical scapegoats to cover all the deaths caused by BCG all over the world, but the N.A.V.L. are not convinced.

The difficult task of exonerating BCG in Germany went on for years, and the highlight of the drama was the fact that the Kiel TB germs produced a green pigment when cultured in bouillon, and that, when a stray ampoule of the Lübeck vaccine, which had somehow escaped destruction until 1933, was similarly treated, the culture slowly turned green. Very pretty, but we are not satisfied that this "gives the green light" to BCG.

When John Tyndall was writing a paper, in 1875, for delivery to the Royal Society, on 13th January 1876, he mentioned, to quote his own words, "the struggle for existence between the *bacteria* and the *penicillium*", and he remarks incidentally that "the *bacteria* which manufacture a green pigment appear to be uniformly victorious in their fight with the *penicillium*".

Tyndall was not writing only of TB germs, but of any kind that might be found in the air of the Royal Institute, where he was working. Did the green pigment prove *identity*—or anything at all except that such germs are particularly tough customers? It is only too obvious that the mere virulence of the Kiel and Lübeck cultures was never in dispute.

Incidentally, should any laboratory workers care to use this information and culture such germs to produce a very much needed antidote to penicillin poisoning, the writer will be very pleased—and immensely surprised—to share any Nobel Prize with them!

The most shocking thing about the whole BCG campaign is that, in spite of its trail of death and injury, when it was loudly proclaimed that 100,000,000 children in the U.S.A. and Europe were to have BCG pumped into them, the thing was treated as a noble attempt to wipe out tuberculosis. The Press reacted quite differently to the news of what German vivisectors did to equally defenceless prisoners during World War II. Why?

The whole vast BCG experiment appears to have done nothing at all but give tubercular abscesses to a vast number of poor sufferers who might otherwise have lived without them all their empty lives. Even its protagonists do not seem to love it any longer. How much did it cost, and who got the money?

## POLIOMYELITIS VACCINES

It appears that epidemic poliomyelitis is a peculiarly American product. That, no doubt, is why, in order to sell us vaccines, we all have to be made polio-conscious. The Radio, if we allow it to, will keep the polio cult going as long as it can; although the frightful dirge broadcast some months ago, glorifying the relentless power of polio, may have caused reactions violent enough to prevent many repetitions of it. Such things should be firmly put down by law.

When Dr. Gustave Rappin, Director of the Nantes Pasteur Institute, wrote a book on infectious diseases, before World War II, he noted the strange fact that, when a few cases of polio appear in a district, it is often impossible to trace any connection between them. One case may be a child sharing a bed with others, with no spread of infection. The nearest other cases may be a mile or so away, all widely separated, with no common milk or water supply, or anything to explain the wide distribution. This seems to mean that the virus is very common and may be in almost everybody, that its infectivity is negligible, and that it requires other factors in order to produce symptoms.

Now, however, since the big-money vaccinators have taken charge, we read of polio-vaccinated babies giving fatal polio to their mothers, etc. Is it possible not to suspect that a new and much more

infectious poliovirus has been artificially produced? Remember the myxomatosis virus, a laboratory strain deliberately made more virulent and distributed to kill the rabbits, and the influenza virus of 1918-19, which- arose and spread from the American Army camps after a mysterious though unintended modification and infected half the world's population.

We have no need here to discuss the battles between the Salk and the Sabin vaccines. Readers who want a real insight into that mutually destructive, big-money war should read *Margin of Safety*. It is a high-class pot-boiler to boost the Sabin oral vaccines (while there is yet time?), but it contains a lot of alarming and amusing stuff. We doubt, however, whether America will be willing to accept statistics of millions of Russians all saved from polio by pink cocktails! If these contained real virus, developments may be expected eventually—but will they be reported?

The author of the book, Dr. John Rowan Wilson, tells us that Dr. Salk, before he made his vaccine, was in touch with Prof. Lépine, who had replaced Prof. Ramon at the Pasteur Institute. We have discussed the question of "live" and "killed" viruses on pages 32, 33 and 34 of this booklet, dealing with it in the light of the latest discoveries, but Prof. Lépine, in 1950, wrote a book, *Poliomyelitis*, in which he dismissed the idea of using vaccines against the disease. He says that one either uses a live virus and runs the risk of causing an epidemic, or one uses a killed virus, which does not give lasting immunity.

Nevertheless, he gave a striking proof that, even at that date, he knew what really matters about poliovirus. In Athens, he tells us, monkeys fed upon natural foods and living in the open air were able to bear poliovirus injected right into their brains, and not one of them developed polio, whereas, the same kind of animals, kept in small, dark cages in Paris, and fed upon laboratory (pasteurised?) food, succumbed to the injections at the rate of 9 out of 10!

As this is by far the most important laboratory information ever published in the whole vast literature of the subject, we demand that it should be broadcast in all languages and to all the schools in the world. This would save more lives and more suffering than any vaccine—past, present or future.

Some people may indeed wonder why Prof. Lépine ever began making a polio vaccine, but we cannot help feeling that, when the Pasteur Institute saw the profits that were being made by the Salk vaccine, they may have hinted that if he would not make a new polio vaccine for them, they might find someone else who would.

Nature Cure followers know already that if the pasteurised milk, white sugar and white flour, and all such rubbishy food, could be absolutely banned for a few years, the figures for most serious diseases would fall very quickly.

It is revealing to study the history of polio in the U.S.A., and to compare the graph of the 1916 epidemic, without the use of vaccines, with that of recent years in which we have had the benefit of all the vaccines. The line of the first outbreak rises and falls equally rapidly and looks like a sharp church steeple—quite symmetrical and only covering about two years; the graph of the recent epidemic, on the other hand, covers many years and looks like Milan Cathedral after an air raid. Is this not yet another instance of vaccines prolonging the reign of an epidemic?

### **TETANUS VACCINE (OR SERUM)**

Tetanus, like tuberculosis, is a disease which does not protect the victim against a second or subsequent attack— unless the first one is fatal, of course. It is therefore inexcusable to pretend that one can vaccinate against it. This fact was clearly known to doctors and clearly proclaimed at the end of the last century.

Nevertheless, there is great confusion about this subject. If tetanus is held to be synonymous with lockjaw, there is no recovery rate at all, but people can get something called tetanus several times in a few months; when Army medical reports mention recovery rates of 60 per cent or more, they must be referring to something quite different from true tetanus. This fact, and the confusion in the public mind as to the difference between vaccine and a serum, makes it hard to discuss the subject briefly. If, as some people believe, the tetanus bacillus is merely a morbid, anaerobic evolution of the common colibacillus in its coccal form, this would explain why it is never found in the oxygenated bloodstream, but only at the site of an injury. It would also explain how tetanus may arise without any external wound. What is important is the proper treatment of the wound and the patient, preferably by safer methods than routine serum inoculation, as this has killed large numbers of people.

As to vaccinating against future wounds, the present habit of mixing tetanus vaccine with diphtheria and whooping-cough vaccines makes confusion worse confounded and adds to the danger of causing encephalitis. The only way to escape these confounded dangers is to avoid every vaccine and serum on principle.

The worst thing about the tetanus industry has been the haunting fear, in the minds of most intelligent people, that they may be knocked down in the street and be unconscious when they are first treated by a doctor. This means that they may be inoculated with antitoxin, which may be fatal, as it so often has been. This antitoxin is not sold by blackmailing the patient, who, in any case, cannot give his consent while he is unconscious. In this case it is the doctor who is menaced if he does not use the serum. If the patient should die from tetanus, some serum-worshipper will demand an inquest, so that the doctor can be publicly censured. If, on the other hand, he dies after, and probably from, massive doses of serum, the coroner will describe the case as "one in a million", and no one will be blamed.

That is how the business has been run for many years, but the doctors are now getting dissatisfied with the position and are trying to replace routine injection with drugs or some other and safer method. It is good news indeed if antitoxin is on its way out at last. Serum-worship has retarded the real progress of medicine for far too long.

## YELLOW FEVER VACCINES

The story of "Yellow Jack" and of its conquest by means of mosquito control is very well known, but the sequel, "Yellow Jack Breaks Jail," published in the American *Saturday Evening Post*, has not been very closely followed up by most people; it is all too complicated. Apparently, as there were no yellow fever vaccines at the time when the Panama Canal was constructed, something had to be done about this, lest yellow fever should disappear altogether without a vaccine. Consequently, it was then discovered that the monkeys of Brazil had antibodies in their blood, thus "proving" that they had been infected at some time by something like yellow fever. Since the aedes mosquito was not present in the Brazilian jungles, other carriers had to be found, and it appears now that any disease resembling yellow fever, in Brazil or Africa, is carried by ticks or insects. They

carry, at the present time, about 60 new yellow-feverish viruses, called "arbor viruses", and so the possibilities for vaccination are practically limitless. Many nations have compulsory vaccination and they can always add one more to the growing list, just like France.

When the staff of the SHAEF Office had to go to Paris for two or three weeks, just before VE Day, after residing in Grosvenor Square, they all had to be vaccinated against everything, of course, and one of the deadly perils they had to be protected from was yellow fever. So successful was this vaccination in protecting them from the arbor viruses of the jungles of Paris that not one of them developed yellow jack during a whole month! The unqualified success of this daring experiment, and of others like it, no doubt, explains why, according to *Margin of Safety*, it has been arranged "by international agreement" (probably with no member of the public present) that all travellers to yellow fever areas in Africa or South America shall be compelled to have this dangerous vaccine pumped into them, The show must go on.

### **PLAGUE VACCINES**

The major plagues of history have been studied as closely as possible by modern epidemiologists, and the only safe general conclusion to be drawn is that soil, sanitation and pest control, in that order, are much more important, both to humans and to domestic animals, than any kind of injections.

We, in Britain, need not waste time in discussing plague vaccines, because we got rid of plague completely without them. In recent times, the one plague death reported was that of a scientist who infected himself while working on the disease. He had been vaccinated against it only shortly before—for the 23rd time in 12 years.

### **INFLUENZA VACCINES**

Enough has been said (on p. 37) about the impossibility of vaccinating against any new and virulent strain of influenza virus—the only kind that really matters. But, there has been news recently of a new oral vaccine against influenza.

It is impossible to make fair comment upon a new drama, comedy or farce before the curtain has gone up on the first performance. If one warns the public to stay away on the grounds that the stars are hopelessly incompetent and the author an idiot, and tells the management to vacate the theatre and make room for people who know their job, there is likely to be legal trouble. In fact, it has happened.

Nevertheless, we are entitled to suspect that all those vaccines for which safety can be claimed are not really vaccines so much as drugs or placebos.

Nature Cure adherents know that the dangerous complications of influenza are due to bad treatment and other factors. The disease itself is not a killer.

### **IMMUNITY AGAINST VACCINATIONS AND INOCULATIONS**

The immunity of the individual to the vaccination tyranny depends, firstly, upon his knowledge of the real nature and the true history of the business, and, secondly upon his being able to stand up to the completely ignorant and officious underlings who support the whole racket.

It is almost incredible that a liberty-loving country like France should submit to an impudent tyranny which requires that all who want passports to travel abroad should have a large number of poisonous "shots" pumped into them (it was 11 even before the BCG vaccination was made compulsory, and it took over 4 months to give all of them properly). If the whole nation could have the fact brought to their notice at the same moment, there would be a second French Revolution.

We invite all who care for health and liberty to join the N.A.V.L. and be informed in good time as to how to deal with particular problems. Many travellers put off asking for help until it is too late for the League to do anything for them. Some have had all their "shots" and then found that it was not necessary to have any. Many have been mad too ill to travel, and some have been killed through their lack of foresight.

Many members of the League have gone all over the world without any inoculations, but most people can avoid them if they will insist upon their legal rights under Article 83 of the International Sanitary Regulations.

The whole subject of travel restrictions and the vaccination certificates required here and there is, however, too complicated to be described briefly; also, regulations may be changed or suspended at any time and at short notice.

We therefore urge anybody who cares for human and animal welfare to help themselves and others by joining the National Anti-Vaccination League.

*The following extract from an article by Keki R. Sidhwa from Heath for All, "The Scare Diseases , May 1965.*

<http://members.rotfl.com/sidhwa/index.html>

For years Dr. Matthew J. Rodermund, MD of Wisconsin, USA, offered \$10,000 to anyone who could prove scientifically that smallpox is contagious. Nobody ever claimed the money.

Dr Charles A.A. Campbell, MD of San Antonio, USA, who was for years in charge of an isolation hospital made exhaustive experiments in order to demonstrate that smallpox is contagious, but found that this is not the case. He even succeeded in persuading the mayor of San Antonio and the city council to go to the hospital and mingle with the patients and have a meal with them. The Bexar County Medical Society, before whom he read a paper detailing his experiments and his conclusions, refused to publish his findings. He later published them in his book, 'Bats, Mosquitoes and Dollars'. Dr. Rodermund was even more daring, he broke open the smallpox pustules, rubbed the pus on his face and hands and moved about freely for three or four days,, deliberately neglecting to wash himself. No smallpox outbreak occurred.

The famous Dr. Sydenham, of England, called smallpox 'the most safe and slight of all diseases as long as no mischief be done by either physician or nurse', which is significant indeed. In olden days people died not of smallpox but of the treatment that was given to them.

Does vaccination prevent smallpox? Anyone who has made a thorough study of the subject will in all honesty have to admit that it does not. In India, even today, when over 90 per cent of the population are said to have been vaccinated, thousands are dying of what is diagnosed as smallpox in spite of - or because of - the compulsory injections. Major Reginald F. E. Austin (R.A.M.C.), who served in India in a medical capacity, was greatly in favour of hygienic living, cleanliness, and sanitation rather than vaccination, and he said so in so many words. He poo-pooed the whole vaccination programme as a diabolical disaster.

'MOST INNOCENT'

Dr. Henry Blumberg, the medical superintendent of Southport Children's Sanatorium, speaking before the Royal Commission on Vaccination, described smallpox as 'most innocent and least dangerous', and he spoke against vaccination.

When we turn to tetanus - and other of the scare diseases - we find Dr. I. A. Toomey, MD of Cleveland, Ohio, USA, saying in the Journal of the American Medical Association, May, 1942, that drainage, cleanliness and proper incision of wounds were of greater importance than the anti-toxins administered. In 1940, the Surgeon-General of the American Army sent a letter to Congress requesting a change in the manner of treating tetanus in soldiers. He rightly stressed the fatal effects due to anaphylaxis resulting from the administration of anti-toxin, and claimed that better results were achieved by ensuring cleanliness and the proper drainage of wounds.

What applies to smallpox and tetanus applies to all the other scare diseases. In typhoid and cholera more people are killed by wrong treatment, i.e., feeding and drugging the patients, than by the disease itself. The writer knows many people who have suffered from quinine poisoning - the after effects of the deadly 'cinchona. bark' remedy for malaria. The list could be multiplied.

What, then, is the nature cure approach to these so-called scare diseases? In brief the answer is the

same as that which applies to to all problems of ill-health. Health/high-level health alone will safeguard you against coronary thrombosis, typhoid, cholera, etc.

# SANITATION, NOT VACCINATION THE TRUE Protection against Small-Pox

*A Paper read before the Second International Congress of Anti-Vaccinators, held at Cologne, October 12, 1881,*

By WILLIAM [TEBB](#).

AT the first International Anti-Vaccination Convention, held last December at Paris, I had the honour of explaining the existing state of the opposition at that period to the Compulsory Vaccination Acts in England. My first thought on the present occasion was that I might appropriately continue the same theme, with a record of the important events which have occurred since our last convention, including the acceptance by Mr. P. A. Taylor, the leader of the Anti-Vaccination party in the House of Commons, of the position of President of the London Society for the Abolition of Compulsion, together with a glance at the conferences and public meetings in the metropolis and elsewhere, the public demonstrations at Brighton and Leicester, the considerable accessions of active support from influential quarters, the issue of important Parliamentary returns confirmatory of our position, and the publication and distribution of literature, at least five-fold that of any similar period in England, with other indications of encouraging progress, which, if detailed, would constitute an interesting chapter in the history of our agitation. I have preferred, however, to take a wider range, and to address you on the subject of "Sanitation *versus* Vaccination, as a preventive of Small-pox."

One of the most serviceable arguments in use by our opponents the pro-vaccinators is, that prior to Jenner's discovery, small-pox was a scourge of the first magnitude, a relentless and fell decimator and destroyer of the human race. I shall not attempt to inquire how much of this is true, and how much is due to a lively imagination, except to mention one testimony, that of Dr. James Moore, who, in his "History of Small-pox (a work dedicated to Dr. Jenner), says that inoculation has occasioned the loss of millions of lives. These points have been dwelt upon by abler pens than mine, and their testimony is before you.

Sanitation, which has for its end the prevention of disease by the removal of the causes of disease, is

a science which of late years in England, America, France, and Germany, and in other countries has engaged the attention of some of the ablest and most thoughtful minds. It is not, however, a new discovery. It was taught by the Jewish lawgiver, Moses, in numerous stringent regulations for the tent and camp, and by the Greeks and Romans, as their systems of baths, aqueducts, and drainage-works testify. In Rome the remains of the *Cloaca Maxima* are pointed out to every stranger as one of the sights of the city. With the decline of the Roman Empire, sanitation became one of the lost arts, and for many centuries plagues and epidemics carried off countless thousands in all the large centres of population, and were regarded as visitations of God with which it was presumptuous to interfere. Macaulay, in his "History of England," showing the conditions of life two centuries ago, says : "Cabbage-stalks and rotten fruit accumulated in heaps at the thresholds of the Countess of Berkshire and Bishop of Durham. Rubbish was shot into Lincoln's-inn-fields, and St. James's-square was a receptacle for all the offal, dead cats and dogs of Westminster ; and these were deposited under the windows of the great magnates of the realm—the Norfolks, the Pembrokes, and the Ormonds." "Men died faster in the lanes of our towns than they now die on the coast of Guinea."

Other writers confirm this testimony. The streets were mostly unpaved, with open gutters, cesspools under houses, stagnant ditches, polluted streams, tainted wells; and the air was contaminated with effluvia arising from the decaying bodies of the dead, interred in close proximity to living urban populations.

Mr. BUCKLE says, that the smells in London were so bad that sweet herbs and perfumes were kept in the rooms to neutralise them. Nor were the interiors of our houses much more wholesome than their exterior surroundings. "The floors," says a writer of the sixteenth century, "generally are made of nothing but loam, and, are strewed with rushes, which, being constantly put on fresh, without a removal of the old, remain lying there, in some cases, for twenty years with fish-bones, broken victuals, the dregs of tankards, and impregnated with other filth underneath from dogs and men." Clothing was seldom changed, and was pervaded with unwholesome odours; linen and cotton were aristocratic luxuries; the food was coarse and badly cooked; two centuries ago there were no fresh vegetables grown in England, small quantities being imported from Holland for the exclusive benefit of the rich. These were days when the plague, sweating sickness, black-death, remittent fever, small-pox, and all forms of zymotic diseases, engendered by filthy habits and unwholesome surroundings, abounded. Violation of the laws of Nature breeds its own cure through manifold chastisements, but it was not until the severe visitation of cholera in 1831, that attention was awakened in England to the importance of the subject.

And in 1848 public opinion had sufficiently advanced to enable Parliament to pass what was called the "Nuisance Removal Act," as well as the "Public Health Act," by which was established the General Board of Health, and thenceforward the furtherance of sanitation became one of the recognised duties of the State. A series of amending Acts of Parliament have been passed relating to the public health, embracing cleansing of streets, removal of nuisances, construction of sewers, building of streets and houses, ventilation of public buildings, regulation of lodging houses, prevention of river pollution, and similar matters, and if the authorities had been content to fight disease by preventive measures of this kind alone, the zymotics might by this time have been deprived of their epidemic power; but, unfortunately, in an evil hour Parliament was induced to listen to a faction of the medical profession, who, unable to obtain the public acceptance of their theories on their own merits, determined to do so by the authority and assistance of the State, and

were enabled to force upon everybody a disease called the cow-pox, because, as it had been pertinently said, somebody might catch the small-pox. In 1853 the Vaccination Acts were introduced by a private member, and passed into law, without notice or public discussion, and it is no exaggeration to say that a more wretched and obnoxious edict has not been foisted on the English-speaking race since the passage of the atrocious Fugitive Slave Law in America thirty-five years ago. Vaccination, which is a spreading of disease, became thenceforward, by a strange perversion of the fitness of things, officially associated with sanitation.

Several of the diseases I have mentioned have now practically disappeared, without any medical preventive, but solely by the effect of improved sanitation; yet small-pox, which vaccination promised to stamp out, is still raging, notwithstanding the lavish expenditure of millions among the medical profession; and the fell disease is a standing disproof of the Jennerian predictions. Reposing on a State-endowed remedy, which has been insolently called the greatest discovery in medical science, all special investigations into the causes of small-pox have been officially considered superfluous. During the present epidemic in London, June 10, 1881, a member of the English Parliament, Mr. Daniel Grant, asked in the House of Commons whether the Government would appropriate a sum of money to inquire into the causes of the outbreak. The President of the Local Government Board replied that the Board had no funds for that purpose; yet the official vaccination grants amount to over £100,000 a-year! Were it not for the determination to uphold vaccination at all hazards, the official excuse that the cause of small-pox lies in unfathomable mystery would long ago have been summarily set aside.

In a recent number of the *Leicester Free Press*, it is said :—" So far as we are concerned in Leicester, a town containing 120,000 inhabitants, with many thousands of unvaccinated children, smallpox seems to be about the least dangerous of all diseases, and is not to be named by the side of scarlet fever, measles, whooping cough, diarrhoea, or even consumption. If a case of small-pox is discovered, instant isolation is adopted, and during the last five years we have hardly had five deaths. That being the state of the case, one need not wonder that the fear of the disease should disappear, or that resistance to vaccination should increase."

Dr. FARR, in his official report for 1876, says :—" Experience has shown that the various forms of plague are influenced to a large extent by sanitary conditions. All zymotic diseases are most fatal in the densest districts, and although this may be due in part to contagion, it is certainly due in part to the concentrated impurities of towns."

And Professor PLAYFAIR says :—" No epidemic can resist thorough cleanliness." Those who have intelligently watched the course of zymotic outbreaks, and noted the localities where they have arisen and the causes by which they are engendered, are convinced that it is within the power of Governments by means of scientific sanitary appliances and methods to stamp out small-pox altogether. Supposing vaccination to be abandoned, this revolution would be brought about, for it is the opinion of many of the ablest opponents of the vaccination laws in England that one cause of the perpetuation of small-pox in our midst is the application of this alleged remedy of vaccination. Every one now admits that a considerable portion of vaccination in England is variolation, *i.e.*, small-pox matter passed through the cow, and that what is called vaccination is nothing but modified small-pox. In no part of England has submission been so rigorously enforced as in the English metropolis, where, in addition to the energetic efforts of vaccination officers and public vaccinators, stimulated by special awards, there has been inquisitorial house to house and school to

school visitation; the remorseless cow-poxing in the work-houses even of infants scarcely a week old; the hunting of unvaccinated fugitives from parish to parish, like slave-hunting in the United States ; and the relentless prosecution of the parents of un-vaccinated children in every police-court in the metropolis. And what is the result? Has small-pox been stamped out, as all the Jennerian prophets in succession have loudly predicted? On the contrary, in proportion as public money and State machinery have been diverted from sanitation (the only scientific adversary of small-pox), to vaccination, or the unscientific treatment by poisoning the blood, the disease has spread with the result shown by the Registrar-General in his annual summary for the year 1880, which tabulates the small-pox mortality of London for the last thirty years as follows:

Decades.	Estimated Mean Population	Small-pox Deaths.
1851-60	2,570,489	7,150
1861-70	3,018,193	8,34.7
1871-80	3,486,486	15,551

The last decade showing an increased small-pox mortality of 80 per cent. It must not be supposed, however, that this mortality is equally spread over the Metropolis, or that it exists in all classes of habitations alike. In the princely mansions of South Kensington, Hyde Park, and Regent's Park, in the aristocratic districts of Bayswater, Notting Hill, Haverstock Hill, the open and airy slopes of Hampstead [Dr. EDMUND GWYNN reports (*Lancet*. Nov 5, 1881) the death-rate for Hampstead, with a population of 45,436, at 12.6 per 1,000 for 1880, as compared with 22.2 in the metropolis generally] and Highgate, in the salubrious suburbs of Ealing, Clapham, South Hornsey, [Dr. JACKMAN, Medical Officer of Health for the South Hornsey district, states that the death rate of the district is only 10.7 per 1,000 living, and the birth-rate is equal to 39.0 per 1,000. Special inspections of the houses in the district are made from time to time by Mr. ABRAMS, the Sanitary inspector, and a proposal is now on foot to procure for the inhabitants a constant water supply.—*Lancet* Nov.. ,1881] Sydenham Hill, Wimbledon, Chislehurst, and Finchley, cases of small-pox are of the rarest occurrence. The epidemic is found amongst the poor, ill-fed, uncleanly, intemperate, over-worked populations of Hackney, St. Giles's, Bethnal-green, Poplar, Shadwell, Bermondsey, and Southwark, amongst those who live in the courts and alleys, in old and decayed habitations, and in the miasmatic atmosphere in which the neglected residuum of this immense city are reduced to dwell. Amongst the denizens of these tin-wholesome districts will be found the largest proportion of the specially unhealthy children, the offspring of the diseased and vicious to whom the so-called protection, vaccination, is prohibited by official instructions. These children have no vitality to resist small-pox and other zymotic diseases, hence it is that a larger number of the unvaccinated or unhealthy children die of small-pox than the general average. This pretended protection must needs be given not to the weak and sickly, who most require protection, but to those whose physical strength is itself an all-sufficing safeguard.

The *British Medical Journal*, an ardent pro-vaccinating advocate, in its issue of Oct. 23, 1880, says, "It is probable that a larger proportion of unvaccinated persons is to be found amongst the ignorant, dirty, and wretched inhabitants of the slums of London, and very few amongst the educated and better fed members of society. The disease is much intensified by over-crowding." Thus the highest vaccination medical authority vitiates and overturns the entire fabric of Dr. BUCHANAN'S figures which, both in England and Germany, seemed a few months ago to have galvanised the vanquished Jennerians into a spasmodic vitality. When Dr, SOUTHWOOD SMITH, Mr. EDWIN CHADWICK, Mr. H. D. DUDGEON, and other leading sanitarians, commenced their work thirty

years ago, by showing that filth, bad drainage, impure water, and overcrowded dwellings were the causes of zymotic diseases, the rank and file of the medical profession ridiculed their theories with unsparing scorn. Evidence, nevertheless, as to the truth of the theory and contention accumulated, so rapidly indeed, that had not many of the doctors. relinquished their fatuous objections, they must have placed themselves outside the intelligence of the age. The vaccinators yielded to public opinion reluctantly, and so far as small-pox is concerned, many of them still audaciously defend their oft-exploded theories. One of the most striking proofs in support of my contention is that afforded in a letter written by our esteemed friend and colleague, the energetic sanitary reformer, Dr. OIDTMANN, illustrating the enormous advantages of sanitation in preventing small-pox in the German invading army, and the dangerous consequences of the neglect of these precautions in the French army ; the conditions as to vaccination being alike in both cases.

In the *Natur-Arzt*, published at Dresden in 1873, Dr. OIDTMANN says :—" In my numerous marches and halts in the campaign of 1870-71, I directed my particular attention to the health statistics. After the taking of Verdun, I noticed that the rooms in which the French hospital patients were miserably decimated during the bombardment, were inexpressibly close and ill-smelling—breeding places of small-pox poison. The only German physician of the garrison being unwell, it fell to my lot to root out these filthy lurking-holes of pestilence. At a later period, after the battle of St. Quentin, I was physician of the garrison staff of that place, and all the statistics of the French, German, and International Hospitals for six weeks in succession passed through my hands. The number of French who, during that time, died in these hospitals of pyaemia (blood-poisoning) and phlegmonia (blood impurities) was so wonderfully great in proportion to the small death-rate of the German hospitals, that the vaccination statistics of your English newspapers can hardly admit of comparison with it. What then was the cause of the 'protection' of our people from these two diseases? Had they been inoculated for pyaemia and phlegmonia? Certainly not. But, whereas in the French hospitals a veritable pest atmosphere reigned night and day, yet at Abbeville, on the contrary, where we had no French army doctors, and where the arrangements of the hospital were in the joint hands of myself and the medical men of the place, the statistics of recovery from small-pox were highly favourable, and indeed equal for French and Germans. The enormous difference between the small-pox mortality of the two armies, was caused by the crying neglect of hygienic precautions in the French military department, and by the excessive concentration of their system of stationary sick depots, as opposed to the freshness of the hygienic arrangements of the German hospitals, and the ambulatory movements of their scattered troops. No more decisive proof can exist of the correctness of my theory— that the strength and spread of small-pox is both proportioned to and progressive with the fostering and shutting in of the small-pox vapour—than these statistics of the Franco-German War."

Proofs of the truth of the value of sanitation are, however, nearer at hand, and a satisfactory demonstration is afforded by the associations in London which have devoted their attention to improving the dwellings [Dr. SOUTHWOOD SMITH, referring to the improved conditions of the inhabitants of the model dwellings, at p.17 of his "Results of Sanitary Improvements." says.:—"There has been in the improved dwellings complete exemption of typhus, cholera, and, it may be added, small-pox; yet it must be admitted, that other forms of zymotic disease—scarlet fever, measles, whooping cough, and diarrhoea—have occurred, though rarely, and these maladies have in no instance spread."] of the poor. A wholesome habitation in a crowded district is shown to diminish the death-rate by a third or half, as compared with that of the occupiers of old houses in

the same locality. I have before me a report of the thirty-sixth half-yearly meeting of the Improved Industrial Dwellings Company, held at the Mansion House, London, August 5, 1881. This association controls 3,681 tenements or habitations (with a population of 18,000 persons), nearly all of which are located in the denser parts of London, and the mortality is only 16.7 per thousand, while the death-rate of the adjoining houses is 30 to 35. Although the report is for a year when there was a severe epidemic of small-pox the secretary, Mr. JAMES MOORE, informs me that only one death from that disease occurred. The thirty-seventh report of another, the Metropolitan Association for improving the Dwellings of the Industrial Classes, read June 6, 1881, gives the death-rate of an average population of 5,675 at 155 per thousand. And as the average mortality of the entire metropolis is 23 per thousand, there has been a saving of life of seven or eight per thousand. In the last-named association there has not been one death from smallpox during the past ten years, while the surrounding habitations have often been the hotbeds of contagion. An equally satisfactory result has been achieved by the Victoria Dwellings Association, which has been in existence six years. Their buildings are situated at King's Cross, a crowded centre of the Metropolis, and at Batter-sea, one of the outlying suburbs. The average population has been 2,500, out of which only twenty-four deaths occurred during the past twelve months, or less than half the Metropolitan death-rate, and not a single death from small-pox since the association was formed. The facts prove the truth of my contention, that sanitation is sufficient to prevent and stamp out all zymotic diseases including small-pox; and even if it could be shown that vaccination would do the same, it is nevertheless wholly unnecessary. Earl SPENCER, in opening the Sanitary Exhibition in London, on July 16, said that already in Great Britain the death-rate had been so much diminished during the past ten years that 300,000 lives have been saved, as compared with the previous decade, and this was largely due to improved sanitation. An official report on the sanitary condition for 1881, says that more than three-fourths of the reduction is due to the decrease of severe zymotic diseases, the product of filth, which good sanitation can remove.

It is clear, therefore, from the foregoing facts, that small-pox can be extirpated by means of sanitation alone, a remedy which, besides being absolutely efficacious, can be adopted by municipalities and by individuals with the certainty that it is attended with none of the dreaded evils inseparable from the compulsory injection of lymph of doubtful origin and unknown virulence and power. The testimony of Dr. FARR and Professor PLAYFAIR, both pro-vaccinators, and the evidence deduced from the death-rate of the various improved dwellings associations, leave Governments without excuse for continuing a system which, besides being of non-effect as a preventive, is often the cause of ineradicable mischief. Compulsory medicine, according to the testimony of Mr. MACLAREN, the late Lord Advocate for Scotland, and other high authorities, is opposed to the ancient constitution of England, and is, therefore, a gross infraction of the liberty of the Citizen and of parental rights. The work of our Congress is to assist in restoring the birthright of our citizens, to give back to parents their highest duty and privilege—the sacred right to protect and defend their offspring *from* evil, and to liberate the oppressed of many nations from an ignorant, unjust, and indefensible tyranny.

The laws which I arraign are overbearing, but being founded on injustice, must ere long crumble before a growing public opinion, which now demands, and will soon compel, their unconditional repeal ; and the pretended duty of experimenting upon our neighbour's children will cease to supersede the real duty of protecting our own.

# Smallpox death rate

by [Dr Shelton DC](#)

If the death rate of smallpox and fevers was so enormous, it was largely due to the medical treatment of that time. A number of eruptive diseases such as measles, chicken pox, scarlet fever etc. were regarded as smallpox before Dr. Sydenham differentiated between the various symptom-complexes. How great the number of deaths was from scarlet fever, measles, chicken pox etc., that were included in the smallpox epidemics will never be known. Dr. Russell T. Trall, the eminent Natural Hygienist, considered smallpox "as essentially . . . not a dangerous disease." He cared for large numbers of patients afflicted with smallpox and never lost a case. Under conventional medical treatment, patients were drugged heroically, bled profusely, were smothered in blankets, wallowed in dirty linen, were allowed no water, fresh air and stuffed with milk, brandy or wine. Antimony and Mercury were medicated in large doses. Physicians kept their patients bundled up warm in bed, with the room heated and doors and windows carefully closed, so that not a breath of fresh air could get in, and given freely large doses of drugs to induce sweating (Sudorifics), plus wine and aromatized liquors. Fever patients were put into vaporbath chambers in order to sweat the impurities out of the system. Given no water when they cried for it and when gasping for air were carried to a dry-hot room and after a while were returned to the steam torture. Many must have died of Heat Stroke!

How did smallpox originate? It appeared only with the collapse of the Greek and Roman Civilization with its high standards of health. Neither Greece nor Rome suffered from smallpox while a disease resembling it decimated populations in Africa and Asia. The sanitary and hygienic systems of the great pagan civilizations—public baths, gymnasia, solaria, athletic stadiums, municipal water supply, drainage, toilet facilities, well-aired, sunny, spacious and clean living quarters, garbage disposal, simple, natural and unspoiled foods—prevented the appearance of infectious diseases and fevers. The sanitary conditions in the towns and cities of Europe in which smallpox raged were most frightful. According to Montgomery's English History, the streets of London and other cities were rarely more than twelve to fifteen feet wide were neither paved nor lighted. Pools of stagnant water accumulated everywhere, heaps of garbage abounded and were only removed when it began to obstruct the traffic. There was no sewage and dead dogs, cats, rubbish, rotten vegetable and fruit refuse, human and animal excreta, and slops from the kitchen were all thrown into the streets. Surrounded by high walls, cities could not expand and people were forced to live in a slum-like manner. Holes served as windows, with little or no ventilation, whole families slept in one room often in one bed, and hundreds of persons lived in one building crowded in from the sub-celler to the attic. They rarely ever washed, had no bath tubs, no underwear and wore the same clothes day and night. They lived in utmost poverty, slaved long hours, even the children worked, drank heavily of alcohol, ate like hogs of spoiled, unnatural food and suffered from malnutrition.

### *National Federation of Federal Employees*

P.O. Box 76082, Washington, DC 20013

202-260-4683 (V) 202-401-3139 (F)

Local 2050

July 2, 1997

Mr. Jeff Green

Citizens for Safe Drinking Water 3243 Madrid Street San Diego, CA 92110

Dear Mr. Green:

I am pleased to report that our union, Local 2050, National Federation of Federal Employees, has voted to co-sponsor the California citizens' petition to prohibit fluoridation of which your organization is the sponsor. Our union represents, and is comprised of, the scientists, lawyers, engineers and other professionals at the headquarters of the U.S. Environmental Protection Agency here in Washington, D.C..

A vote of the membership was taken at a meeting during which Professor Paul Connett and Dr. Robert Carton made presentations, respectively, on the recent toxicological and epidemiological evidence developed on fluoride and past actions (and their bases) of Local 2050 with respect to fluoride in drinking water. The membership vote was unanimous in favor of cosponsorship.

It is our hope that our cosponsorship will have a beneficial effect on the health and welfare of all Californians by helping to keep their drinking water free of a chemical substance for which there is substantial evidence of adverse health effects and, contrary to public perception, virtually no evidence of significant benefits.

These judgments are based, in part, on animal studies of the toxicity of fluoride coupled with the human epidemiology studies which corroborate them, and the studies of rates of decayed, missing and filled teeth in the United States (fluoridated and non-fluoridated communities) versus non-fluoridated European countries.

Our members review of the body of evidence over the last eleven years, including animal and human epidemiology studies, indicate a causal link between fluoride/fluoridation and cancer, genetic damage, neurological impairment and bone pathology. Of particular concern are recent epidemiology studies linking fluoride exposures to lower I.Q. in children.

As professionals who are charged with assessing the safety off drinking water, we conclude that the health and welfare of the public is not served by the addition of this substance to the public water supply.

Best wishes to you and your organization for success in keeping what would otherwise be a hazardous waste of the fertilizer industry from being disposed of in California's drinking water supplies.

Sincerely,

J. William Hirzy, Ph.D.

Senior Vice-President

---

**Ed. Note:** As of April 1998, the National Federation of Employees Local 2050 changed its name to the National Treasury Employees Union. Chapter 280.

They have 1500 Members.

Dr. Hirzy invites your call at 202-260-4683

---

This is a letter from the Citizens for Safe Drinking Water-Utah

April 4, 2000

To whom it may concern,

There is currently an active effort in Utah to fluoridate our public drinking water. Current law allows the issue to be placed on the ballot by city councils or--in first and second class counties--by county commissioners. This is the only issue allowed by law to be placed on the ballot without going through the initiative process first.

Citizens for Safe Drinking Water--Utah is concerned about fluoridation for a number of reasons, including:

The fact that there has never been a scientific study, using tap water, which proves the safety of fluoride.

The fact that there has been a steady stream of research studies which show that fluoride in drinking water is not safe for everyone, and that the federal Health and Human Services warns that subsets of the population are at substantial risk from fluoride.

The fact that it is not appropriate to use the public water supply as a delivery system for mass medication; chlorine treats water; fluoride treats people.

The fact that a product which cannot be diluted enough to be legally dumped into the Ocean is purported to be safe when diluted at 1 ppm and added to our drinking water.

The fact that fluoride is cumulative in the body and that it is impossible to regulate the dosage in a one-size-fits-all approach.

The fact that when total intake of fluoride from all sources is taken into consideration, including commercially processed foods and beverages, fluoridated water results in the overdosing of many people

The fact that there are many good alternatives for those who want fluoride, such as rinses, gels, and fluoride tablets.

The fact that proponents of fluoride use decades-old documentation in addressing both the effectiveness and the safety of fluoride.

Feel free to contact us, for further information. This is not simply "a voting issue" or "letting the people decide." This is a matter of public safety for Utah citizens and highlights the responsibility of the promoters of fluoridation to inform the public of potentially harmful effects of fluoride to subsets of the population. This, they are not doing.

This Letter is from The University of Utah.

Thursday, May 14, 1998

To whom it may concern:

It has been proposed to add fluoride to the water supply of the larger communities of Utah to prevent dental caries. This proposal will undoubtedly generate debate about the benefits and risk of low level ingestion of fluoride on human health.

I wanted to comment on some possible untoward side effects associated with the ingestion of low levels of fluoride. In 1991 three colleagues and myself published a paper in the Journal of the American Medical Association entitled "Hip fractures and fluoridation in Utah's elderly population." (See JAMA 1992; 268:746-748) suggesting that there was a 27% (rate ratio=1.27) increase in hip fractures among women, and a 41% (rate ratio= 1.41) increase in hip fractures among men age 65+ living in Brigham City, the largest fluoridated community in Utah, compared to Logan and Cedar City. The study covered fractures occurring between 1984-1990.

We undertook the study because of reopens in the medical literature of increased hip fractures among women who had received high doses (75 mg/day) of fluoride for the treatment of osteoporosis. We were surprised to find an effect at the much lower dose from a fluoridated water system (between 1-2 mg/d).

Since our study was published three additional reports have appeared in the medical literature. Sower et al., (American Journal of Epidemiology 1991, 133:649-660) reported a more than 100% increased risk of hip fracture among women ages 55+ living in Iowa communities with 15+mg/l of fluoride compared to communities with 1 mg/l of fluoride.

Jacobsen et al., (Annals of Epidemiology 1992, 2:617-626) studied 129 U.S. counties with fluoridated water supplies and reported an 8% (rate ratio=1.08) for women and 17% (rate ratio=1.17) increase in hip fractures among the fluoridated compared to 194 counties without fluoridation.

Jacquín-Gadda et al. (JAMA 1995, 273:775. letter to the editor) reported on hip fractures among 3578 people age 65+ living in southwestern France, and drinking fluoridated water. They were able to calculate an individual dose for each subject, and control for body mass, and cigarette smoking. They reported an 86% increase in hip fractures (rate ratio=1.86) among those with the highest levels of fluoride intake (0.11-1.83 mg/L) and no effect for calcium in water, nor for other sites of fractures besides the hip.

One of the four scientific studies on the association of hip fracture with fluoride consumption in drinking water, all found an increased risk of hip fracture among those age 65+.

The study by Jaquin-Gadda et al., had the most precise information on the study subjects daily fluoride consumption, and was able to control for other potential confounding factors such as cigarette smoking, physical activities, etc.. The investigators found the strongest association between low level fluoride consumption and subsequent hip fracture.

All four studies mentioned above suggest that hip fracture may be an adverse health effect of fluoridation of public water systems. Certainly further work needs to be done on this association including a cost/benefit analysis before additional public water systems are fluoridated.

Sincerely yours,

Joseph L. Lyon, MD., M.P.H. Professor

Department of Family and Preventive Medicine

50 North Medical Drive

Salt Lake City, Utah 84132

## Silicofluorides and Lead

Here, we have some information on what the affects are of Fluoride on people and our children.

### **FLUORIDATION INCREASES LEAD ABSORPTION IN CHILDREN**

The chemical most commonly used to fluoridate America's drinking water is associated with an increase in children's blood lead levels.

Most studies that purport fluoridation's safety and effectiveness in preventing cavities use the chemical sodium fluoride. However, 90% of fluoridated communities inject cheaper Silicofluorides (fluosilicic **acid and sodium Silicofluorides**) **into their drinking water** based on the theory that each chemical comes apart totally so that freed fluoride can incorporate into tooth enamel.

Silicofluorides **do not separate** completely, as sodium fluoride does, reports Professor Roger D. Masters, Ph.D., of Dartmouth College, and co-researcher Myron Coplan, chemical engineer. "As a result, **water treatment** with silicofluorides apparently functions to **increase the** cellular uptake of lead," they state.

In research published in the International Journal of Environmental Studies (September, 1999), Masters and Coplan studied lead screening data from 280,000 Massachusetts children. They found that **average blood lead levels are significantly higher in children living in communities whose water is treated** with silicofluorides. A survey of over 120,000 children in Georgia towns (population 15,000 to 75,000) corroborates this effect.

The Center for Disease Control (CDC) warns that excessive blood lead levels can cause learning disabilities, behavioral problems and seizures.

## Fluoridation Survey

Please take a moment to share your feelings with us and possibly, the world here on our site.

Masters and Coplan report that lead is a highly significant risk factor in predicting higher rates of crime, attention deficit disorder, hyperactivity and substance abuse. In a study now in press, Masters' research team found higher rates of violent crime and substance abuse in silicofluoridated communities.

Is this a risk we want to take with our children?

---

## WATER TREATMENT WITH SILICOFLUORIDES AND LEAD TOXICITY

**Roger D. Masters and Myron J. Coplan\***

*Department of Government, Dartmouth College and Gruter Institute  
for Law and Behavioral Research, IL. B. 6222, Hanover, NH 03755 (USA);  
Intelleguity, 38 Silver Hill, 8 Natick, MA 01760 (USA)*

*(Received in final form 26 August 1998)*

Toxic metals like lead, manganese, copper and cadmium damage neurons and deregulate neurotransmitters like serotonin and dopamine (which are essential to normal impulse control and learning. Earlier studies show that - controlling for socioeconomic and demographic factors - environmental pollution with lead is a highly significant risk factor in predicting higher rates of crime, attention deficit disorder or hyperactivity, and learning disabilities. Exposure and uptake of lead has been associated with industrial pollution, leaded paint and plumbing systems in old housing, lead residues in soil, dietary habits (such as shortages of calcium and iron), and demographic factors (such as poverty, stress, and minority ethnicity). We report here on an additional "risk co-factor" making lead and other toxic metals in the environment more dangerous to local residents: The use of silicofluorides as agents in water treatment. The two chemicals in question - fluosilicic acid and sodium Silicofluorides - are toxins that, despite claims to the contrary do not dissociate completely and change water chemistry when used under normal water treatment practices. As a result, water treatment with silicofluorides apparently functions to increase the cellular uptake of lead. Data from lead screening of over 280,000 children in Massachusetts indicates that siliconfluoride usage is associated with significant increases in average lead in children's blood as well as percentage of children with blood lead m excess of 10 ug/dL. Consistent with the hypothesized role of silicofluorides as enhancing uptake of lead, whatever the source of exposure, children are especially

at risk for higher blood lead in those communities with more old housing or lead in excess of 15 ppb in first draw water samples where silicofluorides are also in use. Preliminary findings from county-level data in Georgia confirm that Silicofluorides usage is associated with higher levels of lead in children's blood, In both Massachusetts and Georgia, moreover, behaviors associated with lead neurotoxicity are more frequent in communities using silicofluorides than in comparable localities that do not use these chemicals. Because there has been insufficient animal or human testing of Silicofluorides treated water. Further study of the effect of silicofluorides is needed to clarify the extent to which these chemicals are risk co-factors for lead uptake and the hazardous effects it produces.

## Populations that are Unusually Susceptible

The title says it all.

Excerpt below taken from: *Toxicological Profile For Fluorides, Hydrogen Fluoride, and Fluorine* (19,

PB93-182566, April 1993, Agency for Toxic Substances and Disease Registry, U.S. Department of Health and Human Services, TP-91/17, page 112.

**Existing data indicate that subsets of the population may be unusually susceptible to the toxic effects of fluoride and its compounds. These populations include the elderly, people with deficiencies of calcium, magnesium, and/or vitamin C, and people with cardiovascular and kidney problems.**

Because fluoride is excreted through the kidney, people with renal insufficiency would have impaired renal clearance of fluoride (Juncos and Donadio 1972). Fluoride retention on a low-protein, low-calcium, and low phosphorus diet was 65% in patients with chronic renal failure, compared with 20% in normal subjects (Spencer et al. 1980a). Serum creatinine levels were weakly correlated ( $r=0.35-0.59$ ) with serum fluoride levels (Hanhijarvi 1982). People on kidney dialysis are particularly susceptible to the use of fluoridated water in the dialysis machine (Anderson et al. 1980). This is due to the decreased fluoride clearance combined with the intravenous exposure to large amounts of fluoride during dialysis. Impaired renal clearance of fluoride has also been found in people with diabetes mellitus and cardiac insufficiency (Hanhijarvi 1974). People over the age of 50 often have decreased renal fluoride clearance (Hanhijarvi 1974). This may be because of the decreased rate of accumulation of fluoride in bones or decreased renal function. This decreased clearance of fluoride may indicate that elderly people are more susceptible to fluoride toxicity.

**Poor nutrition** increases the incidence and severity of dental fluorosis (Murray and Wilson 1948; Pandit et al. 1940) and skeletal fluorosis (Pandit et al. 1940). Comparison of dietary adequacy, water fluoride levels and the incidence of skeletal fluorosis in several villages in India suggested that vitamin C deficiency played a major role in the disease (Pandit et al. 1940). Calcium intake met minimum standards, although the source was grains and vegetables, rather than milk, and bioavailability was not determined. Because of the role of calcium in bone formation, calcium deficiency would be expected to increase susceptibility to effects of fluoride. No studies in humans supporting this hypothesis were located. Calcium deficiency was found to increase bone fluoride levels in a two-week study in rats (Guggenheim et al. 1976) but not in a 10-day study in monkeys (Reddy and Srikantia 1971). Guinea pigs administered fluoride and a low-protein diet had larger increases in bone fluoride than those given fluoride and a control diet (Parker et al. 1979). Bone changes in monkeys following fluoride treatment appear to be more marked if the diet is deficient in protein or vitamin C, but the conclusions are not definitive because of

incomplete controls and small sample size (Reddy and Srikantia 1971). Inadequate dietary levels of magnesium may affect the toxic effects of fluoride. Fluoride administered to magnesium-deficient dogs prevented soft-tissue calcification but not muscle weakness and convulsions (Chiemchaisri and Philips 1963). In rats, fluoride aggravated the hypomagnesemia condition, which produce convulsive seizures. The symptoms of magnesium deficiency are similar to those produced by fluoride toxicity. This may be because of a fluoride-induced increase in the uptake of magnesium from plasma into bone.

Some people with **cardiovascular problems** may be at increased risk of fluoride toxicity. Fluoride inhibits glycolysis by inhibiting enolase (Guminska and Sterkowicz 1975; Peter et al. 1964). It also inhibits energy metabolism through the tricarboxylic acid cycle by blocking the entry of pyruvate and fatty acids and by inhibiting succinic dehydrogenase (Slater and Bonnet 1952).

There is evidence that daily doses of 34 mg fluoride (0.48mg/kg/day) increases the risk of non vertebral fractures in women with post menopausal osteoporosis (Riggs et al. 1990). **Post menopausal women** (Danielson et al. 1992; Sowers et al. 1991) and **elderly men** (Danielson et al. 1992) **in fluoridated communities may also be at increased risk of fractures.**

# Fluoridation

## Fluoridation in Europe

### Articles

This section includes a few Newspaper Articles on the topic of Fluoridation. One is from our own Master Herbalist, David Christopher.

### What are other countries doing?

### Letters

This section has a handful of letters from various organizations and people on Fluoridation.

Water fluoridation was stopped in the following World Health Organization (WHO) Countries:

### Professionals

This page was prepared by the Citizens for Safe Drinking Water - Utah and provides the names and contact information for some knowledgeable professionals.

Federal Republic of Germany (introduced 1952, stopped 1971)

Sweden (introduced 1952, stopped 1971)

Netherlands (introduced 1953, stopped 1976)

Czechoslovakia (introduced 1958, stopped 1988/90)

German Democratic Republic (introduced 1959, stopped 1990 (Spremborg 1993) Union of Soviet Socialist Republics (introduced 1960, stopped 1990)

Finland (introduced 1959, stopped 1993)

Outside Europe: Japan (introduced 1952, stopped 1972)

### Silicofluorides & Lead

Here, we have some information on what the affects are of Fluoride on people and our children.

"The reason for these cessation's of water fluoridation was not a political one, but the consequence of scientific discussion of its effectiveness and side effects."

### Unusually Susceptible

The title says it all.

"Dentists and WHO experts have predicted a very large caries increase ("a tide of caries") after termination of fluoridation. Analyses of the data, however, reveal a significant decrease in dental caries (caries decline) after suspension of water fluoridation in Japan in the Netherlands, in Prague, in the German Democratic Republic, and elsewhere. Never has any real increase in dental caries been observed after water fluoridation was discontinued."

### Rejection ???

A list of places that have retracted fluoridation since 1990.

<http://www.fluoride-journal.com/98-31-3/313-171.htm>

### In Europe

What are other countries doing?

IF YOU'RE NOT SURE IT'S SAFE,

**DON'T FLUORIDATE!**

**VOTE NO ON FLUORIDATION.**

### Geography

Take a look at which Cities and States Fluoridate their water.

Fluoridation in Europe. *FLUORIDE* 31(3), 1998, pp 171-174 International Society for Fluoride Research

### Links

Don't take our word about fluoridation, check out what others have to say about it. There are both pro-fluoridation and anti-fluoridation sites listed. We also have a few quotes we feel you might like.

### Fluoridation Survey

Please take a moment to share your feelings with us and possibly, the world here on our site.

## A Little USA Geography

Take a look at which Cities and States Fluoridate their water.

## Largest Fluoridated Cities

Forty-two of the fifty largest cities in the U.S. are supplied with fluoridated water

Largest Fluoridated Cities

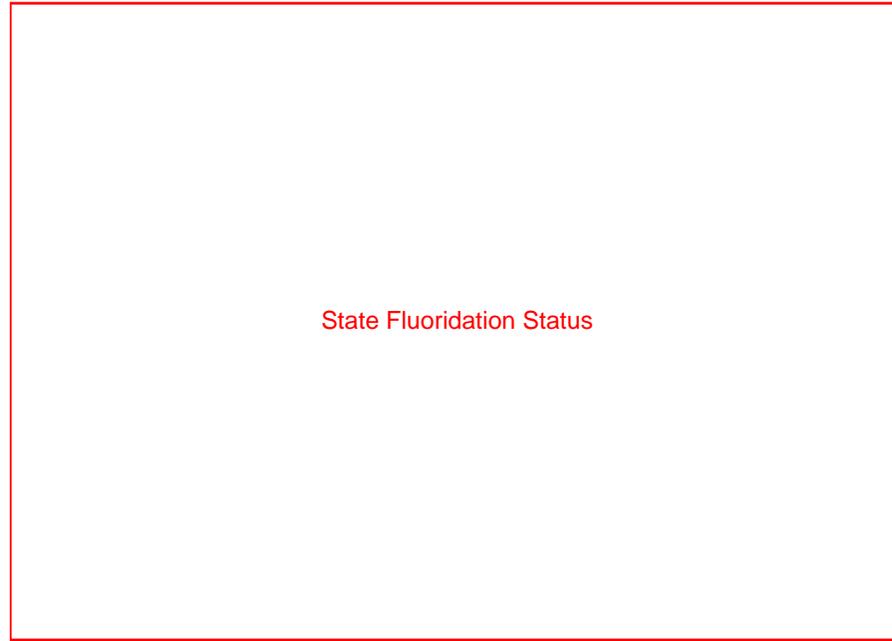

*Two cities (Jacksonville, Florida, and El Paso, Texas) are naturally fluoridated.*

*\*Los Angeles, California, plans to implement fluoridation in early 1999.*

*Information current as of November 1998.*

# State Fluoridation Status

States with 75% of the population served by fluoridated community water supplies.\*

*\*Data compiled by the American Dental Association and the Centers for Disease Control and Prevention/Division of Oral Health.*

*Current as of November 1998.*

## History of Comfrey

The genus name of Comfrey, *Symphytum*, is derived from the Greek *symphyo*, “to make grow together,” *phyton* which means “plant,” and *officinale* which means that this was the official medicinal plant sold in apothecaries and pharmacopoeias. The common name, Comfrey, comes from the Latin *con firma*, alluding to the uniting of bones, and from the Latin *confervere*, to boil or grow together, or to heal. The other common names given to this plant allude to its healing powers: boneset, bruisewort, and knitbone.

By 400 B.C. this plant was already in use in Greece. The earliest recorded Comfrey remedies were made only of the root. The Greek historian Herodotus recorded its use and recommended it to staunch severe bleeding and the Greeks later used the root to cure bronchial problems. The Greek poet-physician, Nicander, (of the second century B.C.) mentions the plant as a remedy for poisons in his herbal *Alexipharmica*; and another famous Greek physician, Galen (A.D. 130-200), mentions its healing powers in his writings as well. Greek physician Dioscorides, a well-known natural healer of his day, documented its use in his herbal and prescribed it for healing wounds, broken bones, as well as respiratory and gastrointestinal problems. He was employed as Nero's medical officer to the Roman army (thus, traveling extensively and having much cause to use Comfrey) and documented his experiences in five volumes with descriptive accounts on medicinal plants. Dioscorides prescribed Comfrey for its bone-knitting and wound-healing virtues.

The Roman naturalist and contemporary of Dioscorides, Pliny the Elder, experimented with the roots and remarked that boiling Comfrey roots in water produced a sticky paste which glued pieces of meat together. The people of the first century A.D. made poultices of Comfrey because of this observable fact and drank it as a tea for internal ailments such as diarrhea, bleeding and stomach disorders. Pliny, as well, was an army man and avid writer who compiled fifteen volumes on medicinal plants.

Comfrey appears in monastery writings and herbals from A.D. 1000. Saxon herbariums recommended it for “internal bleedings, ruptures, hernias, for which purpose, to give one example, Comfrey leaves were heated in or over hot, near-ash embers, ground and stirred into honey, and then taken on an empty stomach.” The Cistercians, Benedictines and other religious orders are credited with furthering the cultivation of Comfrey plants during long stretches of warfare because it was a mainstay plant in the monastery gardens and used specifically to heal soldiers' wounds.

The Middle Ages saw continued use of this wonderful plant. Swiss physician Paracelsus, (1493-1541 A.D.) remarked, “To what purpose do you superadde vinegar to the root of Comfrey,” he asked surgeons, “or bole, or suchlike balefull additaments, while God hath compos'd this simple sufficient to cure the fracture of the bones?” The gummy roots actually stiffen into a cast when spread on muslin and wrapped around a sprain, a broken bone that has been set, or torn ligament. Comfrey roots were used in teas for those who would cough up blood, according to Turner's Herbal (1568). By the late sixteenth century the herb had reached a high level of popularity and all levels of social status (from King to pauper) were known to cultivate it in their gardens. Another herbal from this era (1597) was written by herbalist John Gerard, who was renowned during Queen Elizabeth's reign, and who also recommends Comfrey for “those who spit blood and have inward wounds and burstings.”

In the seventeenth century the leaves were also being used in tea form, though English herbalist Nicholas Culpeper still recommended the Comfrey roots, “full of glutinous and clammy juice...for all inward hurts...and for outward wounds and sores in [all] fleshy or sinewy parts of the body...[It] is especially good for ruptures and broken bones.” He also prescribed the herb for hemorrhoids, gout, gangrene, fever, respiratory and menstrual problems. John Parkinson, Master Herbalist and apothecary to King James I, raised Comfrey to a new level of well-deserved acceptance. His herbal, *Theater of Plants*, (1640) was the bible for contemporary herbalists and

physicians of his day. He suggested using the herb internally as an expectorant for lung problems, in tea form to take away fevers and in syrup form for any inward hurts. For external applications, Parkinson cited his findings that the roots were great for gluing together torn flesh and broken bones; a decoction of the root was used to heal hemorrhoids; putrescent ulcers, gangrene and similar problems were also noted to be helped by Comfrey.

Englishman John Josselyn wrote a book titled *New England Rarities Discovered* (1672), which catalogued his observations of early colonial herb gardens; he notes, "Good examples of the Englishman's herbal transplants were the well-known Plantain, Mallow, Nettles, Dandelion, Shepherd's Purse, Wormwood, Knotgrass and the hardy perennial `Compherie with the white flower." In 1812 English physician, Dr. William Withering, recorded various uses of Comfrey in his *Systematic Arrangement of British Plants*, Vol. II. He lists its edibility, but notes that not all animals seek the herb as forage.

People also used Comfrey for more than medicinal reasons-they cooked it in soups, stews and tossed it into salads; farmers cultivated it as fodder for their livestock; and one Englishman, Henry Doubleday, even used Comfrey as a substitute for the stamp glue, gum Arabic, that was difficult to obtain. He was so impressed with this plant, and moved by the suffering caused by the Irish Potato famine of the 1840's, that he established a charitable organization to research the use and cultivation of Comfrey in hopes of ending world hunger. The earlier part of the 19th century found Comfrey tea as one of the best selling herbal beverages, enjoyed for both its flavor and for its healthful benefits.

In the Americas, the Native American Cherokee tribe is known to have used this plant internally for many ailments and early settlers raised the herb in their gardens. The nineteenth-century Eclectic physicians prescribed it for dysentery, cough, diarrhea, bronchitis and menstrual discomforts. Dr. Charles J. Macalister, the scientist who isolated allantoin from Comfrey, tells of a case in Lancashire, England where a physician he knew had an experience of Comfrey's healing powers. He writes, "Three years ago I was called to see a girl with gastric ulcer, haematemesis and severe vomiting and treated the case in the usual orthodox manner. In three weeks the patient was able to return to the mill. When congratulating the mother on her daughter's speedy recovery the old woman said to me: "Do you mind my telling you something Doctor?" On my replying in the negative-"Well," she said, "my girl has never taken a drop of your medicine and all she has supped is pints of strong Comfrey tea." `Since this occasion I have found it an excellent sedative for the gastric mucous membrane.'

## Location of Comfrey

Comfrey is a member of the Boraginaceae family whose major noticeable characteristics include bluish flowers and bristly hairs and is of the genus *Symphytum*. There are three plant species in the genus *Symphytum* that are relevant to the crop known as Comfrey. Wild, or common Comfrey (*Symphytum officinale*) is native to England and extends throughout most of Europe into Central Asia and Western Siberia. Prickly or rough Comfrey (*Symphytum aspernum*), named for its bristly leaves, was brought to England from Russia around 1800. Quaker, Russian, or blue Comfrey originated as a natural hybrid of *S. officinale* and *S. aspernum*. This hybrid was called Caucasian or Russian comfrey in reference to its country of origin. Cuttings of this hybrid were shipped to Canada in 1954 and it was named Quaker Comfrey after the religion of Henry Doubleday, the British researcher responsible for promoting Comfrey as a food and forage plant. The majority of Comfrey grown commercially in the United States appears to come from these same plants shipped to Canada and derived from the British Bocking Mixture (the place where they were grown is Bocking, England), which is a mix of several clones that differ slightly in plant vigor and general organic structure.

The Comfrey plant is a low, dense shrub whose stems can reach three to five feet in height. Being a perennial herb, it dies back in the winter. The leaves are coarse and hairy; clasping and alternate (without stipules) on the stem and their margin is entire. The size of the leaves ranges from five to twelve inches becoming progressively smaller toward the top of the plant. The flowers are purplish, white or pale yellow and each single one is tubular shaped and about a half inch in length. They come in a cyme (cluster of 15-20 flowers per peduncle) and are scorpioid in their growth pattern. The calyx consists of five sepals, the corolla is five lobed and the flower has five anthers. The nutlet is deeply embedded in the calyx of each flower. The roots are short, thick and tuberous and the entire root system is expansive and grows as deep as eight feet into the ground.

The plant requires deep, though not necessarily good, soil for cultivation. Productivity is not very sensitive to soil pH, but highest yields occur on soils with a pH of 6.0 to 7.0. The ideal planting times are in the spring and Comfrey is best propagated by division, not seed. It produces its highest yields in full sunlight and under cooler conditions, though, it is drought resistant due to its extensive root system. It prefers moist, fertile soil, but is adaptable to many kinds of soil. Comfrey plantings are known to last indefinitely (more than twenty years) if soil fertility and proper weed control are maintained and are best planted three to four feet apart from one another. Comfrey is a high-protein forage that obtains all of its nitrogen from the soil; therefore, this nutrient must be added to the soil through composting and fertilization. It drives its roots deep into the soil, bringing up calcium, phosphorus and potash, as well as many trace elements.

Diseases are not a serious problem here in the United States. In England, Comfrey rust fungus (*Melampsorella symphyti*) overwinters in the roots and reduces the amount of old plantings harvested, but this disease has not spread to the U.S. due to plant quarantine regulations on the importation of plants or roots. There haven't been any insect problems reported in the U.S. related to Comfrey.

Comfrey is also recommended as a fertilizer in the garden because its carbon to nitrogen ratio is about 14 to 1. When compost is made we are using bacteria to lower the proportion of carbon to nitrogen compounds in order to produce heat. It is compost which makes a garden into a thriving place, too, because it makes the minerals and nutrients that plants need readily available to them. The average ratio of carbon to nitrogen is 10 to 1. Therefore, Comfrey is nearly compost before it goes on the heap! The following is a recipe for Comfrey fertilizer:

“Pick a good sized handful of leaves. Place them in a container with enough water to cover the leaves. Cover and let this cook for 4 weeks in cool weather or 2 weeks in hot weather. Then squeeze the leaves to extract as much juice as possible. Strain and use at a rate of 1/3 cup of comfrey juice to one gallon of water. Use as a foliar feed and soil drench around the plants...the

## Chemical Constituents

There has been much research and study done (Australia, Great Britain, Africa, USSR, United States) on Prickly Comfrey (*Symphytum asperrimum*) and Quaker Comfrey (*Symphytum peregrinum*) as forage plants due to their high protein content and the fact that Comfrey is the only land plant that takes vitamin B12 from the soil. The entire plant is a good source of vegetable protein, and the green leaves contain vitamins A, C, E, and several B vitamins, including choline, the fat-emulsifying vitamin that helps fight cholesterol deposits. Other ingredients are folic acid, the anti-anemia vitamin, and some B12, which controls the deadly pernicious anemia. The leaves also contain the vital minerals of calcium, potassium, phosphorus, some iron, a little iodine, and many other trace minerals. Comfrey is one of the richest sources of silicon in the botanic world, surpassed only by horsetail grass. On the following pages is a list of the chemical constituents in *Symphytum*, their medicinal actions and where *Symphytum* lands on the list of plants species with the highest amount of that constituent (ppm = parts per million):

[allantoin](#) (leaf) 13,000ppm; (root) 6,000-8,000 ppm-the biological activities are antidandruff, anti-inflammatory, anti-peptic, anti-psoriatic, anti-ulcer, immuno-stimulant, keratolytic, sunscreen, suppurative, vulnerary. *Symphytum* is the number one plant species with the highest amount of allantoin.

[aluminum](#) (root) 237 ppm-the biological activities are anti-silicotic, anti-vaginitic, candidicide, encephalopathic. *Symphytum* does not make the top plant list for this constituent.

[ascorbic-acid](#) (root) 132 ppm-the list of the biological activities of this mineral is about 65 actions long! For my purposes, I would highlight the fact that it is anti-hepatotoxic, anti-inflammatory, anti-hemorrhagic, anti-mutagenic, anti-oxidant, anti-septic, anti-tumor, anti-ulcer, cancer-preventative, diuretic, interferonogenic, uricosuric, and vulnerary. *Symphytum* does not make the top plant list for this constituent.

[ash](#) (root) 140,000 ppm-no biological activities reported. *Symphytum* does not make the top plant list for this constituent.

[asparagine](#) (root) 10,000-30,000 ppm-the biological activities of this mineral are anti-sickling and diuretic. *Symphytum* is the third highest plant species with this mineral.

[beta-carotene](#) (root) 660 ppm-again, the biological activity list is too long to mention, so I will highlight what I see as the most pertinent to this study: anti-carcinomic, anti-leukoplakic, anti-mutagenic, anti-oxidant, anti-tumor, anti-ulcer, cancer-preventative, immuno-stimulant, interferon-synergist, and phagocytotic. *Symphytum* is number fifteen on the top plant species list.

[bornesitol](#) (root)-no amount is listed. There are no biological activities reported for this constituent. *Symphytum* is number three on the top plant species list.

[caffeic-acid](#) (root)-no amount is listed. The biological activities that most pertain to Comfrey use are the following: analgesic, anti-bacterial, anti-cancer, anti-carcinogenic, anti-hepatotoxic, anti-inflammatory, anti-mutagenic, anti-oxidant, antiseptic, anti-spasmodic, anti-viral, cancer-preventative, diuretic, fungicide, hepatoprotective, immuno-stimulant, insectifuge, and sedative. *Symphytum* doesn't make the top plant list for this constituent.

[calcium](#) (root) 11,300 ppm-this mineral is crucial to the formation of strong bones and teeth, proper blood clotting, cancer preventative, anti-atherosclerotic, among many other actions. *Symphytum* doesn't make the top plant list for this constituent.

[carbohydrates](#) (root) 759,000 ppm-there are no biological activities reported, though, these are the building blocks of foods for the body. *Symphytum* doesn't make the top plant list for this constituent.

[carotenes](#) (plant) 6,300 ppm-this is vitamin A and is intrinsically connected to beta-carotenes because one beta-carotene molecule can be converted to two carotenes in the body. Both of these substances are known as liver builders and cleansers. It is helpful in wound healing, anti-oxidant,

protects mucous membranes, anti-cancer, and is known to be non-toxic in any amount. “Many researchers are now saying that people who have a high beta-carotene intake may have a lower risk of cancer.” *Symphytum* is number one on the plant species list to contain the highest amount of this vitamin.

chlorogenic-acid (root)-amount is not listed. The biological activities that most pertain to the use of Comfrey are as follows: anti-bacterial, anti-cancer, anti-hepatotoxic, anti-inflammatory, anti-oxidant, antiseptic, anti-viral, cancer-preventative, diuretic, fungicide, hepatoprotective and vulnerary. *Symphytum* doesn't make the top plant list for this constituent.

choline (root)-amount is not listed. The biological activities that most pertain to the use of comfrey are as follows: anti-cirrhotic, hepatoprotective, ileorelaxant, and lipotropic. *Symphytum* doesn't make the top plant list for this constituent.

chromium (root) 8 ppm-this mineral plays a vital role in the metabolism of glucose in the body. It helps to synthesize cholesterol, fats and proteins. *Symphytum* does not make the top plant list for this constituent.

cobalt (root) 129 ppm-this mineral plays an important role in assisting the body to assimilate and utilize vitamin B12. It participates in the production of red blood cells, boosts the cells ability to assimilate iron and it stimulates the production of enzymes required for a variety of body processes. *Symphytum* is number thirteen on the plant species with the highest amount of this constituent.

consolicine (root)-the biological activities listed are CNS-paralytic, curaroid, myoparalytic and appears to have some toxicity to it. However, note that it doesn't even have a ppm or trace amount after the name-is there so little of this in the root as to barely make the chart? *Symphytum* is number one on the plant species with the highest amount of this constituent.

consolidine (root) 17 ppm-the biological activities listed are CNS-Depressant, CNS-paralytic,curaroid and myoparalytic and they have some toxicity connected to them. Again, I notice the small amount found only in the root. *Symphytum* is number one on the plant species to contain this element in the highest amount.

d-mannose (root)-amount not listed. This is a monosaccharide and plays a role in inducing interferon in the cells which helps in immunity. *Symphytum* is the number nine on the plant species list to have the highest amount of this constituent.

echimidine (root)-amount not listed. This is another one of the toxic alkaloids because its biological activities are listed as hepatotoxic and mutagenic. Again, *Symphytum* is listed as the number one plant species to have the highest amount of this constituent. Note, too, that the amount available in the plant is not listed.

echinatine (root)-amount not listed. There are no biological activities listed for this chemical and *Symphytum* (root) is the number two plant to contain this chemical in its highest amount.

fat (root) 17,000 ppm-there are no biological activities reported. *Symphytum* does not make the top plant list for this constituent.

fiber (root) 72,000 ppm-biological activities listed are anti-diabetic, anti-obesity, anti-tumor, anti-ulcer, cancer preventative, cardioprotective, hypocholesterolemic, hypotensive, and laxative. *Symphytum* does not make the top plant list for this constituent.

GABA (root)-amount not listed. The biological activities are too numerous to repeat here but the ones that are relevant to the usage of Comfrey are sedative, tranquilizer, anti-stress, neurotransmitter, hypotensive, cardiovascular, diuretic, neuroinhibitor, CNS inhibitor, and anti-lethargic. *Symphytum* is number twenty-seven on the top plant species list. glucose (root)-amount not listed. The biological activities that are specific to Comfrey usage are anti-edemic, anti-hepatotoxic, anti-varicose. *Symphytum* doesn't make the top plant list for this constituent.

glucuronic-acid (root)-amount not listed. The biological activities listed here are: antidote (camphor), antidote (morphine), anti-hepatotoxic and detoxicant. *Symphytum* is number eighteen on the top plant species list.

gum (root) 50,000-100,000 ppm. There are no biological activities reported for gum. *Symphytum* is number six on the plant species list.

heliosupine-n-oxide (root)-amount not listed. This appears to be one of the pyrrolizidine alkaloids because of the “n-oxide” attached to the name. *Symphytum* is number one on the plant species list.

hypoxanthine (root)-there are no biological activities reported for this chemical. *Symphytum* is the

number ten on the plant species list.

iron (root) 810 ppm-this chemical is crucial to a healthy immune system because it carries oxygen from the lungs to all other bodily cells and tissues. Among many important bodily functions that are too numerous to mention, one function worthy of note is that it also boosts liver and kidney functions. *Symphytum* does not make the top plant list for this chemical.

isobaneranol (root)-the amount is not listed and there are no biological activities reported. *Symphytum* is the number one plant highest in this constituent.

kilocalories (root) 2,170/kg-there are no biological activities reported and *Symphytum* does not make the top plant species list.

l-arabinose (root)-the amount is not listed and there are no biological activities reported, though this is a gum/simple sugar and therefore an energy provider. *Symphytum* is number twenty-three on the top plants list.

l-rhamnose (root)-the amount is not listed and there are no biological activities listed. It is a gum/simple sugar and therefore provides energy. *Symphytum* is number twenty-three on the top plants list for this constituent.

lasiocarpine (root)-there is not an amount listed. The biological activities present are anti-tumor, carcinogenic and hepatotoxic. *Symphytum* is number one on the top plants list for this constituent.

lithospermic-acid (root)-amount not listed. The biological activities are anti-gonadotrophic, anti-thyroid and cardiotoxic. *Symphytum* is number five on the top plants list for this constituent.

lycopsamine (root)-amount not listed. The biological activity is hepatotoxic and *Symphytum* is number two on the top plants list for this constituent.

magnesium (root) 1,700 ppm-there is a myriad of benefits due to this chemical. The following are only a few of the ones that are more specific to the action of Comfrey: anti-convulsant, anti-inflammatory, anti-lithic, and anti-spasmodic. *Symphytum* is not listed on the top plants list for this chemical.

manganese (root) 67 ppm-there is a myriad of benefits due to this chemical. The ones more closely related to the action of Comfrey are as follows: it is required for the breakdown of protein (of which Comfrey has a lot) and fats and is involved in bone growth and development; it is vital for the proper functioning of nerve health; it stimulates the production of antibodies and phagocytes which fight infection and disease. *Symphytum* is not listed on the top plants list for this chemical.

mucilage (root) 290,000 ppm-the biological activities listed for this constituent are cancer-preventative and demulcent. *Symphytum* is number ten on the top plants list for this constituent.

mucopolysaccharides (root) 250,000-300,000 ppm-there are no biological activities reported for this constituent, but this is a long sugar chain that stores energy. *Symphytum* is number one on the top plants list for this constituent.

niacin (root)-no amount is listed. This is vitamin B3 and is necessary for a healthy nervous system and proper brain function. Among many important functions are the following: anti-convulsant, anti-dermatitic, anti-spasmodic, cancer-preventative, hepatoprotective, sedative. *Symphytum* is not listed on the top plants list for this constituent.

octadecatetraenic-acid (seed)-no amount is listed and there are no biological activities reported for this constituent. *Symphytum* is number two on the top plants list for this constituent.

phosphorus (root) 2,111 ppm-this is the second most plentiful mineral in the body next to calcium and most of it is located in the bones and teeth. It is essential to the proper development of bones, teeth and cells. It helps the body to utilize vitamins and helps to convert food to energy and it is an immuno-stimulant. *Symphytum* is not listed on the top plants list for this constituent.

potassium (root) 15,900 ppm-the cell of the human body contains more potassium than any other mineral and it is essential for the chemical reactions that take place at the cellular level. It is important in the nervous system and works with sodium to maintain the proper acid/alkaline balance in the blood. It is an anti-fatigue and anti-spasmodic. *Symphytum* is not listed on the top plants list for this constituent.

protein (root) 94,000 ppm-there are no biological activities reported for protein. Of course, proteins are the building blocks of life, so this is crucial to the action of Comfrey as a vulnerary. *Symphytum* is not listed on the top plants list for this constituent.

pyrocatechins (root) 24,000 ppm-there are no biological activities reported for this constituent. *Symphytum* is number one on the top plants list for this constituent.

reducing sugars (root) 51,500 ppm-there are no biological activities reported for this constituent. *Symphytum* is number four on the top plants list for reducing-sugars.

riboflavin (root) 7.2 ppm-this is vitamin B2 which helps the body to digest fats, proteins and carbohydrates and convert them into usable energy. Among many of its benefits, it is necessary for cell respiration and growth, it facilitates the use of oxygen by body tissues and is thus vital to the repair of bodily tissues. It is also a cancer-preventative. *Symphytum* is not listed on the top plants list for this constituent.

rosmarinic-acid (leaf) 5,000 ppm-the biological activities that are relevant to the usage of Comfrey are as follows: anti-bacterial, anti-hepatotoxic, anti-inflammatory, anti-oxidant, anti-shock, anti-viral and cancer-preventative. *Symphytum* is not listed on the top plants list for this constituent.

selenium (root)-the amount is not listed. The biological activities that are relevant to the usage of Comfrey are as follows: analgesic, anti-cirrhotic, anti-oxidant, anti-ulcerogenic, cancer-preventative and fungicide. *Symphytum* is not listed on the top plants list for this constituent.

silicic-acid (leaf) 40,000 ppm-the biological activity listed for this is anti-diabetic. *Symphytum* is number three on the top plants list for silicic-acid.

silicon (root) 35 ppm-the biological activity listed is anti-arteriosclerotic. *Symphytum* is not listed on the top plants list for this constituent.

sodium (root) 3,510 ppm-the biological activity listed is hypertensive. *Symphytum* is not listed on the top plants list for this constituent.

stigmasterol (root)-the amount is not listed. The biological activities that pertain to the usage of Comfrey are as follows: anti-hepatotoxic, anti-inflammatory, anti-viral, cancer-preventative, and sedative. *Symphytum* is not listed on the top plants list for this constituent.

sucrose (root)-the amount is not listed. The biological activities that pertain to the usage of Comfrey are as follows: anti-oxidant, demulcent, and vulnerary. *Symphytum* is not listed on the top plants list for this constituent.

symlandine (plant)-the amount is not listed and no biological activities are reported. However, *Symphytum* is number one on the top plants list.

symphytine (root)-the amount is not listed. The biological activity listed is hepatotoxic. *Symphytum* is number one on the top plants list.

symphytocynoglossin (root) 21 ppm-the amount is not listed and no biological activities are reported. However, *Symphytum* is number one on the top plants list.

tannin (plant) 80,000-90,000 ppm-the biological activities that pertain to the usage of Comfrey are as follows: anti-bacterial, anti-hepatotoxic, anti-oxidant, anti-viral, cancer-preventative, hepatoprotective and anti-HIV. *Symphytum* is not listed on the top plants list for this constituent.

thiamin (root) 1.2 ppm-the biological activities that pertain to the usage of Comfrey are as follows: analgesic, anti-cardiospasmic, anti-deliriant, anti-fatigue and anti-neuralgic. *Symphytum* is not listed on the top plants list for this constituent.

tin (root) 6.7 ppm-the biological activities listed are anti-acne and anti-bacterial. *Symphytum* is not listed on the top plants list for this constituent.

viridiflorine (plant)-the amount is not listed and there are no biological activities reported. However, *Symphytum* is number one on the top plants list.

water (root) 862,000 ppm-there are no biological activities listed for water, but it is important to remember that the body cannot function without water. It keeps all the systems functioning. *Symphytum* is not listed on the top plants list for this constituent.

xylose (root)-the amount is not listed. The biological activities are anti-diabetic, diagnostic, and dye. *Symphytum* is not listed on the top plants list for this constituent.

zinc (root) 2.8 pp-the biological activities that pertain to the usage of Comfrey are as follows: anti-arthritic, anti-eczemic, anti-infective, anti-viral, astringent, immuno-stimulant and vulnerary. *Symphytum* is not listed on the top plants list for this constituent.

## Contra-Indications

The literature is full of warnings to not ingest Comfrey, especially the root, due to the pyrrolizidine alkaloids (hereafter noted as PAs) that it contains. In the past twenty years Comfrey has been linked to four cases of veno-occlusive disease worldwide. However, these cases involved long-term, abusive doses of Comfrey tea (e.g., ten cups of Comfrey tea plus handfuls of Comfrey-pepsin tablets every day for years). “The studies already performed certify that PAs have an acute hepatotoxic effect and a carcinogenic effect with chronic application; therefore, they confirm the opinion stated in the expert textbooks that the hepatotoxicity and carcinogenicity of these PAs is considered proven. Considering this fact, the use of higher constituent levels or an exposure of longer duration are connected with damaging effects, which go beyond the responsible measure of the insights of medical science. This evaluation corresponds to current scientific knowledge, regarding a methodical procedure for identifying carcinogenic substances, and the interpretation of existing reports. The data are scientifically defensible and therefore, sufficient. The demand for further evidence concerning the establishment of risk, before a decision is made, can therefore not be considered.”

Studies done in the United States have found that, “there is extreme variability in the PA content of commercial Comfrey products. Products containing Comfrey in combination with other ingredients were found to contain the lowest alkaloid levels, while the highest levels were found in bulk Comfrey root, followed by bulk Comfrey leaf. Hot water infusions of both Comfrey leaf and root were prepared and also proved to contain PAs; this is contrary to claims by proponents of Comfrey leaf who maintain that it is harmless because its PA levels are low and because PAs are not particularly water-soluble.”

These two articles are echoed throughout the literature in one way or another. The one article that I read which opposes these was by Dr. D.B. Long, Ph.D., M.A. He adequately explains the actions of pyrrolizidine alkaloids and which ones are active in Comfrey. He then goes on to critique two of the major studies done on this topic. The first one was done by the Chemistry Department of the University of Exeter in conjunction with the Toxicology Unit of the Medical Research Council at Carshalton and the Michaelis Nutritional Research Laboratory at Harpenden, England. Their studies consisted of 1) The extraction and purification of the alkaloid for direct injection into rats to determine immediate toxicity, 2) Direct feeding experiments with rats to determine long-term chronic effects, and 3) The determination of alkaloid content in the green leaves of various Comfrey clones. To summarize Dr. Long's critique, he noted that the method used was effective in separating out closely related alkaloid compounds, but is less reliable in giving repetitively reproducible results.

The second study that Dr. Long critiqued was done by Furuya and Araki in Japan. They confined their research to *Symphytum asperrimum* (not the one used medicinally) and they, too, extracted the alkaloids from the plant and fed it to rats. They gave the rats an intravenous injection of 300 mg of the purified alkaloid per Kg of rat tissue and this caused death in approximately 50 percent of the experimental animals. In reference to this Dr. Long notes, “Thus in the case of Comfrey tea if it be assumed that normal methods of infusion could extract just over half the alkaloid that was extracted by 8 hours in a Soxhlet apparatus in the laboratory, each cup of tea could contain 100 micrograms of alkaloid. At this level the consumer could never attain the lethal dose of 300 milligrams/Kg tissue found necessary to produce the acute reaction in rats. Even to consume this quantity it would take a 150 lb. man drinking 4 cups of tea per day a total of 140 years. Furthermore it is known that to produce chronic reactions, sub-lethal doses over a prolonged period are necessary.”

Dr. Long concludes his analysis of the studies by saying that the use of Comfrey as food for mankind or animals does not present a toxic hazard from alkaloids. He notes that extensive use of the herb as forage for animals has failed to reveal any deleterious effects, but instead has had considerable benefits to them. He states again that the alkaloid content is lower when the herb is

used in its wholesome state.

There are some interesting things that I noticed as I researched this herb, of which I will now note. First, there is no definition for pyrrolizidine in the Merck Index (twelfth edition, 1996), nor in the dictionary, nor in my medical dictionaries—the word does not exist in these books. The source in which I found some information was online. Still, none of the literature that I found would make a list of the PAs that are in Comfrey. Even Dr. Duke's database doesn't tell you exactly which ones are the noted pyrrolizidine alkaloids. In studying the chemical constituents list noted in Dr. Duke's database, I could not help but notice a few important chemical activities that are never mentioned in any of the literature that I have read to date.

For example, the following chemical constituents are listed as anti-hepatotoxic, hepatoprotective or otherwise liver-building: ascorbic-acid, found in the root at 132 ppm; beta-carotene, found in the root at 660 ppm; caffeic-acid, found in the root in trace amounts; carotenes, found in the whole plant at 6,300 ppm and one carotene is turned into two beta-carotenes in the body, putting the liver-building potential (when combined with beta-carotene) at 13,260 ppm. Comfrey is the plant that contains the highest amount of carotenes on Dr. Duke's list. To give you a contrast, the carrot, known as a tremendous liver builder, has 673 ppm of beta-carotene in its root. Then additionally Comfrey contains chlorogenic-acid, found in the root in trace amounts; choline, found in the root in trace amounts; glucose, found in the root in trace amounts; glucuronic-acid, found in the root in trace amounts; iron, found in the root at 810 ppm; niacin, found in the root in trace amounts; rosmarinic-acid, found in the leaf at 5,000ppm; selenium, found in the root in trace amounts; stigmasterol, found in the root in trace amounts; tannin, found in the plant at 80,000-90,000 ppm.

Some simple arithmetic puts the liver-building, hepatoprotective chemicals in the root at 1,602 ppm plus the eight constituents listed that are found in trace amounts. The amounts found in the plant and leaf come to a total of 101,300 ppm!

Now, let's compare that to the pyrrolizidine alkaloids, the chemicals noted on Dr. Duke's list as toxic or hepatotoxic: consolicine, found in the root in trace amounts; consolidine, found in the root at 17 ppm; echimidine, found in the root in trace amounts; heliosupine-n-oxide, found in the root in trace amounts; lasiocarpine, found in the root in trace amounts; lycopsamine, found in the root in trace amounts; symphytine, found in the root in trace amounts. For all of these chemicals, *Symphytum* is the number one (or two) plant known to contain the highest amount of this chemical. Nonetheless, if we do our math, we find that the total of PAs is 17 ppm plus the six constituents that are found in trace amounts. We have 102,902 ppm of liver-building, anti-hepatotoxic constituents as compared to 17 ppm of hepatotoxic constituents—not counting the trace amounts found on both sides. Although I am not a chemist, this discrepancy is glaring and needs investigation. My intent is to research this discrepancy.

I also find it interesting that four deaths in twenty years has given the FDA reason to blacklist Comfrey, and yet thousands of people die (or suffer serious and life-threatening side effects) each year from prescription drugs, chemotherapy, misdiagnoses and many other forms of modern medicine. Have we lost the good of reason here? Or do we have a political struggle that is rooted in greed and the lust for power?

## Formulas and Dosages

The future for Comfrey looks grim, or at least mired in political controversy! I tried to obtain some bulk Comfrey root and leaf at my local health food store and they said that it had been discontinued. In fact, they only had 4 products in the entire store that contained Comfrey: three ointments for external application and one tincture, manufactured by the Herb Pharm, that claimed to have removed the PAs. For its dosage, the tincture recommends 30-40 drops in a little water, two to five times per day. The ointments say to apply externally only as needed. There is the BF&C formula through the Dr. Christopher Herb Shop that contains Comfrey leaf. This is one of two products that I found that is intended for internal use. The recommended dose is two capsules three times daily as a support to promote healthy bone, flesh and cartilage function.

There were many more products containing Comfrey to be found online:

Sun Soaps carries four products, mainly ointments/gels, that contain Comfrey. These are for external applications.

Hilton Comfrey Compress sells just the compress which is produced using the best Comfrey extracts. It is available in two different sizes, sells mainly for use on horses, and can be cut to suit individual use. For external use only.

Comfrey Herbal Anti-inflammatory creme sells just this one Comfrey containing creme. It is for external use only.

Elizabeth's Essentials Comfrey Range sells fourteen products containing Comfrey, all of which are for external application only.

## Personal Experience

Let me begin with some of my own health history. In 1985 I had major back surgery to repair a badly herniated disc at L4-L5 and a broken bone at L5-S1. The surgeon took out seventy percent of my disc and then took bone from my hip and grafted it to the broken area of my spine. It was fully a year before I felt "normal" again; but I went on to play professional volleyball as well as other things which my surgeon told me would be athletically impossible. A doctor friend told me that I had had an unusual recovery, one out of a thousand, given the type of surgery. Interestingly enough, I took herbs after I left the hospital, though I was uninformed at the time; I just took what was handed to me and left it at that! As the years passed, I found as long as I stayed in great shape athletically my back never bothered me. After my athletic career ended in 1990, I changed occupations to carpentry.

In 1992, I hurt my back at work and was out for three months. I did physical therapy and returned to work full-time, until I hurt it again in 1997. I could never manage to stay in the kind of physical shape I needed (for my back), work full-time as a carpenter-and live life! So my back became progressively weaker until in 1997 it gave out. It was at this point that I became interested in herbs. I knew modern medicine could give me no hope for full recovery, so I began to look elsewhere; in my search I discovered the School of Natural Healing, BF&C and all the wonderful help that is available through natural therapies. In 1997, I was in constant pain, couldn't walk around the block without pain and couldn't bend forward at the hips more than ten degrees. I saw my chiropractor three times a week for a year. Now, in May of 2000, I can walk (even jog!) around the block, work a full day free of pain as a carpenter, and work in my garden; basically I am not hindered from doing the things I want to do in my life.

Comfrey, in the BF&C formula, has been a major part of this process. At first I began only taking BF&C internally; as I learned more, however, I branched out into other avenues of healing. I have done two three-week stints of "The Incurables Routine" for the past two summers and intend to do it again this summer. This, of course, involves drinking Comfrey leaf tea three times a day, taking BF&C internally, as well as BF&C fomentations it at night. I was surprised the first time I did this routine to discover that I felt amazingly strong and energetic throughout the entire process. I look forward to doing "The Incurables Routine" again as it made me feel wonderful!

I grow Comfrey in my garden as well. I have one plant that I know is *Symphytum officinale*; I also have two other plants that I know are not *Symphytum officinale*, as I purchased them before I knew there were different types. I have made and used "Comfrey tea" fertilizer for my garden; many of my plants are healthy and thriving. Though it was smelly, I'm sure that the Comfrey tea played a big part to do in my garden's success.

I've made the "Potassium Drink" recipe, which involves Comfrey leaves fresh from my garden, and had no deleterious effects from the Comfrey ingestion. I drank the whole eight quarts of it in one week and found that the broth was both tasty and nutritious.

In December of 1998 I wrenched my right hip out of the socket; I also discovered I was born with an unformed right hip socket (known as hip dysplasia). This caused another eight months of chronic pain. During that time I took large quantities of BF&C internally (3-4 `00' capsules three times a day), fomented with BF&C, and continued with other therapies-chiropractic, exercises, (semi) mucusless diet, other herbs, and prayer. In the midst of healing my right hip, I took a self-defense course (May 1999). On the first day I sprained my right ribs! Once again, I took massive doses of BF&C (2 `00' capsules every hour for about two weeks) internally, as well as fomentations at night. I had to sit out the second session, but was able to fully participate (carefully) for the remaining three sessions.

I use the BF&C ointment on any cuts or abrasions, of which I receive many in the field of carpentry. I put a glob of ointment on, followed with a bandaid at night; the cut is usually seventy-five percent healed in the morning and fully healed by the following morning. Recently, my husband had a bicycle accident and suffered severe "road rash" on his entire right side. He

had severe abrasions on his right calf, thigh, hip and forearm. We used poultices containing slippery elm and fresh Comfrey leaf at night; during the day we also applied copious amounts of the BF&C ointment. We did not take the ointment off to apply the poultices, but just kept adding more. The wounds have healed without scarring.

I have also had a nagging left knee problem over the past three years that continues to improve and it is nearly gone at the writing of this paper. My chiropractor thinks it's chondromylasia or tendonitis-either way, the therapy is still the same: BF&C!

I expect to be on the BF&C formula for a long time due to the amount of skeletal damage I've experienced in my life. I need to grow disc and bone material in my spine, right hip and left knee. X-rays have shown that I have mild arthritis in my spine as well; interestingly enough, however, my chiropractor could not tell by looking at my x-rays that I've undergone past surgeries. The bones have healed so well that the normal things that show up on x-rays (related to surgery) are not present! Due to the warnings about the pyrrolizidine alkaloids in Comfrey, I have been diligent to herbally protect my liver as well. I use the Barberry LG formula and take Milk Thistle in my morning green drink daily.

In brief summary, my personal use of Comfrey and the historical evidence noting the medicinal uses of Comfrey, have validated many positive healing results. I believe it is necessary for the herbal community to continue research to discover new uses of this wonderful herb and dispel the misconceptions put forth by agencies such as the FDA. I am grateful that Dr. Christopher's has not bent to the pressure of the FDA to remove Comfrey from the BF&C formula.

What a blessed plant Comfrey is; I for one, am grateful to have found it!

## Contentions with the Comfrey Studies

We sent a large stack of documentation to the FDA and the FTC refuting their claims that Comfrey is harmful. The following is a list of problems we saw in the studies that the FDA and FTC used to make their decision. Click on the #s to find how we responded to them, or follow the links across the top.

Contentions:

- [1.](#) Studies pointing to harmful effects of *Symphytum officinale* were performed with the root which has a higher Pyrrolizidine alkaloid content and is not used internally in Dr. Christopher formulas.
- [2.](#) Studies were performed with extremely concentrated extracts or single constituents of the herb containing higher Pyrrolizidine alkaloid content than the whole plant.
- [3.](#) Studies were performed by injecting plant constituents under the skin or in tissue cultures, exhibiting an unrealistic scenario of this plant's use.
- [4.](#) Many studies cited in literature related to harmful effects of *Symphytum officinale* were performed on related species with higher Pyrrolizidine alkaloids content than *Symphytum officinale*.
- [5.](#) *Symphytum officinale* has been shown to act as a cell proliferant and have analgesic effects in clinical studies.
- [6.](#) *Symphytum officinale* has been clinically proven not to have carcinogenic effects.
- [7.](#) *Symphytum officinale* contains hepatoprotective constituents that help protect the liver from damage, these substances are not included in tests of this plant and would effect the outcome of these tests.
- [8.](#) *Symphytum officinale* has been used as a feed and forage crop for centuries without incident.
- [9.](#) *Symphytum officinale* has demonstrated its safety through thousands of years of documented traditional use.
- [10.](#) *Symphytum officinale* use has low incidence of hepatic problems.
- [11.](#) Case studies that seem to show harmful effects from consuming *Symphytum officinale* reflect poor application of the scientific method.

12. *Symphytum officinale* has demonstrated its safety through 43 years of use in Dr. Christopher's formulas without incident.

## Response to #1

1. Studies pointing to harmful effects of *Symphytum officinale* were performed with the root which has a higher Pyrrolizidine alkaloid content and is not used internally in Dr. Christopher formulas.

J Pharm. Sci 1994 May;83 (5):649-53

Determination of pyrrolizidine alkaloids in commercial comfrey products demonstrates that products containing comfrey leaf in combination with other herbs contained the lowest alkaloid levels (0.1 ppm) of the products tested.

*The leaves have the lowest alkaloid content of the plant parts tested. The leaf is the part used internally in Dr. Christopher's herbal combinations.*

Gastroenterology 1985 Apr;88(4):1050-4

Hepatic venocclusive disease associated with the consumption of pyrrolizidine-containing dietary supplements.

The case discussed in this article described a 49 year old woman who ingested large amounts of *Symphytum officinale* root over a long period of time.

*In this case the woman ingested large portions of the root for an extended period of time. The root is not used internally in Dr. Christopher's herbal combinations.*

J Appl Toxicol 1983 Jun;3(3):127-30

Mutagenic effects of aqueous extracts of *Symphytum officinale* L. and of its alkaloidal factions. This study was done on alkaloidal factions obtained from infusions of *Symphytum officinale* L. root and not the leaf. It shows that isolated constituents of the root may be toxic but fails to demonstrate the root is toxic in its whole form

*This study shows that isolated constituents of the root can be toxic but fails to implicate the leaf which is used in Dr. Christopher's herbal combinations.*

Experientia 1982 Sep 15;38(9):1085-7

Pyrrolizidine alkaloids from *Symphytum officinale* L. and their percutaneous absorption in rats. This study demonstrates that pyrrolizidine alkaloids are not readily absorbed through the skin and therefore, are not of significant concern when applied in this manner.

*The alkaloids in comfrey are not readily absorbed through the skin, external application of a crude preparation (cream or ointment of the whole plant) of the root is not harmful.*

## Response to #2

2. Studies were performed with extremely concentrated extracts or single constituents of the herb containing higher Pyrrolizidine alkaloid content than the whole plant.

Nat Toxins 1996;4(4):163-7

Analysis, separation, and bioassay of pyrrolizidine alkaloids from comfrey (*Symphytum officinale*).

Demonstrates that some parts of the plant contain higher pyrrolizidine content than others (the leaf containing the lowest). And that the effect of the alkaloids individually is different from that of the alkaloids in the whole plant extract.

*Alkaloids react differently in the body when they are isolated. Many studies are done on the effect of these isolated constituents, but the results cannot be used to determine safety of the whole plant.*

Int J Exp Pathol 1993 Apr;74(2):211-7

Hepatocyte membrane injury and bleb formation following low dose comfrey toxicity in rats.

This study attempted to prove the toxicity of low level doses of comfrey by using isolated Pyrrolizidine alkaloids extracted from the plant.

*This study was not done on the safety of the entire plant, only certain isolated constituents. This study should not be used to determine the toxicity of the whole plant.*

T. Furuya and K. Araki (1968) Studies on Constituents of Crude Drugs. (Alkaloids of *Symphytum officinale* Linn. Chem. Pharm. Bull. 16 1512-2516

Pharmacological tests with rats showing symphytine to have a LD50 of about 300mg/kg; that in an intravenous injection of 300 mg of the purified alkaloid per Kg of rat tissue caused death in approximately 50% of the experimental animals. Thus in the case of comfrey tea, it is to be assumed that normal methods of infusion could extract just over half the alkaloid that was extracted by 8 hours in a Soxhlet apparatus in the laboratory, each cup of tea could contain 100 micrograms of alkaloid.

*At this level the consumer could never attain the lethal dose of 300 mg/Kg tissue found necessary to produce the acute reaction in rats. Even to consume this quantity it would take a 150 lb man drinking 4 cups of tea per day a total of 140 years. This scenario is unrealistic. Comfrey leaf is not toxic unless copious quantities are consumed for long periods of time.*

| [References](#) | [Testimonials](#)

## Response to #3

3. Studies were performed by injecting plant constituents under the skin or in tissue cultures, exhibiting an unrealistic scenario of this plant's use.

Planta Med 1989 Dec;55(6):518-22

Studies on the effect of alkaloid extract of *Symphytum officinale* on human lymphocyte cultures. This study used an isolated extract of comfrey on human lymphocyte cultures to show toxicity.

*This study fails to demonstrate the whole herb's toxicity and was not administered as a decoction or infusion (the way comfrey is realistically consumed).*

J Natl Cancer Inst 1979 Aug;63(2):469-72

Injection of hepatic tumors in rats by senkirkine and symphytine.

This study was conducted on 3 groups of 20 rats group 1 injected with an extract of senkirkine, group 2 with symphytine (an alkaloid of comfrey), and group 3 with a NaCl solution. The rats were predisposed to liver problems (male inbred ACI rats). All group 1 rats survived for more than 290 days after the start of injections, and 9 of 20 rats developed liver cell adenoma. All group 2 animals survived for more than 330 days after the start of injections. Of 20 rats 4 had liver tumors, 3 had hemangioendothelial sarcomas, and 1 had liver cell adenoma. The control group 3, had no liver tumors.

*This test demonstrated that injected isolated constituents may be harmful. However, it failed to show the toxicity of the whole plant administered realistically.*

Hirono I Mori H, Haga M: J Natl Cancer Inst. 61(3):865-868

Carcinogenic activity of *Symphytum officinale*.

Rats were injected with isolated alkaloids from *Symphytum o.* resulting in mild liver damage compared to a control group.

*This study proved that in order to produce even a limited amount of liver damage in a rat it is necessary to administer the equivalent of several times its own body weight of comfrey leaf (when the results are expressed as fresh material) or at least 1% of its diet as comfrey root. It is difficult to envision a situation in which a human subject would assimilate an equivalent amount of comfrey over a similar time span. Deaths in the rats occurred at levels which for humans would be equivalent to the alkaloid from 19,880 leaves or 28 times his body weight. So to extrapolate the results of Hirono's study to humans, it would be necessary to eat three ounces of fresh comfrey leaf every day for 56 years to induce any liver damage.*

T. Furuya and K. Araki 1968 Chem. Pharm. Bull 16 2512-1516

Studies on constituents of crude drugs specifically alkaloids of *Symphytum officinale*

Pharmacological tests with rats showed symphytine to have a LD<sub>50</sub> of about 300 mg/kg or rat tissue when given intravenously.

*At this level the consumer could never attain the lethal dose of 300 mg/per kg of tissue found necessary to produce the acute reaction in rats. Injecting plant constituents does not have the same physiological effect on the body as drinking an infusion (tea) of the plant.*

## Response to #4

4. Many of the studies cited in literature related to harmful effects of *Symphytum officinale* were performed on related species with higher Pyrrolizidine alkaloids content than *Symphytum officinale*.

Pathology 1991 Jan;23(1):35-8

The effects of comfrey derived pyrrolizidine alkaloids on rat liver.

Pyrrolizidine alkaloids extracted from *Symphytum uplandicum* were used to show the toxicity of comfrey. This Russian comfrey species is not sold or distributed in herbal formulas.

*None of Dr. Christopher's original formulas include Symphytum uplandicum, or any other Symphytum species other than officinale.*

Experientia 1980 Apr 15;36(4):377-9

Structure and toxicity of the alkaloids of Russian comfrey (*Symphytum uplandicum* N.), a medicinal herb and item of human diet.

Alkaloids extracted from this related species exhibited chronic hepatotoxicity in rats. This study was not performed with the whole herb of the correct species.

*None of Dr. Christopher's original formulas include Symphytum uplandicum, or any other Symphytum species other than officinale.*

## Response to #5

5. *Symphytum officinale* has been shown to act as a cell proliferant and have analgesic effects in clinical studies.

Roum Arch Microbiol Immunol 1993

Action of some proteic and carbohydrate components of *Symphytum officinale* upon normal and neoplastic cells.

Crude water extracts of symphytum officinale stimulated in vivo proliferation of studied neoplastic cells. Therefore, *Symphytum* is an effective cell proliferant.

*Traditional usage of comfrey as a cell proliferant is substantiate with this clinical trial.*

F.M. van den Dungen et al. Planta Med 57(2) 1991

Inhibition of Compliment Activity by High Molecular Compounds of *Symphytum officinale*.

Common comfrey, of *Symphytum officinale* L. is well known for its wound healing properties. At the site of a dermal wound, activation of complement is one of a complex series of processes.

Since complement factors upon activation exert important immuno-regulatory effects, modulation of complement activity may promote the healing of wounds.

*Traditional usage of comfrey as a cell proliferant is substantiate with this clinical trial*

R.S. Goldman et al. Fitoterapia LVI(6) 323

Wound Healing and Analgesic Effects of Crude Extracts of *Symphytum officinale* in Rats.

The crude extract of *S. officinale* (comfrey) afforded the cicatrization process by increasing at first the number of fibroblasts and in a later phase, the number of collagen fibers in experimental lesions produced in rats. The number of blood vessels was also increased on the seventh day of treatment. On experimental edema induced by carrageenin in rat's paws, the crude extract at doses of 150 and 300 mg/kg showed no effect. Analgesic effect was seen with doses of 300 mg/kg.

*Comfrey's use as a burn remedy is substantiate in this clinical trial.*

## Response to #6

6. *Symphytum officinale* has been clinically proven not to have carcinogenic effects.

Ames, B. PhD. et al. 1987. Science 236:271

Study of carcinogenity of naturally occurring and man made substances. Comparative risk assessment.

Dr. Bruce Ames determined in his clinical study that a water infusion (tea) made from *Symphytum officinale* had the same carcinogenic effect as 1 peanut butter sandwich (aflatoxin), ½ the risk of consuming a raw mushroom (hydrazine), ½ the risk of consuming a diet soda containing saccharin. And about 1/100 of the risk of consuming a standard beer or glass of wine (ethyl alcohol). Dr. Ames also estimated that comfrey/pepsin tablets carry up to 200 times the risk of comfrey tea.

*Symphytum officinale* is as safe as many common food items.

## Response to #7

7. *Symphytum officinale* contains hepatoprotective constituents that help protect the liver from damage, these substances are not included in tests of this plant and would effect the outcome of these tests.

James Duke; United States Department of Agriculture Phytochemical and Ethnobotanical Database. (Search for all active constituents of *S. officinale* was conducted and included later in this report).

Search for Hepatoprotective and Anti-Tumor principles of *Symphytum officinale*

This data base shows at least five substances in comfrey that have a protective effect on the liver; they are Caffeic acid, Chlorogenic acid, Glucuronic acid, Lasiocarpine, and Rosmarinic acid.

Caffeic acid has anti-hepatotoxic, anti-tumor, and hepatoprotective actions. Chlorogenic acid which has anti-cancer, anti-hepatotoxic, anti-mutagenic, anti-tumor, and hepatoprotective actions.

Glucuronic acid is a anti-hepatotoxic, Lasiocarpine exhibits anti-tumor actions, and Rosmarinic acid is a anti-hepatotoxic.

*Since Symphytum officinale has been used as animal feed and forage for centuries with safe results, it is likely that these hepatoprotective and anti-tumor qualities of the plant act to counter the plant's Pyrrolizidine alkaloids content. This is why the most damaging studies done on comfrey were conducted using Pyrrolizidine alkaloids isolated from the plant while disregarding the plant's significant liver protecting constituents that would have a profound effect on the results of the study.*

## Response to #8

8. *Symphytum officinale* has been used as a feed and forage crop for centuries without incident.

Cheeke PR, Carlsson R: Nutritional reports International 18(4):465-472, 1978

Evaluation of several crops as sources of leaf meal: Composition, effect of drying procedure and rat growth response

This study suggests benefits of consumption of *S. officinale* and does not implicate comfrey as a liver toxicant.

*Comfrey used in its whole form is safe.*

Lawrence D Hills Comfrey- Past present and future 1976

A test at the Fujisawa Farm of the Nihon Agricultural University in Japan showed that adult pigs do well on 8 to 9 kg (17-19 pounds) of green comfrey leaf per day. This means replacing 30 percent of the meal with cut comfrey. The University report states a noticeable result was the improved health of the pigs fed on comfrey not only from the allantoin which banished scouring but better mineral balance. This was also observed an the Devon farm institute..

*Comfrey has been used as a feed crop for animals without incident, these were animals that consumed large amounts of comfrey for most of their lives.*

Lawrence D Hills Comfrey- Past present and future 1976

Experience gained over many years with feeding cattle and horses on comfrey in different parts of the world has failed to produce any evidence of an acute reaction. Equally well there is an absence of any direct evidence of liver tumors of the chronic reaction in comfrey fed animals having been observed in slaughter houses.

*No liver problems resulted in feeding farm animals comfrey in large amounts.*

## Response to #9

9. *Symphytum officinale* has demonstrated its safety through thousands of years of documented traditional use.

Comfrey is referred to in Materia Medica written for thousands of years. Dioscorides (200 AD), Lobelius (1570), Sarracenus's version of Dioscorides (1596), Gerald's Herbal (1597) and The Pharmacopeia Londinensis Collegarum (1668) all point to the extensive use of *Symphytum officinale* as a herbal remedy. All also mention that *Symphytum officinale* was already established as a herbal remedy for some time. None of these early pharmacopeias and Materia Medicas give warnings of the herb's use and generally regard comfrey as a safe plant with high value.

## Response to #10

10. *Symphytum officinale* use has low incidence of hepatic problems.

Human Toxicology, PC Anderson and AEM McLean

Hepatotoxic effects of *Symphytum officinale* questioned in clinical setting.

The Laboratory of Toxicology in London, sent volunteers a questionnaire regarding how long they had used comfrey and the amount and form in which the herb was taken. At the same time the participants underwent liver function tests at the local hospital. There was a considerable variation in how the herb was taken and in what form. Nonetheless, results of the tests were found to be within the normal range with the exception of a slight elevation in bilirubin levels in two of the participants. There was no evidence of liver injury in this sample, even for those who had consumed the herb for twenty years.

*Comfrey is safe when consumed in its whole state. The people in this study were repeat consumers of comfrey for long periods of time without ill effects.*

## Response to #11

11. Case studies that seem to show harmful effects from consuming *Symphytum officinale* reflect poor application of the scientific method.

Mee Ling Yeong et al J. Gastroenterology and Hepatology 5,211-214 1990

Hepatic veno-occlusive disease associated with comfrey ingestion

A 23 year old man was diagnosed with veno-occlusive disease after going to the hospital for a fever and malaise. Diuretics were administered and a shunt employed to relieve liver congestion.

The man died of liver failure seven days after installing the shunt. The liver was not biopsied to see if Pyrrolizidine alkaloids or their metabolites were present. His friends reported that he had consumed comfrey 1-2 weeks prior to his hospitalization. It was not determined what species or if indeed it was comfrey at all. It was also not determined if there were other Pyrrolizidine alkaloids sources present in his diet. Also it was not determined if his habit of binge eating and consumption of marijuana caused deterioration of the hepatic cells leading to this problem.

*Nothing was done to determine if indeed he had ingested Symphytum officinale. The plant cannot be implicated on here say or second hand accounts of its usage.*

Nancy Bach, MD et al Am J Med. Volume 87 page 97 July 1989

Comfrey Herb Tea-Induced Hepatic Veno-Occlusive Disease

A 47 year old woman had consumed ten cups of comfrey tea a day along with handfuls of comfrey/pepsin tablets. This amount of consumption went on for more than one year. Four years later, she developed a liver problem diagnosed as veno-occlusive disease. Although the woman in the study consumed very large amounts of a plant, it was not determined exactly what species of *Symphytum* or indeed, if it was even a *Symphytum* species at all through current tests. She also had symptoms of abdominal pain and fatigue before using comfrey. These are both symptoms of veno-occlusive disease that she may have had before consuming the plant. This is not determined in this case. Therefore, the case study should not be used in reference to the hepatotoxicity of *S. officinale*.

*This woman had symptoms of veno-occlusive disease before consuming the plant. It cannot be determined if the plant worsened, caused, or had anything to do with her condition.*

Ridker PM, et al Gastroenterology 88:1050-4 1985

Hepatic Venocclusive disease associated with the consumption of pyrrolizidine containing dietary supplements

A 49 year old woman consumed six capsules of comfrey-pepsin tablets daily for four months.

For six months she had taken Mu-16, which also contained Pyrrolizidine alkaloids. The researchers failed to investigate. The pyrrolizidine alkaloids in the Mu-16 tea could have been the toxic Macrocyclic diesters or another alkaloid. Yet, comfrey was implicated in this incident.

There is also evidence that comfrey-pepsin tablets contain higher amounts of Pyrrolizidine alkaloids than other comfrey containing products.

*Comfrey was not the only source of pyrrolizidine alkaloids in his diet. Comfrey cannot be implicated in this case study.*

Weston CFM et al. Brit Med J July P 183 1987

Veno-occlusive disease of the liver secondary to ingestion of comfrey

A 13 year old boy was treated for liver enlargement and abdominal swelling with Prednisolone and Sulfasalazine. This treatment seemed to help and the medication was discontinued. He was then treated with acupuncture and comfrey root tea. Exact strength and frequency are unknown but the course of treatment lasted more than two years. A flare up of Crohns's disease led the doctor to prescribe more Prednisolone. After two years he was again hospitalized with fever, abdominal pain, and swelling. Liver biopsy showed veno-occlusive disease.

*Although at the time all other known factors were ruled out, further investigation shows that the medications he was taking could have been the major culprits in this case. Prednisolone can cause abdominal pain, gastrointestinal upset, and damage the liver. This liver damage (brought on through hypokalemic alkalosis) would have weakened his liver and made him more susceptible to liver toxicity. Sulfasalazine can cause headache, nausea, vomiting, gastric distress, and hepatitis. This indicates that people with a history of liver toxicity should not use Prednisolone and Sulfasalazine together.*

## #12

12. *Symphytum officinale* has demonstrated its safety through 36 years of use in Dr. Christopher's formulas without incident.

There have been no reported incidents of serious side effects from people using Dr. Christopher's formulas containing comfrey. We have found this herb to be safe and effective. Two incidents of slight skin irritation have occurred but these cleared up after discontinuing use of the product.

Testimonials of the safety and effectiveness of Dr. Christopher products containing comfrey appear later in this report.

*With thousands of people consuming Symphytum officinale everyday and with no incidence of the plant causing serious harm, it is obvious that it is safe for human consumption.*

## Comfrey Testimonials

This is only a small sampling of the stacks of testimonials we have on Comfrey.

Testimonials of the safety and effectiveness of products containing *Symphytum officinale*.

### *S. officinale* effective for sprains and breaks

August 9, 2000 ~ This is my comfrey story. I'll try to be brief and concise. I began to study and research herbs and so called alternative health therapies several years ago, both as a consequence of publishing my own newspaper called "Active Voice," which allows all people equal access at unedited, mass communication, and as a result of a friend coming down with liver cancer and being told to go home and die by medicinal "experts." I make that intro only to explain that my quest to learn began in earnest and that my studies and research have become deep and serious. This past year I have been running a series in my newspaper called "Kicking Cancer's Ass," which is incorporating all I have learned as well as inviting information from others.

Over the course of my studies and research on health and healing, many of the herbal concepts and information were introduced to me via videotapes by Dr. John R. Christopher and Dr. Richard Schultze, thanks to a man named Sam Biser who put the tapes together. This is where I first began taking notes on comfrey and its curative powers. It is far from the only source I have come to trust which advocates the usage of comfrey and also emphasizes comfrey's abilities to heal.

As a person who has always been physically active, involved in playing sports with much running and jumping and physical contact, I have often and consistently suffered sprains in my ankles. I have been lucky to never suffer any breakages, but I have experienced severe, as well as minor sprains, ranging from those which have required air casts and usage of crutches to those which can be brushed off easily.

Earlier this year while playing basketball I came down on someone's foot and my own ankle rolled and suffered tremendous pain. My immediate reaction was more than simply "here we go again" because I genuinely thought I heard something snap as I went down. When I got up and hopped and walked gingerly around a bit it seemed to be similar to past twists or sprains I had suffered. It didn't seem to be as bad as the original pain indicated, or as bad as the sound made me fear, so I moronically began playing again until our game time was over for the day about an hour later. Having experienced such sprains before I should have known enough to take care of it then or at least afterwards that night. But I didn't, and the next morning my ankle was roaring tremendous pain and I was unable to walk.

As I thought about how dumb I was I also thought about all the times I had heard and read about comfrey being used to heal sprains and breaks back in the "days" of the Native Americans, and also by herbalists such as Christopher. I remembered not just the mere fact that comfrey was good, but that the key ingredient was allantoin, which somehow served to helped bind and mend tissue and even induce regeneration of new cells. We had grown comfrey in our herb garden and had some already cut and ready for tea in supply. And so I began that day my own experiment on myself with comfrey.

Every couple hours I would make a pot of comfrey tea, then douse my badly sprained ankle with wash cloths soaked in the tea. I had a strange feeling that as long as my ankle wasn't broken, which I felt strongly that it wasn't, that this might actually work better than paying a large sum of money to have somebody take a picture of my wounded ankle and tell me to stay off it for awhile. By night time the ankle was still certainly very discolored and not ready to walk on comfortably,

but I did notice a decrease in the terrible pain that was there in the morning. Perhaps it was natural due to the span of time. Perhaps it had something to do with the comfrey, which in many journals has been touted as having painkilling properties.

When I went to bed I was thinking it would be nice to be able to allow the comfrey to work on my ankle as I slept. But it would be too messy and the heat from the tea would die out too quickly if I wasn't awake to keep refreshing the dressings. I remembered, though, that the key ingredient, the allantoin, was also contained in the aloe vera plant. I decided to let the allantoin work overnight by applying a homemade ointment of aloe vera all around my wounded area.

Even though I have read in a few places that comfrey, when applied externally, does not penetrate to the inside, I didn't totally believe it because it didn't totally make sense to me. Surely if one has a hot tea being soaked and rubbed and allowed to rest on their skin, at least some of that heat and that water, and whatever content that water holds with it, is going to get through open pores and make their way into the system. I know these are not scientific thoughts or suggestions but they were mine and I should hope that ultimately there will never be an attempt by bureaucracies and governments to shackle individual thought and reasoning and choice which, after all, oftentimes leads to new discovery and progress and evolvment and positive growth.

The next morning, after allowing the aloe vera ointment to work on my ankle during the night, and after that day long of comfrey tea dousing, my ankle felt unbelievably better. I could not walk comfortably without limping but the pain that had been screaming at me a day earlier was almost completely gone. I was amazed and I decided to give my ankle another day of comfrey tea dousing, which I did. I also applied another round of aloe vera ointment that night. The next day I was almost walking normally. On the third day, after again using comfrey, I went to work at UPS where for five to six hours a night I put much physical strain and wear on my legs, my ankles, my whole body. There was soreness as I worked this night and certainly I was not totally healed at this point, but I absolutely believe if I hadn't used the comfrey and the aloe vera I would have had to stay away from work, as well as other things, for a much, much longer period of time. I do believe going to work slowed and retarded the healing process. For a few days, especially after getting home from work my ankle was sore and hurt. But the soreness and pain was minor, all things considered, and I never went backwards in my healing and I was back playing basketball a week later with typical energy and zest.

I don't pretend to be an expert at anything. It is my wish while here to learn and grow and evolve in a positive direction, and hopefully somehow prove to be positive for others as well. I question the motives and the sensibility and the logic of those who would try to control free choice and the dissemination of educational information regarding health and healing. The healing of my ankle, and my own attribution of that healing to the curative powers of comfrey may possibly be made in error. But I doubt it. I believe the comfrey alleviated my pain and speeded my recovery. And I didn't pay money to do it. I just used my mind and my heart and one of nature's gifts that was at my disposal. Perhaps that is why some are worried about people using comfrey. Perhaps easy access of the medicine poses a threat to those who care most about money and power, even in matters of health and healing, and in matters of life and death. Perhaps those who would represent inanimate entities which try to regulate such choices might be better off realizing they are essentially, ignorantly putting shackles on their own individual minds, hearts and souls.

### *S. officinale effective as a cell proliferant*

Just another story to substantiate the use of comfrey. I was slicing some vegetables with a big butchers knife and I accidentally sliced my pointerfinger along with it. It was a nice slanted incision and fairly deep. I immediately washed it and put some X-ceptic liquid (which contains comfrey) on it. Then I used the BF&C ointment (which also contains comfrey) on it and covered it with a bandage. By the next day, I could use my finger as if nothing happened. By the second day, my finger was starting to seal from the inside out of the cut. By the fourth day, I did not need the bandage anymore and used the finger freely. This combination of herbs is unsurpassed in its variety of healing situations.

Regards,

Pauline Esposito

*S. officinale effective treatment for soft tissue damage:*

I had two accidents in 1998, in which comfrey helped more than any traditional treatment offered by MDs. (In fact, all MDs offered were pain killers and physical therapy, which only made the injuries worse.)

In 1998, I had a trip and fall accident at work, Florida Power & Light, in Miami. I tripped on an uneven sidewalk there, and hit the concrete on both knees, one hand, and one elbow. I had several injuries shoulder, elbow, left hand, both knees, and foot. (My left hand is still quite disabled in the last 2 fingers.) I couldn't move or use my little finger on my left hand and was sure it was broken, I couldn't sleep well because my shoulder was in excruciating pain, and I had a bad limp because of my right foot and knee. I also have several pits and scars on both knees and my right forearm.

Work was incredibly painful- I was working in a foam collar, with my only good hand supporting my head. After not being able to sleep well for months, on the Labor Day weekend, I finally decided that the only way I could get care would be to use my own brain. I studied the two herbal reference books I found, and discovered comfrey. I went to "Bread of Life" health food store in Fort Lauderdale, and bought a pre made lotion with comfrey, and also some bulk comfrey to make other infusions and lotions at home.

I was amazed at the results- in less than 3 weeks, I was able to hold my head up without the collar, and my shoulder returned to near normal. The other injuries were helped somewhat, as well, although not as dramatically.

Of course, after all the time missed from work, Debbie Griffin and Ron Zabowski, the managers at Florida Power and Light, terminated my employment. I retained an attorney named "Mandell" from Miami, who did nothing for a year, then told me he couldn't help me, and I was out of cash.

I ended up living with my parents in Wisconsin, and about a year later, the County of Milwaukee started paying for my medical care through its GAMP program. (In a way, this was only fair the government had let the insurance companies run wild, so in the end, the government paid for my care). It was at this time, in 1999, that a second set of x rays taken in different positions showed the cause of my neck problems- the radiologist found a healed fractured neck. I'm sure that comfrey helped with the heal of that fracture in the previous year.

Although the physical therapy in Milwaukee didn't help much, and I had basically been an invalid for over a year because of myofascitis, I finally found a chiropractor/cranial sacral therapist who fixed me up in a few weeks. Once again, I was saved by alternative medicine. I am now working full time, and am gradually becoming more able to live my life as a normal person (I'm even able to do a few jumping jacks!).

I credit my recovery both to herbal medicine and chiropractic/cranial sacral treatments. (In addition to the comfrey, replacing ibuprofen and darvocet with valerian root helped the pain better, and the valerian stopped the spasms which were spreading the myofascitis. Horsetail also helped with providing silica and selenium for soft tissue damage, etc.) If anything, traditional medicine only spread my myofascitis with their exercises, causing my muscles to spasm even more, thus tearing other soft tissues around them (this is how myofascitis spreads and eventually becomes fibromyalgia). Their pain killers/ anti inflammatories/ muscle relaxers made my body so toxic that I gained over 60 lbs. in one year, which is weight I still haven't lost - when I try to lose it, I get symptoms of system toxicity (headaches, dizziness...).

All the best,

Pam Rotella

*S. officinale effective healer of connective tissue*

I have used comfrey is many ways as an external oil in conjunction with emu. All the comfrey is purchased through "HerbPharm" who removes the harmful agents. It works remarkably well for the treatment of psoriasis and excema. I would really hate to see the use of comfrey to be regulated when it has so many applications. It is also known as the bone knitter. Used with emu

oil I have found this to be true. We need our choices as to the fate of our bodies. They are ours.

Sincerely,  
Soapmstr@aol.com

*S. officinale useful in treating fractures, and other injuries.*

We use Dr. Christopher's BF&C containing comfrey at our house almost every day. We put it on wounds, scars, varicose veins, skin problems and hernia's in its ointment form. My children take the capsules in large quantities when they injure themselves or break a bone. After an accident last year that scraped one son up pretty bad, he took an herbal bath in BF&C. I have to keep it handy all the time because a couple of my children refuse to go to scout camp, girls camp or on a trip without having a bottle of capsules handy in case they have an injury. They know how fast they will heal if they have this great product. They also know that it will save them a trip to the doctor. We use the ointment instead of stitches. The tea and capsules instead of a cast for breaks, and to help with sprains. My son Jordan has learned that if he used BF&C properly, a sports injury will not keep him out of the next game. He had a bad goalie take out his knee in a soccer game last year and we were afraid that he may need medical help. He refused to go to the doctor and started taking large quantities of BF&C. The coach just couldn't believe it when I said he could play in the game the next Saturday.

Sincerely,

Natalie S. Petereit, MH

*S. officinale effective for soft tissue damage.*

I would hate to see the government decide to make you change the formulas with comfrey in it, just because someone, somewhere along the way didn't use prudence and wisdom and abused the use of comfrey. My experiences and my family's experiences have been numerable with products containing comfrey and not once have we had a problem.

My husband and I have been using the Herbal Tooth Powder for over a year now and have had great success. I had a tooth that was causing me a great deal of trouble and I was afraid I would have to have it taken out. Since using the powder I have been able to keep it and the sensitivity has almost disappeared completely. My dentist says my teeth & gums look great and healthy.

My husband had a bad cold that went into his chest and developed a cough we could not seem to get rid of. He took the Resp free and within a week his cough was gone and his lungs were back to normal. We use the Resp free now whenever someone in the family gets a chest cold and it helps the body repair itself.

BF&C has been a great blessing in our home. I sliced the top of my knuckle off and used BF&C ointment on it and within 1 week the skin had healed and I was able to use my thumb again. My daughter (who is a piano performance major in college) jammed her finger while playing volleyball and needed to be healed quickly due to her need for practice. We soaked the finger in comfrey "tea" and alternated with ice cold water. After a couple of hours we put a poultice of BF&C around the finger and by morning she had complete use of her finger. This same daughter also developed an irritation in her wrist (similar to carpal tunnel syndrome) from her 4 6 hours of practice a day. We got a brace and started using the BF&C ointment on her wrist and she has no problems with her wrist now.

Our family also uses Calc Tea and Anti plague with great success, also. Many skeptics will say that the successes we have had with these products is due to the treatments and time, not due to comfrey. But I know what works for my family and I have seen the healing take place. We have never had any problems with any of these products and I would hate to see the formulas change just because someone used comfrey unwisely. The Dr. Christopher products are safe and I am secure in this knowledge, from my own studies with herbs and from personal and family use.

Sincerely,

Karen Thomas  
Kempner, TX

*S. officinale used without side effects*

Hi Nathan Our herb baby is wonderful and growing like a weed!! She has gained 6 pounds in her two months of life, and has grown an inch already. Must be the good mother's milk with all the herbs eh??? about the comfrey: I have used the comfrey burn paste on some serious steam burns, with no scarring, and it took the pain out almost immediately!! I also use it regularly in many of my formulas with no negative results what so ever!! Get a life people and leave god' gifts to mankind alone. If it weren't for comfrey and many other herbs I wouldn't be here today! Hope this is helpful, Nathan. If any more details are needed, let me know. Keep in touch!!

Vicki Morrison

*Comfrey effective treatment for tissue damage:*

We have had only positive experiences with comfrey combinations.

When I did my thesis for my Master Herbalist Certificate I did it on Comfrey because of the experiences we had.

Early one morning about 4 years ago our son brought our grandson over with his hand wrapped in a towel. Our grandson (about age 2) had gotten a hold of a steak knife and had cut the end of his finger so that only the nail was holding the tip to the finger. We packed the cut with BF&C ointment and bandaged it tightly. They left the bandage on for 2 days without disturbing it and when they took it off the skin had sealed up and there was just a pink line where the cut had been. They covered it with more BF&C and bandaged it again. It was totally healed without a scar within a week. Our grand kids now call BF&C ointment "glue" because of how well it heals their cuts and scrapes. We used BF&C fomentations externally and tea internally over a period of a few months to successfully heal a hernia.

Anti plague has stopped many a cold from becoming a problem. We have used comfrey leaves as the basis for a morning green drink and it only made us feel better. We feel that the most important herbs to have for emergencies are comfrey and cayenne.

Margaret Thompson  
West Valley City, UT

*S. officinale effectively used to treat cornea tear.*

I have grown up knowing that Comfrey, left to grow underneath the wire mesh bottom of rabbits cages keeps these highly cold sensitive animals free from this problem, they eat it as it grows into the cage. I also lived in TX hill country when my children were very small. Allergies, resulting in sinus infections, were common. I used to make a tea from the Comfrey I grew that helped me keep them in better health. These may be 'simple' uses, but effective. And my grandmother would be amazed if she thought our government had come to the point of 'regulating' the things she taught me her herb garden was a source of healing, tasty delights and family time pleasures, for me.

I am sorry to hear that our government has so many lobbyists and special interests that they want to regulate anything that they're not making money (or paying) on and depriving us of our rights to make choices for ourselves.

Sally Rumpf

I just happen to have a great testimony for the use of BF&C! 3 Days after my youngest son's graduation, he and a friend were horsing around in the back seat of the car. When they imitated the 3 stooges fingers in the eye deal the friend got my son in the eye and took a gouge out of his cornea...

I tried BF&C. I was able to get some close to home at a health food store. Anyway, I did compresses for my son and also gave him 3 capsules 5 times a day. The eye was completely healed within 3 days!!!

I also did take him to an eye specialist who was amazed at how quickly the eye had healed. From no vision to 20/20 in 3 days!! That did not come from patching the eye alone or the anti inflammatory drops that we were made to use, it was the BF&C no doubt.

Hope this helps! I am going to continue in my studies to become a Master Herbalist but for financial reasons I need to do it one course at a time. I love the course and the experience I am getting. Everyone asks my help for their ailments already!

Have a GREAT day!

Dori Polnack

*S. officinale use to treat insect bites:*

I've used Comfrey successfully to treat insect bites on my daughter's legs. I simply put dried Comfrey into my coffee maker, made a few pots and added this to my daughter's bath water. Nothing else had worked..and she was surprised that the herbs helped, but she admitted that they, indeed, did the job.

Thanks,

R. Barfield

*S. officinale effective treatment for Carpel Tunnel Syndrome, used in large amount without side effect:*

This communication is from ROBERT N. HUMASON, presently one of your Master Herbalist curricula students in Fresno, California. I have also been heavily involved in wellness through proper natural nutritional dietary choices since 1958. It is through your school of herbology presently undergoing that I found a natural ally healing herbs to compliment all those years of emphasis on choosing proper raw, natural foods and beverages. As to your need for real time experiences with Comfrey, specifically, I herewith offer both my own as well as my wife's actual healing experiences with this wonderful herb:

My wife, Phyllis Humason, had developed a chronic right arm syndrome involving Carpel (Tunnel) of the right wrist and pain thereto, elbow nerve pain, and right shoulder joint, very painful discomfort and therefore limited motion. (Ironically, nothing in my "tool chest" of 42 years of nutritional knowledge seemed to remove what I've just described here, I say with some embarrassment). She had this problem for the last several years, but with much intensity for two years minimum. It was last August 1999 when I began your herbology studies that I discovered and learned sufficiently about Comfrey and the Christopher products incorporating Comfrey within their formulation. My wife began using CALC TEA for its organic calcium as well as for the mechanisms of removing inorganic deposits. She began applying BF&C Ointment on all painful areas. She began ingesting BF&C Syrup. Today, and for quite some months, she has been totally free of all symptoms in all sites of her right arm. While we certainly ascribe considerable worth to our ongoing dietary choices, we have POSITIVE evidence that

Christopher's CALC TEA, BF&C OINTMENT, & BF&C SYRUP were responsible for symptom relief within a period no longer than 3 months. Yes, by abstinence from animal meat (as my own ongoing studies proved was overly acid and harmful for the human organism) starting a few years back, my wife's challenge in the Carpel site was waning, but I fully believe the RATE at which remediation occurred AFTER BEGINNING the Christopher products listed herein was the key to

full confidence these products were highly instrumental in her purest of comfort and arm motion today. We can say without reservation that Comfrey played a vital role in the processes of this relief. My wife has absolutely NO adverse reactions from using Comfrey.

For all my 43 years in natural health, I still find it very difficult to understand why (our?) American government continues to hassle natural herbs and foods when 100% of ALL American approved medications are TOXIC to the human organism!

As to my own personal experiences, I take CALC TEA regularly also. My reason is rather differently. We have our residence on a large semi rural property with our own water well and pump. Our water is very hard and inorganic calcium buildups are very pronounced. However, I wasn't as "hep" about steam distilled water as your Dr. Christopher, but in taking your herbalist program of studies, there was no doubt that I should have been using steam distilled water for all the 28 years at this same home site. The long and short of this is that for the past 2 or 3 years, my blood pressure had risen higher than the traditional specifications, but yet in the "borderline" limits. From your school, I learned of the natural chelation characteristics of CALC TEA's organic calcium, and I find my BP moving back to normal. While certainly it is the organic calcium that has such a good effect, it is Comfrey which synergizes the formula to react favorably. I also have used successfully with POSITIVE indications that it is/was Comfrey at the helm when I applied fresh, raw leaf of Comfrey from my own garden to raw, just done, wounds from working on our small "farm." Wound healing almost in the wording of "miracle" occurred in every case. I have also used the bulk cut Comfrey from Christopher's for incidental burns and wounds on my own body. We genuinely feel that Comfrey leaves NO QUESTION that its use is beneficial however it is applied.

*Years of S. officinale use without side effect:*

I have been studying and using herbs for 7 years and I am a student of the School of Natural Healing. I have used the following products which have comfrey in it with absolutely no side effects. I have used Calc T, BFC, and herbal tooth powder. I have had no bad experiences.

Only good ones that have provided relief and healing effects of these products. I have recommended these products to other people who would not live without them. The Calc T is especially good. My sister in law will not live without this formula as it relieves the pains she has in her legs! The herbal tooth powder has stopped bleeding and inflammation of the gums for my husband. I had a sensitive area on my gums from a receding gum that is no longer sensitive due to the use of the tooth powder. My parents use the tooth powder and feel that their teeth are cleaner than when they used toothpaste. The BFC ointment is the best. It has cured my father's middle finger that always locked in place. Now it moves freely. I use the BFC ointment on my husbands lower spine and it has helped the stiffness from a little arthritis. I have used the BFC on all kinds of skin ailments with great success. I have used it on incisions and scars and they disappeared or diminished.

Seven years ago as I just started to learn about herbs, the sales women in the health food store took some time to explain her experiences to me. She told me that she had used comfrey and lobelia for years (even when she was told they were toxic). She said they never had a bad effect on her and she was healthier now than before. These herbs helped her and she still recommends them. If I can get her testimony in writing, I will send it to you.

I hopes this helps. Regards,

Pauline Esposito  
Port Washington, NY

*S. officinale effective treatment for "bunions" and insect stings:*

I have had trouble with a bunion for many years and recently the pain moved to the area on the bottom of my foot below my toes. The pain was such that I could barely walk on it. I began using the "Calc Tea" formula in a dosage of 1 tsp. twice a day. In about three weeks the pain is

completely gone and I have no trouble walking. I also use fresh comfrey leaves for any bee or ant sting. I simply chew a small portion of the leaf and apply to the sting and the poison is immediately drawn out and no pain or redness left.

Thanks for listening to my great results with comfrey.

Susan Williams  
Gulf Breeze, FL

*S. officinale used on fractures and sprains:*

I am writing to inform you of my latest experience with Comfrey. A friend of mine had accidentally walked into the corner of a piece of furniture and seriously injured her little toe. She and her husband were visiting and she showed me her foot, and asked if there was anything I could recommend she could use, because at this point she could not get on a pair of shoes, and had to sit with the foot up, because it was throbbing. I made a strong tea of Comfrey, Mullein, and Horsetail, and sent her home with instructions on how to use it. She said he didn't make a poultice, but just dabbed the tea repeatedly on the toe. She called the next day because she couldn't believe how fast her toe had healed. Within 24 hours, the swelling and discoloration was gone! She was so impressed she showed everyone at her work her foot, the next day!! Needless to say she was very happy, and has showed no ill effects from using Comfrey. I have also used it on my son's foot, that he sprained and could not return to work. He healed within 48 hours and was able to return to work, as a restaurant server, who must stand all night! He also had no ill effects. Each of the teas were made with dried bulk herbs from a local herb shop.

Sincerely,  
Cindy Osborn  
Mesa, AZ

*S. officinale used on fractures, hives, and lung problems without side effect:*

My family has grown and used comfrey for generations. I keep several plants in my yard and many time neighbors have come to "raid" my plants to use on broken toes, cracked ribs, as a tea for hives, etc. My self and a grandchild have asthma problems and have found the use of comfrey, mullein and garlic a lifesaver. Not only does it help expel the mucus, I actually use my prescribed inhaler only a couple of times a week instead of several times a day when I use this formula regularly.

Several years ago the USDA banned comfrey and it was removed from some formulas I bought at the health food store. There was a definite difference in the results I received and I stopped buying the formulas and had to make them myself. At that time it was stated that comfrey was banned because there were some suspicious deaths and the people or persons had been using comfrey as a tea. My response...how many have died from using aspirin and it is still on the market.

I hope this helps.  
Cynthia Troutman

*S. officinale used for pain relief*

She went to a radiologist who diagnosed her with osteoporosis problems. All of a sudden, the osteoporosis got very painful in her foot. She put up with that for about 3 weeks. Two days of using the BF&C relieved the pain.

Ethel Kurihara

Aiea, HI

*S. officinale used on mole and other skin problems*

Evelyn MacDonald from Valley Stream, NY called with this success story on BF&C Oil. She used BF&C Oil on flaky areas -- pre-skin cancers. They were completely diminished by using BF&C Oil 3 out of 5 days for 2 months. She also tried the BF&C Oil on a mole. She first tried the black ointment and it made the area large and inflamed. They then used the BF&C Oil and greatly reduced the mole.

*S. officinale used for joint problems*

Barbara, from Boca Raton, Florida

She had joint lock in her shoulder. She took 1 tsp of Calc Tea and 15 capsules of BF&C daily. She was also on a Cucumber and Celery Juice diet. In one week she had full range of motion.

*S. officinale used to treat bone spurs with out side effects:*

My daughter of twelve developed a spur in the base of her thumb around two years old and could never straighten her thumb out. We were told by the orthopedic surgeon to leave it alone and that surgery was to risky for the possibility of total nerve damage. About a year ago we heard about the Herb Shop and were encouraged to soak her hand in Calc Tea and vinegar and then we put BF&C ointment and Deep Heating Balm on. Next we wrapped her hand in gauze and covered that with a cotton glove. We did this procedure day and night. She also took BF&C capsules. It took approximately one month for the spur to dissipate and she can straighten out her thumb completely.

Thank you so much for two wonderful products.

*S. officinale used without side effects*

February 7, 1984

Dear Mr. Christopher:

I have found great relief by taking Dr. Christopher's calcium formula and thyroid formula through the night which was recommended in his "How Important is Calcium" newsletter. I have recommended this treatment to others and to my mother and they all have found it helps their insomnia also.

Thanks for your help, again.

Anne Richards  
Williston, ND

*S. officinale use to increase hair growth*

NOVEMBER 7, 1996

Meg Feinauer of Orem Utah (291 170N) said her hair wouldn't grow past her shoulders (5 yrs).

Started taking Calc Tea regularly after 6 months it grew 4-5 inches

*S. officinale used to treat "swimmer's ears"*

Gentlemen:

I have had phenomenal success with your God given Herbs. I have used the comfrey ointment, nose ointment and your combination of oil of garlic and B&B tincture, for swimmers ears all with equal success.

The Eyebright combination has brought good results for a very severe pain behind one eye. (I have had this for over two years and the doctors have been unable to find cause).

My greatest pleasure has resulted in freedom from pain for my seventeen year old daughter during her menstrual period. She has been hospitalized three times in the past year for vomiting which could not be stopped over a six hour lapse of time. The hormonal Estrogen Combination and Female Corrective Combination have truly given her a new lease on life.

Very truly yours,

Mrs. James F. Harder

*S. officinale used to treat fractures successfully:*

January 16, 1993

I thought that you might like to hear about a success we had with a pack that is recommended in your father's book.

A few weeks ago a member of our family became tangled in a dog chain as they were leaving the house. He flew from the second step of our porch which is about 20" off the ground for about 10 feet and landed with his full weight, and velocity, on his left arm. There were no broken bones but the arm was very painful.

We started treating with the wheat germ/Lobelia/Comfrey pack that Dr. Christopher describes in his book. In less than 30 minutes the pain had been relieved. We continued this treatment at night for a week. Although the sprain took several weeks to completely heal this person did not lose a days work and did not use any pain killers.

Sincerely,

E.W. Pendley

Cheyenne, Wy

## A History of the Healing Chili

The Capsicums are ancient natives of the New World, the oldest known specimens coming from Mexico. From seeds found on the floors of caves that were ancient human dwellings and from ancient fossil feces, scientists have found the people were eating peppers as early as 7000 BC. Presumably originating as wild plants, hot peppers were cultivated between 5200 and 3400 BC. (Heiser: 18), among the oldest cultivated plants of the world. In South America, peppers recovered at the archaeological site of Huaca Prieta have been dated at 2500 BC, these specimens being larger than the wild peppers and therefore presumably cultivated (Ibid). Archaeological research in the Tehucan Valley revealed that among other crops, chilies were cultivated during the Coxcatlan era, around 4000 BC (Johnson, ed.: 150)

Capsicum was introduced to Europe by the historian who accompanied Columbus to the New World, Peter Martyr. He reported the use of these pungent peppers, and the ships physician, Dr. Chatica, reported their use as a condiment and as a medicine, an irony considering that Columbus was seeking the spices of the Far East (Heiser, op.. cit.)

Later, scholars sent from Spain to the New World, notably to Mexico and Central America, chronicle the extensive use of chili peppers in the diet of the Indians. Next to maize, a certain Cobo wrote, it was the foremost plant in the land; and a Garcilaso said that the Peruvian Indians valued chilies more than any other plant, never cooking a dish without them. The Jesuit Acosta noted that it was an item of considerable value for trade in areas where chili did not grow, that it "comforted the stomach" when taken in moderation, and that some of the Indians made offerings of peppers to their gods (Ibid.).

According to sixteenth century historians, South American warriors would burn peppers to use the smoke against the invading Spanish (Ibid.). Interestingly, during the Vietnam war, Buddhist monks armed themselves with spray guns filled with a mixture of lemon juice, curry powder, and Cayenne.

Cayenne peppers reached southeastern Asia a few years after the discovery of America, and today they are almost as important in tropical Asian cuisine and medicine as they are in tropical America. In fact, these peppers became so well established in India not long after their migration that early botanists thought they were indigenous. In India they are an indispensable part of curry, which is a universal ingredient in most Indian cuisine. Peppers are also widely used throughout Africa, and the African produce is thought to be the hottest in the world, perhaps due to climatic or edaphic factors, though it may be due to specialized breeding (Heiser, op. cit). In Ethiopia, the national dish, wort, or Cayenne portage, features this pungent powder. Salt and powdered Cayenne pods are mixed with a little pea or bean meal and made into a paste called dillock. This is kept in a gourd, often hung from the house roof, and used a little at a time, wort being made by adding water to the paste and then boiling the mixture (Ibid.).

Cayenne was introduced into Britain from India in 1548, and Gerard mentioned it as being cultivated in his time (Gri: 175). It is used in folk medicine in various parts of the world, notably Greece, Italy, and parts of Russia, where it is steeped in Vodka and drunk as a tonic in wine glassful doses (Hut:68). It grows and is used abundantly in the West Indies, where the Negroes value it as a certain remedy for many ailments (Klo:217). It is especially valued there for the deadly fevers, especially yellow fever, of which the native people have no fear as long as they have a goodly supply of Capsicum (Ibid.). As in Mexico, the children and adults alike snack on hot pepper pods, eating them one after another "as we would do so many doughnuts," said Kloss. Cayenne is one of the main foods of the Hunzas in Asia Minor, along with apricots and their pits, millet, and other such simple foods. They live to over a hundred years of age, sometimes play polo at the age of 150, and generally die not from diseases, but from falls or accidents (Herbalist:I:I:3 2 ).

# Cayenne

## History

[Medical & Findings](#)

[Cultivation & Usage](#)

[Composition](#)

[Formulas](#)

[Bibliography](#)

Capsicum was early cited as growing in the Hawaiian Islands, cultivated and escaped varieties noted as early as 1897, though the fruits were small and very pungent. It was known as “Hawaiian Chili Peppers.”

In Mexico today, Chilies of various kinds supplement the daily diet and, in addition to providing spice and essential nutrients to an otherwise bland and repetitious diet of tortillas, beans, squash, pumpkins, potatoes and the like, they perform important medicinal functions. Visitors to Mexico often suffer from “Montezuma's Revenge,” a particularly devastating kind of amoebic dysentery. However, if they will eat hot chili with their meals the way the native Mexicans do, they will not suffer this disease. Juliette de Bairacli Levy, when living in Mexico with her small children, did not hesitate to let them drink raw milk—a practice frowned upon by most because of the certainty of dysenteric infection. She spiked the milk with a generous dose of Cayenne and the children were never infected. She noted, too, that eventually the children came to relish the hot-tasting milk. It is reported that the Mexicans, who ingest such quantities of Chili that their bodies are infused with it, are not attacked by predatory birds, if they happen to perish by accident in the deserts; vultures won't touch the Chili-laden body.

Cayenne pepper is the name for the hottest form of Capsicum, which can take other forms. If its heat is 1 BTU, this mild Capsicum is called paprika; if it is from one to twenty-five BTU, it is called simply red pepper; but over twenty-five BTU rating is termed Cayenne. Therefore Cayenne is the strongest of the Capsicum family. In Mexico alone, many varieties (some claim fifteen or more) of peppers are grown, each with a distinctive flavor, and often very hot indeed. Other important varieties are grown in Japan (predominantly used, dried, in cooking), the United States, and Africa, the latter being valued as a high-quality medicinal Cayenne.

One of the United States varieties, imported from the Mexican state of Tabasco, has attained great renown. An American soldier, returning from the Mexican War of 1846-48, brought some pepper seeds to Edward McIlhenny, a banker, who grew plants from them in Louisiana. McIlhenny found that the peppers made a delightfully piquant sauce. During the Civil War, he left Louisiana, but when he returned, finding his plants still flourishing, was persuaded to market his sauce. Since the war had left him without an income, he thought this was worth a try, and the venture proved successful; Tabasco Sauce is a gourmet treat throughout the world (Heiser: 12).

Cayenne pepper was a mainstay of the Thomsonian School of Medicine, Samuel Thomson, the original Botanic Physician, having featured it along with Lobelia in his healing routines. It was an important ingredient in his Composition Powder, and he also used it as a stimulant and an assist to the emetic properties of Lobelia.

Joseph Smith, the Mormon Prophet, was said to have advocated the use of Cayenne. His successor, Brigham Young, eschewing the services of orthodox medical practitioners, encouraged the use of Cayenne and of Composition Powder, the latter even serving as a beverage in place of regular tea or other drinks. Many of the early Church members were well versed in botanic medicine, an interesting example being Priddy Meeks, who was a thoroughgoing herbal practitioner and whose journal we possess today. He gave Cayenne pepper to a young man who had attempted to journey from California back to the East. His feet were both frozen up to his ankles. Meeks felt, “as though by inspiration,” that he should try Cayenne internally for the case. Having given the man too much at first, Meeks reduced the dose as the frozen feet began to hurt terribly. When the dose seemed right, an unusual event occurred: the frozen flesh would rot and rope down from his foot, when it would be on his knee, then clear to the floor, and the new flesh would form as fast as the dead flesh would drop. It seemed to Meeks that the dead flesh was getting out of the way to make room for the new flesh. After sixteen days, the man was able to walk again, having lost only five toenails, instead of both feet—an unusual tale indeed! Meeks related many other cases he healed with Cayenne pepper; he was much in demand with these simple remedies.

In England, Cayenne was called “Ginnie pepper,” since it was purchased from “Guinea,” or the Indies. Being official in both the United States and British pharmacopoeias (even until the 1950's), Cayenne was an ingredient in many of the cure-all remedies of the last century; in fact, it was often the main ingredient, along with aloes and a little soap. The British pharmacopoeia requires that Capsicum should yield not more than six percent of ash, and this will detect any adulterants, which include ground fruit stone, linseed, ground cereal products, oxide of red lead, and colored sawdust (Gri: 176).

Cayenne or Capsicum derives its name from the Greek kaptos, I bite, an allusion to the pungent properties of the fruits and seeds. Although the origin of the species is obscured in antiquity, as

described above, experts believe that all the varieties of chilies originated in one species. For this reason the botanical classification of these plants is sometimes muddled, and *Capsicum annuum* is sometimes described as *Capsicum frutescens* (Stuart: 166). Some sources indicate that our valuable Cayenne is really *Capsicum fastigiatum* (Bar: 148), or *Capsicum minimum* (Hut:67). All of this confusion points to the point we made earlier, that the medicinal Cayenne is classed according to its BTU rating rather than its species.

Other names for Cayenne include African pepper, African red pepper, and African bird pepper, all alluding to the most pungent and superior product obtained from Africa, although this can be light brownish-yellow instead of red in color (Gri:176). It is also called American red pepper, Spanish pepper, and Guinea pepper, as it is obtained from these places. We are already familiar with its name, Chili, in Mexico; in French it is called Capsique or Poivre de Cayenne, and in German it is Spanischer Pfeffer or Schlotenpfeffer.

### **MOST CERTAIN STIMULANT—AND NEARLY A CURE-ALL**

One of the most important uses of (Cayenne is as a circulatory stimulant, an herb that feeds the necessary elements into the cell structure of the arteries, veins, and capillaries so that they, regain youthful elasticity and so that the blood pressure reduces itself to normal. When the venous structure becomes loaded with sticky mucus, the blood cannot circulate freely, so higher pressure is needed to force the blood through. Cayenne equalizes the blood pressure, influencing the heart immediately, and then extending its effects to the venous structure (SNH:407). It also works to cut the mucus in the venous system, and indeed in all the systems throughout the body.

Cayenne is a certain remedy for heart attack; as a stimulant, it can start the heart into action again, and as it facilitates blood flow throughout the body, it will keep the heart going. Used as a heart attack preventative, along with the mucusless diet and a healthful life-style, Cayenne can do wonders in toning and rebuilding the heart and keeping it in top condition. As we will discuss later, Cayenne is one of the richest and most stable sources of Vitamin E, which is known to be a heart builder.

The most common medical use of Cayenne is as a gastric stimulant and digestive aid. It rebuilds the stomach tissue and stimulates peristalsis, thus assisting in assimilation and elimination. In the West Indies, a preparation called Mandram is used for weak digestion and loss of appetite; this is made of thinly sliced, unskinned cucumbers, shallots, chives or onions, lemon or lime juice, Madeira, and a few pods of Cayenne well mashed up in the liquids. It can be used as a chutney or garnish (Gri: 176)

Cayenne is used as a diaphoretic-sweat inducing-herb, especially useful when combined with other powerful diaphoretics such as yarrow, blue vervain, bayberry, etc. It should be given when a chili is coming on, to offset a cold, or to help break a fever, as it sustains the portal circulation (Klo:220) and assists in the removal of mucus, as well as inducing perspiration.

If one believes in the use of emesis to cleanse the stomach, such as the Thomsonians did, large doses of Cayenne will certainly do the job without causing any harm to the patient. If combined with an emetic, such as Lobelia, Cayenne will help the emesis continue over a longer period and prevent bruising or other discomfort. If a person swallows a noxious substance or polluted food or drink, this Lobelia-Cayenne combination will work surely to bring it up. Be sure not to induce vomiting, however, if a corrosive substance has been ingested.

As related above, Cayenne works powerfully to arrest bleeding. You can place Cayenne powder or tincture directly upon an open wound, even one that is gushing blood, and by the count of ten, the bleeding will cease. If there is internal hemorrhaging, in the lungs, stomach, uterus or nose, have the person take a teaspoonful of Cayenne in a glass of quite warm water; the blood pressure will be equalized, taking the pressure off from the affected part, clotting will begin, and the hemorrhage will stop. For hemorrhage of the lungs, a vapor bath with warm Cayenne can do the same thing. In an external wound, even if the cut is so deep it goes to the bone you may fill it with Cayenne pepper and the bleeding will stop and the wound will heal beautifully. A woman fell while descending stairs to the basement and struck her head on the overhang above the staircase. She fell on her elbow and hip as well, but she had hit her eye so: badly that it was oozing blood down her face. She found her way upstairs, and “dumped a pile of Cayenne into her hand and pressed it against her wounded eye” (Herbalist:March, 1978:30). She also took Cayenne internally and applied an ice pack. By this time the bleeding had stopped, and she applied Dr. Christopher's Comfrey Poultice, made with wheat-germ oil and honey, to her eye wound and

other facial wounds. When she went to the doctor, he cleaned out the wound and told her that she would bruise very badly and that, if she wished, he would re-cut the wound and stitch it, as she had passed the eight-hour limit for stitches.

She kept taking the Cayenne and rubbing wheat-germ oil and other oils and herbs on the wound. She also applied wet hot packs for the itching associated with healing. After a few days, the marks of the accident were nearly cleared up, although the doctor had predicted many days of discolor and discomfort. This lady - who has teenage grandchildren—credits her quick healing to Cayenne (Ibid.)

Cayenne is used externally as a liniment as well, effective for wounds, bruises, scalds, burns, and sunburns, applied freely. You can rinse the mouth with the liniment for pyorrhea (Mal:84). It brings out toxic poisons and can be used to relieve lung congestion as well as external problems. It will bring relief for the sufferer of rheumatism. A simple liniment is made by simmering 1 tablespoonful of Cayenne in 1 pint of Apple cider vinegar; bottle, unstained, while still hot. You can also combine the Cayenne with other herbs, such as Golden Seal, Lobelia, etc., to obtain their beneficial effects in the liniment. A plaster of Cayenne, made with bran or hops and combined with Lobelia, is valuable in pneumonia, pleurisy, and other congestion's. Many famous commercial ointments sold by Rawleighs, Watkins, and others, are high in Cayenne.

Cayenne is extremely valuable as an emmenagogue. It will act as a carrier for uterine herbs such as Blessed thistle, taking them directly to the uterus. When expectant mothers go into labor, midwives commonly give them a drink made of Cayenne, apple cider vinegar, honey, and warm water. This stimulates good contractions, gives energy—and as an added benefit, circumvents any possible hemorrhage and acts as an anti-shock remedy, as labor often brings about shock. In fact, this combination is a most efficient anti-shock remedy and should be supplied in any case of shock. Cayenne in hot water alone will also work.

Cayenne will increase a persons feeling of vitality and activity—as it is a stimulant—without any bad aftereffects, such as do other stimulants. Combined with Lobelia, it is wonderful in cases of depression or low spirits.

Capsicum is an excellent antiseptic. For infectious sore throat, combine it with slippery elm and lobelia. It will kill germs when applied to wounds, and can be taken to ward off diseases one has been exposed to (Herbalist 1:1:33).

Since it works so effectively to eliminate mucus from the body, it is an excellent expectorant. Mixed with ginger, it does a wonderful job of cleaning out the bronchial tubes and sinus cavities and relieving immediately all problems of colds and congestion (Mal:85).

Cayenne is used as an accentuator with other herbs; it increases the value and healing properties of the herbs and carries them to the afflicted part of the body. Indeed, Cayenne affects every portion of the body through its marvelous action in the venous structure. It relieves cramping or pain throughout the system. It reduces inflammation and reduces hemorrhoids, even when they are serious and painful. It can help cleanse the system of alcoholism and even reduce the discomfort of a hangover, or worse, the miseries of delirium tremens. It has been said to be a sure assist in cases of diphtheria, used internally and externally as a fomentation of the tincture. It has been combined with other herbs to make an excellent eyewash-though the user needs a bit of courage the first time! It will relieve a relaxed throat, toning it up immediately. If you soak the oil in cotton, you can apply It to an aching tooth, and the relief will last a long time. Sprinkle a little of the powder into your socks at night if you suffer from cold feet; your toes will be warm all night. Rub it on if you have a sprain or a backache. Drink the tea if you have problems with flatulence. The American Indians used to say you could get rid of a wart if you bound on a fresh pepper pod every day.

Cayenne is rich in Vitamins C, A, B and G. It is an excellent source of Vitamin E. In Szent-Gyorgi's Nobel Prize winning research on Vitamin C in 1937, he had been using a substance, obtained from adrenal glands, that he suspected to be Vitamin C. When he could no longer obtain this substance, on a hunch he tried to use Paprika peppers for his work, and found them a rich source of this substance, later to be called Vitamin C. Capsicum also contains Calcium, Phosphorus, and Iron.

## Cayenne as Medicine and Current Findings

### FROM THE MEDICAL WORLD

Most medical doctors eliminate hot foods such as capsicum from the diets of ulcer patients and others with delicate digestion; as we have shown, this is directly opposite to that which is recommended by herbalists.

Their actions are influenced from medical research showing hemorrhaging occurring after introducing (mechanically) capsicum into the stomachs of persons prone to hemorrhages. Their observations are fact but tend to be inconclusive. Perhaps any substance introduced mechanically into the system could have caused hemorrhaging. From personal experience, I was very uncomfortable taking capsicum for my bleeding ulcers, but after one day of taking capsicum, in water, I never again experienced passing dark blood through my stools. Perhaps the immediate bleeding observed, by the researchers, would have been corrected through continued herb care.

### FOOD AS MEDICINE

The most prominent non-medical use of Capsicum, of course, is culinary, a perfect example of the old maxim, "Let your food be your medicine and your medicine your food." In kitchens all over the world, Capsicums are used to prepare hot dishes, and are even featured as a vegetable themselves. The peppers are ground and mixed with other spices to make Chili Powder, a common seasoning almost everywhere.

If you are fortunate enough to grow or purchase your own chili peppers, you can preserve them yourself. You can pickle them as you would cucumbers, adding carrots, celery, onions or other vegetables as the Mexicans do. If you wish to can or freeze green chilies, you will need to roast and peel them. Roast them over an open flame or in a hot oven until the skins blister. Quickly put them into a plastic bag or damp cloth until the steam loosens the skins. You may then, with hands gloved in rubber gloves or well-oiled—to avoid blistering or burning—peel the peppers. Remove the seeds if desired, chop if desired, and freeze in plastic bags, well-sealed. If you wish to can them, follow directions included with your canning jars as to pressure needed in a pressure canner.

You may use green hot peppers to make your own taco or hot sauce. To two or three quarts of tomatoes, add salt and garlic pepper to taste, and two to three cups of chopped, peeled chills. Can as usual for tomatoes.

The Mexicans make a raw chili salsa, with chopped tomato, onion, garlic, and fresh chili pepper. This salsa is an excellent and garnish to any meal.

By far the easiest culinary use of Cayenne is just to sprinkle it upon your food, as you would use black pepper. Use a little at first, increasing as you become accustomed to the pungency. For everyday maintenance of good health, this is an excellent way to use Cayenne. Even children can

learn to enjoy foods thus seasoned.

As for other uses, the leaves are used extensively in the Philippines as a green dye. The powder can be sprinkled in primitive living sites to drive off bugs and vermin, as they detest Cayenne, and it can also be burned to fumigate against vermin. A room thus fumigated can be opened and used fight after the treatment, as the fumes are not poisonous to humans (Levy:43).

## CURRENT FINDINGS

Recent research has focused on the extraction and isolation of the constituents of Capsicum. Lee et al. devised a mass fragmentographic method for the quantitative microanalysis of Capsaicin, the major medicinal constituent of Capsicum (Journal of Chromatography, 21 July 1976). Salzer, noting that most industrially prepared quick foods are relying on seasoning extracts rather than the more easily deteriorated spices themselves, discovered that the main flavoring constituent of Capsicum is capsaicin (Critical Reviews in Science and Nutrition, 1977).

Of most interest medicinally, Frischkorn and Frischkorn researched the debilitating tropical disease, schistosomiasis, or snail fever, which is contracted through the skin by contact with snail larvae in fresh water. They estimate that up to half of the people in the third world are afflicted with this disease. Aside from chemotherapeutic treatment and water treatment, they discovered that the oil of Capsicum annum, which is high in capsaicin, kills the larvae, and that frequent ingestion of Capsicum can help treat the disease (Naturwissenschaften, September, 1978)

Of particular interest to herbalists who are interested in the reasons why Capsicum is so valuable in heart disease, Kanner et. al. analyzed Capsicum annum for tocopherol content. They found that of all the edible plants, Capsicum annum contained the most natural Vitamin E, which is in a peculiarly stable form. In fresh, ripe pepper fruits, they found 3-10 mg./100 grams, which shows that the vegetable could become a significant source of Vitamin E in the diet. Vitamin E is often used to treat heart conditions. Because there is also a goodly amount of ascorbic acid (Vitamin C) in the peppers, the two vitamins are well balanced naturally, which the authors considered a fact of great importance in nutritional and technological considerations (Journal of Agricultural and Food Chemistry, November-December, 1979, pp. 1316-8).

## DESCRIPTION

Capsicum belongs to the botanic family Solanaceae, commonly known as the Nightshade family and including potatoes, tomatoes, green peppers, eggplants, the deadly nightshade, henbane, Jimson weed, petunias, and tobacco (Heiser:1). They are not true peppers, but were misnamed by early Spanish explorers who confused their hot taste with the pepper to which they were accustomed.

Capsicum annum is a shrubby perennial plant two to six feet high. Branches are angular, usually enlarged and slightly purple at the nodes; petioles medium; peduncles slender, often in pairs, and longer than the fruit; calyx cup-shaped, clasping base of fruit which is red, ovate, and long; seeds small and flat, from ten to twenty nine. The cuticle of the pericarp is uniformly striated and in this particular is distinct from other species. The taste is pungent and the smell characteristic, though not disagreeable (Gri: 175-76).

The peppers, when dried, vary in lengths from 3/8 inch to 2 1/4 inches and in width from 3/16 to

1/2 inch. The shape is blunt and roundish at the base, tapering to a point; oblong-acuminate. The pods are shiny, flattish and somewhat wrinkled. The seeds are small, flat, reniform, and yellow.

The African varieties are smaller and more pungent than the American varieties, which are larger and more heart-shaped.

## Cultivation and Usage

### CULTIVATION AND COLLECTION

Cayenne and the other Capsicums can be cultivated just like Green Peppers. Seeds can be purchased at garden stores or through seed catalogs. You can start them under glass or in the house in mid-February if you plan to set them in late May. Feed the developing seedlings manure tea and turn them so each side gets equal sun.

When you are ready to set the plants, protect them from cutworms with a tin-can or brown-paper collar and set them three feet apart, as they grow bigger than bell peppers. Harden the plants gradually—partially shading them—for about a week, and mulch them to preserve moisture. Do not over-fertilize them, or you'll get much leaf and little fruit.

When picking chilies, use rubber gloves to protect your hands. When they are ripe, their hotness is at a peak, and further reddenning will not make them hotter, but just a little sweeter. You can preserve them as described above, or string them up for drying, as is commonly done in Mexico.

### PREPARATION AND USAGE

The mature pepper pods are dried carefully and are either stored whole or ground for storage. You can purchase ground Cayenne pepper and store it with eider leaves or bay leaves in it to prevent insect infestation; sometimes, if you open a can of grocery-store Cayenne, it will be infested with large worms. Dr. Christopher said it was because worms know good food when they see it! Properly stored Cayenne will keep well for about a year. To keep it longer, you can make a tincture, and it will last as long as you could wish. Dr. Christopher stored some for twenty years, and when he unpacked it, it was as good as new!

The quickest and most efficient preparation of Cayenne is the tea, mixing a teaspoonful to a tablespoonful in warm water and drinking it. Many people, not wishing to suffer the pungency of the herb, take it in capsules, and this is all right, but the herb works much more quickly if taken in tea. It is usually not made into a decoction, as the medicinal factors are lost. Another method commonly employed to cut the hot taste is to eat a spoonful of peanut butter before taking the herb, but Dr. Christopher said he thought that was just for kids!

The tincture can be applied externally or taken internally. To make it, macerate two ounces of Cayenne in one quart of 90 proof alcohol for fourteen days.

For an excellent bath to be used in cases of aches and pains, influenza, apoplexy, etc., mix teaspoonful each of Cayenne and Ginger and add to a very hot bath. This will cleanse the pores and remove toxins.

In addition, the reader may be interested in the following research analyzing Capsicum:

Constituents. In 1876 Thresh extracted the drug with petroleum, treated the extract with aqueous alkali, and by passing carbon dioxide through the alkaline liquid precipitated crystals of an intensely pungent compound, capsaicin. As may be inferred from the method of preparation, capsaicin is of phenolic nature.

Capsaicin (Vanillyl amide of isodecenoic acid)

The pungent phenolic fraction of capsicum also contains a proportion of 6,7 - dihydrocapsaicin. The capsaicin content of fruits varies appreciably in a range up to 1.5 per cent and is much influenced by environmental conditions and age of the fruit. It occurs principally in the dissepiment of the fruits, for example, entire fruit 0.49; pericarp 0.10; dissepiment 1.79; seed 0.07. The pungency of capsicum is not destroyed by treatment with alkalis (distinction from gingerol, which also contains the vanillyl group) but is destroyed by oxidation with potassium dichromate or permanganate. Chilies also contain ascorbic acid (0.1-0.5 per cent), thiamine, red carotenoid such as capsanthin and capsorubin and fixed oil (about 4-16 percent). They yield about 20-25 per cent of alcoholic extract (capsaicin) and about 5 percent (official limit 8 percent) of ash. Hungarian capsicums or 'Paprika' are derived from a mild race of *C. annuum* and are a convenient source of ascorbic acid. According to Bennett and Kirby the pungent principle of *C. annuum* is composed of capsaicin 69 percent, dihydrocapsaicin 22 per cent, nordihydrocapsaicin 7 percent, homo-capsaicin 1 percent and homodihydrocapsaicin 1 percent. The presence of the three minor components was established by mass spectroscopy.

A number of colorimetric assays can be used for the quantitative determination of capsaicin (see p. 213); The B.P.C. utilizes ultraviolet absorption at 248 and 296 nm.

### Biogenesis of Capsaicin.

Work by Leete and Loudon on *C. frutescens* and by Bennett and Kirby on *C. annuum* has shown that phenylalanine is incorporated into the C6-C1 vanillyl unit of capsaicin, the C-3 of phenylalanine giving the methylene group of the vanillylamine residues; the incorporation probably proceeds via cinnamic, p-coumaric, caffeic and protocatechuic acids. Tyrosine did not appear to be a probable precursor. Leete's feeding experiments with <sup>14</sup>C have given incorporation consistent with the hypothesis that the C10 isodecanoic acid is formed from isobutyryl coenzyme A and three acetate units. (Treaxardevans).

The United States Department of Agriculture analyzed a raw chili pepper for nutritional content; their results follow.

	Immature green pods, excluding seeds	Mature Red pods, including seeds	Mature Red pods, excluding seeds	Mature red dried pods

## Dr. Christopher's Formulas Containing Cayenne

As we might expect, since Cayenne is a superior carrier for other herbs, many of Dr. Christopher's Combinations contain Cayenne.

- Prospallate* - The combination used to heal and tone the prostate and related organs.
- Nu-Fem* - The female tonic.
- Naturalax* - The formula to heal and tone the bowel.
- Panc Tea* - The formula which heals the pancreas and helps in blood-sugar related diseases.
- BP* - The formula which regulates blood pressure.
- Herbal Composition Powder* - Used for colds, flu, and many other ailments.
- Adrenatone* - The formula to strengthen the adrenal glands.
- Herbal Eyebright* - The toning eyewash.
- Yucca AR* - The arthritis and rheumatism formula.
- Mem* - The formula to improve memory and strengthen brain functions.
- Relax-eze Tea* - The formula to rebuild frayed nerves.
- Professor Cayenne Penetrating Deep Heating Balm* - For minor aches and pains.
- X-Ceptic* - The best herbal antiseptic available.
- Professor Cayenne Hot Lemon Lip Balm* - Lip balm
- The Antispasmodic Tincture* - A formula for coughs
- Cayenne Extract* - A potent fourteen-day extract, is made of Japanese, African, and American peppers.

## Hundreds of Children Poisoned by Tap Water

**By Saidou Arji**

**14/01/2001**

**Inter Press Service**

NIAMEY, Jan 14 (IPS) - The Societe Nigerienne des Eaux (SNE), Niger's water company, is being sued because hundreds of children in Tibiri, 720 kilometres from Niger's capital, Niamey, were poisoned by grossly elevated rates of fluoride in the town's water.

The children, ranging in age from 15 months to 14 years, contracted skeletal fluorosis, a disease

which causes deformities of the bones, according to medical sources.

The children suffer symptoms ranging from stiffness of the joints, arthritic-like symptoms and chronic joint pain, to calcification of the vertebral column, crippling spine and joint deformities, muscle wasting, and neurological defects. Mottling of the teeth is a less serious form of the disease that comes from ingesting lower levels of fluoride (dental fluorosis).

According to Dr. Moussa Koini, who has written a medical dissertation on the topic, the disease is caused by drinking water containing too much fluoride.

Water samples taken in Tibiri from SNE facilities show that the water contains 4.77 to 6.6 milligrams per litre, instead of the maximum 1.5 milligrams recommended by the World Health Organisation (WHO).

Out of the 425 recorded cases of children with fluorosis in Tibiri, there are 262 boys and 162 girls, a proportion of 61.79 to 38.21 percent. The age bracket most affected is the three to seven-year-old group. There are 62 three-year-olds and 55 six year olds affected. Sixty-eight percent of the victims are five-year-olds.

According to Dr. Koini, crippling skeletal fluorosis affects mostly children. There have been no reported cases of adults in Tibiri contracting the disease. This is due, he said, to the fact that growing children absorb more fluoride than do adults. Adults can become ill with the disease, but they would need to have drunk heavily fluoridated water for more than 20 years.

Skeletal fluorosis is a very disabling disease. Hadjia Kande, a mother whose two youngest children are paralysed, says life is a daily burden.

"Look at my children. Neither one of them can even go to the toilet by himself. I need to provide them with constant attention, so I can't regularly get to my job at the cotton mill."

One of the children, 13-year-old Salissou, expressed how sad he is. "I'm afraid to drink water from any source, even well water. Look at the state I'm in, it's really a shame," he said. Although it disables both boys and girls, the disease is even worse for girls as it can have grave consequences for childbearing.

Dr. Koini explained that "if there are outgrowths around the pelvic area, girls can have difficulty giving birth and may have to have Caesarian sections because of an inability to deliver vaginally," he stated.

The origins of the Tibiri tragedy date back to 1983, when the first waterworks was built. The first cases of the illness appeared 10 years later, when many children fell ill.

The Tibiri children's tragedy has produced a hue and cry from the public, especially human rights groups who specialise in these types of issues.

The Nigerien Association for Human Rights (ANDDH) has recruited a panel of lawyers to defend the victim's interests. During a recent press conference, the ANDDH chairperson, Khalid Ikhiri, who is also a chemist at the University of Niamey, emphasised the importance of pursuing this matter through the courts so that the children can receive monetary compensation for the damages they have suffered.

"Fluoride poisoning is fatal. Those children will be disabled for the rest of their lives. Every movement they make is painful, and as a result, they cannot engage in the normal play and other activities of children their age," he added.

Ikhiri's intention in filing suit against the SNE is also to end the impunity that the company has always enjoyed. "The SNE needs to answer for this tragedy since it's their mission to provide the public with pure drinking water," he said.

Confronted by the indignation the Tibiri affair has aroused and by press condemnations, the director of the SNE, Seyni Salou, declared that the elevated fluoride rate uncovered in Tibiri's water cannot be pinned on his operation. He said that the standard tests for water purity are regularly performed on all samples.

However, Salou did acknowledge that fluoride is not normally tested for in the standard tests generally performed on drinking water. "There is rarely a high rate of fluoride in naturally occurring sources. The case of Tibiri is an exception."

Salou recalls that drilling for water in Tibiri's substratum took place in 1983 by the Water Office. The SNE did not yet exist at that time.

"At the time this operation was turned over to us, nowhere was it ever mentioned in the technical documents that there was fluoride in the water."

"Naturally, we continued to distribute water until the health services advised us in 1988 that there was an outbreak of bony lesions among Tibiri's children. We did every possible analysis of the water, even the most farfetched, and finally figured out that the tap water contained a great deal of naturally occurring fluoride," Salou stated.

The SNE director believes that more studies still need to be done to be sure that the only cause of the problem is the fluoride. He thinks that the evidence is not yet conclusive. Nevertheless, he acknowledged that the ANDDH is in its rights to pursue a suit since the laws of Niger allow for it.

More than compensation for the victims, the provision of healthy water for Tibiri's citizens is today's priority. The SNE has confirmed that they have taken steps to bring down the fluoride level to 1.6 milligrams per litre.

Salou indicated that there are permanent changes to be made. Among them is a new water project in the neighbouring town of Maradi. The technical studies have already taken place with help from the Chinese, and work on the new supply project is expected to begin in February 2001.

"Bringing in water from Maradi is the only possible solution because there is fluoride even in Tibiri's groundwater," Salou added.

The government has asked Niger's development partners, most notably UNICEF, to provide assistance to the victims. UNICEF says that a Finnish organisation is ready to finance a community assistance project for Tibiri's children.

The goal of this project, which should begin in the first quarter of 2001, is to provide therapeutic assistance to the sick children, which will be based on nutritional remedies, physical rehabilitation, and orthopaedic correction.

Salmeye Bebert, the director of child welfare, added that the project will help research the exact scope of the disease and will determine the source of pollution of Tibiri's water.

Niger's infant mortality rate of 274 per 1,000 in 1998 was one of the highest in the world.

## Fluoridation Gets Flushed on Election Day

NEW YORK

Nov. 12, 2001

PRNewswire

*The following press release was issued today by the New York State Coalition Opposed to Fluoridation:*

Voters on November 6, 2001, rejected fluoridation in several U.S. cities despite hundreds of thousands of dollars spent by fluoridation proponents in public relations campaigns. This adds to a growing list of cities that rallied against adding the claimed cavity-fighting fluoride to their water supplies.

According to newspaper accounts:

\* On election day, Worcester, Massachusetts, residents renounced fluoridation for the fifth time since the 1950's. Fluoridation proponents refused to debate but spent \$400,000 trying to win this referendum. The victorious opposition spent only \$5,196.

\* Modesto, California, citizens rejected fluoridation for the second time, shunning a \$1 million

grant offered by Fluoridation 2000, a statewide group, to cover the cost of fluoridation equipment. Fluoridation proponents outspent opponents by over 10 to 1.

\* Flagstaff's, Arizona, electorate decisively turned down fluoridation for the third time via mail-in ballots.

\* Sixty two percent of Sutherlin, Oregon, voted against fluoridation on election day.

\* In Gilbert, Arizona, opponents of fluoridation, inspired by these victories, plan to attack fluoridation again, which is slated to start in Gilbert at the end of the month.

"People who study the issue, themselves, find out fluoridation's health risks far exceed any possible benefits and deprives individuals of their choice to be medicated," says Paul Connett, Ph.D., Coordinator, Fluoride Action Network and Professor of Chemistry, St. Lawrence University, N.Y. "If your community fluoridates and you want it stopped, call us. We can help you."

Some other places defeating fluoridation this year:

\* January 2001 -- Willamina, Oregon, City Council says "no" to fluoride.

\* March 2001 -- Norridgewock, Maine, votes down fluoridation.

\* April 2001 -- City residents of McPherson, Kansas, rejected a fluoridation proposal by a nearly 5-to-1 ratio. It was their third vote against fluoridation.

\* May 2001 -- Brewster, Massachusetts, said no thanks to fluoride in the town's water systems.

\* May 2001 -- Harper, Kansas, citizens successfully petitioned against fluoridation.

\* June 2001 -- Eureka Springs, Arkansas, city officials followed water customers' advice and rejected fluoridation.

\* August 2001 -- Woods Cross, Utah, City Council said no thanks to fluoridation after a citizens' group presented them with a petition to opt out of a countywide fluoridation plan.

\* September 2001 -- Goldendale, Washington, council members unanimously rejected any proposal to add fluoride to the city's water supply.

\* October 2001 -- Centerville, Utah, City Council decided against fluoridation.

\* October 2001 -- White Salmon, Washington, City Council rejected fluoridation.

In other countries:

\* March 2001 -- Japan's Assembly of Kanra-machi, Gunma Prefecture, rejected a fluoridation proposal.

\* April 2001, Onehunga, New Zealand, voted two to one against fluoridation.

\* October 2001 -- Voters in Kamloops, British Columbia, Canada, ended 40 years of fluoridation.

On election day, 2000, 14 communities voted down fluoridation.

## **Dentists to sue over continued fluoridation of drinking water**

**By Fionnuala Quinlan**

**October 22, 2001**

**[\*The Irish Examiner\*](#)**

A GROUP of Irish dentists are to sue the Minister for Health, Micheál Martin, for continuing to fluoridate drinking water.

The dentists, who are breaking ranks with the Irish Dental Association, plan to lodge papers with the High Court after handing a letter of protest into the Dáil on Friday.

The move comes as the Forum on Fluoridation — set up by the minister to examine both sides of the fluoride argument — completes its report, due to be published by the end of the month. The forum was branded a “rubber-stamping exercise” by the dentists planning to sue the Government.

The group of 20 — Irish Dentists Opposing Fluoridation — maintain that health authorities have not fulfilled their obligation under the 1960 Health Act to carry out regular surveys into the health effects of fluoridation.

Spokesman Dr Don MacCauley said the department had never carried out a comprehensive survey, although international research has linked fluoridation to cancer, irritable bowel syndrome, hip fractures and thyroid disorders. A study published in American medical journal NeuroToxicity found that fluoride exposure could produce lower IQ levels in children.

Up to 50% of Dr MacCauley’s teenage patients have dental fluorosis — which has been linked to fluoridation — which creates white spots or lines on teeth and causes tooth enamel to chip, he said.

The agent used, hydrofluosilic acid, is a waste component of the fertiliser industry and contains traces of chromium, mercury, arsenic and lead, according to Dr MacCauley.

Ireland is now the only country in Europe to insist that drinking water be fluoridated, although nine county councils, two corporations and seven urban district councils have voted to end fluoridation.

Dr MacCauley said the group opposed fluoridation because medication is being administered without consent, the public has not been fully informed of the risks and side effects and fluoridation causes dental fluorosis.

Kildare-based GP Andrew Rynne is taking a separate case against the Government and the Irish Medicines Board (IMB) on the grounds that, although fluoride is a medicine, it is not licensed by the IMB.

A Health Department spokeswoman said all the issues raised by Dr MacCauley had been covered by the Forum on Water Fluoridation. However, she declined to comment on the contents of the report in advance of its publication.

# Utah a national leader by not fluoridating

Written by David W. Christopher M.H.

*[The Daily Herald](#)*, Provo, Ut.

Sunday, June 4, 2000

Utahns consistently reject fluoride because we cut through the enormous endorsements and weigh the facts. We are not behind the times, but ahead of the 60 cities that bucked the system and rejected fluoride in the 1990's. We're unique because we vote. Most cities are fluoridated by executive order.

The task of unmasking this fluoride farce is monumental. Utah being the least fluoridated state is pivotal. If we can withstand the onslaught of federal, state, industrial, and of course medical pressure, Utah can send a clear message to Washington that like Europe and the majority of the world we will not be a part of the biggest hoax perpetrated on America since its inception. One lemming bucking the crowd will be noticed by other States who then might finally call for congressional hearings ferreting out the perpetrators of this insidious practice of dumping toxic waste into our drinking water under an EPA loophole.

Is fluoride toxic? Science shows fluoride is more toxic than lead (Clinical Toxicology of Commercial Products-1984) The majority of fluoride is captured into ponds from EPA required smokestack scrubbers and sold untreated to municipalities. The technical name is fluorosilicic acid, and yes it is a toxic waste that can totally dissolve any cement barriers.

Is fluoride a cumulative toxin? Of course it is; that's how it's supposed to work. It attaches to the calcium in bones. That is why dentists apply it to your teeth. However, when you drink it in water it enters the blood stream and attaches to the first bones it comes in contact with. Does fluoride cause hip fractures? Yes. Hip fractures were caused inadvertently in a study designed to prove fluoride prevented osteoporosis. In the trials elderly women were given 75 mg. per day of sodium fluoride and compared to a control group. The study ended abruptly with the horrifying discovery that fluoride caused these fractures. In light of this study another study looked at low levels of fluoride in drinking water at the optimal level of 1 ppm. Hip fractures were 27% higher in women and 41% higher in men living in Brigham City, the largest fluoridated community in Utah, compared to non-fluoridated Logan and Cedar City. These studies were verified in five additional studies including the French study (JAMA 1995; 273:775) that showed an 86% increase in hip fractures in fluoridated communities. Additionally, Toronto which has been fluoridated for 35 years has twice the hip fractures as Quebec which has never been fluoridated.

Is fluoride absolutely safe? Of course not! There are more than 500 peer reviewed studies documenting adverse effects of fluoride ranging from cancer to brain damage. Tragically all of these studies will be dismissed as non conclusive by a medical system which has a predetermined mind set that fluoride is safe and effective.

Should we vote on it? By the initiative process, yes. If they can't get enough signatures? Then no, and quit wasting our time. How many times? I guess until they join our side!

David Christopher

## Prominent researcher apologizes for pushing fluoride

By Barry Forbes,

*The Tribune*, Mesa, AZ

Sunday, December 5, 1999

Reproduced with permission

"Why'd you do it, Doe? Why'd you toss the fluoride folks overboard?"

I had just tracked down Dr. Hardy Limeback B.SC., Ph.D. m Biochemistry, D.D.S., head of the Department of **Preventive Dentistry** for the University of Toronto, and **president of the Canadian Association for Dental Research.** (Whew.)

**Dr. Limeback is Canada's** leading fluoride authority and, until recently, the country's primary

**promoter** of the controversial additive. In a surprising newsmaker interview this past April; Dr. Limeback announced a dramatic change of heart. "Children **under three should never use fluoridated toothpaste,**" he counseled. "Or drink fluoridated water. And baby formula must never be made up using Toronto tap water. Never."

Why, I wondered? What could have caused such a powerful paradigm shift?

"It's been building up for a couple of years," Limeback told me during a recent telephone interview. "But certainly the crowning blow was the realization that we have been dumping contaminated fluoride into water reservoirs for haft a century. The vast majority of all fluoride additives come from Tampa Bay, Florida smokestack scrubbers. The additives are a toxic byproduct of the super-phosphate fertilizer industry."

"Tragically," he continued, "that means we're **not just dumping toxic fluoride into our drinking water. We're also exposing innocent, unsuspecting people to deadly elements of lead, arsenic and radium, all of them carcinogenic. Because of the cumulative properties of toxins,** the detrimental effects **on human health are catastrophic.**" A recent study at the University of Toronto confirmed Dr. Limeback's worst fears. "Residents of cities that fluoridate have double the fluoride in the hip bones vis-à-vis the balance of the Population. Worse, we discovered that fluoride is actually altering the basic architecture of human bones."

Skeletal flourish is a debilitating condition that occurs when fluoride accumulates in bones, making them extremely weak and brittle. The earliest symptoms?

"Mottled and brittle teeth," Dr. Limeback told me. "In Canada we are **now spending** more money treating dental fluorosis than we do treating cavities. That includes my own practice."

One of the most obvious living experiments today, Dr. Limeback believes, is a proof-positive comparison between any two Canadian cities. "Here in Toronto we've been fluoridating for 36 years. Yet Vancouver-which has never fluoridated-has a cavity rate lower than Toronto's." And, he pointed out, "cavity rates are low all across the industrialized world including Europe, which is 98% fluoride free. Low because of improved standards of living, less refined sugar, regular dental checkups, flossing and frequent brushing. Now less than 2 cavities per child Canada-wide,' he said.

"I don't get it, Doc. Last month, theca Centers for Disease Control (CDC) ran a puff piece all across America saying the stuff was better than sliced bread. What's the story?"

"Unfortunately," he replied, "the CDC is basing its position on data **that is 50 years old, and** questionable at best. Absolutely no one **has done research on fluorosilicates, which is the junk they're dumping into the drinking water.**"

"On the other hand," he added, "the evidence against systemic fluoride intake continues to pour in."

"But Doc, the dentists"

"... have absolutely no training in toxicity," he stated firmly. "Your well-intentioned dentist **is** simply following **50 years of misinformation from public health and the dental association. Me, too. Unfortunately, we were wrong.**"

Last week, Dr. Hardy Limeback addressed his faculty and students at the University of Toronto,

Department of Dentistry. In a poignant, memorable meeting, he apologized to those gathered before him.

"Speaking as the head of preventive dentistry, I told them that I had unintentionally mislead my colleagues and my students. For the past 15 years, I had refused **to study the toxicology information that is readily available to anyone. Poisoning our children was the furthest thing from my mind.**"

"The truth," he confessed to me, "was a bitter pill to swallow. But swallow it I did."

South of the border, the paradigm shift has yet to dawn. After half a century of delusion, the CDC, American Dental Association and Public Health stubbornly and skillfully continue to manipulate public opinion in favor of fluoridation.

Meantime, study after study is delivering **the death knell of the** deadly toxin. Sure, fluoridation will be around for a long time yet, but ultimately its supporters need to ready the life rafts. The poisonous waters of doubt and confusion are bound to get choppy.

"Are lawsuits inevitable?" I asked the good doctor. "Remember tobacco," was his short, succinct reply.

Welcome, Dr. Hardy Limeback to the far side of the fluoride equation.

It's lonely over here, but in our society loneliness and truth frequently travel hand in hand.

Thank you for the undeniable courage of your convictions.

---

### Introduccion:

El programa de limpieza interior se hace con el propósito de purificar el cuerpo preparándolo para su curación. Si está subido de peso, este programa le hará bajar a su peso normal; y si está bajo de peso, le hará subir hasta su peso óptimo. El propósito del programa es eliminar la mucosidad del cuerpo, con lo cual se obtiene una cura natural en una forma muy simplificada, con las menores molestias para el paciente.

Recuerde, no hay enfermedades incurables, solamente personas incurables. Este programa de limpieza interior lo bendecirá in cinco formas:

1. Eliminará el exceso de mucosidad del cuerpo, que es lo que origina el desarrollo de pólipos, tumores, quistes, etc; los cuales hacen que el cuerpo envejezca rápidamente. (Vease "Procedimiento de Purificación-Detoxificación del Cuerpo").
2. Le dará alimentos que son de las más alta calidad vibratoria (que son vivos, nutritivos y saludables), los cuales vigorizarán las partes vitales del cuerpo de tal forma que ellos no pierdan la salud sin aviso. La mucosidad es la causa de alergias, enfermedades, dolores y muerte, y por esta razón le estamos dando esta dieta anti-mucosa que mantendrá el cuerpo limpio de esas sustancias que causan el pronto envejecimiento de la persona.

3. Le proveerá de la ayuda correctiva para facilitar la cura y la regeneración del cuerpo humano. (Véase Ayudas Correctivas).
4. Disipará la electricidad estática del cuerpo, y de esta manera eliminará su resultado, que es la confusión y la frustración.
5. Le proveerá de fórmulas de plantas que le ayudarán a encontrar mejor salud y felicidad.

## **I. LOS TRES DIAS DE LIMPIEZA**

Para empezar este programa de limpieza se requiere que el paciente este bajo una terapia de 3 días de detoxificación (purificación de cuerpo), para entonces proceder con la dieta como se indicará después. El procedimiento de la eliminación de la mucosidad y el catarro y la detoxificación que recomendamos es tomado en parte del libro del Dr. N. W. Walker, "Raw Vegetables Juices": To Detoxicate,,: Phoenix, Arizona: Norwalk Press, Publisher, pp 58-71.

La limpieza suprema es el primer paso para la obtención de la salud. Cualquier acumulación o retención de materia residual de cualquier clase dentro de nuestro cuerpo retardará el proceso de recuperación. Los canales naturales de eliminación son los pulmones, los poros de la piel, los riñones y los intestinos.

La transpiración es la acción de las glándulas sudoríparas de eliminar del cuerpo las toxinas, las cuales podrían ser perjudiciales para nosotros si son retenidas en él. Los riñones excretan los productos finales de la comida y del metabolismo que vienen del hígado. Los intestinos eliminan no sólo los residuos de la comida, sino también materia residual en forma de células y tejidos muertos, que son resultado de nuestras actividades físicas y mentales; las cuales si no son eliminadas, causan putrefacción de las proteínas resultando en toxemia o acidosis.

La retención de estas materias residuales tiene un efecto mucho más perjudicial en nuestro cuerpo que lo que es generalmente sospechado, y su eliminación es uno de los primeros pasos hacia la obtención de progresos notorios.

Un método eficiente para efectuar dicha eliminación rápidamente, particularmente en el caso de adultos, ha sido encontrado a través del siguiente procedimiento: Lo primero que hay que hacer por la mañana, al levantarse, es tomar 16 onzas (1/2 litro) o más de jugo de ciruela seca. El propósito del jugo de ciruela seca no es sólo el de vaciar los intestinos (el cual se realizará de todas maneras), sino también el de atraer los despojos de todo el cuerpo, donde sea que éstos se encuentren, hacia los intestinos y eliminarlos a través de ellos.

Durante los tres días de limpieza, tome 1 o 2 cucharadas de aceite de olivo tres veces al día, para ayudar a lubricar los conductos del hígado y la bilis, etc.

Si la cantidad de volumen de materia eliminada no fuese reemplazada, en igual volumen por algo, entonces el cuerpo se deshidrataría en ese volumen. Por eso, tomando jugo de frutas reemplazamos las materias tóxicas o ácidas removidas o eliminadas. Este procedimiento traerá como resultado una reacción alcalina en nuestro sistema. Hay varios tipos de terapia por jugos - manzana, zanahoria, uvas, cítricos, tomate, etc., pero escoja sólo uno para los tres días, y "chupe" completamente cada bocanada que tome. La elección del líquido para el cuerpo debe ser hecha por experimentación individual y por preferencia.

No se debe comer nada sólido durante los tres días de limpieza, sin embargo, si llega a la noche con mucho hambre, puede comer apio.

**Terapia del Jugo de Manzana.** Como una de las más grandes plantas purificadoras de la sangre conocidas, tenemos la más común de las frutas: la manzana (orden natural: Pomaceae) con más de 2,000 variedades. El Dr. Edward E. Shook dice:

"No hay otro agente curativo o planta en el rango total de agentes terapéuticos conocidos, que puede compararse con el árbol de la manzana, y aunque sería difícil decir cual de sus muchas virtudes es la mejor, suponemos que su abundancia en compuestos de oxígeno naciente es probablemente la razón principal por la cual es una fruta tan apreciada, purificadora de la sangre e infalible remedio para muchas enfermedades." (Traducción)

El análisis químico de la manzana muestra el porqué de su gran valor curativo. Jugo de manzana fresca es lo mejor, si se puede conseguir; sinó, se puede comprar cualquier jugo de manzana embotellada que no tenga preservantes ni aditivos.

Empezar tomando 1/2 litro (16oz) de jugo de ciruela seca (prune juice), como la primera cosa en la mañana, y después de media hora 1/4 de litro (8 oz) de jugo de manzana sin diluir. Revuelva cada bocanada en la boca completamente (llamado "chupar") de tal forma que la saliva se mezcle con élla; de esta manera podemos obtener todo el valor nutritivo y curativo.

(Nota: Esta es la razón por la cual todos los alimentos deben ser comidos sin tomar líquidos, así la comida es masticada y "chupada" lo suficiente para ser convertida en líquido al ser mezclada totalmente con la saliva. Esta es la llave que abre la puerta de la digestión. El jugo no debe ser tragado. De esta manera todo su valor nutritivo será obtenido, y no habrá peligro de regurgitación o de que actúe como un emético para un estómago débil. Este procedimiento ayudará también al páncreas en casos de alto o bajo nivel de azúcar. Usando la saliva es esta forma, el programa curativo de limpieza interior es grandemente acelerado, ya que el resto de los jugos gástricos funcionarán apropiadamente en lugar de fortuitamente).

Entonces, media hora después, tomar un vaso de agua de preferencia destilada, seguido en otra media hora más tarde con más jugo de manzana. Aproximadamente 1 galón (4 litros) de jugo será consumido en un día, por un adulto de tamaño promedio, o una onza (una cucharada) por cada kg de peso de alguien si éste es más pequeño o más grande que el promedio. (Esto, por supuesto, es la dosis sugerida; la edad, la habilidad para asimilar líquidos, etc. determinará la capacidad para cada caso específico). Este procedimiento se recomienda como una "regla de dedo" y no como una ley específica; sin embargo, el procedimiento que estamos explicando ha demostrado ser el mejor.

El disolver la mucosidad durante la terapia de jugo, generalmente causa estreñimiento. Use nuestra fórmula para el intestino grueso (**Fen LB**, que se encuentra en la última sección de este libro), 2 o más cápsulas 3 ó más veces al día.

Repita este método de detoxificación por tres días consecutivos. De este modo aproximadamente 3 galones (12 litros) de toxinas linfáticas serán eliminadas del cuerpo y serán reemplazadas por tres galones de jugo. Esto traerá como resultado una acelerada realcalinización del sistema. Si aparece alguna condición de ictericia (resultado de la alteración del funcionamiento del hígado, que causa color amarillo en los ojos y en la piel) o dolor en la zona hígado-vesícula biliar usar la fórmula No. 3 (**Barberry LG**).

En el cuarto y siguiente días, empiece a tomar jugo de vegetales, y a comer verduras y frutas, preferiblemente crudas (ensaladas). Para el desayuno por ejemplo se podría comer frutas de la estación en rodajas, rayado o cortado, algo de miel para endulzar, y una o dos cucharadas de almendras finamente rayadas y sin echarle sal. Se podría tomar también uno o dos vasos de jugo de fruta fresca o de verduras 30 minutos antes o después de comer las frutas.

Para el almuerzo se podría comer más frutas y 1/2 litro de jugo de verduras frescas y alguna clase de ensalada de verduras.

No debemos alarmarnos si nos sentimos de alguna manera débiles durante o después de este programa de detoxificación. La naturaleza usa nuestras energías para efectuar la limpieza general de nuestro organismo. Pronto obtendremos mayor energía y vitalidad como resultado de este programa, además de obtener un cuerpo mas limpio y saludable. Es bueno hacer los tres días de limpieza mensualmente o varias veces al año.

(NOTA: Si existe la más ligera tendencia hacia apendicitis, podemos hacer uso de enemas con infusión de nebeda (catnip) o de una infusión hecha de tres partes de las hojas de la frambuesa roja (red raspberry) y una parte de las hojas de lobelia, 2, 3 ó más enemas al día por una semana o más, si es necesario. Creemos en el uso de enemas en casos de emergencia solamente, y no como apoyo para unos intestinos inactivos o "flojos").

**Terapia del Jugo de Zanahoria.** El mismo procedimiento que se usa con el jugo de manzana se usa con el jugo de zanahoria. Este puede ser usado directamente sin diluir, tomando un vaso de 1/4 de litro (8 oz) cada media hora, si desea, como con el jugo de manzana.

**Terapia del Jugo de Cítricos.** La mejor terapia de jugos usando cítricos es una combinación.

Estos son preparados frescos y en las siguientes proporciones: 4 a 6 toronjas o pomelos (de acuerdo con el tamaño), 2 o 3 limones y suficiente naranja para completar una mezcla total de 2 litros. Diluir con dos litros de agua para hacer un galon de este surtido. Luego proceda como en la terapia del jugo de manzana.

**Terapia del Jugo de Uva.** Aún si se vive en una zona de cítricos, es permisible substituir este surtido por el jugo de uva sin azúcar y sin aditivos. (Es mejor usar el tipo de frutas que crece naturalmente en la zona que vive de cada persona). Jugo de uva congelada no es recomendable porque son combinados con muchos aditivos inaceptables, en casi la mayoría de los casos. Las marcas de jugos vendidas en las tiendas naturistas que son obtenidas en suelos orgánicos y sin pesticidas son definitivamente superiores que los otros que son vendidos en tiendas regulares.

Diluir 2 litros de jugo de uva con dos litros de agua (de preferencia agua destilada). Se toma un vaso de 1/4 de litro (8 oz) empezando media hora después de haber tomado el jugo de ciruela seca en la mañana. Se sigue con 1/2 litro de jugo de uva diluído cada 20 ó 30 minutos de allí en adelante hasta que todos los 4 litros de jugo se termine. Entonces siga el procedimiento como en la terapia del jugo de manzana.

**Continuación del Ayuno.** Después de los tres días de limpieza, si la persona tiene el deseo y la habilidad de hacerlo, es siempre provechoso ayunar de 1 a 3 días, usando sólo agua destilada, y entonces un día de jugos antes de retornar a las ensaladas y otras comidas regulares. No coma ninguna comida pesada inmediatamente después del período de limpieza o después de un ayuno, sino que adicione éstos a su dieta gradualmente. Este es el mejor camino para retornar a las comidas sólidas.

**Síntomas de la Limpieza.** El inicio del proceso de la limpieza interior de nuestro cuerpo puede venir acompañado por dolores periódicos en las áreas donde la acción de limpieza es más aguda y los desperdicios están saturando el sistema de eliminación de nuestro cuerpo. Habrá momentos en que Usted se sentirá muy indispueto. No se asuste. De hecho, la acción de limpieza puede producir todos los síntomas y efectos de una enfermedad severa, pero la persona deberá actuar aquí con conocimiento y no quejarse del problema temporal creado por la limpieza que se está realizando; se requerirá mucha paciencia, y gran alivio resultará por el hecho de que el proceso de curación esta bien encaminado; y es mejor cuanto más pronto esas molestias vengan y se sientan.

Recomendamos el inicio de baños en tina con aceite de ricino (como se explicará después en este programa) durante los tres días de limpieza con jugos.

Esta eliminación y limpieza no será realizada instantáneamente, y uno no debería esperar que esas acumulaciones, que han sido "empaquetadas" en nuestro sistema durante toda nuestra vida, sean milagrosamente forzadas a salir fuera de los tejidos y órganos de un día para otro. Todo esto tomará tiempo: Llamado Tiempo Cíclico (trabajando con el funcionamiento cíclico normal del cuerpo). Por lo tanto, en el programa del Dr. Christopher usted tendrá días buenos y malos, y esto ocurrirá en ciclos. Estas "enfermedades por la limpieza" vienen en ciclos de 7 días, 7 semanas, 7

meses, y 7 años en la mayoría de los casos (puede variar dependiendo de la persona) y en cada uno de estos períodos cíclicos habrá lo que llamamos la Crisis de Limpieza y Curamiento. Cuando las toxinas venenosas se desprenden y descargan dentro de la corriente sanguínea para ser eliminadas, usted puede sentirse muy indispuosto, y frecuentemente durante una crisis usted puede sentirse peor de lo que pude haberse sentido antes de empezar el programa. Pero, nuevamente, no se asuste. Estas crisis son solamente toxinas venenosas tratando de salir del cuerpo (cargando pesadamente los intestinos) y le estan haciendo el favor de abandonarlo lo más rápido posible (causando dolor y molestia en el proceso de eliminación). Pero los malos días irán disminuyendo mientras que los buenos irán aumentando cada vez más, si usted tiene fé y sigue cuidadosamente el program.

## Rápida Referencia Para los Tres Días de Limpieza

### **Cosas ha necesitar:**

54 onzas o 2 cuartos de jugo de Ciruela Seca (Prune Juice)

9 onzas de aceite de olivo

3 galones de el jugo seleccionado (manzana, zanahoria, cítrico o uva)

3 galones de agua (de preferncia destilada)

### **Pasos para la Limpieza:**

Paso 1: Jugo de Ciruela Seca

16 oz o más al levantarse en la mañana

Paso 2: Aceite de Olivo

Una o dos cucharadas tres veces al día

Paso 3: Jugo y Agua

8 onzas de fluído cada 30 minutos, alternando 8 onzas de jugo elegido con 8 onzas de agua destilada.

### **Tiempo Sugerido:**

7:00 a.m. .... 16 oz de jugo de ciruela seca y 1-2 cucharadas de aceite de olivo.

8:00 a.m. .... 8 oz o más de jugo elegido

8:30 a.m. .... 8 oz o más de agua destilada

9:00 a.m. .... 8 oz o más de jugo

9:30 a.m. .... 8 oz o más de agua destilada

Continúe alternando agua y jugo cada media hora hasta el mediodía.

12:00 p.m. .... 8 oz o más de jugo elegido y 1-2 cucharadas de aceite de olivo.

Continúe alternando agua y jugo cada media hora hasta las 5:00 p.m.

5:00 p.m. .... 8 oz o más de jugo elegido y 1-2 cucharadas de aceite de olivo.

Continúe alternando agua y jugo cada media hora hasta las 8:00 p.m.

8:00 p.m. .... 8 oz de agua cada hora hasta acostarse.

### **Recuerde:**

**Un tipo de jugo por tres días.** Seleccione cualquier jugo (manzana, zanahoria, cítrico, tomate, uva, etc.) Y úselo por los tres días completos.

**Solamente jugo.** No coma nada durante los tres días de limpieza, con excepción de la fruta o vegetal que se está usando con la limpieza.

**Chupe el jugo.** Asegúrese “chupar” totalmente cada bocanada.

**Estreñimiento.** Use más jugo de ciruela seca o tomar Fen LB si se desarrolla estreñimiento durante la limpieza.

**3 días de limpieza.** Repita esta detoxificación por tres días consecutivos.

**Cuarto día en adelante.** Después de 3 días de limpieza empieza a tomar jugo de vegetales y frutas, preferible crudas.

**Sintiéndose débil.** Usted probablemente se va a sentir un poco débil durante o después de la detoxificación ya que su cuerpo usará muchas energías para limpiarse.

**Enema.** Si existe la más mínima tendencia hacia apendicitis, use enema alta, pero sólo úselo en casos de emergencia y no como una “muleta” para unos intestinos flojos.

**Continúe el ayuno.** Una vez que a completa varios programas de limpieza, Usted puede ayunar 3 días más usando solamente agua destilada.

**Síntomas de la Limpieza.** Mientras su cuerpo se empieza a limpiar, Usted probablemente experimentará dolores periódicos en todo su cuerpo debido a la eliminación de toxinas, pero esto brinda una limpieza y un curamiento más rápido.

## II. DIETA SIN MUCOSIDAD

El segundo paso para el curamiento del cuerpo es eliminar de la dieta las comidas que forman mucosa (dieta es definida como la comida diaria de cada persona). No debemos ingerir mucosa en nuestro cuerpo más rápido que lo que éste toma para eliminarlo.

Con este procedimiento preventivo no sólo los sinusoides, los bronquios y los pulmones son despejados sino también la mucosa que produce el estreñimiento. El programa de comidas que dará este maravilloso resultado es conocido como la "dieta sin mucosidad".

**Comidas Peligrosas que Forman Mucosa.** Sustancias artificiales o inorgánicas en la comida deben ser eliminadas de la dieta del paciente:

1. **Sal.** Para aquellas personas que están acostumbradas a usar mucha sal, ésto podría sonar difícil pero, si usted lo sustituye con pimienta molida y condimentos de hierbas, adicionando kelp en polvo, encontrará que el deseo por la sal irá desapareciendo rápidamente. La pimienta es una planta muy nutritiva que ayuda a regenerar el cuerpo cuando es usado en su estado natural. Pero cuando la pimienta es cocinada, su estructura molecular cambia, y se convierte en un irritante inorgánico, y es éste el único momento en que tiene resultados dañinos. El uso de sales que están hechos a base de potasio o de vegetales son buenos, teniendo cuidado de no exagerar.

2. **Huevos.** No deben ser comidos en ninguna forma.

3. **Azúcar y todos los productos derivados.** Usted puede usar miel de abeja, melaza de zahina, pero no azúcar, ni sus aplicaciones.

4. **Carne.** Eliminar todas las carnes rojas de la dieta. Un poco de pescado de carne blanca una vez por semana, o un poco de pollo (que no ha sido alimentado con fines comerciales o inoculados con formaldehído o suero para evitar la descomposición) podría estar

bien (ya que éstas son las mejores formas de carne comestible) pero no los use muy seguido.

5. **Leche.** Eliminar la leche y todos sus derivados, los cuales incluye mantequilla, queso, queso cortado, yogurt, etc. Todas éstas son sustancias que forman mucosidad y en la gran mayoría son de alto contenido de colesterol (especialmente la mantequilla). Como un sustituto para la mantequilla o la margarina usted puede entrenar su gusto y gozar de un buen, fresco y suave aceite de olivo en las ensaladas y verduras, y descubrirá que éste es uno de los mejores alimentos que existen.

6. **Harinas.** La razón para eliminar la harina es que cuando es calentada y horneada a altas temperatura cambia a ser una sustancia formadora de mucosidad. Ya no es una comida, lo que significa que no hay "vida" en ella. Toda comida saludable es orgánica, mientras que la comida que no es saludable, o "comida muerta" es inorgánica. Esta es la clave de todo nuestro programa de eliminación de mucosa.

**Suplementos: Rehabilitación y Ayudas Curativas.** Nuestras recomendaciones suplementarias aumentarán la fortaleza de nuestro cuerpo, empezarán a eliminar la mucosidad de los tejidos y removerán el catarro fuera del sistema.

1. **Cayenne.** Tome una cucharadita de cayenne 3 veces al día. Empieze gradualmente con 1/4 de cucharita en un poco de agua fría (agua destilada preferible). Aumente 1/4 de cucharadita más a la dosis cada 3 días (1er día 1/4 de cucharita. 4to día 1/2 cucharita, etc.) hasta lograr una cucharadita 3 veces al día (el aumento gradual de la dosis acostumbra a su sistema a lo picante de la planta).

2. **Miel y Vinagre de Cidra de Manzana.** Ponga una cucharada de miel y una cucharada de vinagre en agua tibia, tal que la miel se derrita. Tome esta cantidad 3 veces al día. Este debe ser Vinagre de Cidra de Manzana. No use malta u otro tipo de vinagre ya que éstos son dañinos para el cuerpo. El Vinagre de Cidra de Manzana es medicinal y muy beneficioso.

3. **Kelp (Alga Marina).** Cada paciente debería tomar entre 10 a 15 cápsulas diarias, si es que hay alguna indicación de problemas con la tiroides; de otra forma, 2 ó más mantendrán al cuerpo en buena condición como nutrición preventiva. Este se puede tomar en lugar de la sal y ayudar a reconstruir una nueva glándula tiroides. Kelp en polvo puede ser usado en ensaladas o en otras formas.

4. **Miel de caña (Melaza).** Tome una cucharada de melaza de zahina 3 veces al día.

5. **Aceite de germen de trigo.** Tome una cucharada de este aceite 3 veces al día.

**Sugerencias para la Dieta: Alimentos Regenerativos.** Si la dieta es seguida al pie de la letra, le aseguramos que después de un tiempo muy corto usted tendrá una mayor satisfacción de las comidas que recomendamos (debido a la mejor salud que usted alcanzará) que con su dieta anterior. Usted inclusive llegará a su peso normal. Si está con kilos de más, los perderá con esta dieta, y si está bajo de peso, usted ganará peso después de haber pasado por su "nuevo bajo peso", debido a la mucosidad expelida fuera del cuerpo, antes que "carne buena" sea restaurada.

No se preocupe de que esta dieta omita carnes y los tipos de proteínas comerciales, y no se preocupe de adicionarlas a su dieta, ya que usted obtendrá todo lo que su cuerpo necesita de estas comidas. El cuerpo del gorila esta formado en el mismo orden biológico que el cuerpo humano, y él consigue todas las proteínas que necesita de las frutas, nueces y semillas (y para el hombre, las verduras y hortalizas reúnen todo lo que el cuerpo requiere.) Usted puede probar la efectividad de este programa por si mismo.

### **En las mañanas**

Es mejor no "romper el ayuno" (desayuno) hasta por lo menos al mediodía, excepto en casos de personas jóvenes o muy activas. Usted encontrará que ésto no será difícil hacerlo si usted usa las plantas que le recomendamos (como el cayenne, aceite de trigo, etc.). Estos le disminuirán el apetito, y le proveerá de la nutrición necesitada, tal que usted se sentirá satisfecho y habrá tomado estas plantas por la segunda vez durante la mañana antes del tiempo de la comida del mediodía.

Pero si después de tomar los tónicos para el intestino grueso (aceite de germen de trigo, cayenne, vinagre de cidra de manzana, miel de abeja, melaza, te de hierbas, etc.) usted está aún con hambre y quiere comer, la mejor comida para empezar el día es un buen y saludable cereal calentado a baja temperatura. Este debe ser cereal en su estado saludable (con "vida"). O se puede comer frutas frescas.

El cereal es preparado primero remojando en agua el grano sin partir de 8 a 20 horas, y entonces calentando al baño maría (en doble olla de acero inoxidable) a muy baja temperatura de 130 grados F o menos (55 grados C o menos) el que puede ser hecho echando agua caliente sobre el grano y entonces aplicando baja temperatura. Como un sustituto, ésto puede también ser preparado en botellas thermos para una o dos personas, como sigue: Tome un thermo (una pinta, un cuarto o el tamaño que necesite para su familia o sólo para usted), llene 1/3 de ella en la tarde o en la noche, con trigo rojo turco, que es de alta calidad proteínica, entonces termine llenando el thermo con agua hirviendo, (ponga la botella boca abajo una o dos veces, tal que durante la noche el agua circule completamente por la base y no deje nada del trigo sin tratar). Cuando usted abra el thermo en la mañana, después del calentamiento a baja temperatura durante toda la noche, el trigo estará listo para su consumo. El trigo se ha reventado, esta suave y delicioso (ya que nada de su sabor se ha perdido al cocinarse); este proceso se puede mejorar si se remoja el trigo anteriormente. Con un poco de mantequilla fresca y miel de abeja añadida, ésta es una comida deliciosa. Algunas personas les gusta agregar canela, pimienta de jamaica (allspice), etc.

El Trigo contiene todo el potencial de los valores nutritivos que necesita el cuerpo humano. La planta del trigo o hierba del trigo, especialmente, es una comida completa ya que le provee de proteínas, calcio, y todas las enzimas necesarias, vitaminas, minerales, etc., para reconstruir y regenerar la estructura celular de su cuerpo. El grano permanece "vivo" hasta que es "matado" en algún procedimiento de almacenaje químico o por la aplicación de altas temperaturas. La prueba para saber si el germen de trigo tiene "vida" es plantarlo y ver si todavía crece. Este procedimiento es válido inclusive para trigo cocinado y cuando es calentado a baja temperatura en olla de acero inoxidable; retendrá su poder vital y crecerá. Las comidas preparadas en esta manera son orgánicas; por lo tanto, ésta es la manera en que los granos deben ser preparados para su uso. Se nos ha dicho en las Santas Escrituras que "todos los granos 'saludables' y plantas son para el hombre, y el grano es la vara de vida", pero esto no quiere decir que es permitido molerlos a una apariencia de polvo sin finesa, o calentarlos a temperaturas mayores de 100 grados C y cambiar su estructura molecular de orgánico a inorgánico y por lo tanto hacerlo un formativo de mucosidad. El resultado de las invenciones del hombre indica lo contrario. Haga germinar los granos si usted desea, de preferencia remójelos, y revíentelos con calor húmedo (baño maría).

Los granos de trigo germinados son excelentes y nutritivos, pero si usted le dá un plato de éstos a un niño en crecimiento para el desayuno, el estará con hambre al poco tiempo; por lo tanto, un buen plato de granos de trigo, enjuagado y calentado a baja temperatura "le llenará el estómago" por horas. Alternar el trigo con cebada, mijo, trigo macho, centeno, avena de sémola (entero).

Usted puede preparar deliciosas casseroles con cebada, centeno, mijo trigo remojado, como se explicó anteriormente y mientras se está calentando a baja temperatura se puede agregar frutas o legumbres, plantas de buen sabor, etc. Todas las lentejas, frijoles, soya, preparados de esta manera son "vivos" y buenas para comer. La soya y la mayoría de los frijoles pueden ser remojados por dos o tres días y entonces cocinados a baja temperatura por 12 a 20 horas, agregando cebolla, ajos, pimienta, etc. durante el calentamiento.

La mejor manera de ver si su comida esta viva y saludable, es hacer un pequeño surco en su jardín y sembrar algunos granos que sobraron del desayuno, alguna casserola del almuerzo y lentejas de alguna otra comida; y en una segunda fila sembrar alguna wheaties, granola (tipos de cereales comerciales) y un pedazo de pan. Cúbralos y eche agua a cada fila y vea en cual de ellas hay crecimiento.

## **Al mediodía**

Si usted prefiere sólo un almuerzo ligero, entonces prepare una buena ensalada mixta de legumbres en la cantidad que usted desee, usando salsa de aceite de olivo hecho en casa:

1 taza de aceite de olivo

2 cucharadas de vinagre de cidra de manzana

1 pizca de hierbas, pimienta, etc.

(Haga esta salsa o aderezo a su gusto, ya que hay muchas variedades que usted puede hacer: de palta, cebolla, ajos, etc. pero no use las salsas procesadas de las tiendas comerciales.

Jugos pueden ser tomados durante la tarde: de zanahoria, de uvas, de manzana, etc. Frutas secas y un poco de nueces son muy nutritivos y beneficiosos, y los últimos son mejores como proteínas saludables cuando es usado en combinación con las verduras. Si una persona tiene cáncer o inclinación al cáncer no se debe exceder en comer proteínas coma las nueces, almendras, etc. Esto es algo que daña el páncreas si se come en exceso, y en estos casos, coma las nueces sólo en las mañanas. Pero permanezca alejado del maní o cacahuete y concéntrese en las almendras. Una persona con cáncer deberá comer entre 8 a 10 almendras en la mañana y la misma cantidad en el mediodía. Pero no debe tomar ninguna proteína desde la tarde hasta la mañana del siguiente día, permitiendo 16 a 18 horas al páncreas para limpiarse y empezar a trabajar en las enzimas otra vez. Toda proteína debe ser tomada temprano en la mañana, y por supuesto, en casos de cáncer, ninguna clase de proteína secundaria como la carne.

Proteínas son una moda y son altamente sobre-publicitados. Todas las frutas, vegetales (verduras), granos nueces y semillas tienen proteínas en ellas. Si usted está comiendo una buena dieta sin mucosidad y se pregunta por comidas con proteínas, entonces "Pregunte a cualquier gorila". Los órganos de su cuerpo son semejantes a los del hombre, y ellos viven más años que el hombre. Ellos son unos de los animales más fuertes, por su peso, en la faz de la tierra. Ellos se alimentan de frutas, y comen todo lo que crece sobre la tierra: frutas, granos, nueces semillas. Nosotros podemos gozar de las raíces y tuberculos que crecen debajo de la tierra, pero ellos no cavan como nosotros lo hacemos; por lo tanto, con zanahorias, papas, betarragas, etc. agregados a las plantas "arriba de la tierra", nosotros deberíamos ser más fuertes que los gorilas.

Nosotros matamos la vaca para comer la carne por las proteínas que ella consigue por comer pasto. Consigamos nuestras proteínas frescas y naturales y no de "segunda mano" a través de la carne del animal. No usemos algo preparado y mezclado por el hombre en su estado muerto. Las proteínas "comerciales" trabajarán en el efecto y darán rápido alivio para ciertas dolencias, pero el uso exagerado de estos tipos harán trabajar mucho al páncreas y otras glándulas, causando la hipoglucemia (bajo nivel de azúcar en la sangre) o diabetes (alto nivel de azúcar en la sangre). Las proteínas naturales vivas de la comida en el programa de la dieta sin mucosidad, serán usadas así como se necesiten y el exceso será descargado fuera del cuerpo en una forma natural cuando sea necesario. Las proteínas de tipo comercial son de baja vibración y las sedimentaciones permanecerán en las glándulas del cuerpo causando problemas posteriores.

La comida natural es muy importante. El trigo es un grano específicamente para el uso del hombre y si es usado regularmente, éste reconstruirá dentro del cuerpo todos los básicos e importantes elementos requeridos para su salud, además de todas las variedades de vitamina B.

Las comidas regulares pueden empezar con una buena taza o tazón de caldo de verduras. Las verduras deshidratadas en la forma de potasio en polvo (broth), puede ser preparado por usted mismo.

Hay miles de combinaciones para hacer ensaladas, con la cual puede empezar las comidas regulares, y con cierta investigación y experimentación, a usted nunca le faltará algunas ensaladas

interesantes. Después de eso, sirva los vegetales cocinados a baja temperatura (muchos tipos pueden ser preparados con varias hierbas sazonadoras, sacados del calor bajo justamente antes de servir). Estos siempre serán deliciosos y beneficiosos siempre y cuando se mantengan a baja temperatura y en su estado saludable. (Por lo menos, 5 a 6 verduras se debería comer por día, de las cuales 2 deberían ser las hojas de las verduras). Una pequeña cantidad de aceite blando (como el aceite de olivo) adicionado a las papas al horno, zapallo al horno, etc. es muy bueno. Con un poco de intrepidez e imaginación, usando alimentos saludables, usted puede preparar algunos platos muy interesantes y deliciosos. No necesita preocuparse por comer bastante para sentirse satisfecho y tendrá toda la nutrición necesaria para obtener suficiente fortaleza física; haga casseroles con granos enteros, etc. No tome líquidos durante las comidas, mezcle la comida completamente con la saliva. Espere 1/2 hora después de la comida para tomar líquidos.

## **En las noches**

Esta es generalmente la comida principal del día, pero usted puede cambiarlo como lo desee; la comida principal puede ser al mediodía, y la comida ligera con una ensalada, en las noches. Si usted prefiere una comida caliente, empiece con una taza de caldo de verduras. El caldo deberá ser seguido con una ensalada de verduras cocidas que han sido preparadas a fuego lento (baja temperatura). Asegúrese siempre de cocinar en acero inoxidable, pyrex o algún recipiente apropiado, pero nunca en aluminio, NUNCA!

Jugos o nueces, frutas secas o frescas son todas excelentes. Cada vez que use fruta fresca, úsela sola (monodieta). Cuando usted quiere comer otro tipo de fruta, espere 1/2 hora o más, por lo menos, antes de hacerlo (y ésta será asimilada mucho más fácil por su sistema digestivo). La monodieta es para personas en una rutina de curamiento. Si usted se siente bien y saludable, una ensalada mixta de frutas de vez en cuando es permitido.

[Regresar al Empieza](#)

## **Algunas Recetas The Granos Cocinados a Baja Temperatura**

2 ½ tasas avena o trigo integral remojados en agua destilada suficiente para cubrirlos hasta una pulgada encima de ellos..

3 1/4 tasas agua destilada para cocinar.

1/4 cucharita sal marina.

Preparación:

**Remojarlo:** Lavar la avena dos veces. Cubra los granos lavados con agua hasta una pulgada por encima de ellos. Remojarlo por aproximadamente 5 a 6 horas en un lugar frío (la refrigeradora) para prevenir la fermentación.

**Método del FOOD WARMER:** Calentar el agua para cocinar en la cocina hasta casi hervir (160a 180 grados F). Bote el agua que estaba remojando los granos y eche los granos en el FOOD WARMER. Agregue el agua para cocinar calentada y sal marina a los granos. Esto debería bajar la temperatura de la olla a 120-130 grados F. Cocinarlo toda la noche (de 8 a 10 horas) a bajo calor de tal forma que la temperatura no suba más de 130 grados F. Si desea más o menos jugo en los granos, simplemente ajuste la cantidad de agua usado durante el cocinado.

**Método del Horno:** Siga las instrucciones de arriba y ponga los granos toda la noche en el horno con la luz del piloto prendido, o calentando el horno de 150 a 180 grados F de tal forma que la temperatura de la olla se mantenga cerca de 120 a 130 grados F. Este método es más difícil para regular la temperatura que el método del FOOD WARMER.

**Método del Thermo:** Llene la tercera parte del thermo con grano entero. Agregue una pizca de sal marina. Llene lo que sobra con agua hirviendo. Selle el thermo y déjele asentarse toda la noche. Los granos estarán listos para consumirlos la mañana siguiente. Este método tampoco es tan seguro como el método del FOOD WARMER.

**Secretos:** Los tiempos para remojar y cocinar variarán dependiendo en que lugar y altura se encuentra viviendo.

**Para servir:** En la mañana, todo lo que tiene que hacer es servir los granos directamente en los platos, o puede colarlo ligeramente hasta que obtenga una consistencia de harina de avena. Los granos son fáciles de digerir una vez que son licuados y tienen mejor sabor. Trigo licuado tiene un sabor rico en germen de trigo. Para comer en la mañana agregue manzana cortada, pasas, grocellas o bayas, y miel o jarabe de arce (Maple Syrup) para endulzar. Si usa una licuadora, usted puede encontrar los granos más sabrosos sin fruta, sólo con miel y un poquito de canela.

**Trigo:** El procedimiento para el trigo es el mismo que cuando preparamos la avena excepto por el tiempo de remojado y cocinado. Para el tener el trigo listo a las 7:00 a.m. hay que empezar a remojarlo el día anterior como a las 8:00 de la mañana y empezar el cocinado lento a partir de las 7:00 de la noche. Puede también substituir el trigo por centeno o cebada.

**Food Warmer cooker:** Este es un tipo de calentador de comida que usan los restaurantes que puede mantener la temperatura a valores de hasta 120 a 130 grados Fahrenheit. Puede comprarlo en tiendas que venden equipos para restaurantes. Asegúrese en comprar uno que la temperatura de calentamiento no exceda los 120 a 130 grados Fahrenheit.

## Caserola de grano vivo

2 tazas      cebada                      ½      green pepper  
remojar en agua (una pulgada      2 dientes      ajo  
sobre el nivel del grano)      2 cucharadas      aceite de ajo

2 ½ tazas	agua cocida	1 onza	salsa de tamari
1/4 cucharita	sal marina	½ cucharita	savory (ajedrea)
6	zanahorias medianas	3/4 cucharita	marjoran (mejorana)
3/4 to 1 tasa	arverjas	½ cucharita	Vege-Sal
½	Cebolla	1/8 cucharita	cayenne

Para caserola de cebada con zanahoria y tallito de brocoli, reemplace las arevrjas con: 1 tasa de tallitos de brocoli y reemplaze el savory and majoram por 2 hojas de bay (laurel) y 3/4 de cucharita de sweet basil (albahaca dulce) y 3/4 de cucharita de thyme (tomillo).

### Preparación

Enjuage la cebada dos veces en agua y dejelo remojar por 3 a 5 horas. Mientras la cebada se está remojando, manténgalo en un lugar frío, preferiblemente en el refrigerador para prevenir fermentación. Lave y prepare los vegetales. Pele y rebane las zanahorias, corte apio en rebanadas de 1/4 a ½ pulgada. Adelgace los tallitos de brocoli. Corte pimienta verde (green pepper) y desmenuze el ajo. Antes de empezar a cocinar los granos, algunos de los vegetales duros (como zanahorias, cebollas, los tallitos de brocoli y el apio) necesitan ser cocinados. Si usa hojas de laurel (bay leaves) pongalo en la cocina con los vegetales cocidos. Arverjas, green pepper, ajo y otros sasonadores van en la caserola sin pre cocinarlos. Aproximadamente 12 horas antes de servir, caliente el agua para cocinar hasta casi hervir (160 a 180 grados). Vaciar el agua de enjuage del grano y coloque el grano en un warmer-cooker. Agregue el agua caliente y sal al grano. La temperatura del grano debe ser aproximadamente de 110 a 126 grados. Agregue todos los vegetales y los sasonadores. Cúbralo y cocínelo a fuego lento. Antes de servir la caserola, pruebe la sazón a grege cayenne, Vege-Sal, u otros sasonadores. Usted puede substituir el trigo.

Los granos requieren muy poca atención mientras se cocinan, pero la preparación empieza el día anterior para dar el tiempo necesario para el enjuage y el calentamiento a fuego lento. Por ejemplo, empezar a enjuagar la cebada a las 3:00 p.m., empezar a cocinarlo y agregar los vegetales y los sasonadores entre las 6 a 8 p.m. La proporción de grano con vegetales es aproximadamente 50/50. Esta listo para la mañana siguiente.

### Caserola de grano vivo

2 tazas	centeno	2 dientes	ajo
	remojar en agua (una pulgada	2 cucharadas	aceite de ajo
	sobre el nivel del grano)	1 onza	salsa de tamari

2 tazas	agua (destilada)	2 cucharitas	perejil cortado (fresh parsley)
1/4 cucharita	sal marina	1/2 cucharita	salvia (sage)
5 a 6	zanahorias	3/4 cucharita	tomillo (thyme)
1 tasa	arverjas	1/2 cucharita	Vege-Sal
1/2	Cebolla	1/8 cucharita	cayenne
1/2	pimienta verde (green pepper)		

### Preparación

Use el mismo procedimiento usado para preparar la caserola de cebada con la diferencia que el centeno necesita más tiempo de enjuague y un poquito más de tiempo de cocinado.

## III. AYUDA CORRECTIVAS

**Fomentación con aceite de ricino.** Para deshacernos de la mucosidad endurecida en nuestro cuerpo, la que puede generar quistes, tumores o pólipos, la siguiente fomentación es recomendada:

Remoje un pedazo de franela o pañal de bebe en aceite de ricino, exprímalo un poco de tal manera que no gotee mucho y aplíquelo sobre el dorso frontal del cuerpo (desde el cuello hasta la ingle, y de lado a lado). Coloque una bolsa de agua caliente sobre la aplicación del aceite de ricino en el área del hígado (el hígado se encuentra en el lado derecho, bajo la cintura). Nótese que parches calientes no son altamente recomendados aquí, a no ser que una toalla mojada sea colocada entre éste y la franela con el aceite de ricino; aún así, calor húmedo como el que provee la bolsa de agua caliente es lo mejor. Mantenga esta fomentación en las zonas por 1/2 o 1 hora. La bolsa de agua caliente debe ser llenada varias veces ya que el agua en ella se enfría rápidamente.

Los siguientes tres días y sobre la misma zona cubierta por fomentación, masajee con aceite de olivo, en forma circular y dirigido hacia el corazón, durante 5 a 10 minutos.

El séptimo día es de descanso, no sólo para la aplicación de la fomentación, sino para cada parte del programa, tomando sólo agua durante todo el día (cada séptimo día de allí en adelante se realizará lo mismo). En el octavo día, empezar nuevamente con el aceite de ricino por tres días y repetir nuevamente el proceso, juntamente con la dieta sin mucosidad, las hierbas, etc. hasta que el curamiento sea obtenido.

En el uso de la fomentación, el aceite de ricino va a través de la piel hasta el área del hígado y las

glándulas linfáticas y empieza a captar las sustancias venenosas y las elimina a través de los poros; mientras que el aceite de olivo penetra en la piel y cura reconstruyendo nuevos tejidos. Este procedimiento puede durar entre 6 a 8 semanas para limpiar propiamente el sistema, dependiendo, por supuesto, de cada caso.

**Ejercicios.** Es necesario que todos los pacientes hagan algo de trote lento ("jogging"). Esto ayudará a mejorar la circulación, entonar los órganos, y eliminar con mayor rapidez la acumulación de células muertas. Cada persona debería hacer 1 1/2 Km de jogging diario, pero debería empezar con 400 metros o menos. Nunca corra hasta el punto de quedar exhausto porque lo bueno que ha hecho en un día será inútil como resultado del sobre-ejercicio. Si por alguna razón el jogging no puede ser hecho afuera, hágalo en casa frente a una ventana abierta o en su jardín interior. Esto, especialmente, hará vibrar los músculos peristálticos del colon dándole tono, regenerando el útero en un estado prolapso en las mujeres, y ayudando a curar la próstata en los hombres.

**Respiración profunda.** Para no ser complicados, no le daremos aquí el procedimiento científico de respiración yoga o algo semejante. La idea principal es el inhalamiento profundo de aire fresco por la nariz y el exhalamiento a través de la boca. Inhalar lo suficientemente profundo que realmente duela cuando se lo hace. Hágalo cada mañana y cada noche, no menos de 5 o 10 minutos, y usted empezará y terminará el día con vigor y energía; y hacerlo antes de acostarse le ayudará a dormir como nunca antes lo ha hecho. La respiración profunda es el "soplo de vida", y la única forma que usted puede conseguir suficiente elemento de este "dador de vida" es a través de la inhalación del oxígeno del aire por la nariz. Este principio es muy importante pero aún muy subestimado. Una persona puede vivir 110 días sin comida y 16 días sin agua, pero sólo unos cuantos minutos sin respirar. Esto es algo al que prestamos muy poca atención y la respiración superficial, poco profunda es de lo más normal en estos días, y esto es porque ignoramos completamente que la respiración profunda es el "soplo de vida".

## IV. EL CIRCUITO VITAL

Otro punto importante para vigorizar la salud de cada paciente en el programa del Dr. Christopher es el descargo de la electricidad estática del cuerpo mediante el caminar sin zapatos y medias en el jardín o césped durante 10 o 15 minutos cada día. Concerniente a la creación de esta electricidad estática en nuestro cuerpo, lo que sucede es lo siguiente: en el proceso de dar vida al cuerpo físico, los cabellos actúan como antena y absorben energía eléctrica de la atmósfera. Esta fuerza eléctrica penetra a través de la parte superior de la cabeza y distribuye muchos amperios y/o ohmios a cada célula, órgano, glándula, etc., y entonces el resto de la electricidad se supone que pasa y sale fuera del cuerpo hacia la tierra a través de los pies; pero cuando usamos zapatos con planta de jébe o sintética y usamos medias, esa electricidad no puede "hacer tierra" apropiadamente,

entonces ésta se acumula como electricidad estática en el cuerpo y como resultado nos convertimos en personas mentalmente confusas y frustradas.

Lo mas importante, piense positivamente, piense en SALUD! Sepa que usted tiene un grado de salud en este momento; agradezca a Dios por esta salud, y agradézcale en este momento con una oración positiva, agradézcale por la perfecta salud que usted tiene ahora. Recuerde que Jesus dijo: "El campo es blanco, listo para la cosecha." La buena salud es suya ahora si usted piensa positivamente en esta forma.

## V. EXTENSION DE LA LIMPIEZA

Cuando trabajamos con problemas crónicos de salud no podemos esperar limpiar o curar el cuerpo completamente con una o dos rutinas de limpieza. Por lo tanto para eliminar las condiciones crónicas del cuerpo o prevenir que ocurran, se recomienda una extensión en la limpieza como un buen camino a seguir. Esto se debe realizar siguiendo la ya mencionada dieta sin mucosidad.

Al levantarse se toma 1 ó 2 cápsulas (o más si es necesario) de nuestra fórmula para los intestinos (Fen LB). Esto será repetido 1 hora antes del almuerzo, y antes de retirarse a dormir en las noches.

Entonces, 20 minutos antes del desayuno tomar 2 cápsulas de nuestra fórmula para el hígado y la vesícula (Barberry LG), lo cual se repetirá antes de cada comida.

Lo siguiente que se toma es 2 cápsulas de la fórmula para los riñones y la vejiga (Juni Pars) a la mitad de la mañana y a la mitad de la tarde.

Se seguirá esta rutina por 6 días, descansando en el séptimo. Volveremos a tomar estas fórmulas en la segunda semana, agregando 2 cápsulas de nuestra fórmula para purificar la sangre (Red Clover Combination) 1 hora antes de cada comida. Seguiremos nuevamente esta rutina por 6 días descansando en el séptimo. Este procedimiento continuará cada semana por el lapso de 6 semanas, después del cual se descansará una semana. Se repetirá estos intervalos por 6 meses descansando el séptimo mes. Al final de este programa de 7 meses, evaluaremos nuestro progreso y determinaremos si sería beneficioso repetir otro programa de siete meses.

La demora de una semana para agregar la fórmula purificadora de la sangre a este programa es absolutamente esencial por la eficiencia extrema de esta fórmula. En la primera semana estamos abriendo los canales de eliminación del cuerpo, permitiendo así un camino para eliminar las toxinas que serán desprendidas de la sangre por la fórmula purificadora.

## VI. UNAS CUANTAS COMBINACIONES DE PLANTAS

En todas las formulas básicas de limpieza y rehabilitamiento provistas aquí (a menos que exista una condición particular de enfermedad y se necesite una específica combinación de plantas), el programa y procedimiento que sigue son para el promedio de personas y reúne casi todos los requerimientos para resolver problemas generales; esto es a menos, como decimos, que haya una necesidad de prescribir ayuda específica con fórmulas para un tipo de problema específico.

**1. Fórmula para tonificar el intestino grueso.** Tome la cantidad de cápsulas que usted necesite. Como no hay dos personas iguales en año, talla o estructura física ( y los intestinos mismos difieren en personas así como las huellas digitales lo hacen), en la mayoría de los casos se empezará con 2 cápsulas 3 veces al día y regular la dosis desde allí; pero si es difícil conseguir movimiento en los intestinos y el excremento es duro y toma mucho tiempo para eliminar, entonces incrementa la dosis hasta que la deposición se vuelva suave y bien formada (y aquí, en algunos casos difíciles, usted podría tomar hasta 40 cápsulas por día, ya que las plantas que forman estas cápsulas son solamente comida que no pueden hacerle daño). Entonces, después que el material duro se ha aflojado y eliminado, disminuya la dosis gradualmente (éstas son duras incrustaciones de materia fecal que han sido acumuladas en los intestinos por mucho años que se están aflojando y refregando con los líquidos intestinales), pero no disminuya la dosis de este tónico intestinal demasiado hasta el punto de perder la ventaja de "momentum" y continuidad en la eliminación. En muchos casos, la inapropiada alimentación ha causado que los músculos peristálticos de la mayoría de las personas dejen de trabajar, y tomará de 6 a 9 meses, con la ayuda de este tónico (**Fen LB**), para que una persona promedio, pueda eliminar la materia fecal incrustada y reconstituir la estructura intestinal lo suficiente para tener a los músculos peristálticos trabajando por si mismos. Esta combinación es hecha con berberis, cascara sagrada, jengibre, cayenne, etc.

La mayoría de las personas tiene kilos de vieja materia fecal almacenada en el colon, el cual toxifica el sistema y no permite que la comida sea asimilada correctamente, y es por la causa de esta condición de putrefacción, que muchas personas comen mucho más de lo que su cuerpo requiere.

En este proceso, ellos fatigan sus cuerpos tratando de nutrirse suficiente y aún así están siempre con hambre y comiendo; mientras que, después que el intestino es limpiado, la comida es fácilmente asimilada y una persona puede sostenerse con aproximadamente una tercera parte de la cantidad de comida que actualmente consume con 4 o 5 veces más fortaleza, vitalidad y vida. En este momento, el cuerpo limpio está apto para asimilar normalmente los simples valores nutritivos a través de la estructura celular del colon en lugar de ser atrapado en una masa de desperdicio e inhibido por la dura capa fecal formada en las paredes del intestino, donde la mayor parte de las sustancias nutritivas son empujadas y eliminadas antes que pueda absorberse. Cuando el cuerpo está absolutamente limpio, estas ayudas no serán necesarias, entonces "su comida será su medicina y su medicina será su comida". Nombre: **Fen LB**

**2. Formula purificadora de la sangre.** La corriente sanguínea es la "vida misma", y es nuestra misión mantenerla limpia y pura de tal forma que podamos tener un buen sistema circulatorio que lleve la comida (los nutrientes) a todo el cuerpo y que transporte las materias residuales para su futura eliminación.

Una buena purificación de la sangre junto con la limpieza del colon, forman una maravillosa combinación. Estos dos, con una buena dieta sin mucosidad, puede revitalizar el cuerpo y agregar muchos años de vida saludable.

Este reconstituyente de la sangre es hecho a base de trebol rojo, gobernadora, regaliz, la corteza de durazno, etc., algunas son hierbas que limpian y dan astringencia, otras que remueven el colesterol, matan infecciones, o edifican elasticidad en las venas y fortalecen las paredes de las venas y las arterias. Use dos cápsulas 3 veces al día, 6 días a la semana, semana tras semana hasta que la corriente sanguínea fluya como debe, brindando salud y energía. Nombre: **Red Clover Combination.**

**3. Fórmula para el mal funcionamiento del hígado y la vesícula.** Para acelerar el proceso de purificación de la sangre, es bueno tener el hígado y el área de la vesícula bien limpios. Cuando el hígado no funciona apropiadamente, la bilis no es escretada libremente en la región intestinal, y ésta circula dentro del torrente sanguíneo y a través del resto del sistema, causando una condición tóxica llamada "Colemia", que causa indigestión, inactividad, fatiga, estreñimiento, escalofríos, vómitos y fiebre. Porqué esperar hasta estar en esta condición? Esta combinación es a base de berberis, camote silvestre, jengibre, menta, etc. Dosis sugerida: 1-2 cápsulas 15 a 20 minutos antes de las comidas. Nombre: **Barberry LG**

**4. Fórmula para el mal funcionamiento de los riñones.** Aproximadamente 80% de nuestro cuerpo es líquido, y mucho de este fluido debe ser bombeado, filtrado, etc. a través del sistema urinario de la persona. Generalmente no tomamos el mejor cuidado de esta delicada parte de nuestro cuerpo. A través de este sistema circula materias irritantes y del tipo de materias que obstruyen la circulación como el té, el café, las bebidas gaseosas, el agua dura, el alcohol, etc.

Por años hemos usado esta fórmula de plantas con personas que tenían miedo estar en público, por causa de la falta de control del sistema urinario y que les hacia orinar sin su conocimiento. Después de usar esta fórmula, muchas personas han encontrado alivio y están viviendo vidas normales nuevamente. Esta compuesta por perejil, nebrina, malvavisco, entre otros. Dosis sugerida: 2 cápsulas en la mañana y en la noche con una taza de té de perejil (preferiblemente). Nombre: **Juni-Pars**

**5. Para más severos casos de incontinencia.** Esta fórmula es específicamente para la incontinencia y para fortalecer el entero canal de la uretra, los riñones, la vejiga, etc. Dosis sugerida: 2 cápsulas en la mañana y en la noche con una taza de té de perejil (Preferiblemente).

Al retirarse a dormir ajuste una bola de 6 a 8 pulgadas de pita o tela en su ropa de dormir en el

medio de la espalda. Esto es con el propósito de evitar que la persona duerma recostado en la espalda (boca arriba), ya que es así cuando se abren las válvulas que permiten el orinar. Nombre: **DRI, Kid-e-Dry.**

**6. Fórmula para el corazón.** El corazón es el motor que nos dá la vida, que cuando no está propiamente alimentado (con alimentos naturales) sufre de mal funcionamiento (debilidad y ataques cardíacos) causando fallas en el corazón, que es uno de los mas grandes "asesinos" en el mundo. La dieta sin mucosidad usado por un buen período de tiempo rehabilitará el corazón recuperando su fortaleza, pero si éste, sus válvulas y otras partes se encuentran en una condición débil y necesita una ayuda rápida, use el fantástico "tónico para el corazón" para ayudar a su restablecimiento. Esta comida es la fruta del espino blanco (*Crataegus oxycantha*, linn.). Tomando como referencia el libro "Potter's Cyclopaedia of Botanical Drugs and Preparations," una de las antiguas impresiones hechas en Inglaterra (publicado por Potter and Clarke, Ltd., 60 Artillery Lane, London), encontramos que ésta lista a la fruta del espino blanco como un tónico "cardíaco". Esta planta es aclamada como un remedio muy curativo para los desórdenes orgánicos y funcionales del corazón, como la arritmia, el rápido o débil trabajo del corazón, la hipertrofia (insuficiencia valvular) y opresión en el corazón.

El jarabe de la fruta del espino blanco es hecho con esta fruta concentrada usando brandy de uva y glicerina como ayuda y preservante. La dosis recomendada es 1/2 cucharita 3 veces al día. Si sufre repentinamente de todos los síntomas del inicio de un ataque cardíaco o, durante éste, una cucharita de cayenne en una tasa de agua caliente y tomado rápidamente, ha salvado muchas vidas. Nombre: **Hawthorne Berry Syrup.**

**7. Ayuda para el páncreas.** Esta fórmula ayuda al páncreas y otras glándulas afiliadas que a través de su mal funcionamiento causa el alto o bajo nivel de azúcar en la sangre (diabetis o hipoglicemia). Esta combinación ha ayudado a muchos que han tenido hipoglucemia, después de 6 ó más meses de tomar 2 ó 3 cápsulas 3 veces al día, 6 días a la semana. (Todas las plantas medicinales dan resultados más rápidos en 6 días a la semana en lugar de siete, usando el mismo día de la semana para descansar). Aquellos que han usado esta fórmula han tenido un test de tolerancia de la glucosa obteniendo un claro reporte de salud del páncreas.

Hay reportes de personas que usaban alta dosis de insulina, que aunque continúan usándola, la dosis ha decrecido considerablemente, y muchos, después de usar la fórmula por un año, siguiendo la dosis sugerida anteriormente, han conseguido una cura completa. Por supuesto, cuanto más cerca se permanezca de la dieta sin mucosidad y se elimine de las comidas el azúcar refinado, bebidas gaseosas, caramelos, pasteles, etc., los resultados se notarán más rápidamente. Name: **Panc Tea.**

**8. Fórmula de Calcio.** Maravillosa cápsula de calcio natural a base de horsetail (cola de caballo). Como se explica en el libro "Transmutación Biológica", la sílica en la cola de caballo se convierte en calcio y las otras plantas de la fórmula trabajan en combinación con ésta que es "master" en calcio. Necesitamos calcio para la capa que cubre los nervios, para las paredes de las venas y las

arterias, huesos, dientes, etc. esta combinación es de puras plantas naturales. Niños con dientes torcidos y apiñados que más tarde tienen que sacarle la muela del juicio por tener la mandíbula muy angosta, están necesitando calcio en el cuerpo. La mujer embarazada aumenta su capacidad de captar la cantidad de calcio necesaria, ahora para dos personas, así como para edificar en el bebé una buena mandíbula y un buen material para los dientes. Azúcar, pasteles, gaseosas y bebidas alcohólicas, caramelos, etc. roban el calcio del cuerpo, causando varices, calambres, dientes flojos, nerviosismo, etc. Nombre: **Calc Tea, Kid-e-Calc.**

**9. Fórmula para la alergia, sinusitis, alergias al polen y fiebre del heno.** Esta fórmula es una gran ayuda para el aclaramiento de estas enfermedades, una "natural ayuda herbolaria" que trabaja como un descogestionante y antihistamínico que limpia la zona sinusoidal, eliminando de la cabeza, los tubos y pasajes broncopulmonares los molestos obstáculos y mucosa. Esta fórmula consiste de té mormón, malvavisco, gobernadora, perejil, etc.

Para acelerar el proceso de limpieza, use la siguiente combinación en adición a la anterior,: corte la raíz de un rabano picante fresco en pequeños pedazos y licúelo con vinagre de cidra de manzana formando una pulpa espesa, y "chúpelo" completamente antes de pasarlo. Tome 1/3 de cucharita 3 veces al día. Cada 3 días aumente esta cantidad desde 1/3 hasta 1 cucharita, incrementando la cantidad 1/3 de cucharita cada 3 días. Nombre: **SHA Tea**

**10. Fórmula para la circulación de la sangre.** Esta fórmula es dada para ayudar a los purificadores de la sangre a trabajar más eficientemente y también para ayudar a curar alergias, etc. Este grupo de plantas alimentan el sistema circulatorio con cayenne y jengibre (estimulantes) donde el cayenne trabaja en el torrente sanguíneo desde el corazón y las arterias saliendo hacia las venas. Las otras plantas de la fórmula ayudan a estas dos a trabajar juntas para normalizar la presión de la sangre (si es alta o baja) y para obtener una buena lectura del sístole sobre el diástole. La corriente sanguínea es vida misma. Nombre: **BPE.**

**11. Fórmula contra la obesidad.** Combine esta fórmula con la dieta sin mucosidad y usted será un triunfador seguro. Este no es un programa espectacular de rápida pérdida de peso, sino, que sus resultados serán graduales y precisos, sin robar al cuerpo las sustancias nutritivas que necesita, como muchas de otras dietas de moda en estos días lo hacen. Esta fórmula actúa como un purificador de la sangre que ayuda a los riñones a aliviar el exceso de líquido, alimenta al cuerpo para el alivio de las tensiones nerviosas generalmente causadas por las dietas, apacigua el excesivo apetito, alimenta la tiroides y otras glándulas que no están funcionando bien y, además, logra una condición más saludable del cuerpo por el hecho de mantener un buen control del peso. Tome 2 a 3 cápsulas en las mañanas y en las noches con una tasa de té de morgalina (chickweed). Esta fórmula esta compuesta de morgalina, bardana, regaliz, perejil, kelp, etc. Nombre: **CSK.**

**12. Fórmula para el mal funcionamiento de los ganglios.** Debido a la acumulación de residuos tóxicos en el cuerpo por la impropia alimentación, al pobre torrente sanguíneo y a la lenta

circulación de la sangre, los ganglios se congestionan y llegan a inflamarse e infectarse causando mucho dolor. (Hay ganglios en el cuello, pecho, ingle, axilas, etc. que pueden llegar a inflamarse).

Esta fórmula puede ser usada para curar mastitis, mal funcionamiento de la tiroides, etc. Dosis sugerida: 2 cápsulas con una tasa de agua destilada. Nombre: **Mullein and Lobelia**.

**13. Fórmula para los nervios.** Esta es una fórmula que hemos usado con mucho éxito por cerca de 30 años y es recomendada para curar la tensión nerviosa e insomnio. Es un estimulante suave que reduce la irritabilidad y el excitamiento del sistema nervioso, y también reduce o elimina dolores.

Esta fórmula contiene plantas que alimenta y revitalizan el nervio motor en la base del cerebro (área medular y cervicales superiores) y también contiene plantas que ayudan a reedificar y alimentar la espina dorsal. Esta fórmula reedificará también las capas protectoras de los nervios que se encuentran desgastadas, el nervio mismo y sus capilares. Hecha en base de valeriana, lupulo, etc.

Dosis sugerida: 2-3 cápsulas 3 veces al día en una tasa de jugo de apio o de agua destilada.

Nombre: **Relax-Eze**.

**14. Fórmula para el dolor y la pérdida del oído.** Cuando esta fórmula es usada como se explica aquí, puede ser una gran ayuda para curar la falta de equilibrio, problemas para oír, para ayudar al nervio motor, etc. Usando un gotero, por las noches, echarse de 4 a 6 gotas de aceite de ajo y 4 a 6 gotas de B&B a cada oído y taparlos con algodón. Hacer esto 6 días a la semana, de 4 a 6 meses o cuanto se necesite. En el séptimo día lavar los oídos con una pequeña jeringa usando vinagre de manzana tibia y agua en proporciones iguales. Esta fórmula es hecha a base de lobelia y escutelaria entre otras plantas. Nombre: **B&B extracto y Oil of Garlic**.

**15. Fórmula para los pulmones y el sistema respiratorio.** Esta combinación es usada como una ayuda para curar la irritación en el sistema respiratorio, pulmones y bronquios. Es una ayuda para curar enfisemas, así como para otras congestiones de los bronquios y pulmones como bronquitis, asma, tuberculosis, etc. Esta fórmula es muy valiosa para el fortalecimiento y curación del sistema respiratorio completo. Ayuda a la descarga de las secreciones mucosas de los pasajes bronco-pulmonares. La dosis sugerida para adultos: 2 a 3 cápsulas 2 ó 3 veces al día con una tasa de consuelda (comfrey).

Esta fórmula es a base de consuelda, verbasco, lobelia, etc. Nombre:

**Resp-Free**.

**16. Fórmula para los resfríos e infecciones.** Esta fórmula es una combinación de ajo, perejil, berro, etc. que actúa como una ayuda para los tiempos de resfrío o para cada vez el ajo sea necesitado para detener cualquier infección. La dosis para un adulto varía de 2 ó más cápsulas 6 ó más veces por día tomado con una tasa de agua destilada. Nombre: **Garlic, Rosehips & Parsley**.

**17. Fórmula para ayudar a la eliminación los parásitos intestinales.** Esta combinación es a base de ajeno, hinojo, y papaya entre otras plantas. Actúa como un vermífugo (combinación que

causará la expulsión de gusanos y parásitos del cuerpo) y/o como vermícida (agente que destruye los gusanos y parásitos dentro del cuerpo). La dosis sugerida es tomar una cucharadita cada mañana y cada noche por 3 días. En el cuarto día tomar una tasa de té de sena y menta. Descansar dos días y repetir el proceso dos veces más. Nombre: **VF syrup**.

**18. Fórmula para ayudar a las encías.** Esta combinación consiste de encina blanca, consuelda, cola de caballo, lobelia, etc., y es usada para fortalecer las encías (encías sangrantes y el tipo de infecciones causadas por piorrea), y ayuda al fortalecimiento de dientes flojos. Este tipo de polvo dará más brillo a los dientes promoviendo una boca más saludable. Para casos severos coloque esta combinación en polvo entre los labios y las encías (superior e inferior) en el área de los dientes y déjelo allí cada noche durante 6 días a la semana (así como el cepillado regular de los dientes) hasta que el mejoramiento sea evidente. Entonces continúe con el cepillado regular de los dientes usando esta combinación. Nombre: **Herbal Tooth Powder**.

**19. Composición de plantas en polvo.** Consiste de arrayán, clavo de olor, pino blanco, etc. Como es mencionado por el Dr. Nowell, nuestro instructor en Dominion Herbal College, Ltd of Vancouver, British Columbia, en nuestro libro de texto:

"Nosotros hemos hecho y usado esta composición de plantas en polvo por más de 40 años. Cuando decimos que regularmente mezclábamos estas plantas en lotes de 60 libras (aprox. 28 kilos) los alumnos rápidamente verán que, al menos hemos tenido cierta experiencia en esto. Es un remedio para resfríos, principios de fiebre, gripe, ronquera, circulación lenta, cólicos, retorcijones, etc. Creemos que esta fórmula ha hecho más bien al género humano que cualquier otra preparación conocida de plantas individuales.

"Si esta combinación se tuviera en cada hogar, y se usara cada vez que la ocasión se presentara, habrían mucho menos personas enfermas en este mundo. Ofrezca esta composición libremente y sus pacientes le bendecirán. Observe los ingredientes y considere como éstos limpiarán las llagas ulcerosas y grangenosas, relajará los retorcijones y calambres y dolores de estómago e intestinos, subirá el calor del cuerpo equalizando la circulación, y removiendo congestiones. Esto es seguro. Este es efectivo. Nosotros, en innumerables ocasiones, hemos dado una tasa de esta composición cada hora, tan caliente como el paciente puede tomar, hasta que ha empezado a transpirar libremente, y después de 4 a 5 dosis hemos visto a nuestros pacientes con una libre transpiración y, de este modo, removiendo gripes, resfríos y problemas de fiebre." (Traducción). Nombre: **Herbal Composition**.

**20. Combinación para el enjuague de los ojos.** Esta fórmula es excelente para mejorar el brillo y curar los ojos, y es conocida porque remueve las cataratas y gruesas capas de carnosidad. Está compuesto por arrayán, cayenne, eufrasia, etc. Haga esto en forma de té y póngalo en una pequeña tasa de vidrio para enjuagar los ojos. Habrá una ligera sensación de ardor al principio, debido al cayenne, pero no hay nada que temer. Tire su cabeza hacia atrás y aplíquelo en el ojo. Abra el ojo cuando haga esto, como si estuviera bajo el agua. Hágalo 3 a 6 veces al día. Tome 1/2 tasa de

este té en la mañana y en la noche. Puede tomar también 2 cápsulas 3 veces al día para un resultado más rápido. Nombre: **Herbal Eyebright**.

**21. Combinación para ayudar al órgano reproductivo femenino.** Esta es una asombrosa combinación que ayudará a reconstituir a un sistema reproductivo que no esté trabajando apropiadamente (útero, ovario, trompas del falopio, etc.). A través de los años de herbalistas y los pacientes han sido testigos de dolorosas menstruaciones, pesado fluido, retorcijones, espasmos, irregularidad, etc. que han sido curados. El paciente tiene ahora una menstruación sin dolor, regular y una nueva perspectiva de la vida, gracias a la ayuda de esta combinación que reajusta las áreas que no funcionan debidamente. Esta ayuda correctiva para las mujeres es hecha a base de sello dorado, cardo bendito, jengibre, unicornio falso, etc. El uso sugerido es: 2 cápsulas en las mañanas y en las noches ó 3 veces al día si se desea, 6 días a la semana, por el tiempo necesario para obtener el resultado requerido. Nosotros hemos visto muchos casos severos con muchos años de sufrimiento, aliviarse en 90 a 120 días. Algunos se curan mas rápido, otros mas lento. Nunca se encontraran dos casos iguales. Nombre: **Nu-Fem**.

**22. Combinación para ayudar a la próstata.** En casos de mal funcionamiento, sugerimos esta combinación de cayenne, jengibre, ginseng, nebrina, entre, otros. Esta ayudará a disolver las piedras en los riñones, así como limpiará otras sedimentaciones e infecciones en la próstata. Tome dos o más cápsulas en las mañanas y las noches, con té de perejil si es posible. Nombre: **Prospallate**.

**23. Combinación para ayudar a las hormonas masculinas y femeninas.** Estas son comidas de hierbas naturales que son necesitadas por hombres y mujeres de todas las edades. Siendo hierbas "naturales" el cuerpo puede aceptar, asimilar y usar estos materiales que son necesitados para producir estrógenos y otras hormonas en una forma natural. Esta fórmula ayudará a reconstruir las áreas débiles de mal funcionamiento y ayudará a mantener los órganos saludables de tal forma que puedan abastecer la apropiada cantidad de hormonas y estrógenos por ellos mismos. Los tiempos críticos cuando esta fórmula es necesaria son en los tiempos del inicio de la pubertad, durante el embarazo, durante las semanas y a veces meses despues de dar a luz, y durante la menopausia. Las plantas son alimentos naturales, por lo tanto ellos no crean "efectos secundarios" ni "efectos retardados" como evidentemente sucede en los casos de las drogas sintéticas hechas por el hombre. Esta fórmula contiene entre otros el cohosh negro, ginseng, sarsaparilla, unicornio falso, etc.

Cada vez que un mal funcionamiento se presenta tanto en la mujer como el hombre, es bueno usar las siguientes fórmulas juntas, No.21 y No.23 para las mujeres y No.22 y No.23 para los hombres. Nombre: **Changease**.

**24. El bolo vaginal o rectal.** Esta es otra excelente ayuda para la mujer (o bolo rectal para el hombre) que tienen problemas en las areas reproductivas. Los bolos son hechos con plantas curativa que (1) eliminan las toxinas y venenos del cuerpo, (2) ayudan a convertir las áreas de mal fundionamiento en áreas saludables, de tal manera que quistes, tumores y condiciones cancerosas no

tendrán despojos o materia decadente en los cuales puedan vivir, ya que todos ellos son "animales de carroña." Herbalistas que usan esta fórmula han encontrado que estas "rapiñas" serán descargados dentro del sistema sanguíneo para ser luego eliminados, si el programa es seguido con fe. (3) Los bolos extienden la influencia de estas plantas ampliamente desde la vagina o intestinos a través de todo el sistema urinario y órganos genitales. La fórmula consiste entre otros de consuelda, squawvine, barba amarilla, malvavisco, etc. Todas estas plantas son en forma de polvo. Mantequilla de cocoa deberá ser derretida de tal forma que sea mezclada con nuestra combinación en polvo. Mezcle una pequeña cantidad de este polvo con la mantequilla de cocoa derretida hasta darle consistencia. Entonces amase la masa entre sus manos hasta darle la forma de un lápiz de un grosor aproximado del de un dedo medio y de 2.5 cm. largo. Endúrelo en el refrigerador. Entonces esto debe ser introducido en la vagina o en el recto en la misma forma que los supositorios. Será necesario usar una toalla o papel sanitario para mantener el bolo en la vagina o el recto. Inserte el bolo al retirarse a dormir y déjelo allí toda la noche, 6 noches a la semana. La mantequilla de cocoa se derretirá a la temperatura del cuerpo, dejando las plantas solas, la cual será fácil de lavarse. La siguiente mañana use la rutina de la fórmula No. 25. Nombre: **VB**.

**25. Combinación de la tabla inclinada.** Para dar alivio en casos de úteros prolapsados, intestinos y otros órganos, haga un té concentrado (caliente la combinación hasta que se obtenga la mitad de la cantidad inicial) de esta fórmula a base de pino blanco, consuelda, malvavisco, lobelia entre otros. Inyéctelo con una jeringa (mientras se está con la cabeza hacia abajo en una tabla inclinada) dentro de la vagina, 1/4 ó 1/2 de tasa o más; o una tasa o más en el recto, para problemas de prolapso o hemorroides, manteniéndolo dentro todo el tiempo que sea posible antes de evacuarlo. La dosis sugerida es 1/4 a 1 tasa una o más veces al día, y tome 1/4 de tasa de la combinación en tres cuartos de agua destilada 3 veces al día. Cuando el té es inyectado dentro del área abdominal y mientras se encuentre en la tabla inclinada, sobar y masajear la pelvis y el abdomen para ejercitar los músculos, de tal forma que el té sea asimilado por los órganos. Nombre: **Yellow Dock Combination**.

**26. Combinación para evitar la pérdida en el embarazo.** Esta consiste de dos hierbas (Unicornio falso y lobelia). A menos que se indique de otra forma, el té son siempre preparados con una cucharadita de hierba en una tasa de agua destilada. Si se presenta hemorragia durante el embarazo entonces use 1/2 tasa de este té cada media hora hasta que la hemorragia desaparezca, entonces use 1/2 tasa cada hora de vigilia durante todo el día, tratando de permanecer en cama lo máximo posible; y luego 3 veces al día durante tres semanas. Si la hemorragia continúa en lugar de decrecer, vea a un doctor. Nombre: **False Unicorn & Lobelia**.

**27. Fórmula pre-natal.** El uso de 2 ó 3 cápsulas en las mañanas y en las noches ayudará a dar elasticidad a la pelvis y el área vaginal, y fortalecerá los órganos reproductivos para un más fácil alumbramiento. Esta fórmula debe ser usada solamente en las últimas 6 semanas del embarazo. Las plantas usadas son entre otras, squawvine, cardo santo, unicornio falso, lobelia, etc. Nombre: **Pre-Natal Tea**.

**28. Combinación para los huesos, piel y los cartílagos.** Esta es una ayuda para el mal funcionamiento de los huesos, la carne y los cartílagos, y es excelente para venas varicosas, torceduras, curvatura de la espina dorsal, erupciones en la piel, coágulos de sangre, protuberancias producidas por calcio, etc. Haga un té de esta combinación hecha de pino blanco, malvavisco, consuelda, ajeno, etc. Ponga la combinación en una olla con agua destilada (a la proporción de 1 oz de la combinación por cada 16 oz de agua destilada) y déjelo remojar por 4 a 6 horas, caliéntelo a fuego lento por 30 minutos, cuélelo y entonces caliéntelo nuevamente, también a fuego lento, hasta que obtenga la mitad de la cantidad inicial del líquido y agregue 1/4 de glicerina vegetal (si desea).

Remoje una tela de algodón o franela en la mezcla (nunca use material sintético) y aplique la fomentación alrededor de la zona en problema y cúbralo con plástico para evitar que se seque rápidamente. Déjelo allí cada noche 6 veces a la semana, semana tras semana, hasta que se obtenga el alivio deseado.

Para casos severos: Tome 1/4 de tasa de este té concentrado con 3/4 de tasa de agua destilada tres veces al día. También puede tomar 2 cápsulas tres veces al día o usar en forma de unguento. Nombre: **BF&C**.

**29. Fórmula para el acondicionamiento del cabello.** Cada día como una ayuda para reestimar el crecimiento del cabello y durante 2 días, masajee el cuero cabelludo profundamente con aceite de ricino tibio, aplicando sobre la cabeza una toalla mojada con agua caliente por el espacio de 30 ó más minutos. Permanezca con el aceite durante toda la noche. Al día siguiente lávese la cabeza con un buen jabon bio-degradable y enjuégese. Repita el lavado y enjuégese nuevamente con esta combinación (que contiene entre otros gobernadora, salvia, etc.). No se enjuague esta vez, sino déjelo en el cabello y el cuero cabelludo (y masajee bien). Las siguientes dos noches use aceite de germen de trigo. Descanse una noche y repita el proceso por 6 días a la semana cuantas veces necesite. Tome 1 ó 2 cucharadas de aceite de germen de trigo en las mananas y en las noches, y además tome 1/4 de tasa de té de esta combinación hecha con agua destilada, 2 veces al día. Nombre: **Desert Herb Combination**.

**30. Combinación para artritis y reumatismo.** Esta fórmula consiste de hortencia, té mormón, yuca, gobernadora, entre otras plantas, y es una combinación que desintoxica; actúa como un solvente para los aceptados, pero no asimilados depósitos de calcio, plantas que alivian el dolor, ricas en nuevo y aceptable calcio orgánico que puede ser asimilado y usado útilmente; plantas que matan los hongos y la infección y que tiene la habilidad de dar un maravilloso alivio. Este alivio no es inmediato porque aquí se requiere un largo trabajo de reconstitución; el alivio vendrá gradualmente hasta lograr una total curación, pero sólo si usted sigue el programa con fé: 2 cápsulas con una tasa de té mormón 2 o 3 veces al día. Use como una fomentación caliente sobre las zonas tullidas y de extremo dolor (además de esta fórmula) la fórmula No. 28 llamada BF&C. O usarla en forma de unguento. También tome 2 o 4 tasas de la cascara del frejo, diariamente. Además, para un alivio del dolor mas rápido, recomendamos la aplicación externa de la fórmula #44 (Profeso Cayenne). Sin embargo, si Usted continúa con una dieta inapropiada, estas ayudas no darán efecto en la misma forma que si usted sigue las recomendaciones dadas en este libro. Recuerde que las enseñanzas que hemos recibido por años han sido "No hay cura para este caso..." Nosotros estamos

dándole esperanzas, pero sólo si Usted sigue con la dieta sin mucosidad y usa estas combinaciones de plantas. Nombre: **AR-1**.

31. **Fórmula para las infecciones.** Esta fórmula es hecha con llantén, malvavisco, lobelia, nogal negro, etc. Esta maravillosa fórmula mata la infección, elimina las toxinas del sistema linfático, y es un agente natural contra las infecciones. Nombre: **INF**.

32. **Combinación de kelp (alga marina).** Este es una ayuda para las tiroides y los ganglios. Este grupo de plantas ayuda a controlar el metabolismo y alimenta a la glándula tiroides para hacer su trabajo más eficiente. Es una ayuda glandular muy fina y eficiente. Está compuesta entre otros por perejil, berro, kelp o alga marina, etc. Uselo con la fórmula No. 11. Nombre: **Kelp-T Comb**.

33. **Extracto Antiespasmódico.** Consiste de escutelaria, lobelia, cayenne, valeriana, mirra, entre otros. Es para ser usado en casos de convulsiones, desvanecimientos, calambres y retortijones, temblores por delirio, histerias, etc. Es también bueno para piorrea, llagas en la boca, infecciones a la garganta, amigdalitis, etc. La dosis es 1/2 a 1 cucharita en un vaso de agua destilada para hacer gárgaras hasta que el dolor en la garganta desaparezca, también tome una cucharita en agua destilada hervida en las mañanas y en las noches. Nombre: **ANTSP**.

34. **Extract hecho de escutelaria, verbena azul, cohosh negro, entre otros.** Esto es usado en condiciones de nervios alterados, dolor de garganta, hipo y es una gran ayuda para restaurar el mal funcionamiento del nervio motor y asistir en el arreglo de pobre equilibrio y capacidad de oír, y además es una gran bendición para los epilépticos. Masajée este extracto en la médula (la base del cráneo) y en las cervicales superiores, siga las instrucciones en la formula 14, y tome de 6 a 10 gotas en un poco de agua o jugo 2 a 3 veces al día. Nombre: **B&B**.

35. **Fórmula para el alivio de dolores menores.** Esta es una fórmula que consiste de lechuga silvestre y valeriana. Es para ser tomado oralmente o masajeadó externamente para aliviar el dolor. Este es un sedante natural, suave y calmo para los nervios. Nombre: **Wild lettuce & Valerian**.

36. **Fórmula para el asma.** Puede ser usado para dolores de garganta y mucosidad. Excelente para luchar contra las toxinas. Es hecha de verbasco y ajo en base de glicerina vegetal. El uso recomendado es una cucharita o más, tantas veces como se necesite. Nombre: **CMG Syrup**.

37. **Antigua combinación para la tos.** Hecho con cebolla fresca, miel y glicerina vegetal. Uso sugerido: una cucharita o más, tantas veces como se necesite. Nombre: **Cough Syrup**.

38. **Unguento "Negro"**. Un excelente unguento que saca el problema hacia la superficie. Para el uso externo en llagas antiguas, tumores, ebulliciones, verrugas, cáncer a la piel, hemorroides, excelente para quemaduras y como agente curativo. Es hecho con gobernadora, consuelda, trébol rojo, raíz del carmín, etc. Nombre: **Black Ointment**.

39. **Unguento curativo**. Hecho de consuelda, malavisco y aceites, es antiséptico que se usa en lesiones, eczema, hiedra venenosa, para aliviar superficies inflamadas, raspaduras, quemaduras, hemorroides, torceduras e inflamaciones. Bueno para tenerlo a la mano todo el tiempo. Nombre: **CMM Ointment**.

40. **Unguento de morgelina**. Esta hecho a base de morgelina y aceites. Excelente para eczema y/u otras infecciones en la piel, llagas, quemaduras, picazón en la piel o en los genitales, testículos inflamados, acné, urticaria, y también para ulceraciones en la boca y la garganta. Este es un maravilloso y curativo unguento. Nombre: **Chickweed Ointment**.

41. **Unguento para la nariz**. Hecho con yerba buena, menta y baselina, es un antihistamínico natural. Aplicar en la parte interna de la nariz cuando ésta esté congestionada, seca, sensitiva o rajada. Nombre: **Nose Ointment**.

42. **Extracto de nebeda e hinojo**. Una bendición para los niños. Una fina combinación para cólicos, biliosidad, flatulencia, espasmos, etc. Use unas cuantas gotas, o cuanto se necesite, cuando lo desee. Nombre: **Catnip & Fennel Extract, Kid-e-Col**.

43. **Extracto de nogal negro**. Este es uno de los mejores remedios para hongos. Use externamente y frecuentemente. Nombre: **Black Walnut Extract**.

44. **Unguento del Profesor Cayenne**. Este penetrante unguento contiene aceite de olivio, cayenne, aceites, menthol, etc. Es excelente para torticollis, músculos doloridos, dolores de cabeza, dolor en las coyunturas, artritis, etc. Nombre: **Deep Heating Balm**.

45. **Extracto antiséptico**. Este extracto es bueno para infecciones externas e internas. Es a base de roble blanco, mirra, sello dorado, consuelda entre otros en base de alcohol. Nombre: **X-ceptic**.

46. **Combinación para eliminar minerales pesados**. Contiene lobelia y bardana amarilla. Esta es una fórmula para combatir contaminación, externas e internas. Esto ayuda a eliminar minerales

pesados, drogas, y otros contaminantes atrapados en nuestro sistema. La dosis es tomar 2 cápsulas diarias juntamente con cápsulas de gobernadora, 3 veces al día. Nombres: **Bugleweed Combination, Bugle Dock.**

47. **Fórmula para las suprarrenales.** Contiene verbasco, lobelia, ginseng, jenjibre, etc. Esta fórmula corrige cualquier desbalance en las glándulas suprarrenales y también compensa cualquier presión ubicada en el corazón. Nombre: **Adrenetone.**

48. **Fórmula para la colitis.** Contiene malvavisco, consuelda, lobelia, jenjibre, etc. Esta fórmula es para elivio de la colitis, y puede ser usado juntamente con la fórmula para el intestino grueso (Fen LB) y la dieta sin mucosidad. Nombre: **CC.**

49. **Fórmula para las úlceras.** Contiene arrayán, morgelina o pamplina, verbasco, etc. Esta fórmula es usada para aliviar las disconformidades causadas por las úlceras en el estómago y debería ser tomada con té de lúpulo o manzanilla. Tome nota de lo siguiente: para curar las úlceras, tome 3 cucharitas de cayenne al día. Este cayenne puede ser mezclado con agua o jugo de tomate. Es recomendado empezar con 1/8 de cucharita 3 veces al día, y entonces aumentar hasta lograr una cucharita 3 veces al día. Nombre: **ULC.**

50. **Fórmula para los gases.** Contiene hinojo, camote silvestre, jenjibre, menta, etc. Esta fórmula es designada para aliviar la flatulencia. Nombre: **AT-GS.**

51. **Unguento de BF&C.** Esta es la fórmula No.28 en forma de unguento. Es hecho usando aceite de olivio en una base de cera de abeja. Nombre: **BF&C Ointment.**

52. **Anti-Plaga.** El mejor remedio para resfríos, gripe o cualquier enfermedad contagiosa. Esta fórmula fortalece y estimula el sistema inmunológico y puede ser usado como tónico preventivo usando 1 cucharita de este jarabe por día. Si existe infección cambiar la dosis a una cucharada cada hora. Este jarabe contiene ajo fresco, raíz de consuelda fresca, berro, malavisco, escutelarias. entre otros. Nombre: **Anti-Plague.**

53. **Fórmula para aliviar llagas en la boca.** Esta fórmula en extracto es tomado oralmente en la cantidad de 2 goteros llenos 3 veces al día, aplicado localmente. Contiene ajo, escutelaria y sello dorado en base de alcohol. Nombre: **CSR.**

54. **Formula para estimular el sistema inmunológico.** Esta fórmula está diseñada para incrementar la habilidad del cuerpo de prevenir la propagación de bacterias y virus. Consiste de Echinacea, calendula y la flor del trebol rojo (obtenible en base de alcohol o glicerina para niños). Nombres: **Imunacea** extract, **Kid-e-Mune**.

55. **Formula para calmar el sistema inmunológico.** Está diseñada para calmar y fortalecer las respuestas inmunológicas del cuerpo. Muchas veces creemos que somos alérgicos a ciertos alimentos, plantas o animales, pero en realidad, es nuestro sistema inmunológico que está sobreactuando. Esta simple combinación de la raíces del malvavisco y el astrágalo ha ayudado a muchos que sufren de alergias, fiebre del heno, asma, artritis reumática o cualquier enfermedad que muestre una hiperactividad en la respuesta del sistema inmunológico. Nombres: **Immucalm**, **Kid-e-Soothe**.

56. **Fórmula para la Memoria.** Una gran combinación de yerbas muy reconocidas, usadas para limpiar, edificar e incrementar la circulación en el cerebro. Consiste de: Vervena azul, Gotu kola, Te Mormón, el cardo bendito, la cayena, el jengibre y la lobelia. Nombre: **Mem**.

57. **Fórmula fuente de vitaminas y minerales.** Balanceado por la naturaleza, suplemento alimenticio integral y altamente nutritivo. Esta combinación de diente de león, kelpo, purple dulce, espirulina, irish moss, bulbo de la rosa, remolacha, cayena, entre otros, está suplementada con el jugo deshidratado y pulverizado de la alfalfa, la cebada y kamut (trigo no híbrido) bajo el proceso llamado "Quick Dried" para concentrar las vitaminas y minerales de estos tres super alimentos. Al final tenemos una fuente de vitaminas y minerales fácilmente asimilable, ya que esta compuesto de elementos orgánicos científicamente balanceados por nuestra madre naturaleza. Nombre: **Vitalerbs**, **Kid-e-Mins**.

58. **Fórmula para sinusoides congestionados.** Esta poderosa fórmula consiste de Te Mormón, rábano picante y cayena. Para un alivio inmediato de presión senovial debido a resfrios o alergias, usar 20 gotas (1/4 de cucharita) en 1/4 de tasa con agua caliente. Debe tomarse cada media hora. Nombre: **Ephedratean**.

59. **Unguento rubefaciente.** Como lo indica su nombre, este unguento produce circulación en la superficie de la piel causando un color rojo en éste. Usado para aliviar tensión y presión. Excelente para dolor de cabeza por tensión o presión senovial. Uselo poco a poco ya que esta fórmula es muy potente. Contiene: Aceite de Olivo y aceites naturales de canela, eucalipto, cajeput y cristales de mentol puro y alcanfor y otros aceites de fragancias naturales. Nombre: **Sen Sei Balm**.

60. **Combinación verde:** Una mezcla de Alfalfa, paja de cebada y de Kamut (trigo no híbrido) que

han crecido orgánicamente en un terreno virgen separados de los agentes contaminantes urbanos y agrícolas por las mismas montañas que proveen su fuente de agua. Estas yerbas reducen acidez, proveen de la necesitada clorofila, así como de los nutrientes integrales que el cuerpo necesita.

Nombre: **Jurassic Green**.

61. **Combinación para Energía.** En lugar de ser una fórmula que provoca un súbito y no natural golpe de energía, esta combinación de Ginsén Siberiano, pólen de abeja, la raíz del regaliz, gotu kola, yerba mate y la raíz del jengibre, provee energía y vitalidad a través de nutrición integral. La energía adquirida será más constante y duradera. Nombre: **Bee Power**.

62. **Fórmula para Claridad Emocional.** Esta combinación de escutelaria, extracto de valeriana, Uva de Oregon, Jurassic Green (Alfalfa, Cebada y Kamut), extracto de Hiperico (St. John's Wort), Verbasco, Lobelia, Gotu Kola, Sarsaparilla y Diente de León, provee de los nutrientes necesarios para ayudar al cuerpo y a la mente a reaccionar equilibrada y saludablemente en momentos de tensión emocional como depresión, ansiedad y trauma. Nombre: **MindTrac, Kid-e-Trac**.

63. **Fórmula para la Glándula Pituitaria.** Esta fórmula es para el mal funcionamiento de la glándula pituitaria. Consiste de las hojas de la zanahoria para la estimulación de la glándula, gotu kola para nutrir, ginkgo para incrementar la circulación, el verbasco para purificar, oregon grape para influenciar tanto en la pituitaria como en el hígado, y lobelia como un catalítico general. Nombre: **Master GL**.

64. **Fórmula para la circulación en el ojo.** Esta fórmula promueve circulación de sangre en el ojo ayudando a reparar vasos capilares dañados, mejorando la visión nocturna, limpiando los tejidos y brindando antioxidantes a los ojos. Contiene: Bilberry, Eufrasia, Ginkgo y cayenne. Nombre: **Bilbrite**.

65. **Ayuda para la próstata.** Esta combinación asiste al cuerpo en reducir la inflamación de la próstata. Ayuda también a fortalecer y tonificar la próstata mientras lo limpia con antioxidantes nutritivos. Esta fórmula contiene: Saw Palmetto, Mullein y Ginkgo. Nombre: **Prospalmetto**.

66. **Fórmula para fortalecer el Sistema Inmunológico.** Estas plantas han sido usadas por miles de años como tónicos y como elementos preventivos para la salud. Usando este tónico diariamente ayudará a fortalecer el sistema inmunológico y proteger contra los agentes invasores. Los tónicos trabajan mejor en cantidades pequeñas por largos períodos de tiempo. La echinacea en esta fórmula también actúa como un tónico. Contiene: Astragalus, Ginseng Siberiano, Echinacea purpurea (planta y raíz) y el hongo Reishi. Nombre: **Immutone**.

## *Dr. Christopher's Three-Day Cleanse, Mucusless Diet & Herbal Combinations*

For over 30 years this excellent booklet has helped millions of people toward wellness. This booklet covers three aspects of good health: cleansing, nourishing and healing the body through natural methods.

### *Three Day Juice Cleanse*

As a purification/detoxification procedure, the 3 Day Juice Cleanse prepares the body for extended herbal cleansing and the Mucusless Diet by removing harmful toxins and replacing them with nourishing juices. This section offers an understanding of the body's cleansing channels, step-by-step procedures for the juice cleanse and more.

### *The Mucusless Diet*

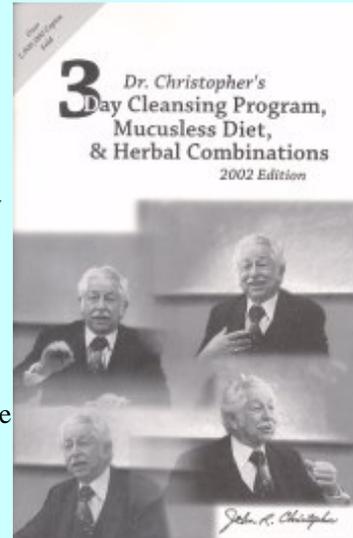

The Mucusless Diet consists of whole "live" foods, giving the body the necessary enzymes, organic vitamins and minerals to help it "live to the age of a tree." Dr. Christopher outlines what to eat, what to avoid, and gives excellent herbal daily supplements to provide the body with energy and nourishment.

### *Dr. Christopher's Herbal Combinations*

65 herbal formulas are discussed and described, including the herbs used in each. Dr. Christopher offers herbal aids for most any health disorder, including diabetes, high/low blood pressure, constipation, hormone imbalance, depression and emotional disease. Sources for each formula are also given.

### ***A Healthier You Audio Newsletter with David & Fawn Christopher***

Master Herbalists David and Fawn Christopher offer monthly herbal information on audio cassette via our "A Healthier You" Audio Newsletter. These informative audio cassettes are select recordings from the popular radio show "A Healthier You", now in its tenth year of broadcasting. Each 60 minute cassette offers up-to-date information and common sense regarding a variety of current health topics, herbs, natural treatments and therapies.

These newsletters are available in a monthly subscription or you may order any of our back-issue cassettes single or in sets of 12. You will receive your first cassette at the beginning of the month following our receiving your subscription, and you will receive a new cassette each month

You can also listen to the "A Healthier You" Live Radio Broadcast online now. It is broadcast LIVE at 9:00 AM in *Mountain Standard Time*. You will need to adjust the time that you tune in appropriately. The link to tune in is on the home page.

### *A Healthier You Audio Newsletter with David & Fawn Christopher*

Master Herbalists David and Fawn Christopher offer monthly herbal information on audio cassette via our "A Healthier You" Audio Newsletter. These informative audio cassettes are select recordings from the popular radio show "A Healthier You", now in its tenth year of broadcasting. Each 60 minute cassette offers up-to-date information and common sense regarding a variety of current health topics, herbs, natural treatments and therapies.

These newsletters are available in a monthly subscription or you may order any of our back-issue cassettes single or in sets of 12. You will receive your first cassette at the beginning of the month following our receiving your subscription, and you will receive a new cassette each month

You can also listen to the "A Healthier You" Live Radio Broadcast online now. It is broadcast LIVE at 9:00 AM in *Mountain Standard Time*. You will need to adjust the time that you tune in appropriately. The link to tune in is on the home page.

### **A Healthier You Audio Newsletters**

## <Up Level Field: No up level page> > **Damaged & Bargain Book Clearance**

These books have been damaged. Damage ranges from crinkled pages, ripped covers, and stains on the books. None of these damaged books are missing pages. Some of them are in this section because new editions have been released. Damaged books are on a first-come, first-served basis. We have a limited number of these books available, and the availability changes frequently. If you order one of our damaged books, as long as it is available we will send it to you. If someone ordered the last copy of a book, even just five minutes before you, that person will get that book. When the last damaged book is sold, we will remove it from the store.

Please feel free to contact us in the office if you have any question regarding our damaged book policy. You can reach us at 1-800-372-8255 from 9:00am-4:00pm Mountain Time Monday-Friday. Keep visiting this section of our store, as our damaged and bargain items change frequently.

## School of Natural Healing > **Family Herbalist Program**

What is the key to great health for you and your family?

The answer is all around you.

Medicinal plants have been used for centuries to keep us healthy. These healing herbs are all around us everyday--in our spice cupboards, refrigerators, gardens, and lawns.

The art of using herbs as medicine has stood the test of time and continues today with The School of Natural Healing. The School of Natural Healing is dedicated to offering excellence in herbal education through high quality materials and assignments that not only tell you, but show you how to use herbs.

The School's **Family Herbalist Course** is designed to empower you with the knowledge and confidence needed to tackle almost any health issue. The Family Herbalist Course is essential for anyone who wants to take charge of their own health and become more informed, educated, and independent. This course explores important concepts in natural medicine that even the most experienced natural healers need to know for success. At the completion of this course the student receives a certificate as a Family Herbalist.

---

The Family Herbalist program is the first section in the Master Herbalist program and is a prerequisite to any other course offered by The School of Natural Healing. You will have 3 months to complete the program. It is also part of [Iridology Part I](#), [Reflexology](#), and [Aromatherapy](#).

The Family Herbalist Course helps you to:

- Feel confident in taking care of yourself and your family
- Become more self-sufficient
- Save thousands of dollars by being your own primary health provider
- Become a great resource for family and friends who want to be healthy
- Understand which foods help the body fight infection
- Maintain a healthy lifestyle
- Understand how fevers work and how to treat them naturally

Master the healing power of water and hydrotherapy

**Materials included:**

*Herbal Home Health Care* text by Dr. Christopher

## Available Courses

### [The Master Herbalist Home Study Program](#)

If you have ever watched or listened to the commercials about prescription drugs and marveled at the number of common side effects, and thought "That's not for me", then this is the course for you. It teaches you every aspect of Herbology, including *identification, horticulture, preparations, herbal chemistry, botany, nutrition, and More.* When you complete, you will be a **Certified Master Herbalist** through The School of Natural Healing.

### [Reflexology Home Study Program](#)

This Program helps you develop the powerful tools needed to assess health conditions and stimulate the body to heal itself. Reflexology is the study of reflex points found throughout the body and how they can be used to enhance health. This course covers basic Herbologist, anatomy, physiology, and beginning to advanced reflexology techniques. Once you understand the basics of Reflexology, your own two hands will be the tools you use to help yourself and your family on the road to great health.

### [Iridology: A Holistic Approach Home Study Program](#)

Traditional Iridology dates back at least 3,000 years in recorded history. It is based on the study of the iris of the human eye. The color, fiber structures and various other features seen in the iris reflect the individual's health condition and tendencies. This is the perfect study for those who want to become independent of the modern health care system.

### [Aromatherapy Home Study -- New --](#)

The art and science of aromatherapy has been practiced for thousands of years. Aromatherapy is a fun and exciting way to improve your family's health as well as your own.

### [Earn CEUs!](#)

If you belong to the AMMA (American Medical Massage Association) or ABMP (Associated Bodywork and Massage Professionals) you can now apply for up to 88 credit hours. Chiropractors, nurses, and naturopaths need to check with their state boards in order to use this herbal course for CEUs.

[Founder & Director](#)

[Instructors](#)

[SNH History](#)

[Career Opportunities](#)

[Accreditation](#)

[Continuing Education](#)

As the problems of health care grow each year, so does the need for knowledgeable and qualified herbalists.

## About Us

The School of Natural Healing was founded in 1953 by Dr. John R. Christopher. For 44 years the School has been the means for thousands of students to begin and further their herbal knowledge and wisdom. Students are brought together with some of the world's greatest herbalists and natural healers via the medium of books, audio and video cassette and live seminars. Students who complete the Master Herbalist Program are prepared to take care of both themselves and their families, and to share their knowledge and wisdom in the service of educating others.

As the problems of health care grow each year, so does the need for knowledgeable and qualified herbalists.

Many people are beginning to understand the importance and safety of having the wisdom to care for their own health, but they do not always know where to seek out the information.

The education field for Herbalists is increasing steadily, and herbal teachers are in demand.

### Our school curriculum and philosophy is built upon the understanding and practice of four fundamental principles:

- Preventative Nutrition
- Eradicating the Cause of Disease
- Healing the Body through Natural Methods
- Education

Master Herbalist training from the School of Natural Healing offers you firsthand, personal experience with herbs growing in your own area. Through correspondence, you will become a backyard herbalist--able to identify and use herbs growing close to your home. You will study materials especially selected for your geographical region in addition to the specialized instruction emphasizing the Christopher method of natural healing. You will also receive tutoring from qualified herbalists by telephone (toll free

in the U.S.).

Whether your interest is in a particular skill or in certification, the School of Natural Healing has courses and programs to fit your needs.

The School of Natural Healing is Registered Under the Utah Post Secondary Proprietary School Act (Title 53B, Chapter 5, Utah Code Annotated 1953)

Registration under the Utah Post Secondary Proprietary School Act does not mean that the State of Utah supervises, recommends, nor accredits the institution. It is the student's responsibility to determine whether credits, degrees, or certificates from the institution will transfer to other institutions or meet employers' training requirements. This may be done by calling the prospective school and employer.

## Live Classes

Each year The School teaches supplemental classes that coincide with our correspondence courses. This year we will not be teaching the Nutritional Herbologist program live in Springville, Utah.

We are holding stand-alone herbal workshops at Dave's Nutrition in Salt Lake City, Utah.

For more information on these classes, follow the link below, or call the office at 1-800-372-8255, or 1-801-489-4254, Monday through Friday from 9 AM to 4 PM MST.

### [Salt Lake City Workshop Classes](#)

By popular request, we are holding a series of workshops in the Salt Lake City area. Learn about Herbal First Aid, Natural approaches to Contemporary Health Issues, Emotional Well-Being and much more. . .

The School of Natural Healing's Dr. John R. Christopher Memorial Scholarship

## Scholarship Application

Name \_\_\_\_\_

Address \_\_\_\_\_

City \_\_\_\_\_ State \_\_\_\_\_ Zip Code \_\_\_\_\_

Phone: Home (\_\_\_\_) \_\_\_\_\_ Work (\_\_\_\_) \_\_\_\_\_

A limited number of Scholarships are awarded from The Dr. Christopher Memorial Scholarship Fund on a yearly basis. These are Partial and Half Tuition Scholarships. Scholarships are awarded based on the applicant's service to his/her fellow men and according to the applicant's financial needs. These scholarships can be utilized for a full or partial program.

Scholarship recipients are required to pay all remaining tuition to begin the course and must finish the correspondence program one year from the date of registration.

### PART ONE

**Please answer the following questions as completely and concisely as possible. Type your response to each**

**question on separate sheets of paper. Attach each response to this information sheet.**

1. Describe a circumstance(s) in which you have offered out-of-the-ordinary service to your fellow men. This should be service you have done outside of your job description--service beyond the call of duty.
2. What service will you render once you have met your educational goals with The School of Natural Healing? Please be specific.
3. Describe any financial situation that would keep you from attaining your educational goals.

*Optional Questions:*

1. Describe any occasion where you have donated to increasing health awareness in underprivileged populations (any aspect of health).

2. How have you defended herbs? (i.e.: writing editorials, getting involved in government decisions, etc.)

**PART TWO**

A. Attach current copies of both your W-2 and 1040 forms to this application. If you are married, attach copies of your spouses W-2 and 1040 forms as well.

- OR - If you are a dependent with no income, attach current copies of your provider's W-2 and 1040 forms.

Currently Employed \_\_\_\_\_ Currently Unemployed \_\_\_\_\_

(Fill out the following information if you are Currently Employed)

Name of Company \_\_\_\_\_

Position \_\_\_\_\_ Supervisor \_\_\_\_\_

## School of Natural Healing > **Payment Plan**

### The School of Natural Healing's Payment Plan

This Payment Program is designed to enable students of any income level to enroll in The School of Natural Healing's Correspondence Courses. This program allows students to make monthly payments towards their tuition. The student receives the first set of materials after the application has been processed and the first payment has been received. After this, the student will receive materials after every third payment.

To take advantage of this program, please fill out and return this [application](#) to:

#### **The School of Natural Healing**

PO Box 412  
Springville, UT 84663

#### **Payment Program Policies**

1. A separate application is required for each section of the program. For example, if you are planning to take the entire Master Herbalist Program, you would fill out an application for the Family Herbalist Program. After you have completed that program, you would fill out an application for the Nutritional Herbologist, followed by the Herbalist Program, and then the Advanced Herbalist program.
2. The Master Herbalist Certification Seminar and the Iridology programs are not part of the Payment Plan Program.
3. After your application is processed and approved, the first set of materials will be shipped to you. Payment Plan courses are processed and debited on the fifth day of each month. If the fifth day of the month falls on a weekend or a holiday, the charge will go through on the next business day. A statement reflecting your payment status will be sent to you each month for the duration of your contract.
4. If you wish to have the next set of materials shipped before they are scheduled, you can do so by sending in a payment equal to the outstanding amount still owed. Contact a representative for more details.
5. If payment is declined, The School will make every attempt to contact you to make payment arrangements. If we are unable to contact you, the responsibility to take care of the missed payments and become reinstated in the program falls to you. Utah Code requires a \$20 bounced check fee for each check that is returned to us. If your payments have not gone through for more than two months, your status in the Payment Program will be put on hold. There is a reinstatement fee of \$50 to become an active

student.

6. The School has the right to deem disagreement in default. It is our decision to determine what is default. Utah Code: If the purchaser defaults against these credit terms, purchaser is liable to pay all costs of collection, including court costs and reasonable attorney fees, whether or not suit is actually filed. Purchaser agrees that any legal action brought hereunder may be brought in Utah County, Utah.

7. It is the responsibility of the student to inform the School of any address, phone number, credit card, or bank changes. If the School is unable to locate the student, we will stop your course material shipment and you may be required to pay a reinstatement fee in order to continue the program.

8. If you wish to opt out of the payment program you may do so at any time. The fee to cancel the payment program is equal to two months payments (\$130). Previous payments will not be refunded, and returned materials will not be accepted.

9. There is no penalty for paying the program off early.

10. This program is exempt from Sales tax.

To apply for our payment plan, [click here](#). To view the School's Privacy Policy, click [here](#).

The education field for Herbalists is increasing steadily, and herbal teachers are in demand.

## Frequently Asked Questions

### **Q: When do classes start and how do I enroll?**

**A:** *Because we have a correspondence course, people enroll every day at The School of Natural Healing. You can [Enroll online](#) or visit the [Contact Us](#) page to get in contact with a registrar.*

### **Q: What happened to the Be Your Own Doctor course?**

**A:** *The Be Your Own Doctor course was discontinued June 1, 2003. It was replaced with the Family Herbalist Program, which has more materials and comes with a certificate.*

### **Q: How long does it take to complete the course?**

**A:** *It takes about 1 ½ years if the student works on the course 1 hour a day. Some students finish in as few as 6 months while others take as many as 3 years to complete the entire program.*

### **Q: Can I call The School of Natural Healing if I have a question on the course material?**

**A:** *Yes, The School of Natural Healing has full-time student advisers trained to assist the student as they work through the course.*

### **Q: Can my spouse or a family member take these classes along with me?**

**A:** *Yes, family members living in the same house can share materials and enroll for half the cost of tuition.*

### **Q: What sets The School of Natural Healing apart from other herbal schools?**

**A:** *Our school invites leading experts from around the country to teach at our campus. This expert instruction is part of our correspondence course in the form of videos and audio tapes. Students graduate from our course with a library of course material, including 22 books, 34 videos and 26 audio cassettes... more than any other course.*

### **Q: What can an Herbalist legally do in the United States?**

**A:** *Herbalists can educate and instruct in the historical usage of herbs, whether by writing books and magazine articles, talking to clients at a clinic or health food store, lecturing or working with family. Herbalists do not diagnose illness or prescribe medicine.*

**Q: Are the videos available in PAL Format? (*International Students*)**

**A:** *Yes, you can get the videos in PAL Format. There is an additional \$300 charge for these videos, due to the increased cost of duplication. Many of our students have opted to purchase a VHS VCR, as a typical player costs between \$60 - \$100, which is a savings of \$200 - \$240.*

**Q: Will I have to pay a customs charge? (*International Students*)**

**A:** *That depends on the country that you live in. If you have to pay customs charges on other items, you will have to pay them on your school course.*

## Available Courses > **The Master Herbalist Home Study Program**

Master Herbalist training from The School of Natural Healing offers you firsthand, personal experience in identifying and using herbs growing in your area. Study materials selected for your geographical region compliment instruction in the Christopher method of natural healing. You will also receive tutoring from qualified herbalists by telephone (toll free in the U.S.). Whether your interest is in a particular skill or in certification, The School of Natural Healing has courses and programs to fit your needs.

Our home study curriculum consists of 22 individual course levels. These course levels are divided into 3 progressive programs: The Nutritional Herbology Program (Levels 100 - 500), The Herbalist Program (Levels 600 - 1300) and The Master Herbalist Program (Levels 1400 - 2200). Students seeking certification as a Master Herbalist must complete all the courses and attend six-days of intensive training at our annual Master Herbalist Certification Seminar.

The Master Herbalist Home Study Program includes an in-depth study and information on the following subjects:

## Reflexology

[Reflexology](#)[Tuition and Fees](#)

## Available Courses > Reflexology Home Study Program

The School of Natural Healings Reflexology Home Study Program helps you develop the powerful tools needed to assess health conditions and stimulate the body to heal itself. Reflexology is the study of reflex points found throughout the body and how they can be used to enhance health.

Learn how to deal with any health problem naturally and without side effects.

### Topics include:

- Heart Disease
- Arthritis
- Sciatic Pains
- Back Problems
- Sinus Infections
- Diabetes
- Kidney Stones

Students of the Reflexology course also receive instruction in basic herbology, anatomy, and physiology.

Reflexology is one of the most useful techniques to increase the health and wellness of your family. Once you understand the basics, your own two hands will be the tools you use to help yourself and your family on the road to great health.

The School of Natural Healings Reflexology Home Study Course is ideal for Licensed Massage Therapists, Naturopaths, Midwives, Chiropractors, and other health care professionals who want to offer more to their clients and patients.

In order to practice reflexology as a profession in most states, one must be a licensed massage therapist. The purpose of this reflexology course is to prepare you to practice reflexology on your family members and yourself without charging for your services.

The certificate awarded after completing this course does not entitle you to practice reflexology professionally, teach reflexology, or use the title reflexologist in ads or endorsements. In most states, licensed massage therapists may use the title reflexologist after taking this course. State laws may vary.

### What Is Iridology?

Learn the ancient practice of assessing current health conditions in the body in your own home through correspondence.

This comprehensive home study program offers a fully informative and detailed look at the science and practice of Iridology. Beginning at basic levels and moving forward to advanced understandings of this art, the student will gain a wonderful knowledge of revealing levels of health, inflammation and degeneration within the human body.

Through the medium of video, Dr. David Pesek enlightens and entertains as he shares his vast understanding of the analysis of the iris. With over 20 hours of video at your disposal, books and workbooks, you can quickly and effectively learn to use the combination of Iridology, Nutrition and Tissue Cleansing to promote harmonized well-being: physically, emotionally, mentally and spiritually.

You must complete each course before starting the next.

### Special Offer:

When you order the Iridology course on-line, we include a free iris chart. This freebie is only given to students who enroll via the Internet.

## Available Courses > **Aromatherapy Home Study Program**

Aromatherapy has been practiced in one form or another since the beginning of civilization. Aromatherapy is the art and science of using oils extracted from aromatic plants to enhance health and beauty. Everyone has used aromatherapy sometime in their life, but most people don't realize it. Vicks Vaporub® is actually aromatherapy, so is Listerine® and so are most cough drops.

In The School of Natural Healing's Aromatherapy Home Study Program, essential oils will fill your home with vibrant fragrances from around the world. This course not only teaches you the fundamentals of natural health care, but also gives you experience making your own essential oil formulas to try out on yourself and your friends. Once you know how to make your own essential oil crafts, you might find yourself giving them away as gifts or even starting your own business. This one of a kind correspondence course includes thirty-two essential oils, seven text books, four study guides, four videos, and two audio cassettes. Every aspect of basic aromatherapy is covered as well as detailed information on anatomy, and making simple home remedies with common herbs and spices you probably already have in your home.

About Us > **Founder & Director**

John R. Christopher, M.H.,  
N.D.

**John R. Christopher, M.H., N.D.**

*Founder*

In his youth, Dr. Christopher began his own study on natural healing when he saw its positive results in healing his mother of dropsy. His enthusiasm increased when he cured himself of cancer using natural methods. Dr.

Christopher, after his experience as a supervisor of a medical dispensary during World War II, decided to become an herbal practitioner. In 1946, he graduated with a Master of Herbology under Dr. H. Knowles at the Dominion Herbal College in Vancouver, British Columbia. Two years later he received his Naturopathic Doctor degree from the Institute of Drugless Therapy in Tama, Iowa. He received an Herbal Pharmacist degree under the renowned Dr. Edward Shook.

Hailed as America's foremost herbalist, Dr. Christopher developed a program to pass on his methodology and founded the School of Natural Healing in 1953. His published works include Herbal Home Health Care, Every Woman's Herbal, and his most renowned work, School of Natural Healing. Prior to his death in 1983, Dr. Christopher received the Agnes Arber Distinguished Service Award for his long-suffering devotion to the cause of herbal practice and his contribution to public health.

# David W. Christopher, M.H.

## *Director*

David W. Christopher, M.H.

Having been raised in the simple ways of natural health, David's interests grew beyond his university study and in 1974 he focused on the discipline of Herbology. In 1979 he became a Master Herbalist and the director of The School of Natural Healing. Today, thousands safely apply the Christopher methodology thanks to his directorship. David is an international lecturer and was instrumental in

establishing England's College of Herbs and Natural Healing. He is the author of [An Herbal Legacy of Courage](#) and various articles on herbs and nutrition have been published in many magazines. David and his wife Fawn host a weekly radio program, "[A Healthier You](#)", that is now in its seventh year.

## About Us > **Other School of Natural Healing Master Herbalist Instructors**

### **Master Herbalist Instructors**

#### **James A. Duke, Ph.D. - Economic Botanist (Ret.)**

With over 32 years experience in the U.S. Dept. of Agriculture (USDA), Dr. Duke became the leading medicinal plant specialist in the federal government and is an expert in ethnobotany . He is the author of over 300 educational and scientific articles and 15 books. As an active member in the American Herb Association, Dr. Duke devotes his time to reestablishing respect for herbal alternatives in modern medicine.

#### **Christopher Hobbs, O.M.D.**

Christopher is a fourth generation herbalist and botanist with over 22 years experience and is an expert in herbal pharmacology. Christopher has written extensively on the medicinal as well as the edible use of plants. His titles include Foundations of Health and a number of single herb publications. He teaches internationally on herbal medicine and has taught at the School of Natural Healing since 1984.

#### **Richard Schulze, M.H.**

Richard has taught at the School of Natural Healing for more than 17 years. As an experienced herbal practitioner, Richard emphasizes the simple and effective art of herbal cleansing. His instruction reflects nature's success when dealing with "incurable" diseases. He stimulates students through creative teaching and hands-on demonstrations.

#### **Sandra Ellis, M.H.**

Sandra has had ample opportunity to discover the miraculous healing power of herbs as an herbal student and mother of 13 children. She is the author of Dr. Mom and has been teaching with The School of Natural Healing for seven years.

## **Dianne Bjarnson, C.M., C.P.M., Q.E.**

For over 12 years, Dianne has been an instructor for The School of Natural Healing. As a NARM certified midwife, Dianne counsels women in the use of nutrition, herbs, and natural procedures for healthy pregnancies and safe childbirth. Dianne is founder and director of the Utah School of Midwifery.

## **Nathan Jaynes, M.T., M.H.**

For the past 6 years Nathan has been a full-time student advisor for The School of Natural Healing. He is a trained Massage Therapist and Master Herbalist graduate of The School of Natural Healing. Nathan has helped develop the current curriculum and teaches local classes for The School as well as for the Utah School of Midwifery.

## **Dr. Ahmed Warfa, Ph.D.**

Dr. Warfa has studied throughout the world receiving degrees in botany, plant systematics and agriculture. He taught for 17 years at the University of Somalia, served as Somalia's Council Chairman of Agricultural Research, and was one of 5 senior advisors to the United Nations. He is currently employed in botanical research at Brigham Young University and is an advisor to the herb industry.

---

## **Iridology Instructor**

### **David J. Pesek, Ph.D.**

Dr. Pesek has earned five degrees from five universities, including Ph.D.'s in psychology and iridology. He is a Clinical Nutritionist and a member of Iridologists International, an honorary association. David is also a psychotherapist and a member of PSI CHI, the National Honor Society in Psychology.

Dr. Pesek has studied various teachings of iridology from around the world and has blended them into one dynamic system. David has practiced complimentary medicine for the past 21 years. He has given expert witness testimony in a court of law regarding the validity of iridology as a means of health assessment. Further, Dr. Pesek is the first American iridologist ever invited to speak at the prestigious International Course for Iris diagnosis in Germany.

Dr. Pesek is listed in the Who's Who Among Human Service Professionals. He is the Founding Director of the Center for Effective Living, which was established in 1976. This institution is one of the first holistic health care centers in the United States.

Dr. Pesek is an international lecturer and seminar leader on the subjects of Iridology, Clinical Nutrition, and natural forms of healing. David serves on the advisory council and the education certification faculty for the National Iridology Research Association. His pioneering work is helping to bring the holistic health concept for healing into focus. He is dedicated to the wellness of mankind and planetary transformation.

## About Us > **History & Overview of the School on Natural Healing**

The School of Natural Healing was founded in 1953 by Dr. John R. Christopher, and has been the means for thousands of students to begin and further their herbal knowledge and wisdom.

Taking charge of your family's health is safe, rewarding and satisfying. However, many people become overwhelmed at the prospect of engaging in herbal study.

At The School of Natural Healing we will show you that you can become your own doctor. In the comfort of your own home, you can become a qualified healer and teacher in less than 2 years by studying only one hour per day .

Our courses are designed to teach herbalism from the ground up. We begin with foundational understandings of natural methodologies and progress through the many aspects of herbal healing, including herb identification, horticulture, medicinal usage's, methods of preparation and more. Students who complete the Master Herbalist program are prepared to take care of themselves and their families, and educate others in natural healing methods.

Our School curriculum and philosophy is built upon the understanding and practice of four fundamental principles:

1. Preventative Nutrition
2. Eradicating the Cause of Disease
3. Healing the Body through Natural Methods
4. Education

## About Us > Career Opportunities for You

Many students of The School of Natural Healing enroll simply for personal enrichment; others use their education in the alternative health field. All of our students become a great help to their family, friends and neighbors by applying the concepts of natural healing taught in our course. Through The School of Natural Healing's Graduate Teaching Program, graduates have the opportunity to lecture in their own area. If students choose to take part in this one-of-a-kind program they will not only gain notoriety as an instructor but also earn income as a Master Herbalist.

### *Graduates of The School of Natural Healing are doing many things such as:*

- Developing and marketing their own herbal preparations
- Consulting for major supplement manufacturers
- Working as nutritional consultants in health food stores
- Free lance writing for health magazines
- Authoring herb and health books
- Instructing at alternative medical schools
- Operating health food stores
- Giving phone tutorials on herbal topics
- Lecturing at conventions and symposiums
- Teaching classes all over the world

## About Us

[Founder & Director](#)

[Instructors](#)

[SNH History](#)

[Career Opportunities](#)

[Accreditation](#)

[Continuing Education](#)

## About Us > Accreditation

The School of Natural Healing is registered as a Post Secondary School by the State of Utah. Currently, there is no nationally recognized accreditation for herbal schools. Furthermore, accreditation or being licensed is not a requirement for a Master Herbalist diploma. Schools that offer fully accredited courses leading to being licensed must require a 4 year residency at a college (costing as much as \$17,000 per year plus living expenses).

### **REGISTERED UNDER**

### **THE UTAH POST SECONDARY PROPRIETARY SCHOOL ACT**

**(Title 53B, Chapter 5 Utah Code Annotated 1953)**

Registration under the Utah Post secondary Proprietary School Act does not mean that the State of Utah supervises, recommends, nor accredits the institution. It is the student's responsibility to determine whether credits, degrees, or certificates from the institution will transfer to other institutions or meet employer training requirements. This may be done by calling the prospective school or employer.

We do not provide placement assistance.

Seminar attendance is subject to administrative approval.

**About Us**[Founder & Director](#)[Instructors](#)[SNH History](#)[Career Opportunities](#)[Accreditation](#)**Continuing Education****About Us > Continuing Education Units**

The AMMA (American Medical Massage Association) and the ABMP (Associated Bodywork and Massage Professionals) will now recognize the training from our courses for Continuing Education Units credit. Our curriculum has been reviewed by these organizations and found to meet their continuing education requirements for members.

The AMMA requires 10 CEUs every year to maintain membership in their organization. The ABMP requires 16 CEUs every year. Below is a breakdown of the CEUs we can offer for each level, program, and entire course.

Individual levels (22 levels in the MH Program)	68 (approx) hours of study each	<b>4 credit hours each</b>
Nutritional Herbologist Program levels 100-500	340 hours of study	<b>20 credit hours</b>
Herbalist Program levels 600-1300	546 hours of study	<b>32 credit hours</b>
Master Herbalist Program levels 1400-2200	614 hours of study	<b>36 credit hours</b>
Complete Master Herbalist Course	1500 hours of study	<b>88 credit hours</b>

After a student massage therapist completes a level or program he may request a letter of completion. We only give credit for completed levels (assignments must be turned in for that level).

### *A Healthier You Audio Newsletter with David & Fawn Christopher*

Master Herbalists David and Fawn Christopher offer monthly herbal information on audio cassette via our "A Healthier You" Audio Newsletter. These informative audio cassettes are select recordings from the popular radio show "A Healthier You", now in its tenth year of broadcasting. Each 60 minute cassette offers up-to-date information and common sense regarding a variety of current health topics, herbs, natural treatments and therapies.

These newsletters are available in a monthly subscription or you may order any of our back-issue cassettes single or in sets of 12. You will receive your first cassette at the beginning of the month following our receiving your subscription, and you will receive a new cassette each month

You can also listen to the "A Healthier You" Live Radio Broadcast online now. It is broadcast LIVE at 9:00 AM in *Mountain Standard Time*. You will need to adjust the time that you tune in appropriately. The link to tune in is on the home page.

### **A Healthier You Audio Newsletters**

## <Up Level Field: No up level page> > **Damaged & Bargain Book Clearance**

These books have been damaged. Damage ranges from crinkled pages, ripped covers, and stains on the books. None of these damaged books are missing pages. Some of them are in this section because new editions have been released. Damaged books are on a first-come, first-served basis. We have a limited number of these books available, and the availability changes frequently. If you order one of our damaged books, as long as it is available we will send it to you. If someone ordered the last copy of a book, even just five minutes before you, that person will get that book. When the last damaged book is sold, we will remove it from the store.

Please feel free to contact us in the office if you have any question regarding our damaged book policy. You can reach us at 1-800-372-8255 from 9:00am-4:00pm Mountain Time Monday-Friday. Keep visiting this section of our store, as our damaged and bargain items change frequently.

## *Regenerative Diet*

by *Dr. John Christopher*

A healthy, invigorating life depends on a harmonious blend of many things, including sunshine, fresh air, exercise, work, play, song, prayer, meditation and recreation. But one of the most vital keys to good health is a proper diet. What, when, and how we eat directly affects our body's ability to withstand illness and disease.

Too many people have become creatures which "live to eat" rather than eat to live. They blindly follow the harmful and deceiving inclinations of their eyes, nose, and taste buds. As a result, more Americans have died of malnutrition, suffocation and constipation of bodily organs and systems than from all the wars, automobile accidents, earthquakes, and fires to date.

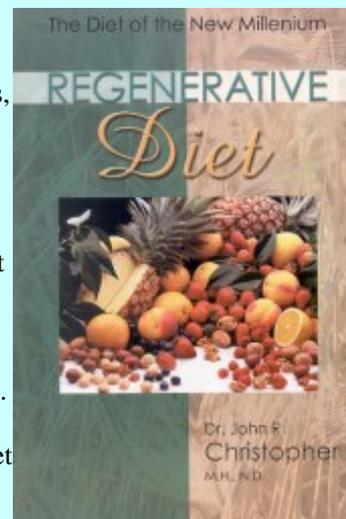

An endless selection of seemingly sophisticated medical terms is used to describe their ills, but what it all boils down to is that years of improper diet have sent mucus, waste and poisons into arterial structures, the digestive system, and even tissues and cells—a great poisoning throughout many parts of the body which eventually brings everything to a standstill.

The Regenerative Diet is designed to regenerate the health of the individual following it. The Regenerative Diet introduces you to the benefits of healthful fasting and points you in the direction of permanent proper eating habits—habits which when faithfully sustained, revitalize and regenerate your entire being for the rest of your life.

The Regenerative Diet includes an eight week "transition" diet plan offering many delicious menu suggestions.

by *David Christopher, M.H.* [Read Online](#) (Opens in a new window)

Don't have time to read Dr. Christopher's biography? No problem. Buy the audio cassette version, and listen along. What prompted Dr. Christopher's passion for study of herbs and natural healing? How did the BF&C formula come about? Learn these and other fascinating facts and history in this, the first biography written on Dr. Christopher. Authored by his son and student, this book recounts Dr. Christopher's youth, his roots in herbalism, methods of healing and joys and struggles as he sought to teach and heal.

### *A Healthier You Audio Newsletter with David & Fawn Christopher*

Master Herbalists David and Fawn Christopher offer monthly herbal information on audio cassette via our "A Healthier You" Audio Newsletter. These informative audio cassettes are select recordings from the popular radio show "A Healthier You", now in its tenth year of broadcasting. Each 60 minute cassette offers up-to-date information and common sense regarding a variety of current health topics, herbs, natural treatments and therapies.

These newsletters are available in a monthly subscription or you may order any of our back-issue cassettes single or in sets of 12. You will receive your first cassette at the beginning of the month following our receiving your subscription, and you will receive a new cassette each month

You can also listen to the "A Healthier You" Live Radio Broadcast online now. It is broadcast LIVE at 9:00 AM in *Mountain Standard Time*. You will need to adjust the time that you tune in appropriately. The link to tune in is on the home page.

## ***An Herbal Legacy of Courage***

by *David Christopher, M.H.* [Read Online](#) (Opens in a new window)

At Dr. Christopher's funeral, many people who had been told by their doctors they would never be able to have children of their own arrived with children—many of them respectfully named John, Raymond and Christopher—having been helped through his counseling and therapies to enjoy the blessing of having their own children.

This is only one of the many successes you will read about in this delightful book.

From his beginnings as an orphan abandoned in Salt Lake City, Utah, to becoming the only practicing herbalist in the US Military and on through his years of treating, lecturing, and discovering his many well-known formulas, this wonderful book chronicles the life of one of America's foremost herbalists, Dr. John Raymond Christopher. Called the "Grand Daddy" of herbal medicine, he touched the lives of thousands of people, sharing life and hope with all who were in need.

## ***Transfiguration Diet***

by *Littlegreen Inc.'s Thinktank*

The perfect diet consists of organic, or living, nutrients. Only an intake of vibrant, live foods can promote optimum health, immunity, and healing.

The *Transfiguration Diet* is the perfect diet, building the body with live enzymes and nutrients from nature balance whole foods.

The *Transfiguration Diet* offers the fastest, safest approach to a disease free body.

It describes the simple method to overcome *genetic* problems regarding obesity, food addictions, cravings, and poor eating habits.

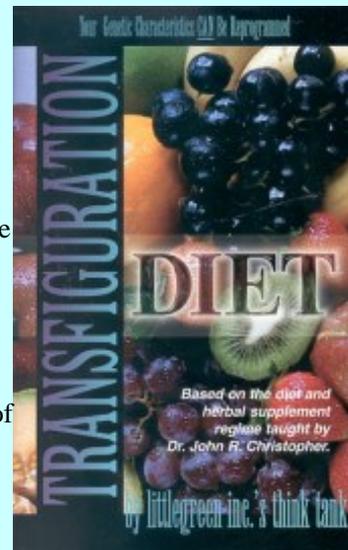

It is a total life-style change rather than a short-term fad diet.

Proper foods build a clean, efficient digestive system and purify the body of long-stored toxic wastes. As damaged tissues are restored, *vitality* and *longevity* increase.

Ultimately, this radical, unique program will help to build a better genetic foundation for you, your children, and future generations.

## *The Mild Food Cookbook*

*by Michael Tracy*

Michael Tracy was reared in rural New England where he developed his skills in culinary sciences while employed as a chef in the coastal resorts of Maine.

The Mild Food Cookbook was inspired by the author's interest in herbal medicine and dietetic healing systems. This book is a great addition to the cooking library of anyone interested in following the mucusless diet. It is a great companion book to *The Regenerative Diet* and *Transfiguration Diet*.

## ***Herbs to the Rescue***

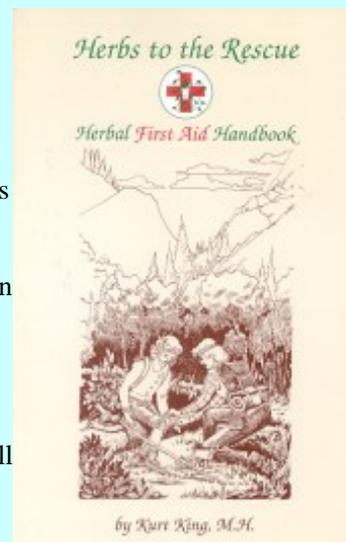

by ***Kurt King, M.H.***

Kurt King, M.H. has been involved with natural healing for over 21 years.

At the age of 16, he first studied natural health and how it related to his studies of the Martial Arts. Kurt holds several degrees in Karate including a black belt and was a professional kickboxer taking several championships throughout the Intermountain West. In 1978, Kurt met Dr. John R. Christopher and studied under him, receiving his Master Herbalist Degree.

He was worked with Dr. Christopher and his family for the past 11 years in one way or another involving herbs. Kurt now lives on a piece of God's good earth in a log cabin in the wild Montana mountains with his loving, supportive wife and seven beautiful, healthy children.

*Herbs to the Rescue* is a visionary's book to help us all not only to survive...but to evolve. Highest recommendations for all Herbalists, as well as anyone who loves life on the Earth.

-Jeanine Parvati Baker, Author of *Hygieia*

Kurt's book *Herbs To The Rescue* is a first of its kind. I know it will provide solutions for numerous health-related complaints, with its easy Herbal First Aid Remedies. I recommend it to everyone that values good health.

-Max G. Barlow, Author of *From the Shepherd's Purse*

Learn the Secrets of Preparing Herbal Medicine in Your Own Home!

This outstanding four hour double video set and laboratory reference manual teaches you how to make salves, tinctures, extracts, liniments, oils, ointments, cough syrups, glycerites, lozenges, oxymels, powders, electuaries, suppositories, skin care products, and much more. It covers wildcrafting, preservation and storage techniques and includes a therapy section which teaches you how to do poultices, packs, fomentations, plasters, steams, baths and other natural therapies.

*"It was a delightful surprise to see this presentation. It has long been needed, and everyone in the natural health care field should become acquainted with it. We must all become more aware of the beauty and abundance with Nature has provided us in the form of these useful plants. I truly endorse the ideas and efforts which resulted in this wonderful video."* Dr. Bernard Jensen, PhD, Nutritionist

**Debra Nuzzi St. Claire, M.H.**, holds Master Herbalist degrees from Dominion Herbal College and The School of Natural Healing. She has worked in the field of herbal medicine for 25 years and has taught classes in herbal preparation techniques since 1984. Debra has formulated over 270 herbal products for the natural health care industry. She is the US Director of the Ethno-Medicine Preservation Project, which is dedicated to the preservation of the medicinal plant knowledge of indigenous peoples on an international scale.

## Dr. Mom

by *Sandra K. Livingston Ellis*

You never know how long it may take for help to arrive. Everyone should know what to do in an emergency.

As my sixteen year old son held his dying ferret, which was bleeding from the nose, ears and eyes after a fall from a second story balcony to a tile floor, and said "Mom, isn't there anything you can do?" We administered cayenne extract and within ten seconds the hemorrhaging stopped and she became very much alive.

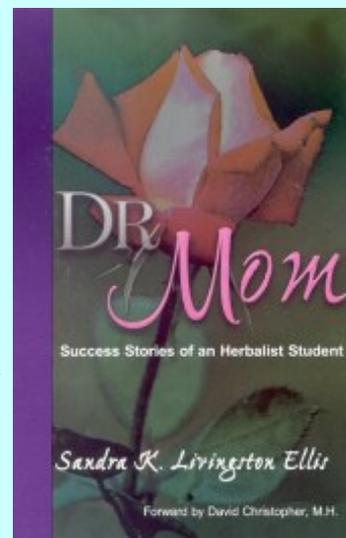

When the doctor look at the x-rays of Nathan's foot, he said, "You have a spiral break of the fifth metatarsal and the bone has rotated. You will need to see an orthopedic surgeon to have it set and possibly pinned." Nathan thanked him for the x-ray and went home. We treated the problem with herbs and four weeks later he was back on the basketball court.

As Jennifer laid on the couch in intense pain with appendicitis, I struggled with what I had been taught about this disease. *What if I wasn't doing enough? What if it ruptured? What if she died?* As Donna took her vital signs, her countenance lit up. "You are on top of this," she said. "There is no fever. If there is no fever, there is no infection, and the infection is what kills you."

By exercising faith and using the knowledge of herbs to take responsibility for her family's health, she was able to turn possible tragedies into miracles. Sandra and her husband, Steve, reside with their family in Springville, Utah.

# DISCLAIMER

In the event the reader of this web site uses the information without the approval of a health care provider, he/she is prescribing for himself/herself and assuming full responsibility for it. This is his/her right to do so, but Herbs First assumes no responsibility for his/her actions. These nutritional products and programs are not offered as an alternative to a orthodox medical, osteopathic, homeopathic, or chiropractic approach to treat diseases, but rather, an adjunct to the conventional treatments and a supportive program that can be used in combination or in addition to other therapies, if desired. Good nutrition does not oppose or contradict the orthodox forms of healing. It complements them.

## BIOLOGICAL INDIVIDUALITY

The human body is very complex. Although each person is similar in general structure and function, each is also uniquely different, responding differently to similar stimuli, therapies and conditions. What may help one person in a certain circumstance or condition, may not help another. This is also true with foods. A particular food that may be nourishing to a healthy person may cause an allergic reaction in another. Each condition may also be unique. Although thousands have had help from the natural methods described here, there have been and will be cases where destructive pathological changes are so severe, and the bodies own healing mechanisms so weakened, that the process of healing could be an extended process. Persevere, and your hard work will be amply rewarded.

## IMPORTANT NOTICE

Herbs First does not diagnose or prescribe. It is not the purpose of Herbs First, their officers, directors, affiliated health centers or independent distributors to replace the services of your health care provider.

It should not be misconstrued to mean, imply or indicate that the product or programs described here will cure anything, as no such claims are made. Only the body can heal itself. These nutritional suggestions are not offered as a cure, rather, as aids to the body in reestablishing normal functions.

We offer this information along with suggested programs to those who want to, and are willing to, share responsibility for their own health with their health care provider.

Even though Herbs First herbal remedy processes contain no drugs, you should use them only as directed by your health care provider. Do not self-diagnose.

Do not attempt to treat yourself for any serious condition. Consult your health care provider. Show him or her this material and undertake a program of treatment under supervision. However, if your health care provider says that nutrition is not important and attempts to treat you only with drugs, we suggest that you obtain a second opinion from a diet conscience health care provider who is more aware of the natural methods of biological medicine, because--after all, it is your health!

# The Quintessence of Natural Living for health & happiness

essays & talks  
on  
the art of natural  
hygiene lifestyle

by Keki R. Sidhwa ND. DO. D.NH.

[Article  
Index](#)

[Who is Dr.  
Keki  
Sidhwa?](#)

[Books  
-](#)

[Next  
Page >>](#)

*Do you know how to get well without drugs? How soon you can get well? What the signs of health are? How to overcome depression without drugs? Why it is so hard to change to a healthier lifestyle? What is 'toxins', 'detoxify' and 'sludged blood'?*

**Find out from Dr. Keki Sidhwa - British Natural Hygiene physician, teacher, scientist, philosopher, visionary and poet**

**"My people are destroyed for the lack of knowledge" - Hosea 4:6**

*Dr Sidhwa has never been complacent. He has never taken knowledge for granted. He has always attempted to seek, to investigate, to question. The numbers of people in Britain and abroad who have been influenced by Dr. Sidhwa's essays has been significant. Many of his essays were reprinted in Dr. Shelton's "Hygienic Review".*

*Dr. Sidhwa has withstood a great deal of persecution and vilification from opponents within the natural therapies. He has suffered much criticism for his vociferous opposition to the "curing superstition". Despite this he has earned an unusual respect from many of his disjoiners. (Dr. Alec Burton)*

## ARTICLES:

### SOME PRACTICAL DO'S AND DONT'S IN NATURAL HYGIENE

Can Natural Hygiene give some practical guidelines to maintain and preserve good health? What are the guidelines in cases of illness?

### HOW TO RECOGNISE HEALTH IN YOU

Many people are able to recognise the signs of ill health within them. We have been conditioned to look for signs of ill health rather than health.

### HOW SOON CAN YOU GET WELL?

People are so used to seeing their symptoms vanish with the prick of a needle, that they also expect instantaneous relief when they embark on a Hygienic way of life. They forget that the speedy relief they had was only temporary.

### LIVING BEYOND YOUR MEANS

Husbinding one's resources is a sure sign of good investment. But how many of us fail to realise that what is true of economical strength is also true of bodily and mental wellbeing.

# Health, Longevity and the Art of Living

The Quintessence of Natural Living is that which provides physical health, mental and emotional poise and spiritual integrity to the human organism to suffuse it with joy and happiness.

Natural Hygiene is the art and science of living in such a way that it provides all these qualities abundantly.

The primordial needs of the human individual to supply vigour and dynamic health and longevity are as follows:

1. Pure Air (unpolluted, without fumes, smog, etc.)
2. Pure water (unpolluted by man's chemicals)
3. Wholesome food grown on unpolluted soil to which mankind is biologically suited to as a frugivore, i.e. The natural diet of man is basically a total vegetarian diet. Man is not a flesh eating animal according to comparative anatomy and physiology, although he has over centuries adapted himself to eat flesh foods.

"The natural diet of man is basically a total vegetarian diet. Man is not a flesh eating animal, although he has over centuries adapted himself to eat flesh foods".

Biologically being in the same class as the primates and the big apes like gorillas. Ideally man should eschew all flesh foods at least. If dairy products and eggs are taken they should not be more than 1-2% of the total diet.

Those who are not able to partake of a total raw diet of fresh fruits, fresh raw vegetables, nuts and seeds should see that at least 70-85% of their total diet is composed of raw fruits and vegetables, nuts and seeds or other protein food 10% and the remaining percentage as complex carbohydrates composed of

### WHAT IS THIS TOXAEMIA?

Toxaemia and toxins are words commonly used in the Natural Hygiene field but many people are still in ignorance of what they are and what they imply.

### SOME PRACTICAL HINTS FOR A DETOXIFYING REGIME

Not many people have the time to undertake a fast. For those who want to detoxify themselves the following practical suggestions will go a long way in helping them to detoxify.

### VEGETARIANISM IS NOT ENOUGH - FOR GOOD HEALTH

Many people make the mistake of choosing a fragment and building a total way of life around it. Vegetarianism is one of them.

### OVERCOMING DEPRESSION WITHOUT DRUGS

The Hygienic practitioner's first duty is to make the person with depression realise that it is within his or her own power to get well, without resort to drugs

### DO "HEALTH FOODS" GIVE YOU HEALTH?

Many people have no idea that the modern day "Health Food Store" has very little in common with the one opened 50 years ago.

### FOOD & LIFE

What is the natural diet of man?  
- How much, when, how to eat?  
- Speaking of food as "medicine" is to transfer to food all the misconceptions about drugs.

cooked whole grains and their products, steamed green vegetables and finally some steamed starchy vegetables as potatoes, yams, beetroot, carrots, parsnips, turnips etc.

4. Sunshine
5. Physical activity and exercise
6. Rest and sleep
7. Relaxation and creative activity to express his creative instincts.
8. Mental and emotional poise with which to meet the stresses and grains of life.
9. The ability to express love and receive love essential for his spiritual growth and reproductive instincts.
10. Faith in mother-nature and the life-force which has shaped his environment to augment his own self-esteem.
11. The need to express humour and laughter, tears of joy and tears of sadness.

"Either mankind stops, looks and listens to his inner voice and conscious awareness or he will end up in a headlong rush - namely his own destruction."

Over the years mankind has instinctively abided by these precepts to go on evolving as a Homo-Sapiens for over 40,000 years.

However in last few centuries mankind has gradually moved away from his instinctive natural

living habits and succumbed to the vagories of the machine orientated technological age whereby he is over the verge of annihilating himself and becoming as much extinct as the plants and animals he has already made extinct by his unnatural behaviour of destroying the very hand that sustains his life - namely his environment.

Either mankind stops, looks and listens to his inner voice and conscious awareness or he will end up in a headlong rush - namely his own destruction. That this is the trend, is observed in the rapid rise in sickness and diseases, in crime and violence, in injustices and cruelty, in greed and possessiveness on one hand and despicable poverty and suffering on the other, and last but not the least, with no foresight and formulation as to the direction we must take, not only to avoid the inevitable end but to reverse the present trend so that our immediate future generations have something to look foreword to instead of disaster.

To that end, i.e. the reversing our foot-steps to that natural life-style that the art of Natural Hygiene is dedicated to. Healing, all healing is a biological process, but Natural Hygiene is the art by which we can enhance the life force in its attempt to cleanse and heal the gaping wounds we have inflicted, not only on our physical, mental and emotional bodies, but on our planet mother-earth.

Over the years I have written extensively on the various facets

### EDUCATE - NOT MEDICATE

In the past Dr Shelton was chastised by Hygienists for his strong language in criticising the medical profession - modern day Hygienists are still sitting on the fence.

### WHAT PRICE - "THE REMEDY MENTALITY"

Ill health is so prevalent that doctors are beset with a mass of people who are seeking relief from their aches and pains and their disabilities.

### NATURAL HYGIENE IDEAS ARE BEING STOLEN!

Many Natural Hygiene adherents would probably be greatly surprised to learn that there is undoubted evidence that Natural Hygiene ideas are gradually being purloined ...

of Natural Hygiene, trying to formulate and make clear in my own mind the only way that is open to us. My field has always been the philosophical and psychological means whereby each individual tries to meet his primordial physical needs as well as emotional needs.

I am of the opinion that in Natural Living, unless we look at the problem with the heart and not just with the head, we will end up in the same mess as the so called scientist and technologist have led us into. That does not mean to say one is superior to the other, but to me the human organism is a Holy Trinity: mind, body and spirit, and that the heart and the head must walk hand in hand as bride and groom on the path of one's salvation.

"...in Natural Living, unless we look at the problem with the heart and not just with the head, we will end up in the same mess as the so called scientist and technologist have led us into".

## Who is Dr. Keki Sidhwa?

Keki Sidhwa was born in Bombay, India of Parsi, Zoroastrian parents. After studying in Bombay University, he graduated from the Edinburgh College of Natural Therapeutics and the British College of Naturopathy and Osteopathy.

He has been in private practice since 1952; co-founder and president of the British National Hygiene Society and ex-president of the International Association of Professional Natural Hygienists (now IAHP), founder and director of Shalimar Health Home, where he has helped over 25,000 people to overcome their ailments by fasting and following a Hygienic life style.

He has lectured extensively in Europe, India, America and Great Britain where he now resides. His interest in primitive cultures, anthropology and comparative religions has helped him to formulate his views on natural living. He is the Editor of the magazine The Hygienist, the oldest magazine currently of its kind. He has authored six books: The Problem of Ill-health, Medical Drugs On Trial Verdict Guilty, Fit For Anything,

First Aid the Natural Way, Words and Music and All Alone (Poems on Health, Love and Life). [The Quintessence of Natural Living](#) is his opus magnum culled from his writings over 35 years and lecturing over the same period.

## Contact

Keki R. Sidhwa, N.D., D.O.  
**Shalimar**  
Harold Grove, Frinton-on-Sea  
Essex C0139BD ENGLAND  
Phone: Frinton 01255 672823  
(From USA 011-44-1255 672823)

Health Retreat Information:

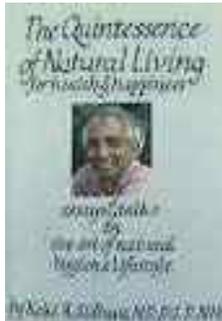

Nowadays Dr. Sidhwa only accepts 2-3 people at a time, so apply at least one month in advance.

The cost is UK£ 250.- per week.

Write or call Dr. Sidhwa. (No e-mail!)

Note: if nobody answers - Dr. Sidhwa may on a travel & lecture tour, and can be gone for weeks at a time. So make arrangements in good time!

## The Quintessence of Natural Living

Some of the articles at this website come from Dr. Sidhwa's book The Quintessence of Natural Living.

[Click here](#) for a list of the articles in the book. (620 pages, published by the British Natural Hygiene Society).

To obtain a copy of The Quintessence of Natural Living contact the [British Natural Hygiene Society](#). (Same address as the author. Price w. postage: £16 in UK, \$27 abroad - payable by UK check, US check or international money order - note that checks must be made out to BNHS).

Or the [American Natural Hygiene Society](#).

"In the wilderness of rubbish to be found in today's "health" literature, here is a jewel to be cherished and shared with all one's ailing friends" Dr. William L. Esser, N.D., D.C.

# Herbert Shelton DC

## [Smallpox](#)

"On May 14, (1930) news came from Germany, of the death of 8 babies, in the Luebeck home for infants, and serious illness of 24 others, caused by inoculation with a tuberculosis serum from cows. Deaths continued to occur until on June 4, the news from Luebeck stated that: "Two infants died today, bringing the toll from administration of anti-tubercular serum to twenty-eight persons. Many others are not expected to live." On June 18, news came from Luebeck that "deaths from inoculation with anti-tuberculosis serum here have reached a total of 41, eighty-five infants are ill." On June 26 the death-toll had reached 44 and eighty-two others were ill.....The serum employed was that concocted by the notorious Calmette, of France, the B. C. G. vaccine that is said, though falsely, to prevent tuberculosis. "--[Shelton](#)

"Under conventional medical treatment, patients were drugged heroically, bled profusely, were smothered in blankets, wallowed in dirty linen, were allowed no water, fresh air and stuffed with milk, brandy or wine. Antimony and Mercury were medicated in large doses. Physicians kept their patients bundled up warm in bed, with the room heated and doors and windows carefully closed, so that not a breath of fresh air could get in, and given freely large doses of drugs to induce sweating (Sudorifics), plus wine and aromatized liquors. Fever patients were put into vaporbath chambers in order to sweat the impurities out of the system. Given no water when they cried for it and when gasping for air were carried to a dry-hot room and after a while were returned to the steam torture. Many must have died of Heat Stroke!"--[Dr Shelton DC](#) <http://www.whale.to/vaccine/shelton.html>

"In 1926, 130 members of the Dallas (Tex.) Chamber of Commerce cancelled their trip to Mexico because vaccination was required as a precedent to entrance. Nearly a 100 medical men, at a conference in Dallas, went to Mexico, after they obtained permission to enter without being vaccinated. Think this over before you submit your child to this evil and superstitious rite."--Dr Shelton DC

"[Dr. Russell T. Trall](#), the eminent Natural Hygienist, considered smallpox "as essentially . . . not a dangerous disease." He cared for large numbers of patients afflicted with smallpox and never lost a case. Under conventional medical treatment, patients were drugged heroically, bled profusely, were smothered in blankets, wallowed in dirty linen, were allowed no water, fresh air and stuffed with milk, brandy or wine. Antimony and Mercury were medicated in large doses. Physicians kept their patients bundled up warm in bed, with the room heated and doors and windows carefully closed, so that not a breath of fresh air could get in, and given freely large doses of drugs to induce sweating (Sudorifics), plus wine and aromatized liquors. Fever patients were put into vaporbath chambers in order to sweat the impurities out of the system. Given no water when they cried for it and when gasping for air were carried to a dry-hot room and after a while were returned to the steam torture. Many must have died of Heat Stroke!"--[Dr Shelton DC](#) <http://www.whale.to/vaccine/shelton.html>

## [Smallpox death rate by Dr Shelton DC](#)

**CHAPTER XXVIII SERUM POISONING (same as chapters 2 & 3 of Vaccines and Serum Evils)**

## [Vaccines and Serum Evils by Herbert Shelton \(c1940's\)](#)

Yet our medically controlled Health Boards cook up fake epidemics, create panics for profit, such as the ones in Kansas City in 1921, Pittsburgh in 1924, Philadelphia, Baltimore, Washington in 1925. An effort was also made to create a panic in New York in 1925, but due to the open fight against it by the *New York Evening Graphic*, the Commissioner of Health called it off.

You are vaccinated and have smallpox. The vaccine was of "insufficient potency," although this was discovered too

late—that is, after you have the smallpox. You are vaccinated and do not develop smallpox—it is assumed that the vaccine was potent. It is like the old test for mushrooms—eat them and live they are mushrooms; eat them and die, they are toad stools.

"In 1926, 130 members of the Dallas (Tex.) Chamber of Commerce cancelled their trip to Mexico because vaccination was required as a precedent to entrance. Nearly a 100 medical men, at a conference in Dallas, went to Mexico, after they obtained permission to enter without being vaccinated. Think this over before you submit your child to this evil and superstitious rite."--

The whole purpose of this propaganda is not to secure the health and welfare of children, but to guarantee the steady inflow of profits to the physicians and manufacturing drug houses.

In 1924 at Concord and Bridgewater, Mass., other groups in schools suffered severely. The white-wash in these cases was that the serum had been allowed to freeze before using. In 1926 when the famous publicity stunt was pulled off, whereby, a dog team carried serum over land to Nome, Alaska, which did not have an epidemic of diphtheria and which knew nothing of the Herculean efforts to save it, it was explained that freezing the serum does not damage it.

Bitten on the hand by a dog on Aug. 3 anti-rabies shots were started the following day. These are said to have been followed by a "mild reaction," that is, mild symptoms of poisoning. He was sent home and then "trouble struck hard." He was rushed to the post hospital where he died. The fact that they thought he was out of danger and sent him home reveals how little they know.

"The serum employed was that concocted by the notorious Calmette, of France, the B. C. G. vaccine that is said, though falsely, to prevent tuberculosis. This vaccine has left a trail of disaster behind it wherever it has been used. It does not and, of course, cannot protect from tuberculosis. The only prevention of tuberculosis is scrupulous hygiene. Given this and no one need fear the disease. Not even children of tubercular parents, though in constant association with them, will develop tuberculosis, if they are cared for hygienically."

"The *American Medical Journal*, March 16, 1929 tells us that two Chicago physicians sent out a questionnaire to 4,426 picked medical men, asking their opinions on vaccine and serum therapy. Some 1,261 physicians replied. Their replies are described as "exceedingly unfavorable," while over 90% of those replying state that they do not employ vaccines and serums. They say: "Of the 396 physicians in the list who answered as members of the Congress of American Physicians and Surgeons, not one considered the use of vaccines a superior method of treatment of infectious diseases."--[Dr Shelton DC](#)

Norway suspended vaccination because of hoof and mouth disease being spread by the practice. In this country our Department of Agriculture traced the epidemics of foot and mouth disease in 1902, 1908 and 1914 to smallpox vaccine.

Lockjaw is a comparatively rare disease except where a vaccination epidemic rages. In his *Principles and Practice of Medicine*, Sir Wm. Osler says of tetanus as a disease transmitted by vaccination: McFarland collected 95 cases practically all American. Sixty-three occurred in 1901, in which R. W. Wilson demonstrated the tetanus bacillus. Most of these cases occurred about Philadelphia."

*The States Public Health Report*, March 20, 1925 says that several fatal cases of tetanus in vaccinated individuals has recently occurred in the United States" The *Report* for June 26, 1925, contains accounts, in its first six pages, of eleven cases of tetanus following vaccination. Boys are more susceptible than girls to post-vaccinal tetanus.

In a letter dated Aug. 9. 1929, and addressed to Senator Robt. F. Wagner, Dr. Hugh S. Cummings. Surgeon General of the U.S. Public Health Service, says the figures which his letter shows are incomplete, for deaths due to post-vaccinal tetanus are as follows: 1925---29; 1926---15; 1927---17, 1929---1. As most of these deaths occur after school opens in September, at which time the great orgy of vaccination begins, the apparent reduction in 1929 is probably very deceptive.

In the early part of 1925, while the whole of the East was in the throes of a vaccination epidemic, the *New York Evening Graphic* uncovered at least two deaths from post-vaccinal tetanus, and many other cases of vaccinal injury in Baltimore. After they published the accounts of these cases, the hospitals in Baltimore established a rigid

ensorship and suppressed the horrid truth about this criminal practice. But a truce with tetanus; the newspapers carry frequent reports of such deaths and I can only touch the high spots here. Everyone can know of these cases who cares to investigate.

In the *Brooklyn Times*, March 21, 1929, Health Commissioner Wynne, New York, is reported to have said in an address to the Optometrical Club: "Here is the answer (to the physician's economic problem). Let them take in 20 children an hour, one hour a day, 3 days a week at a charge of \$5 for each anti-diphtheria inoculation. That will bring a revenue worth while to the doctor."

These various organizations collect many millions of dollars yearly from a generous and well meaning, but uninformed people, spend the major portion of the money in fat salaries and overhead or administration costs, spending much of it to pay for cruel and futile experiments on animals (research) and precious little of it for the purposes for which it is given. Like all organized charity, these things are soulless rackets.

# Serum Poisoning

## CHAPTER II

Parents are frightened into having their babies and children "immunized" against a whole series of diseases, having them inoculated with vaccines, serums, anti-toxins and toxoids of all kinds. The constant stream of propaganda carried on by the pharmaceutical houses and commercial medicine to keep this profitable business alive is filled with manufactured and "doctored" statistics, lies, distortions and statements designed to frighten parents. The whole purpose of this propaganda is not to secure the health and welfare of children, but to guarantee the steady inflow of profits to the physicians and manufacturing drug houses.

In *Red Book Magazine*, Aug. 1952, Edward T. Wilkes, M.D. presents a "New Immunization Schedule for Infants." It is the schedule announced by the Michigan State Health Department and is similar to the one recommended by the American Academy of Pediatrics. Here it is:

"Injections against whooping cough, diphtheria and tetanus are to be started at three months instead of six, as formerly prescribed. The reason for this is that more than half the deaths from whooping cough occur in infants under six months of age (I wonder what this death rate under six months in whooping cough has to do with tetanus and diphtheria?)

"Smallpox vaccination should be given at five months.

"Booster shots for protection against whooping cough, diphtheria and tetanus are recommended at the age of two or three years.

"Immunization against diphtheria, tetanus and smallpox should be renewed at five or six years of age and again at nine or ten years."

Vaccines and serums are given on the theory that they "act" in the same way as one "attack" of an "infectious" disease in immunizing the patient against a second "attack." Years ago, in my *Regeneration of Life* I proved this theory, that one "attack" immunizes against a second "attack," to be illogical, unscientific and contrary to the facts. I showed that one may have smallpox, for instance, five times following immediately upon the heels of five successful vaccinations. Cases are on record of patients who had pneumonia as much as fifteen to fifty times. Think this over and answer the question: *What kind of serum will ever be found to immunize us against pneumonia?* But if not against pneumonia, how about other so-called infectious diseases? Suppose we study diphtheria.

Quain's *Dictionary of Medicine*, (1902 edition) says: "One attack of diphtheria confers no prolonged immunity upon its subject. Even during convalescence the patient has been known to develop the disease afresh, and this may be repeated more than once."

Coodall and Washbourn, in *A Manual of Infectious Diseases*, state: "It is uncertain how far one attack of this disease (diphtheria) protects against a second. Certainly relapses and second attacks are not very rare."

It is certain from these facts that toxin-antitoxin can no more immunize a child against diphtheria than against burning by fire. In this connection, physicians tell us that babies are immune to

diphtheria, inheriting their immunity from the mother, but that they lose their inherited immunity at about six to nine months. The mother must have lost hers at about that same age. Where and how did she reacquire her immunity in order that she might transmit it to her child?

A substance called, "diphtheria toxin" is mixed with antitoxin to make toxin-antitoxin. J. W. Hermetet, M.D., in an address published in the *Illinois Medical Journal*, Nov. 19, 1929, p. 368 says of this toxin, which he refers to as a "deadly toxin," that "toxins are the most concentrated forms of poisonous material. ... One ounce of diphtheria toxin will kill 600,000 guinea pigs or 75,000 large dogs."

In the *Annals of Internal Medicine*, Jan. 1929, C. D. Mercer, M.D., says that "Toxin-antitoxin is not a harmless preparation and should not be given to school children in a haphazard way."

The United States Public Health Service gives the ideal mixture of "antitoxin" and "diphtheria toxin," (forming toxin-antitoxin), as of such a poisonous character that when five doses are inoculated into each of five guinea pigs two shall die acutely in four to ten days and the other three shall die of diphtheria paralysis in from fifteen to thirty-five days. Only a thoroughly dishonest Health Board or school physician can ever represent this poisonous mixture as harmless.

Jesse R. Gersterley, M.D., reported a case of sudden death from nephritis (inflammation of the kidneys) in a child, following inoculation with toxin-antitoxin. This report was published in *The Medical Clinics of North America*, March 1926. This report caused C. D. Mercer, M.D., F.A.C.P., of West Union, Iowa, to investigate the dangers of this serum.

He reports, *Annals of Internal Medicine*, Jan. 1929, p. 668 that, out of 125 children, between the ages of six and twenty who were inoculated 27, or 20% of them, showed albuminuria after the third toxin-antitoxin inoculation, compared to only 13, or 10%, presenting this symptom of kidney destruction prior to the inoculation. He says that "a great many apparently healthy children have albuminuria" and that "administration of T-A (toxin anti-toxin)' doubled that percentage in 120 school children."

E. Gatewood, M.D., and C. C. Baldrige, M.D., say in the *Journal of the American Medical Associations* April 2, 1927: "A multiplicity of untoward sequelae have been observed in patients treated with immune serum. The common symptomatology includes fever, urticaria, erythema, oedema, lymphadenoma, (malignant tumor of the lymph glands), arthralgia (pain in the joints), smothering sensations, headache, nausea and vomiting. Occasionally there are more serious and lasting manifestations such as peripheral neuritis, epididymitis (inflammation of the epididymis, a small body attached to the testicle), and orchitis." (inflammation of the testicles).

I may add that paralysis, convulsions, inflammation of the heart, heart failure, and sudden death are also more frequent results than the general public is aware of. For a convincing array of such cases, taken from standard literature of the subject, I must refer the reader to my *Serum Poisoning a Medical Crime*.

On Jan. 27, 1928, in Bundaberg, Australia, 8 children received their second inoculations of toxin-antitoxin and thirteen received their first inoculations. The Report of the Royal Commission of Inquiries into Fatalities at Bundaberg, published by the Parliament of the Commonwealth of Australia, June 13, 1928 says: "Of these twenty-one children, eighteen became ill with symptoms of significant similarity during the night of the 27th January or the early morning of the 28th January.

Eleven died during the 28th January, and one on the 29th January."

"My little darlings; they are all gone" was the heart wringing cry that came from one poor mother as they lowered her 3 sons, victims of this medical slaughter, into their little graves. One father was at the burial where his two daughters were buried, while the mother was at the hospital with her two sons, who, with more than a score of others, were seriously ill. Efforts were made to whitewash this "accident," as it was called, but well-informed people are not blinded by such efforts.

At Baden, near Vienna, Austria, in an infant's home, in September 1923, seven children died as a result of toxin-antitoxin inoculations. As a result the Austrian government outlawed the use of this serum: *The British Medical Journal*, Sept. 26, 1925, page 578, says:

"On the advice of professor Piruquet, active immunization of school children against diphtheria with toxin-antitoxin has been forbidden in Austria.

In 1919 a similar thing happened in Dallas, Texas. Forty "severe reactions" with ten deaths from acute myocarditis (heart disease), resulted in the H. K. Mulford Company paying damages to the extent of \$78,000 in 69 suits. This case was also white-washed as an "accident."

In 1924 at Concord and Bridgewater, Mass., other groups in schools suffered severely. The white-wash in these cases was that the serum had been allowed to freeze before using. In 1926 when the famous publicity stunt was pulled off, whereby, a dog team carried serum over land to Nome, Alaska, which did not have an epidemic of diphtheria and which knew nothing of the Herculean efforts to save it, it was explained that freezing the serum does not damage it.

In July 1929, little ten-year-old Anna Voight, New York City, died a few hours after having received an injection of anti-lockjaw serum for a slight wound she had received. In his report, the Assistant Medical Examiner, Benjamin Vance, M.D., gave the cause of death in these words: "Sudden death following administration of antitoxin."

An article in the *Daily News* (New York), of Aug. 15, 1953, lies about the killing of Pfc. John Moccia, of New York City, when it says in an effort to shield the serum, that "it was a dog bite which got Johnny." This twenty-three year old soldier died on the morning of Aug. 14 of encephalitis caused by anti-rabies shots. It was the medical profession that "got Johnny," as they get thousands of others with their damaging and killing methods of preventing and curing disease."

Bitten on the hand by a dog on Aug. 3 anti-rabies shots were started the following day. These are said to have been followed by a "mild reaction," that is, mild symptoms of poisoning. He was sent home and then "trouble struck hard." He was rushed to the post hospital where he died. The fact that they thought he was out of danger and sent him home reveals how little they know.

The *Daily News* story says that "an examination showed that Johnny had died of encephalitis. 'Only one person in 5,000 who takes rabies injections gets encephalitis, and only one victim in 1,000 of encephalitis dies,' an Army medical man said, shaking his head at the improbable thing which happened to Johnny."

It was not an improbable thing which had happened to Johnny, although these venders of pus and putridity always offer statistics to show that such killings are rare. John Moccia was killed as certainly as if he had been shot down in Korea. He did not die "of a dog bite" as the *Daily News*

said, but of vaccine poisoning. Had he never had the anti-rabies shots he would still be alive and as sound as the Army permits its men to be. Why the shots? Is there a physician in the U.S. today who does not know that rabies is a myth? Is there a physician in the whole world who does not know that all vaccines and serums are dangerous, frequently very damaging and sometimes fatal? Do they not all know that every vaccine and serum is without value? Do they not all know that the vaccine and serum practice is as great a racket as the blood-transfusing racket that is still being farmed by the Red Cross, "to save a fighting man's life" after the Army has discontinued using blood? Rabies! Hydrophobia! Mad dog! Myths that are kept alive for the money that is to be made out of them. How long will a misinformed and cowed public continue to permit itself to be exploited by soulless scoundrels in this manner?

Did I but have the space, I could give the reader accounts of numerous such cases, since it has become the custom to inoculate everyone with tetanus antitoxin for every pin scratch, nail prick, burn, and to do the same for parturient mothers.

Death and damage comes from all serums. On May 14, (1930) news came from Germany, of the death of 8 babies, in the Luebeck home for infants, and serious illness of 24 others, caused by inoculation with a tuberculosis serum from cows. Deaths continued to occur until on June 4, the news from Luebeck stated that: "Two infants died today, bringing the toll from administration of anti-tubercular serum to twenty-eight persons. Many others are not expected to live." On June 18, news came from Luebeck that "deaths from inoculation with anti-tuberculosis serum here have reached a total of 41, eighty-five infants are ill." On June 26 the death-toll had reached 44 and eighty-two others were ill.

Killed them to save them! And the process goes on. Parents are indifferent or apathetic. Law makers wink their eyes and grant licenses to more men to carry on the same practices, while aiding in persecuting Christian Scientists, Chiropractors, Naturopaths, *Hygienists* and others.

The serum employed was that concocted by the notorious Calmette, of France, the B. C. G. vaccine that is said, though falsely, to prevent tuberculosis. This vaccine has left a trail of disaster behind it wherever it has been used. It does not and, of course, cannot protect from tuberculosis. The only prevention of tuberculosis is scrupulous hygiene. Given this and no one need fear the disease. Not even children of tubercular parents, though in constant association with them, will develop tuberculosis, if they are cared for hygienically.

In St. Louis, Mo. in the Fall of 1901, eleven children were killed and scores injured, by prophylactic doses of diphtheria anti-toxin. This is the serum that is supposed to cure diphtheria. It has never saved a single case. On the contrary, as I have shown in *Serum Poisoning A Medical Crime*, it increased the death-rate; and it is only by skillful juggling of statistics that it can be made to appear to have lowered the death-rate.

When wholesale deaths follow an orgy of inoculations, it is customary to blame the deaths on faulty serum. As an example of this, there was the large number of deaths reported in Japan in December, 1949 following inoculation with diphtheria anti-toxin. On Dec. 30, the press reported 64 deaths and 900 ill from the inoculations. The inoculations were halted, while the serum was being investigated. I do not know how many more of the 900 who were ill also died, nor how many of them were left with serious after effects. The press did not find this matter to be "news."

But all deaths from inoculations and all serious disease resulting from these inoculations are not due to "faulty serums." On the contrary, in every orgy of inoculation, as in the army, many serious troubles arise and deaths are often reported. In these instances, "faulty serum" is not blamed—only when several deaths and much serious sickness follow do they find the serum to be "faulty." But all inoculations give rise to troubles ranging all the way from slight, transient trouble to instantaneous death from *anaphylaxis*. In many instances, serious permanent organic impairment has resulted.

Despite all of this injury and danger, parents might be justified in taking a chance with the health and life of their children, did the inoculations actually prevent the diseases against which they are directed. But there is not a shred of unequivocal evidence that any vaccine or serum will or can prevent any disease or render it milder.

The *American Medical Journal*, March 16, 1929 tells us that two Chicago physicians sent out a questionnaire to 4,426 picked medical men, asking their opinions on vaccine and serum therapy. Some 1,261 physicians replied. Their replies are described as "exceedingly unfavorable," while over 90% of those replying state that they do not employ vaccines and serums. They say: "Of the 396 physicians in the list who answered as members of the Congress of American Physicians and Surgeons, not one considered the use of vaccines a superior method of treatment of infectious diseases."

In Oct. 1925 an effort was made to introduce toxin-antitoxin into the public schools of London, England, as it has been introduced over here. The London County Council referred the matter to their "Public Health and Education Committee." This Committee rejected the proposal, saying, among other things, "it is not advisable" because "these lines of investigation (of toxin-anti-toxin) should be thoroughly explored before further consideration is given to the immunization of school children."

That toxin-antitoxin does not immunize against diphtheria is certain from many facts. Sir George Newman, Chief Medical officer of the British Ministry of Health, says in his 1927 *Annual Report*, page 188: "Owing to the few months which must elapse from the time of inoculation until the child is sufficiently protected to resist an attack of diphtheria, this type of inoculation has no immediate effect in checking an epidemic. How long immunity lasts cannot be determined. Three doses will produce full immunity in 80 or 90 per cent of the children."

Not over 15% of children ever have diphtheria, even during an epidemic. If the inoculation only "immunizes the 85% to 90% who would not have diphtheria anyway, why give it?"

Dr. Peters, lecturer on infectious diseases, University of Bristol, says that one of his fever hospital nurses, who was not allowed in the diphtheria ward until six weeks after the last two or three doses of toxin-antitoxin, developed diphtheria, and two other nurses developed diphtheria while being immunized, but who were not in contact with any known case of the disease. His opinion, based on his hospital experience, he states as follows:

"1. You can have diphtheria after you have given a negative Schick test." (Proving the test to be unreliable).

"2. You may not be particularly susceptible even if you give a positive Schick test." (Proving the test to be utterly worthless).

"3. You can have the disease even if you have been immunized." (Proving that the immunization process does not immunize.)

Dr. Joe, of Edinburgh, states that he personally knew of 33 children who had diphtheria after they had been immunized—*immunized!* Hundreds of such examples have been reported.

Compare this with the fact that the cities of Lasalle, Peru and Oglesby, Ill., were reported, in *The Illinois Medical Journal*, Nov. 1929, p. 337, by Arlington Ailes, M.D., Health Director of these three cities, aggregating 30,000 people, not to have had a case of diphtheria in two and one-half years and not a death from this disease in three and one-half years, with the use of toxin-antitoxin 'practically nil." Their neighboring city, Chicago, where toxin-antitoxin has been lavishly used showed a rise in both the case rate and death rate. "In 1928 it (diphtheria in Chicago) again increased over 60 percent and nearly 100 percent in mortality." Let them find an alibi for these facts if they can. But you save your children from the dangers of all serums and vaccines.

## RT Trall MD

### [THE TRUE HEALING ART Or, HYGIENIC vs. DRUG MEDICATION--Trall MD](#)

"I have myself, through Natural Hygiene, over 16 years, treated all forms and hundreds of cases of typhus and typhoid fevers, pneumonia's, measles and dysentery's, and have not lost a single patient. The same is true of scarlet and other fevers. No medicine whatever was given."----Dr Trall, 1860.

## Smallpox by Herbert Shelton

From: The Hygienic System, Dr. Herbert M. Shelton, Orthopathy, Vol. VII, 1941

.....just as before the time of (Dr.) Sydenham, all cases of measles, chickenpox and scarlet fever were diagnosed as smallpox. Today if a case of chickenpox has no vaccination scar, it is smallpox; if a case of smallpox has a vaccination scar, it is chickenpox. Few cases now reported as smallpox are ever sick enough to go to bed. The mortality from VACCINATION is much higher than that from smallpox.

Smallpox, along with measles, scarlet fever, etc., is commonly referred to in medical works as a "disease of unknown origin." It is assumed to be due to germs, but the supposed causative germs have never been found. Epidemics occur chiefly in winter when germs are less active. Protein excess, foul air and inactivity seem to be its chief causes.

Sydenham, who saw more of the old virulent variola vera than all the now living physicians in this country together have seen, says: "As it is palpable to all the world how fatal smallpox proves to many of all ages, so it is clear to me from all the observations that I can possibly make, **THAT IF NO MISCHIEF IS DONE, EITHER BY PHYSICIAN OR NURSE, IT IS THE MOST SAFE AND SLIGHT OF ALL DISEASES.**" Under hygienic care recovery is rapid with little or no pitting.

The "disease" is as **CONTAGIOUS AS INGROWING TOENAILS**, and every case must be quarantined. Fear of the disease **MUST** be kept up in the public, for it is only thus that the present farce can go on.

# Soil And Health Library

Health begins in the soil; Healing begins with hygiene; Liberty begins with freedom.

---

This is a free public library offering a tightly focused collection of books about holistic agriculture, holistic health, self-sufficient living, and personal development. Most of the titles in this library are out of print. Some can be quite hard to find; many of these books are old enough to be public domain materials.

The titles on this website are here because one person, Steve Solomon, intensely believes that when grasped as an inter-related whole these books can constitute a self-guided course of study or curriculum that connects agricultural methods to the consequent health of animals and humans, shows how to prevent and heal disease and increase longevity. There are also smaller collections about homestead-based lifestyles and about why globalized society is resistant to changing its food and health systems.

The Soil and Health Library has four major sections and a clipfile:

**Radical Agriculture.** Here, the underlying theme is how to create physical health through nutrition. This section's interest is far wider than organic gardening and farming. Other health-determined approaches to food-raising are also included. Go to the [Agriculture Library](#)

**The Restoration and Maintenance of Health.** Here, the focus is nutritional medicine, primarily on methods that maintain health with proper diet and heal illness by limiting or reducing nutrition. There are also selections concerning longevity and nutritional anthropology. Go to the [Health Library](#)

**Achieving Personal Sovereignty.** Physical, mental, and spiritual health are interlinked--holistic. This collection focuses on liberating achievements, especially homesteading and the skills it takes to do that: small-scale entrepreneuring, financial independence, frugality, and voluntary simplicity. There is also a collection on social criticism, especially from a back-to-the-land point of view. Go to the [Personal Sovereignty Library](#)

**Achieving Spiritual Freedom.** There are many seemingly-different self-betterment roads leading to the same place. Most spiritual seekers choose a path that aligns with their own predispositions. My preferences are for methods that empower a person to self-determinedly handle their own development in an independent manner. Go to the [Spiritual Freedom Library](#).

**Clippings and Miscellaneous.** Since inception of this library in 1996, patrons have sent information and URLs where I would find interesting bits of information and viewpoints. I hope you will continue to do so. Until December, 2001 these were viewed without making permanent reference. Then it was realized that a file of these items might be well worth sharing. Here you will find articles and essays and etc. that support and enhance the information found in our book collections. [Go to the Clipping File.](#)

Please help build it.

## ALSO:

- [CONTACT US](#) | [YOUR PARTICIPATION](#) | [LONG RANGE PLAN](#)
- The books we provide are deciphered with Caere's OmniPage Pro or ABBYY's FineReader software, using Epson Perfection 1200/1240 flatbed scanners (a gift to the library courtesy of Lee Larson of Portland, Oregon). Despite great care to eliminate any imperfections, there will almost certainly be some typos remaining. If you find any errors, or anything that even seems it might be an error, please let us know exactly what and where it is. Be specific, please. We will check it and fix it. [Errors.](#)
- The Soil and Health Organization maintains [links to other sites](#) that support its aims and goals.
- [Letters from patrons](#) of the Soil and Health Library.
- **How to enjoy reading these books more.** This library has intentionally been formatted to work when using the most primitive sorts of browser programs. The books it contains carry no instructions for the display of any particular fonts and only in a few cases are line lengths specified. But unfortunately, most users set their browser windows quite wide so that whilst visiting most sites they can see all the display at once. But when reading a book on this site, it is suggested that you set your browser window quite narrow, so as to better mimic the line length found in ordinary books.

## The Purpose of Soil And Health (dot) Org

I prefer to learn by going back to the originators of a body of knowledge because those who follow in the founders' footsteps are rarely trailblazers of equivalent depth. Even when the earliest works in a field contain errors because their authors lacked some bit of data or had a fact wrong, their books still contain enormous wisdom. If nothing else, study of older books lets us discover that the conditions that prevail today aren't the way things always were--while on some levels, some things hardly ever change at all.

There are powerful tendencies on Earth causing the foundations of knowledge to be lost in obscurity. That would be okay if there were better knowledge and wiser wisdoms coming on line to replace them. But usually the opposite is the case. I have observed this tendency in every area of study I've taken up seriously: history, agriculture, natural medicine, even investing. As the sort of person Sir Albert Howard called "the laboratory hermit . . . someone who knows more and more about less and less" increasingly dominates ever-wider areas of scholarship, the focus of scholarship gets ever narrower and less wise.

Here's an example. Despite all the recent advances of so-called "scientific" agriculture, the nutritional qualities of our basic foodstuffs have been declining during this century. That's largely because most agronomists focus on bulk yield and profitability of the crop, while knowing next to nothing about animal/human nutrition. However, there's a little-appreciated "law" about this area: nutritional value usually drops in direct relationship to the increase in bulk production. Or, in agriculture at any rate, "quality" seems the opposite of "quantity."

Industrial agriculture has also devastated the self-sufficient, independent lifestyles. Take the U.S. for an example. In 1870, something like 90 percent of all Americans lived on free-and-clear farms or in tiny villages. And in consequence, enjoyed enormously greater personal liberty than today. The current decline in personal rights in America is NOT the result of there being more people dividing up a fixed and limited amount of total possible liberty into smaller and smaller slices. It is a consequence of financial insecurity, financial dependency and wage slavery. Only free persons can forthrightly demand their liberties. A similar degredation has occurred in Australia and Canada.

I think what has happened since 1870 was, as the industrial food system became ever more "efficient" it also made the price of basic agricultural commodities move lower and lower as their quality also moved lower. Consequently most country folk rejected their self-sufficient-farm birthright for a paying job in town, and soon became wage-enslaved. Wage slaves, like all other kinds of slaves, feel insecure and think that they have to shuck and jive in order to survive.

The global industrial system's focus is on efficiency in all areas, including farming, but the apparent cheapness of economically-rational agriculture does not reflect a true accounting of costs. Despite the statistical increase in average lifespan, our average health and feelings of wellness have been declining. Consider as an example the large proportion of your neighbors whose mental awareness seems wrapped in fat. Americans especially are disdained world wide for being hugely obese. Australians and Canadians are going the same way. I cannot testify about other parts of Earth, not having travelled extensively. Americans, Canadians and Australians spend ever-larger portions of their productivity on the treatment and cure of disease. This whole area of "health" care is not really a productive use of effort, but really constitutes enormous waste, pain, and suffering, whose source is almost entirely unappreciated.

Dr. Isabelle Moser, who spent 25 years conducting a clinical practice using holistic approaches, told me that what she termed the "constitution" of her older patients was typically much stronger than the constitution of her younger ones. Each generation got a poorer start than the one before it as each generation built the foundation of their health from foods produced on ever-more degraded soils grown ever-more "scientifically," and more and more consisting of processed, denatured fodder. (The full text of Dr. Moser's book [How And When To Be Your Own Doctor](#), is in the Health Library.) (For a good discussion of the concept of "start," read Wrench's [Wheel of Health](#) in the Longevity Library. *See also*: Shelton's *Orthotrophy*, [Chapter 36](#).)

Maybe someone will write in and tell me who the sage was that so wisely quipped, "if they can stop you from asking the right questions, you'll never come up with the right answers." In this library you will encounter individuals who DID ask the right questions and even came up with some of the answers.

I've observed that modern higher education points people's attention away from the Truth and toward an ever-increasing confusion created by too much data. In consequence, many can no longer recognize evil, even when it is in front of their eyes. So I am making it my personal work to restore the availability of key books written by amazing individuals, *books that offer major illumination to those who can already see, books that speak the truth to those who can already hear.*

## How You Can Help

If you admire what is being done here and wish to assist this effort:

- You can suggest titles for inclusion and discuss the content and direction of this library. Suggested titles may be old enough to be public domain or may be newer than that, but must be out of print. By Australian copyright rules we cannot offer books that are currently in print unless they are also old enough to be public domain material.
- You can help scan and prepare books. This can be particularly enjoyable when you are deeply interested in reading the title or greatly admire the book. If you already have a flatbed scanner and a PC, then this library can assist you to obtain use of effective optical character recognition software at no cost to you and provide guidance whilst you do your first book.
- You can make a contribution to help cover the costs of this site. Expenses are not large, but having a domain name, offering significant amounts of bytes for free download on the world wide web, and buying old books do cost. [Go to our financial statement.](#)

# VACCINE AND SERUM EVILS

BY

HERBERT M. SHELTON

## Vaccinia

### CHAPTER I

*Vaccinia* is an acute infectious disease caused by *vaccination*. *Vaccination* is the inoculation of child or adult, well or sick, with septic matter (pus) derived from suppurating (festering) sores on the abdomen of a previously infected cow. I think this definition is incomplete in an important respect—I should have said that it is a criminal operation.

The disease dates from about the year 1774 when an ignorant and superstitious English farmer, Benjamin Jesty, vaccinated his wife and three children with matter taken from sores on cows suffering with cow-pox," using a darning needle with which to make the incisions. Jesty believed a superstition, then prevalent among the milk-maids, that, one who had had cowpox was immune to small-pox.

Notes of this daring experiment were made by a doctor Nash who died in 1785. At his death these notes passed into the hands of Mr. Thomas Nash who was acquainted with Edward Jenner, a notorious charlatan, who is credited with having "discovered" vaccination. In 1789 Jenner inoculated his eighteen month's old son with swine-pox matter. He followed this with other inoculations of other children and the filthy practice of vaccination was definitely launched.

An English writer, Arthur Wollaston Hutton, M. A., says of Jenner's framing and qualifications: "But his professional acquirements were but slender; *his* medical degree was the outcome of no examination or scientific work, but merely of a fee of fifteen guineas paid to the University of St. Andrews; while his other and more important distinction, his Fellowship in the Royal Society, was obtained by what even Dr. Norman Moore, his latest biographer and apologist, is constrained to admit was little else than a fraud."

Thus we have a filthy practice, born out of the ignorance and superstition of the past and fathered by an ignorant imposter and fraud, palmed off on the world today as a scientific procedure. It is really remarkable, the number of instances in the history of medicine, of practices and theories now in vogue, that owe their origin to ancient customs, traditions and superstitions.

It is not known how remote was the belief among the cow hands and dairy maids of England in the immunizing potency of cow-pox; but it is thought to have come out of the practice of inoculation which was introduced into England from the East, by Lady Mary Wortley Montague, wife of the British Ambassador to the Ottoman Court, in 1717. The practice was abolished by act of Parliament in 1840, due to its evils. In 1754 the Royal College of Physicians issued the following manifesto, which reads strangely like the statements made by physicians today about vaccination:

‘The College, having been informed that false reports concerning the success of inoculation in England have been published in foreign countries, think proper to declare their sentiments in the following manner, *viz.*: That the arguments which at the commencement of this practice were urged

against it have been refuted by experience, that it is now held by the English in greater esteem, and practiced among them more extensively than ever it was before, and that the college thinks it to be highly salutary to the human race."

Despite this evident lie by this august body, the practice was not successful; it was not highly salutary; and experience did not refute the arguments used against it. It was a very damaging practice which caused an increase in small-pox in England and was finally abolished by law. Edward Jenner, following Benjamin Jesty, grafted the old inoculation practice onto the milk-maid's creed and vaccination (from vacca—cow) was born.

I mentioned that the inoculation practice was introduced from the east. The date of the origin of this superstitious practice is hidden in the darkness of pre-history. Savage and barbaric peoples, in various parts of the world, practiced inoculation. It is thought to have started in India. where so many of our superstitions originated, and spread from there to Africa and Europe.

From time immemorial the Negroes and Arabs of Nubia practiced inoculation against smallpox. The Ashantees and the Moorish and Arab tribes in Northern Africa practiced arm to arm inoculation from ancient times. Savage tribes of the Upper Congo practiced it to prevent "syphilis." The Baris of Lado inoculated themselves over the left breast. The Negroes in Senegal inoculated their children on the arms. The Moors and Pouls of Senegambia practiced inoculation against pleuro-pneumonia. A practice of this kind was in vogue in Berne, Switzerland in the 18th century.

The first record of smallpox seems to be in India, where also is the first record of inoculation, where the practice was in vogue over three thousand years ago. Dhanwantari, the Vedic father of medicine, and the earliest known Hindu physician, supposed to have lived 1500 B. C., is said to have been the first to practice inoculation and it is also stated that the Hindus employed a vaccine. For over a thousand years inoculation has been practiced in China.

The practice is so mixed up with the religious superstitions of various peoples that its origin may not be difficult for students of religious history to guess. In India, in Malaba and in other sections of the world, inoculation was mixed up with the worship of the smallpox goddess. Inoculation seems to have been nothing more than a superstitious rite designed to placate and appease the wrath of an irascible deity. People who imagined all their sufferings were sent upon them because they had offended some of their gods or goddesses originated the filthy rite to get the goddess into a good humor again.

According to a Mr. Porter, who was English Ambassador at Constantinople in 1755 (*Gentleman's Magazine*, Oct. 1755): "It is the tradition and opinion of the country that a certain angel presides over this disease. That it is to bespeak his favor and evidence their confidence that the Georgians take a small portion of variolous matter, and, by means of scarification, introduce it between the thumb and fore finger of a sound person. The operation is supposed to never miss its effect. To secure beyond all uncertainty, the good will of the angel, they hang up scarlet clothes about the bed, that being the favorite color of the celestial inhabitant they wish to propitiate."

I cannot imagine St. Paul, who refused to eat meat that had been offered up to idols, baring his arm for pus that is being offered up to the goddess of smallpox. I cannot imagine Moses, whose Kosher laws, in most of their essential particulars, are excellent, commanding the Jews to have this trefe stuff inoculated into their bodies.

*Symptoms:* Vaccinia begins after inoculation with slight *irritation* at the site of vaccination. On the third or fourth day the *eruption* appears in the form of a red papule, surrounded by a red areola. On the fifth or sixth day the papule becomes a vesicle, being filled with a watery substance or a clear substance, with a distinct central depression (umbilication). By the eighth day the vesicle is perfected and is then surrounded by a wide reddened zone of *inflammatory edema*, which is the seat of *intense itching*. By the tenth day the contents are purulent (pus) and the vesicle has become a *pustule*. The surrounding skin is now much *inflamed* and *painful*. About this time the reddened areola begins to fade and *dessication* sets in with the gradual formation of a thick brown *crust* or *scab*, which becomes detached and falls off about the twenty-first to twenty-fifth day, leaving an ugly *scar*. The scar is at first red but gradually becomes paler than the surrounding skin having a *punched-out* appearance and is *pitted*. The evolution of this pathology is accompanied with *fever* and *constitutional symptoms*, *malaise*, and *enlargement of the adjacent lymph nodes or glands*.

Notice the symptoms above described (and this description is gathered from standard medical works) and you will at once realize that we have been describing an acute disease—really the acute symptoms of septic infection. Vaccinia will be found classified in medical books as an acute infectious disease. The infectious matter is pus taken from pustules on a cow which has previously had pus from the pustules of a smallpox patient rubbed into incisions in her skin. It is a morbid product, a virus, and is not and never was "lymph from the calf". Vaccine is pus—it is the fluid product of suppuration. To vaccinate a person is to produce disease in that person. It is an effort to prevent disease by producing disease. It does not always "run true to form." The above description of the disease does not fit all cases.

*Complications and Sequelae:* *Irregular and atypical pocks* may form; several vesicles may *coalesce*, a general *pustular rash*, covering the whole arm or large parts of the body, and called *generalized vaccinia*, may develop, about the eighth to tenth day.

Abscess, sloughing, cellulitis, erysipelas, general septic infection, urticarial eruptions, syphilis, leprosy, tuberculosis, actinomycosis (big jaw), mental disease, tetanus (lock jaw), paralysis, meningitis, sleeping sickness, etc, may follow. In rare cases the pock may reappear in the same place after it is apparently healed. In some instances the abscess that may form refuses to heal. I saw one case of this kind where the abscess continued to discharge pus after fourteen years. Speaking of generalized vaccinia, Sir Wm. Osler says: "In children the disease may prove fatal." Osler quotes Ackland's arrangements of the dates on which possible eruptions and complications may be looked for as follows:

"1. During the first three days: Erythema; urticaria; vesicular and bullous eruptions; invaccinated erysipelas.

"2. After the third day and until the pock reaches maturity: Urticaria, lichen urticatus; erythema multiforme; accidental erysipelas.

"3. About the end of the first week: Generalized vaccinia; impetigo; vaccinal ulceration; glandular abscesses; septic infections, gangrene.

"4. After the involution of the pocks: In vaccinated diseases, for example syphilis."

Under the heading "Transmission of Disease by Vaccination," Osler says: "Syphilis has

undoubtedly been transmitted by vaccination." Under the heading, "Influence of Vaccination upon other Diseases," he says: "A quiescent malady may be lighted into activity by vaccination. This happens with congenital syphilis, occasionally with tuberculosis . . . At the height of the vaccination convulsions may occur and be followed by hemiplegia." (Paralysis of one side of the body.)

Norway suspended vaccination because of hoof and mouth disease being spread by the practice. In this country our Department of Agriculture traced the epidemics of foot and mouth disease in 1902, 1908 and 1914 to smallpox vaccine.

It is the medical alibi, when these evils follow vaccination, and they are far more common than the uninformed may imagine, that they are due to "carelessness" or to "secondary infections." Dr. Richard C. Cabot says: "The other thing that bothers people is the fact that vaccination sores get septic, sometimes when the vaccination is clumsily done, and sometimes when it is correctly done. We need not necessarily blame the doctor because the patient has a bad arm. In spite of all precautions, if the patient is in a bad condition, the break in the skin may become septic."

This is only a half truth. The vaccine sore is septic from the start. Vaccine is septic matter. Vaccination is deliberate and forcible septic infection. We do blame the physician, because he introduced the septic matter into the arm.

This picture of vaccination is a black one, but it is by no means the whole picture. It is almost impossible to exaggerate the evils of this filthy, superstitious practice and any physician or vaccine propagandist who asserts that vaccination is harmless is either an ignoramus or a liar. I shall make this quite clear before I am done with this subject.

"I wish we had known sooner what an awful thing vaccination is," wrote Mrs A. Kyles, in a letter to the editor of the *St. Louis Times*, of Nov 1926, after her boy had died of lockjaw following vaccination. He was vaccinated Oct. 15 and died Nov. 8. 1926; the lockjaw developing about Oct. 31. Thousands of other fond mothers have cried. "I wish we had known sooner what an awful thing vaccination is." Why be so willing to believe the sales talks of those who make money out of vaccines?

On Oct. 7, 1926, little Elmer Perry, four-years-old son of Mr. and Mrs. John Perry. of 35 Schalk St., Newark. N. J. was vaccinated by order of the Health Authorities. Fifteen days later he become sick, and on Oct. 27 they carried him to the hospital suffering with lockjaw. A few hours later he died. "They killed my boy, they killed him," cried the grief stricken father. "They have taken the sunshine from my life," wailed the frantic mother. This was but one more of thousands of such tragic scenes. Medical men kill them to save them.

The authorities in this case hastily denied all responsibility for the boy's death. They blamed the boy. It is a fair sample of the cowardly manner in which physicians always disclaim responsibility for their deeds. They are the only class of criminals of which I know who can escape the penalties for their crimes by placing the blame on their victims.

On June 20, 1926 little Geraldine Creamer, age 4, 611 John St., Peekskill, N. Y.. died of lockjaw, following vaccination during a cooked up smallpox scare—a case of ivy poisoning having been diagnosed as smallpox. The culprits in this case explained that the girl, who had been vaccinated on the leg, received the lockjaw infection from garden soil, while playing in the garden. In a full page article in the *New York Evening Graphic*, I challenged them to give me lockjaw by wounding me in

a dozen places and rubbing the soil from the garden in every wound, The Commissioner of Health made a weak reply in the local paper, but ignored my challenge. He did not want his alibi exposed by a test,

Lockjaw is a comparatively rare disease except where a vaccination epidemic rages. In his *Principles and Practice of Medicine*, Sir Wm. Osler says of tetanus as a disease transmitted by vaccination: McFarland collected 95 cases practically all American. Sixty-three occurred in 1901, in which R. W. Wilson demonstrated the tetanus bacillus. Most of these cases occurred about Philadelphia."

*The States Public Health Report*, March 20, 1925 says that several fatal cases of tetanus in vaccinated individuals has recently occurred in the United States" The *Report* for June 26, 1925, contains accounts, in its first six pages, of eleven cases of tetanus following vaccination. Boys are more susceptible than girls to post-vaccinal tetanus.

In a letter dated Aug. 9. 1929, and addressed to Senator Robt. F. Wagner, Dr. Hugh S. Cummings. Surgeon General of the U.S. Public Health Service, says the figures which his letter shows are incomplete, for deaths due to post-vaccinal tetanus are as follows:

1925---29; 1926---15; 1927---17, 1929---1. As most of these deaths occur after school opens in September, at which time the great orgy of vaccination begins, the apparent reduction in 1929 is probably very deceptive.

In the early part of 1925, while the whole of the East was in the throes of a vaccination epidemic, the *New York Evening Graphic* uncovered at least two deaths from post-vaccinal tetanus, and many other cases of vaccinal injury in Baltimore. After they published the accounts of these cases, the hospitals in Baltimore established a rigid censorship and suppressed the horrid truth about this criminal practice. But a truce with tetanus; the newspapers carry frequent reports of such deaths and I can only touch the high spots here. Everyone can know of these cases who cares to investigate.

Within recent years other troubles have been definitely traced to vaccination. I have already quoted Dr. Osler's statement that "at the height of vaccination convulsions may occur and be followed by hemiplegia." Paralysis is a more frequent result of vaccination than has heretofore been suspected. Dr. Osler says: "Cerebro-spinal meningitis has a curious predilection for soldiers." Captain Sheffield Neave, of England, says, "meningitis is a disease of soldiers and babies." During World War I there was a great mortality and invalidism among soldiers due to cerebro-spinal meningitis. Anti—vaccinationists declared it to be due to vaccination. This brought vigorous protests and loud denunciations from the devotees of pus and the smallpox goddess.

In the "Lancet" the leading British medical Journal, of September 4. 1926, is set forth accounts of seven cases of encephalo-myelitis (inflammation of the brain and spinal cord and their membranes), following vaccination in two London hospitals within recent years. Prof.. H. M. Turnbull and Prof. Jas. McIntosh who painfully and carefully investigated these cases stated in the *British Journal of Experimental Pathology*, from which the "Lancet" quotes, that: "*There can be no doubt that vaccination was a definite causal factor.*"

The *Lancet* declares that the account in the Journal: "includes summaries of clinical histories and necropsies and descriptions of the pathological changes, gross and minute in the central nervous system as well as in the vaccinated areas, regional lymphatic glands, and other tissues. Beautifully

clear drawings illustrate the histological lesions found in the spinal cord at lower levels. The evidence of aetiology (the science of cause) derived from clinical and histological manifestations is shown to be strong, and is confirmed by the results of biological experiments (experiments on animals made independently by Dr. Paul Fildes and Prof. McIntosh). Inoculation of material from the brain and spinal cord of three of these cases showed the presence of vaccinia virus, no other virus being obtained."

The suspicions of these physicians were first aroused in 1912 when a post-mortem on a recently vaccinated boy of 15 years revealed encephalo-myelitis. In December, 1922, a 9 year old girl came to necropsy with a diagnosis of tubercular meningitis. However the microscope revealed no lesions except recent vaccination scabs, glandular inflammation, in the region of vaccination and slight changes in the central nervous system. Brain and cord presented the same peculiar changes as those found in the boy ten years previously.

"Other cases," says the *Lancet*, "were now quickly recognized one in a man of 21, and 'the rest in girls of 7, 12, 15, and 22 respectively. All these patients except one girl died in the course of an acute attack of encephalo-myelitis complicated by broncho pneumonia."

As an example of how these seven cases proceeded the case of the woman 22 years of age will suffice. She was vaccinated while an infant and again on November 29, 1922. Seven days thereafter she developed a severe headache and other symptoms. On the 10th and 12th days she was drowsy and had high fever, On the 13th day she became semi-comatose and on the 14th day she died.

The *Lancet* for October 9, 1926, states that in Holland, during the period from January 1, 1924, to July 1, 1925: "35 cases, of which 15 were fatal, occurred of Encephalitis following vaccination after an interval of 10 to 30 days," had elapsed.

he *Lancet* further declares in the article previously quoted from: "Investigation of the possible path of infection gave negative results—Close examination of the vaccinal areas and regional glands yielded but little information, since the histological changes appeared to be essentially similar to those in a control case, a recently vaccinated boy killed in an accident."

This means that the ordinary and regular course of mischief pursued by vaccination may easily result in the production of these diseases. The *Lancet* further says: "Though the path of infection cannot be traced, the authors would appear to have ample justification for concluding, in view of the close resemblance between the clinical histories, the uniformity of the pathological findings, and the *absence of similar cases independent of vaccination that vaccination was a definite causal factor and no chance coincidence.*" (Italics mine).

In the year 1927 when Mr. Marky and Senator Love debated on vaccination, we exhibited on the platform, a little girl whose body was frightfully twisted, greatly emaciated and paralyzed as a result of vaccination. With the smooth sagacity of the suave politician and with resort to the ancient medical subterfuges of "secondary infection" and "intercurrent malady," Dr. Love attempted to make the audience believe the child's troubles were due to something other than vaccination. But an "intercurrent affection" is mere bunk. It never existed outside the medical mind. The *Lancet* had formerly held to the same theory with regard to such cases as cited above. Referring in its issue of August 1, 1925, to the numerous cases on the continent, it declares: "Experiment and pathological research have shown that this form of the disease is not due to the virus of Jenners

vaccine" .... "There was latent infection" and "vaccination merely hatched it out."

"Latent infection" is another subterfuge that has long served the blundering medical profession when tuberculosis, syphilis and leprosy follow vaccination. But the end of this subterfuge is drawing near. The *Lancet* has unsaid what it declared in the quotation above. It declares: "Similar cases independent of vaccination were not observed at the same time nor any other time. The authors give cogent reasons against the assumption that the post-vaccinal cases described by them and by workers abroad are merely examples of poliomyelitis, (inflammation of the gray matter of the spinal cord) or encephalitis lethargica (sleeping sickness), in which vaccination was an immaterial accident." It declares that encephalo-myelitis following vaccination always exhibits more extensive lesions than those of sleeping sickness and that "histologically, the inflammation in ordinary cases of poliomyelitis (infantile paralysis) differs conspicuously from that following vaccination." In 1923, 1924 and 1925 great efforts were made in England to have everybody vaccinated. Thousands of vaccinations were performed. There occurred a great increase in the cases of Encephalitis-Lethargica. In 1924, there were 6,296 cases of this and similar affections reported in England and Wales, with a population of 38,746,000; or 162 cases per million of population. In Liverpool, with a population of 836,000 there were reported 257 such cases; or 306 cases per million of population. Liverpool was fifty per cent better vaccinated than the average of England and Wales, and had almost 100% more Encephalitis. I presume this was due to an "intercurrent affection," or a "latent infection," or to a "secondary infection."

*The New York State Journal of Medicine*, May 15, 1926, carried two articles from foreign Journals discussing similar cases on the European continent. In one of these Carl Leiner, (Vienna) is said to have discussed encaphilitis and meningitis developing in nine to fifteen days after vaccination. He admits that in a generalized infec

tion, like generalized vaccinia, there may be intracranial complications. The article also states that Dr. Lucksch saw three cases and knew of four more and of the seven children, five died. In two autopsies, which he obtained, he was able to show beyond doubt that "death had been due to encephalitis." Bastianse, of the Hague, collected notes of 34 similar cases which occurred in Holland during 18 months of 1924-25, with a mortality of forty per cent—"deadlier if anything than ordinary epidemic encephalitis." "In addition several cases of serious meningitis have been reported."

Three cases reported, by the author of the article, in Austria, showed that "not only the encephalon but the cord and peripheral nerves may be involved, s that the affection may be spoken of broadly as a meningoencephalitis polyneuntis."

The other article is a brief of an article by Dr. W. F. Winkler, chief of the University Clime of Rostock. It says: "Quite recently isolated cases of cerebral symptoms, suggesting encephalitis, following vaccination have been reported from Holland, Czechoslovakia, and Germany and from Switzerland there have been reported two cases of serious meningitis."

The Netherlands, and other countries, for instance, France, have also reported cases of this kind. *In the Journal of the American Medical Association*, July 3, 1926, p. 45, is an article by its Berlin correspondent discussing "Nervous disturbances and Smallpox Vaccination." In it are these words: "In regions in which there is no organized vaccination of the population, general paralysis is rare. In patients with general paralysis he (Dr. Daraskwiewicz), has never seen smallpox scars, but

vaccination scars were always present." Physicians of Holland declared: "It is impossible to deny a connection between vaccination and the encephalitis which follows it." It is noted that, whereas, boys are most susceptible to post-vaccinal tetanus, girls are most susceptible to post-vaccinal encephalitis.

It would be idle to assert that all cases of local or general paralysis are due to vaccination. There are cases due to other causes also. But these other cases must not be made a basis for denying the evil influence of vaccination, as some vaccine apologists attempt.

How new is the phenomenon? Who knows? Dr. Pierre Baron, Ancien Intern of the Hospitiaux of Paris, prefaces his work on post-vaccinal encephalitis (1929), in which his conclusions are based on his own observations, with a case he found after searching through medical annals and unearthed a report of a case in the *"Archives de Medicine des Enfants,"* in 1907. Dr. Combay of the Medical Society of the Hospitals of Paris, reported a case which had occurred in his practice in 1905. Dr. Comby tells of a baby girl, in excellent health when vaccinated at four months of age, who developed convulsions on the eighth day, followed by strabismus and other troubles. She did not die but was left with an "important sequel." She no longer recognized her surroundings; almost forgot how to nurse; had a vague look; "veritable intellectual obnubilation," developed idiocy with progressive cerebral sclerosis (hardening of the brain), and nearing her eighteenth month died. Her death went into medical "statistics" as due to pneumonia—an old trick in hiding their crimes.

Dr. Baron's book discusses 255 cases of post-vaccinal encephalitis, avowedly discussed as such in medical works. His list is far from complete, for he credits the United States with only four cases, all of these before 1927.

Great Britain appointed two committees to investigate this matter—the Andrews Committee, appointed Nov. 1923, which made its report May 1925; and the Rolleston Committee appointed Feb. 1926, which made its report Feb. 1928. These two committees were composed of eminent medical men all of whom supported vaccination.

The Andrews Committee reported 62 cases of post-vaccinal encephalitis with 36 deaths—40 females and 22 males; average age 10 1/2 years. Four cases were under one year, one case fifty years, and forty-eight cases were from six to sixteen years. Government vaccine had been used in 53 of these cases, of which 30 were fatal. The Rolleston Committee reported 30 cases with 16 fatalities. Government vaccine was used in 18 of these with 8 deaths. This committee also reported the subsequent history of 10 non-fatal cases under 15 years, showing that 4 were permanently injured in some way—in mind, memory, temper, vigor, relapse.

Since vaccination was made compulsory in England and Wales one million infants have died (to 1930) of convulsions, tetanus, encephalitis, meningitis, and other nervous ailments. How many of these were due to vaccination there is now no means of knowing, but in the light of present facts, we are safe in assuming that a large proportion of them died from this cause.

In 1924 there were recorded in England and Wales 5,039 cases of encephalitis lethargica, 397 of cerebro-spinal fever, 777 acute poliomyelitis, 83 of polio-encephalitis—a total of 6,296 cases, with 2,200 deaths, 2,520 permanently injured brains (insane), and 1,575 complete recoveries. The cases in 1924 were three times as great as the yearly average for the nine preceding years. In 1922-23-24 the physicians of England and Wales cooked up a number of smallpox scares causing 288,000

revaccinations. "Extra vaccination was followed by this extra crop of sleepy sickness."

A case of post-vaccinal encephalitis was reported in Ireland in 1930 in a baby boy of 10 pounds. He was vaccinated on May 3 and became ill on May 10, "being cross and very restless with vomiting. Next day he was quiet and apathetic and on admission to the hospital his condition resembled tetanus."

The League of Nations in its Report of Aug. 27, 1928 mentions 139 cases and 41 deaths in Holland. This resulted in Holland stopping compulsory vaccination during 1928-29. The total number of vaccinations in Holland in the first half of 1928 was less than one-third of those for the first half of 1927 and the deaths from encephalitis were reduced to less than one-third.

Germany modified her compulsory vaccination law. She adopted an optional clause, such as the one England had. *The International News Service*, Feb. 27, 1930 informs us: "The change of attitude of some medical experts towards vaccination in favor of a less rigid enforcement of the law has been brought about mainly through a considerable number of post-vaccinal diseases observed in Holland and England and in sporadic cases in Germany.

"Vaccinated people developed a sort of cerebral inflammation (encephalitis post-vaccinalis) which resulted in a number of deaths and in several cases of a mild form of mental derangement."

Here is part of an item which appeared in the *Journal of the American Medical Association* for April 5, 1930: "Reisch reports that following the vaccination of 233 children aged between 5 and 10 years, several cases with encephalitic symptoms were observed. Two were especially severe and ended fatally. The necropsy revealed the changes characteristic of encephalomyelitis. Six other children also developed encephalitic symptoms from six to twelve days after the vaccination."

The Report of the Commission of Smallpox and Vaccination of the Health Organization of the League of Nations, Geneva, Aug, 27, 1928, says: "The post-vaccinal encephalitis with which we are dealing has become a problem in itself mainly in consequence of the events of the last few years in the Netherlands and England and Wales. In each of these countries the cases which have occurred have been sufficiently numerous and similar to require them to be considered collectively. Their occurrence has led to the realization that a new, or at least a previously unsuspected or unrecognized, risk attaches to the practice of vaccination."

Now what of America? Do such cases ever occur here? They do. But they are seldom reported and, it seems, are never investigated. In 1930 Julia Motley, age 12, of Irisburg, Va., died of acute infantile paralysis which "seized" her 3 weeks after she had been vaccinated. Her parents attributed her death to vaccination, whereupon the State Health authorities came to the rescue of vaccination. *The News Leader*, Richmond, March 28, 1930 says: "While the parents gave vaccination as the cause of death, Dr. J. V. Shackelford, the physician, states that the death certificate (made out by him, of course), shows that the little girl died of acute infantile paralysis, with which she was seized three weeks after she had been vaccinated."

And that's that! The physician who vaccinated the girl makes out the death certificate to shield himself and the vaccine and the matter is settled. The girl is now immune to smallpox and the smallpox goddess has been appeased. This reminds me very much of a statement contained in the memorandum, of Professor Jorge, to the Committee of the International Office of Public Hygiene (published in the monthly bulletin of that organization, for Jan. 1927) where he refers to "the

*motives which weighed with us not to noise abroad in the great press the news of this complication of a prophylactic operation hitherto looked upon (sic) as innocuous . . ."* (Italics mine.)

The press probably would not have published the news had they given it out, for, it always protects the medical profession. The press is as good about suppressing the truth as Professor Jorge and his coworkers. The mediums of intelligence (?), our newspapers, magazines, movies, churches and schools, play a vast part in the continual bunking of our more or less brainy public, while every subsidized press or scientist, professor or preacher, is entirely a political organ, at the beck and call of the exploiters. Of course, when it is all said and done, the class of nincom-poops who take any stock in the stuff dished out, do not really count. They are like the defenders of any kind of "it-works-one-day-a-week" philosophy: in that when the tide rises, they will be found to be without a bathing suit.

Surgeon Chas. Armstrong, in *Public Health Reports*, Aug. 23, 1929, says in an article on post-vaccinal encephalitis: "In so far as the age factor is concerned, the custom in this country of performing primary vaccinations at the sixth or seventh year would seem to predispose our population to the complication. Cases have, moreover, occurred. Wilson and Ford, and Fulgham and Beykirk have reported 3 cases in this country which were confirmed by pathological studies. Other possible cases based on clinical and epidemiological grounds have been reported from Connecticut, Rhode Island, New York, Maryland, Illinois, California, Washington, and the District of Columbia."

The *Weekly Bulletin* of the Dept. of Health, of New York City, Sept. 7, 1929 devotes several pages to a discussion of post-vaccinal encephalitis and says: "Although only a few cases have been reported in the United State, it seems advisable to call physicians' attention to this complication so that any cases in which persons recently vaccinated show symptoms pointing to the central nervous system can be carefully investigated."

It may be interesting enough for physicians to study symptoms pointing to the central nervous system but it will not be interesting to you or your afflicted child. Since the medical profession is determined not to abandon this filthy and deadly practice, no matter how many children are sickened, maimed and killed, it is up to you to prevent post-vaccinal encephalitis, and all the other troubles discussed in this chapter, by not permitting your child to be infected with this dirty cow pus.

It is your child. It does not belong to the state. It was not born into this world to furnish money to the medical profession. You are responsible for its care and training. If you betray your child by giving it over to this modern moloch, you deserve a worse fate than any Dante ever pictured. Parents owe certain responsibilities to their children. One of these is certainly to guard these children against attack from all foes, including the foes of their health. It is the duty of every parent to "refuse and resist" vaccination for his or her children, wherever such a parent may live and whatever the circumstances under which the vaccination is demanded. Fight, go to jail, resist in every possible manner the cow-pox bullies and their putrescent points. In Italy some years ago, when a group of physicians invaded the homes of Italian mountaineers to forcibly vaccinate the children, the mountaineers simply stripped the pus-punchers of their clothes, gave them a liberal dose of their own "medicine," and sent them scurrying home. I recommend this measure for immediate adoption in this country. Let the rascals suffer as they make others suffer. It will teach

them a much needed lesson.

In reply to an inquiry, addressed to the United States Public Health Service, by Senator Robt. F. Wagner, New York, Surgeon General Hugh S. Cumming says: "One case (of encephalitis following vaccination) in the United States was published in 1929 and two in 1927. These three cases seem to be definitely established as sequelae of vaccination. Several other cases less well established have come to our attention but need not be considered here."

That these and all figures given in this reply are not complete is evident from the closing paragraph of his letter. He says: "Although a search has been made of the literature since 1925, we cannot be sure that this is a complete list. While the Public Health Service endeavors to learn of and in many instances to investigate untoward cases suspected of being caused by biologic products, there is no legal mechanism requiring the reporting of such cases to the Public Health Service."

The Report of the Surgeon General of the U. S. Army, 1918, shows that during 1917 there were admitted to the army hospitals 19,608 men suffering from anti-typhoid inoculation and vaccinia. The Report for 1919 covering the year 1918 shows the total admissions suffering from typhoid vaccination to be 23,191, and 10,830 suffering from vaccinia. Assuming that the proportions of those suffering from these two inoculations were about the same for the two years it means that approximately 20,000 were in the army hospitals admittedly suffering from smallpox vaccination. This takes no account of those whose sufferings were attributed to something else, nor of those whose sufferings, though great, were not great enough to cause them to be sent to the hospitals.

The *Chicago Tribune*, June 6, 1926, carried the account of the death of Kasmir Jeskey, 10-year-old son of Mrs. Anna Jeskey, 1523 17th Ave., Meirose Park. The *Tribune* stated: "Blood poisoning believed to have resulted from vaccination yesterday claimed the life of Kasmir Jeskey."

The Report of *The Register General*, England, from 1875 to 1923 recorded 1,464 deaths officially admitted to have been caused by vaccination. These figures give but a small part of the picture for most such deaths are covered up. For instance, in one series of deaths caused by vaccination, Public Enquiry revealed that vaccination had been mentioned as a cause in only one case. In another series of seventeen deaths following vaccination, investigated by a medical man, who published the details, only one death had been attributed to vaccination. One British physician said: "In certificates given by us voluntarily and to which the public have access, it is scarcely to be expected that a medical man will give opinions which may tell against or reflect upon himself in any way, or which are likely to cause annoyance or injury to the survivors. In such cases he will most likely tell the truth, but not the whole truth, and assign some prominent symptom as the cause of death. As instances of cases which may tell against the medical man himself, I will mention erysipelas after vaccination and puerperal fever. A death from the first cause occurred not long ago in my practice, and although I had not vaccinated the child, yet in my desire to preserve vaccination from reproach, I omitted all mention of it from my certificate of death."

Vaccination must be saved from reproach at all costs. Who cares how many children are killed if only vaccination may be saved from dishonor. It is up to parents to put an end to this crippling and maiming of children. It is the sacred duty of all parents to protect their children from all harm. If the medical profession is not honorable enough to abandon this highly remunerative, though evil and deadly practice, it behooves parents to cut their professional throats.

Will it be urged that while vaccination is often productive of harm and death, it produces less of these than it prevents? If so, I shall show that this is not true. But, grant for a moment the truth of the assertion, it is still true that to force such a dangerous process upon one is unjustifiable. It is a danger and we each have a right to choose between two dangers. Compulsory vaccination is a crime.

*The Christian Herald*, England, July 7, 1927, carries an account of a smallpox epidemic, of a very serious type, in 15 departments (counties) in France, with a death rate of nearly 50 per cent in women and about 33 per cent in men. All of these cases were vaccinated people—many of the victims having been vaccinated as many as three times. If vaccination protects, why did it fail in these cases?

In our army during the Spanish American War and in the Philippines the soldiers had been vaccinated, not only annually, but every six weeks. Chief Surgeon Lippincott said: "Vaccination is carried on as regularly as post drill." Yet the official report shows 276 cases of smallpox in 1899 with 78 deaths; 246 cases in 1900 with 113 deaths; and 125 cases with 37 deaths in 1901; the case fatality of nearly fifty per cent, in 1900 being the highest ever recorded for this disease in the army a well vaccinated army, if ever there was one.

In 1872 Japan passed a compulsory vaccination law which was rigidly enforced. But smallpox continued to "ravage" that country. In 1885 another law was passed requiring revaccination every seven years. From 1886 to 1892 there were 25,474,370 vaccinations, revaccinations and re-re-vaccinations recorded in Japan. During these same seven years, 1886 to 1892, Japan had 156,175 cases of smallpox, with 38,979 deaths, or a case fatality of nearly twenty-five per cent which exceeds the smallpox death-rate of the pre-vaccination period when nobody was vaccinated. In a single year (1893) Japan had 41,898 cases of smallpox with 11,852 deaths.

In 1896 the Japanese Parliament passed an act, which was immediately signed by the Mikado, requiring every resident of Japan, whatever his or her station in life, to be vaccinated and revaccinated every five years. The act was rigidly enforced under severe penalties. Baron Takalira boasted in London in 1906, at the Jubilee Dinner of the Society of Medical Officers of Health of England that:

"There are no anti-vaccinationists in Japan. Every child is vaccinated before it is six months old, revaccinated when it enters school at six years and again re-vaccinated at fourteen years of age when going to the middle school, and the men are re-vaccinated before entering the army, while a further re-vaccination is enforced whenever an outbreak of smallpox occurs."

Notice the last part of this statement. If vaccination prevents smallpox, how do "outbreaks of smallpox" occur in such a thoroughly vaccinated country? There can be but one answer; namely, *Vaccination does not protect.*

This compulsory vaccination law became effective in Japan in 1896. In 1897 there were 49,946 cases of smallpox in Japan, with 2,276 deaths from this cause. In 1908 there were 10,067 cases with 5,837 deaths officially recorded. From 1889 to 1908 Japan had 171,611 cases of smallpox with 47,919 deaths. If anybody thinks that vaccination, re-vaccination, and re-re-vaccination prevents or mitigates smallpox, let him look at these figures. Here is a case fatality of nearly 30 per cent. It would be interesting to know to what extent the disease was *mitigated* by vaccination in those

47,919 fatal cases of post-vaccinal smallpox.

The *New York Medical Journal*, July 22, 1899, contains an article on "Vaccination in Italy," by Chas. Rauta, M.D., Prof. of Hygiene and Materia Medica in the University of Perugia, Italy. In this he points out that "Italy is one of the best vaccinated countries in the world, if not the best of all, and we can prove that mathematically." He says further: "For twenty years before 1885, our Nation was vaccinated in the proportion of 98.5 per cent. Notwithstanding, the epidemics of smallpox that we have had have been something so frightful that nothing before the invention of vaccination could equal them." "During 1887, we had 16,249 deaths from smallpox; in 1888, 18,110; and in 1889, 13,413."

Referring to the Italian army, in which "vaccination had been performed twice a year in the most satisfactory manner for many years past" he says that, "now we see that soldiers not protected because vaccination did not 'take' were less attacked by smallpox than those 'duly protected,' by the good results of their re-vaccination; and that the death-rate in those vaccinated with good results was greater than among those in whom the vaccination did not take."

We have forced vaccination on the Philippines since we took over the Islands. Spain had done the same thing previously. In 1905-06; 1907-08 and in 1918-19 these Islands experienced severe smallpox epidemics, the 1918-19 one being the worst of all. There were 47,887 cases of smallpox with 16,578 deaths officially reported in 1918. In Manila alone, the best vaccinated part of the Islands, there were 1,326 cases and 869 deaths, or a case mortality of 65.3 per cent. The lowest mortality, 11.4 per cent was in Mindanao, the least vaccinated portion of the islands.

The Health Service got busy and vaccinated thousands and thousands, performing about four vaccinations for each inhabitant in Manila. This was followed in 1919 with 99,300 cases of smallpox, with 47,395 deaths. In two years time in a population of less than 11,000,000 there were 147,187 cases of smallpox and 63,973 deaths.

The 1920 Report of the Philippine Health Service, (see pages 141 and 142), makes the following very brief comment: "*From the time in which smallpox was practically eradicated in the city of Manila to the year 1918 (about 9 years) in which the epidemic appeared certainly in one of its severest forms, hundreds after hundreds of thousands of people were yearly vaccinated with the most unfortunate result that the 1918 epidemic looks prima facie as a flagrant failure of the classic immunization towards future epidemics.*" (Italics mine.)

Alibies were offered for the failure, however, and the dirty work continues. No matter how great the evil, those who profit from it will not correct it—not so long as profits are still to be made therefrom.

There is an unvaccinated country in this world without smallpox. Australia is the great unvaccinated country and despite dire predictions of disaster from vaccine advocates, Australia remains free from smallpox. Three-fourths of her population have always been in the never-vaccinated class. Under the modern theory that vaccinal immunity lasts only five years (Italy vaccinated twice a year and failed) 21/2% of her population are "protected."

In the whole of Australian history less than one person a year has died of smallpox. Many of these were from the outside and were simply quarantined there. In Queensland where the official figures show 1 vaccination for every 1,500 births the state has had but one "outbreak." In 1892 a

well-vaccinated quarantine official "contracted" the disease on ship. There were no other cases. The "epidemic" had no show among an unvaccinated people. In Victoria in 21 years there were 5 deaths from smallpox and 14 deaths from vaccination—these are only those deaths that are honestly attributed to this cause. This coincides with the reports of the Register General of England covering a period of years in which there were, in England, 42 deaths from smallpox under five years of age and 157 deaths officially admitted to have been due to vaccination. There are also the official figures which show that "only 109 children (under five) in England and Wales died of smallpox in the twenty-nine years ending December, 1933, but 270 died of vaccination" in the same period in these two countries.

In England and Scotland the decline of vaccination has been accompanied by the practical disappearance of smallpox. Here are the figures, briefly England, 1871-75 percentage of vaccination 97.6%; smallpox deaths per million people, 228; 1910-20 percentage of vaccination 43.9; smallpox deaths per million people 0.4.

Scotland, 1855-1874 one of the best vaccinated countries of the world, "not an unvaccinated child in Scotland;" 9,087 children under five years old died of smallpox; 1907-1919 with about one-third of the children vaccinated only 7 deaths under five years from smallpox.

I would not go so far as to say that vaccination has never saved a single person from smallpox. It is a matter of record that thousands of the victims of this superstitious rite have been saved by the *immunizing potency of death*. But it is a fact that the official statistics of England and Wales show unmistakably that, while vaccination has killed ten times more people than smallpox, there has been a decrease in smallpox concomitant with the decrease in vaccination. The following table of official statistics from England and Wales giving the average annual percentage of births vaccinated and the number of smallpox deaths registered will prove instructive to all intelligent readers:.

Period	Percentage of births	
	Vaccinated	Smallpox deaths
1872-1881	85.5	3,708.2
1882-1891 .	82.1	923.0
1892-1901	67.9	436.5
1892-1911..	67.6	395.3
1912-1921	43.3	12.2
1922-1931	43.1	25.0
1932-1941	34.9	1.4

During the period when 85.5 percent of all babies born were vaccinated and another ten per cent of them died before they were old enough for vaccination, these two countries had an average annual number of 3,708 deaths from smallpox. When vaccination had declined until only about one-third of the infants born were vaccinated the average annual death rate in smallpox had dropped to less

than two a year. It may be appropriately asked, in the words of the *Vaccination Inquirer* (London), Feb. 1947: "How could an operation that was declining be responsible for the extermination of smallpox?"

In 1942 a case of smallpox at Swindon (Britain) resulted in the vaccination of large numbers of people. Only three cases of smallpox occurred and these all recovered, but twelve vaccinated individuals died from inflammation of the brain. In the same year near Edinburg, Scotland eight people died of smallpox (six of these had been vaccinated) while ten died from the effects of vaccination.

In Britain during the years 1939 to 1944 there were 60 cases of post-vaccinal encephalitis, 31 of whom died. This is a fatality rate of slightly more than fifty percent. During this same period, there were but 21 cases of confirmed smallpox with but three deaths. There were, in other words, in Britain during this period, three times as many cases of post-vaccinal encephalitis as of smallpox and ten times as many deaths from post-vaccinal encephalitis as from smallpox. As these figures are official and are supplied by the British medical profession itself, as they make the diagnoses and report the cases and deaths, they constitute damaging admissions by the profession that, while vaccination does not prevent smallpox, vaccinia is a much more dangerous disease than smallpox.

Since the first edition of this book was published, England, the first nation in the world to pass a compulsory vaccination law, has repealed her law and no one in the British Empire, not even in her armed forces, is forced to submit to vaccination. Since 1907 nobody among her citizens or in her armed forces was compelled to be vaccinated if he conscientiously objected to it. On the same ground parents could avoid vaccination for their children. In this land of the craven and home of the slave, a land that proudly boasts that it gained its freedom in 1776 from this same British Empire, vaccination is still compulsory in several of our states and in many cities outside these states, as well as in the armed forces of the country. Civil service employees are also compelled to submit or lose their jobs.

Smallpox is always worse where vaccination abounds. The scratch of vaccination is the "scratch of death." Yet our medically controlled Health Boards cook up fake epidemics, create panics for profit, such as the ones in Kansas City in 1921, Pittsburgh in 1924, Philadelphia, Baltimore, Washington in 1925. An effort was also made to create a panic in New York in 1925, but due to the open fight against it by the *New York Evening Graphic*, the Commissioner of Health called it off.

Surgeon J. P. Leake, says in *Public Health Reports*, Jan. 28, 1927, the weekly bulletin of the U. S. Public Health Service: "Will a nonimmunized person contract smallpox if exposed to the disease? By no means uniformly. Exposure to smallpox, especially to the milder forms, without contracting the disease frequently occurs and is no definite evidence of immunity. The number of cases of smallpox among the unprotected persons in contact with patients suffering from the disease is very much less than 100 per cent

"Though smallpox is unquestionably many times more frequent in the unvaccinated than in those who have had even a single vaccination, it is believed that neither the vaccination history nor the presence of scars should be given diagnostic weight. The unreliability of such a criterion is especially evident in virulent outbreaks of the disease

"The purpuric, uniformly fatal form of smallpox, is the most difficult to prevent by vaccination, and

cases of this form, without a true smallpox eruption, may occur in persons with a fairly good vaccination history . .

"The mildness of the form of smallpox commonest at present is one reason for endeavoring to make preventive vaccination as harmless and as mild as possible

"Cases and even fatalities, occur in every severe epidemic among persons who were vaccinated in good time but with vaccine found, too late, to be of insufficient potency; such cases and fatalities also occur among persons thought to be protected by successful vaccination performed years previously."

You are vaccinated and have smallpox. The vaccine was of "insufficient potency," although this was discovered too late—that is, after you have the smallpox. You are vaccinated and do not develop smallpox—it is assumed that the vaccine was potent. It is like the old test for mushrooms—eat them and live they are mushrooms; eat them and die, they are toad stools.

In 1926, 130 members of the Dallas (Tex.) Chamber of Commerce cancelled their trip to Mexico because vaccination was required as a precedent to entrance. Nearly a 100 medical men, at a conference in Dallas, went to Mexico, after they obtained permission to enter without being vaccinated. Think this over before you submit your child to this evil and superstitious rite.

In this country the risks from vaccination, according to official figures, which are slanted in favor of vaccination, is ten times greater than the risk of smallpox. According to the figures of the United States Public Health Service there were officially reported an average of sixteen deaths per million vaccinations in this country in the years 1925 to 1928 inclusive. These deaths cover only those officially admitted to have been due to vaccination and do not include the deaths from encephalitis, meningitis, etc., which resulted from vaccination. Up to that time twenty cases of encephalitis had been officially reported in the United States as resulting from vaccination. The Public Health service instituted an investigation to determine the extent of such cases in this country, but I have seen no report of their findings.

During the years 1927 to 1929 inclusive there were officially reported an average of 1.18 deaths per million population from smallpox in the United States. In many of these deaths, smallpox is not given as the primary cause of death. Deaths from smallpox have almost reached the vanishing point in this country, only thirteen states of which require vaccination precedent to school attendance and none of which require vaccination of infants and adults outside the armed forces.

Due to the fact that vaccination is more dangerous than smallpox, many leading medical men refrain from vaccinating their own children. An editorial in *American Medicine*, March, 1914, says:

"The growing opposition to vaccination is a matter of grave concern. This new movement . . . is not the illogical and absurd anti-vaccinationist crusade, but is the conviction on the part of very intelligent men, that it is useless to protect against an infection which they may never encounter . . . This attitude is not confined to laymen, but is taken by those leading men in the medical profession who postpone vaccination of their own kith and kin until the last moment. Two world renowned men have confessed to us that they have had their children vaccinated only in obedience to public opinion in and out of the profession . . . So we hear men saying that there is not one chance in a million of their children being infected with smallpox, but that there is far more chance of pus infection or tetanus from the vaccine .

This criminal practice will end as soon as parents develop sufficient interest in the welfare of their children. At present parents offer up their children on the altars of the smallpox goddess, because commercial ghouls demand it, and hope that the children will not be greatly injured. If a child is invalidated for life or is killed, the parents meekly accept the lying excuses of the scoundrels who maim and murder children for money, cry a little, and return to their movies and joy rides. Reader, do you know how Judas felt after he had sold his master for a few pieces of silver? If you have surrendered your child to be vaccinated and inoculated, after you learned the truth, you know how he felt. There is one great difference between you and him—Judas had decency enough to go out and hang himself.

## Commercial Medicine

### CHAPTER III

I am an incurable idealist and a chronic optimist, but I am not able to shut my eyes to what I see going on around me. I don't believe in looking always on the "bright side" of things and refusing to examine the darker side. In the human garden there flourish some mighty foul weeds, most of them cunningly disguised, that need to be looked at and destroyed.

Ours is a system of pig-ethics. I do not mean by this merely our love of wallowing, but include also our selfishness, our game of grab and stab. Modern business of all kinds is just such a game, cleverly disguised, though it often is, under a pretense of philanthropy, service and idealism. At the root of business, and supplying its motive power is a sordid commercialism that does not hesitate to trample the most sacred things of life, even life, itself, in the mud and mire to attain its selfish ends. Idealism can make little or no headway in our world until these pig-ethics are destroyed. For our pig-ethics employs idealism, not as a working principle, nor yet as a way of life, but as a cloak to mask the ulterior motives of the fraud and the cheat.

Some years ago a large drugless sanitarium, located in Battle Creek, offered stock for sale. The heads let it be known that they expected to pay dividends amounting to returns of twenty per cent, upon the investment. Think of this! A professedly humanitarian institution run on the same basis as a steel mill, or a public utilities corporation! Besides providing a fat living for the actual workers in the institution, they could pay large dividends to absentee owners. Does it not look as if the sick, with one foot in the grave, were going to keep the healthy on easy street.

This shameless exploitation of the sick and dying is carried on by every so-called school of healing on earth. Then, when a patient dies, the undertaker comes, with the same commercial motives, the same pig-ethics, and while the grief-stricken wife or husband, mother or son feels that there is nothing that he or she would not do for the beloved deceased, takes a mean advantage of this emotional state and holds them up on a fashionable burial.

In more recent years the shameless exploiters of human life and health, not content with the profits they were deriving from their abuses of the actually sick, have found ways and means to exploit the non-sick as well. As of old, this new form of exploitation hides behind a smoke-screen of altruism; the exploiters are doing it all for the good of humanity, for the public health, for the protection of our children, etc. Medical science is a form of madness from which few medical men ever recover. Backed by commercialism, this madness runs rough-shod over, the life and health of the people.

Few of us ever stop to consider the power of slogans in their effect upon the mob mind. "To Hell with Autocracy," "Down with the Kaiser," "Berlin or Bust," "Make the World safe for Democracy," "Work or fight," "Bonds or' Bums," or "Bonds or Bread Lines," "Republicans and Prosperity," "Democrats and Disaster," "Save the Children," "Buy a Tag," "There's a reason," "A Baby in every bottle," etc., *ad infinitum, ad nauseam*, are only a few of the soul stirring slogans that have helped to make this republic what it now is.

We are misled by these cheap slogans and have come to "think" in slogans and act in slogans. The man or woman who has a sincere and intense feeling towards humanity, a feeling that constitutes a religion in itself, and which is too broad and deep to exist in the narrow confines of any creed and

too strong to be devoured by the greeds of the time, must look on this spectacle with hatred and disgust.

Huge sums of money are collected to feed and clothe and care for the suffering and needy in foreign lands. What for? So that big business can sell its goods to these needy ones. It is a game of you pay for my goods and I'll ship them to the hungry in China. Organized charity is a cold, soulless business; a system of exploitation as much as any of our departments of big business.

Religion, whether called by one name or another, whether labeled *theism* or *atheism*, is profitably exploited by those who want to keep their hands soft and white. The exploiters in all fields prattle their idiotic platitudes about brotherhood and service, while going through the mechanical motions of their pet religion (?), where they curiously find sanction for it all, while shutting their eyes and ears to the solemn truth that they have humanity nailed to the cross.

I am not as much interested in the adults on this cross as I am in the children. If the adult population of this world allow themselves to be bullied and beaten, deceived and cheated, maimed and killed by the exploiters, they have no one to blame but themselves. They have but to rise in their collective might and these exploiters will desert their positions like rats leaving a sinking ship. Neither are the exploiters as much interested in the adult, except as the one who pays the bills, as they are in the children. We have just about turned our children over to them, body, mind and soul.

The physicians are moving heaven and earth to increase their, incomes, and they insist that there is a steady falling off in" patronage due to the fact that the public, in ever increasing numbers,, is turning to the other and newer schools. Costs of living are mounting, it costs more time and money to acquire a medical education and competition from without their ranks has made them desperate. They have tried, by every foul means—persecution, prosecution, slander, misrepresentation, lies—to destroy competition, but its growth has been steady despite this effort.

The profession is honeycombed with graft and corruption and thoroughly imbued with the spirit of commercialism. Commercial surgery, compulsory medicine, lying propaganda, fear and every foul means of drumming up trade are employed to increase their incomes. The *Journal of the American Medical Association*, Nov. 4, 1922, prints and address by Dr. W. S. Rankin. Sec. of the North Carolina State Board of Health in which he says:

"Last year we inoculated 70,000 persons against typhoid fever and 1,000 children between six and twelve years of age against diphtheria. The county Commissioner paid the local practitioners 25 cents for each complete inoculation, and that was \$20,000 which went to the profession last year which otherwise would not have been received. The work of the medical profession with the State Board of Health does not stop when the \$20,000 is paid. It goes on. In the dispensaries which were conducted in Union County, North Carolina, with 35,000 people, the physicians vaccinated 10,000 people in a campaign of five weeks. That was \$2,500 paid to twenty physicians—only \$125 each, but think of the effect on the business of the profession in keeping up that work. It goes on."

Does the last statement refer to the business the physician will receive from those who are made sick by vaccination? At least, he emphasizes the doctor's business and the increased income to him through state medicine,

In a paper entitled *Medical Practice and Public Health*, read before King's County (N. Y.) Medical Society, March, 16, 1926 the Hon. Louis I. Harris Dr. P. H., M. D., Commissioner of Health of the

City of New York, said: "In school work we have felt rather self-satisfied and smug. During the last eighteen years, the health department has conducted the examination of children, generally without any competition from or by the medical profession. This indicates a lack of understanding by family physicians of the glorious opportunity for service which they are missing. It is no new thing that I mention. *You have heard it time and again.* When we, in the health department send home a physical examination blank, a very simple and rudimentary one at that, and ask the parent to take the child to a physician to be examined, then, assuming that the parent follows our instructions, the physician fails to *capitalize* the opportunity." (Italics mine.)

The reader will readily see that the Board of Health is here trying to build business for the physicians, and Harris tells these physicians that what he is saying to them has been told to them time and again. But they don't seem to be so enthusiastic about it. Evidently not all physicians are as unscrupulous as the political medicos in the Boards of Health.

Mather Pfeiffenberger, M.D., president of the Illinois State Medical Society, in a speech before the annual Conference, Illinois Health Officers, Springfield, Ill., Dec. 3-4, 1926, said: "Prevention practiced to the uttermost will create more work for the physician and not diminish it, for the full time health officer will be educating his community constantly. There will be more vaccination, more immunizing, more consulting and use of the physician. His services will be increased many fold.

"I am informed that epidemic and endemic infections cause only 12 per cent of all deaths and that this percentage is declining very rapidly. Only 15 per cent of all children would ever get diphtheria, even under epidemic conditions, while 100 per cent are prospects for toxin-antitoxin. The percentage who would ever get smallpox, under present time conditions, is even less; but 100 per cent are prospects for vaccination. Scarlet fever will soon come in for its 100 per cent also, as it may for measles, judging from the reports on that disease. Typhoid fever is disappearing, due to sanitation, but vaccination should be used when the individual travels into unknown territory and countries." Thus another medical leader tells physicians how to increase their incomes by exploiting the children and non-sick adults.

Guy L. Kiefer, M.D., Commissioner of Health of Michigan, says in the *Journal of the Michigan State Medical Society*, Aug. 1928:

"In this state there are 100,000 people born annually. They are practically all susceptible to diphtheria from the moment they are born. They are highly susceptible from the age of six months until they are immunized. If these infants were all immunized, and for this service the physicians receive from \$5.00 to \$10.00 per case, the net income would be from \$500,000 to \$1,000,000. Michigan has 5,000 cases of diphtheria annually. If the physicians received for their services, exclusive of all other costs, an average of \$50.00 per case the income from this source would be \$250,000. *The increase in physicians income from diphtheria would be from one-quarter to three-quarters of a million dollars,* if we would immunize all children against this disease soon after they are six months of age, instead of waiting until they are stricken with the disease and then treating them.

"Some maternity hospitals are vaccinating with vaccine virus all babies born in their institutions. Babies under ten days old very seldom have any general reaction and the immunity usually lasts for the whole life-time of the individual. It is estimated that one-third of all the births in this state occur

in hospitals. If all hospitals were to establish this rule as part of their regular procedure, *it would mean an addition of 30,000 immunized people in the state each year and an additional income of at least \$60,000 to the physicians or hospitals.*

"When the 100,000 people born every year in Michigan are vaccinated against smallpox at birth, the income to the physicians would approximate \$200,000. The 500 cases of smallpox that occur every year, treated at an average of \$50,000 per case, bring physicians \$25,000. *Thus the physicians, by adopting the practice of vaccination at birth, would increase their income by nearly \$200,000.*

"We have taken diphtheria and smallpox as examples of the economic advantage of immunization, but the same conditions apply to other diseases and to other public health measures.

*"With the persistent educational work by the physicians and the Michigan Department of Health, these immunization programs will succeed in reducing the number of these preventable diseases and increasing the earning of the physicians who actively sponsor this modern type of practice."* (Italics mine.)

In the *Brooklyn Times*, March 21, 1929, Health Commissioner Wynne, New York, is reported to have said in an address to the Optometrical Club: "Here is the answer (to the physician's economic problem). Let them take in 20 children an hour, one hour a day, 3 days a week at a charge of \$5 for each anti-diphtheria inoculation. That will bring a revenue worth while to the doctor."

Mr. Osborne, Health Officer of East Orange, N. J., in an address reported in the *Journal of the Medical Society of New Jersey*, September, 1929, points out that the physician would receive several times more by inoculating children than by treating cases of the disease.

In an editorial, Jan. 1930, the *American Journal of Public Health*, points out in dollars and cents how much money physicians would receive from inoculating babies and adds: "There are of course four times as many preschool children as babies, and ten times as many school children. The opportunity for increasing practice by carrying on immunization among the preschool and school populations in the physician's clientele offers an almost unlimited field."

Dr. Vander Veer says, in a discussion reported in the *Journal of Medical Society of New Jersey*, February, 1930: "Dr. Wynne, Health Officer of New York City - gave me a clue to the subject of economics in which he said that we doctors had been going along the same old lines and had not created any new business, so I finally evolved this as a slogan in New York State: We cannot get away from the lay organizations, therefore we will lie down with them and ask them to provide means for carrying on the health programs and we are going to benefit ultimately from the periodic health examinations by an increased income. As a concrete example, take a town of 3,000, if only 200 come to us for examination at \$3.00 each that would be \$600 that would accrue to be divided among the doctors; if 100 came for examination at \$25.00 each there would be \$2,500 to be divided.

Vander Veer gives more statistics about the fees they would receive and then says: "That is the thing that strikes home to our doctors in New York State." Thus the reader will see that I am right in saying that physicians are using the various lay organizations, Parent-Teacher Associations, etc., to build business for them. The Red Cross has long been a tool of these men.

In the early part of 1930 one of my readers sent me a news clipping from the *Cincinnati Times Star*,

headed *Health Work Aids Doctors*. It said "thousands are sent to physicians as result." The whole article is as follows: "Are 'socialized' health agencies preventative and curative, bringing lean times and reducing the number of physicians and other private health workers?"

"Do public clinics, public hospitals and public health departments affect the income of physicians, surgeons and dentists?"

"These questions, presented Saturday to Health Director William H. Peters, brought the declaration that in his judgment the only effect was that practitioners had to modify their activities.

"Dr. Peters pointed out that when Cincinnati purified its water there was an almost entire elimination of thousands of cases of typhoid fever and other water-carried diseases, treatment of which gave an immense revenue to physicians, nurses and others.

"On the other hand Dr. Peters said the medical inspection of schools by publicly employed district physicians aided private practice. Thus the inspectors discover defects in children, which are reported to parents and thousands then take their children to the family physician or a specialist.

"The public drives for the immunization of children against diphtheria brought a great revenue to private practitioners. There were about 35,000 children treated and of this number about fifty-four per cent by private practitioners, or about 19,000. At \$5 a treatment the revenue would be \$95,000. Annually there are about 7,500 children to be so treated. This work gives a revenue far in excess of what the treatment of the disease yielded, said Dr. Peters.

"So he said, the agitation for annual general physical examination in his opinion, has resulted in thousands of persons resorting to their physicians, surgeons and dentists to be examined.

"Dr. Peters said it was requisite for physicians and other health practitioners to 'reconcile themselves to the age.' He said more should go in for preventative medicine and all should recognize how public health activity stimulated persons to mind their physical and mental condition and thus helped the private practitioner.

"Dr. Peters said it was true there were some physicians in this community who complained of the 'inroads' that 'socialized' medicine was making on their incomes and that there were perhaps some who actually were affected. He declared that there were compensations that in the mass more than canceled such instances."

This accounts for the growing interest on the part of physicians and health boards and serum and vaccine makers and dentists, in so-called *health education*. They are bent on increasing the business of the physicians and dentists and the sale of more vaccines and serums.

Inspecting the school children increases the work of physicians. It is done the country over. Not merely the school child, but the pre-school child now comes in for this form of exploitation. Here in San Antonio, for instance, The Parent-Teacher Association sponsors medical examinations of the pre-school child. Tonsil operations and other operations, eye-glasses, serums and vaccines and other forms of vandalism and poisoning follow these examinations and the physicians of the city are enriched in purse.

Medical inspection of school children is a means of boosting business for physicians. The inspected children are brow-beaten abused, bullied and "ragged" to have their tonsils removed and toxin

anti-toxin inoculated into them, by the incompetents who are placed on the school board. These physicians do nothing useful; but do much to injure the physical and mental health of children, besides greatly annoying parents and teachers. But the practice will not end until parents kill it.

A few years ago, the Bronx County Medical Society, through one of its Bulletins, expressed its resentment against the extent to which the toxin-antitoxin campaign had been pushed in New York City. Health Commissioner Wynne, in the *Weekly Bulletin* of New York City Department of Health, of July 19, replied that "The plan followed by the Dept. of Health should evoke nothing but commendation. It provides a simple, inexpensive, effective and entirely ethical method whereby the general practitioner can secure additional practice." Such is the altruism of these great public spirited physicians on the Boards of Hell (th).

Wm. A. Rohlf, M.D., President-elect of the Iowa State Medical Society, said in his official address at a meeting of that body a few years ago: "Allow me to quote from a letter received from Dr. Steel-smith: 'For the five year period preceding the State Department's Education toward diphtheria immunization, namely, the five years preceding 1923, there occurred in Iowa more than three thousand cases of diphtheria each year. Many of these cases were not seen by any medical practitioner, but the average revenue as computed by statisticians signifies that the physicians of the state of Iowa received in cash approximately \$20 per case for the treatment and cure of diphtheria for each of the five years preceding that state-wide anti-diphtheria program. This would result in physicians of the state receiving approximately \$60,000 for such work each year incidental to diphtheria.

"Now in comparison to that, allow me to suggest that there are approximately 44,000 children born each year in Iowa. For the sake of figures, we will say that the average price for immunization would be \$3 per child. If the physicians would interest themselves in preventative medicine and see to it that every child is treated before he is a year of age they would see clearly that from such practice the physicians of the state of Iowa would receive \$132,000 a year, or twice as much as you and I received years ago for treatment of cases."

Rohlf adds: "There is still much to do in the way of bringing about ideal conditions through vaccination and immunization, The role of local infection has opened up other avenues for our activities.

We should be personally interested, and, as physicians, assist in the examination and' treatment of school children."

These men plan ways of doubling their incomes and come to the public with the plea that they are sincerely interested in the health and welfare of our children and that they put over their income-increasing programs for the health of our babies and for the welfare of the school children. They are as cold-blooded as any class of criminals on the whole earth. Indeed, I know of no other class of criminals who live by crippling, maiming and killing babies and children.

It is asserted that there are 1,454 formally organized state and local tuberculosis associations in the United States. The organizations affiliated with the National Tuberculosis Association spent in 1928 at least \$6,196,376.98, the major portion of which was secured through the sale of Christmas seals. All of this begging by Tuberculosis Associations is to create jobs for physicians. Their work is admitted to have no influence on tuberculosis.

A Red Cross officer said to the victims of the Mississippi Flood, as reported in the *Savannah (Ga.) News*, June, 14, 1927: "From now on your meal tickets are canceled until you can show your vaccination scar." A similar order was given by this same disreputable organization in a later flood in New England.

People give freely of their money and goods to help the victims of calamities, and the medically controlled Red Cross uses that money to buy serums and vaccines, and pay incompetent physicians and uses the plight of the victims as a club, to make them submit to medication they do not need and do not want. The Red Cross can never have a penny of the author's money and I shall use all of my influence to prevent others from donating to its system of graft.

The so-called "mental hygiene" movement, which seeks to become a regular part of our public schools, is a commercial move, composed of the usual surgical and serum methods. The movement has among its heads several men who have been convicted of crimes in their care of the insane and men who are notorious for their extreme cruelties to animals in vivisection work. This is an extremely dangerous move and should not be permitted to touch the children of this country, who are surely suffering enough, at the hands of the medical moloch.

Of the same unholy and commercial character as the tuberculosis society and the Red Cross are the Foundation for Infantile Paralysis, the Society for the Prevention and Control of Cancer, the Damon Runyon Cancer Fund, the Arthritis Society, the Heart Association, the society to aid Crippled Children and similar panhandling organizations that regularly rattle the cup on the streets and in the press of the country. These various organizations collect many millions of dollars yearly from a generous and well meaning, but uninformed people, spend the major portion of the money in fat salaries and overhead or administration costs, spending much of it to pay for cruel and futile experiments on animals (research) and precious little of it for the purposes for which it is given. Like all organized charity, these things are soulless rackets.

## **PREFACE**

THE remarkable spread of leprosy during the past thirty years has excited much public attention. Having for many years been interested in the public health, I have been prompted to investigate the causation of this increase. My attention was first called to the growing ravages of leprosy during a visit to Asia Minor in the year 1884, and to one source of infection the extent of which is as yet imperfectly realised (I mean vaccination), by the perusal of the evidence brought before the Select Parliamentary Committee on Vaccination of 1871 by Dr. R. Hall Bakewell. In 1888-89, during a visit to the Virgin, Leeward, and Windward Islands, British Guiana, and Venezuela, I took the opportunity of investigating this serious allegation. In the course of my inquiries I obtained particulars of a number of cases of leprosy due to vaccination. These were furnished by highly respectable colonists, but were often coupled with the request that no names were to be published, either of the suffering families or of those who communicated the details. This reluctance, which is entitled to every consideration was due to the fear of exposing relatives, and damaging their social - standing in the community where they reside. Although the danger of communicating leprosy by vaccination has been admitted in official and other reports, I have on many occasions found it extremely difficult to get at the facts, copies of important documents having been repeatedly refused by officials both at home and abroad, and notably in the French Colonial possessions.

It is perhaps too much to expect that those who regard Jenner as one of the greatest of human benefactors will display much energy in bringing to light such cases as I have referred to.

Some of the obstacles in the way of independent investigation of this subject are alluded to in a communication, read before the Royal Vaccination Commission, from Dr. Charles E. Taylor, Secretary to the Legislative Council, Island of St. Thomas, Danish West Indies. Dr. Taylor states that during his 20 years residence at St. Thomas, D.W.I., he has known many cases of the communication of leprosy by means of the vaccinator's lancet, but he adds that the sufferers or their families invariably decline to have the fact disclosed. One resident physician in Honolulu, who told me how the disease had been disseminated by means of vaccination in Hawaii, strongly deprecated making the details known, as he would not answer for the consequences. Despite these difficulties, however, a good many cases are recorded by medical men of high standing and wide experience, and some of them are here presented to the reader. Cases have come under my cognizance in which the reports of district surgeons, showing the spread of terrible diseases by means of vaccination, have been officially suppressed.

In June, 1890, I appeared as a witness before the Royal Commission on Vaccination, and gave evidence as to the results of my inquiries up to that date. This evidence will be found in the third report of the proceedings, pages 154-161.

At that time my investigations had been mainly limited to the West Indies, British Guiana, and Venezuela. Since then I have extended my - personal investigations to Norway, California, the Sandwich Islands, Ceylon, Egypt, New Zealand, Cape Colony and Natal in South Africa, and most of the Colonies in Australia, and have put myself in communication with superintendents of leper asylums and leading dermatologists in all other countries where leprosy is endemic. The results of these inquiries, with other collateral evidence bearing on the subject, are briefly set forth in this volume. While the *pros* and *cons* of the theories of heredity, fish-eating, malaria, and contagion, have been frequently dealt with by wellknown writers, this is, I believe, the first attempt made to bring together a body of evidence regarding the inoculability of leprosy and the evidence of its communicability by means of vaccination.

To physicians, superintendents of leper hospitals librarians of public institutions in Norway, Hawaii, the West Indies, the United States, and other countries, I am indebted for valuable official and other documents bearing on the subject, which I have freely quoted.

The *British Medical Journal* of July 3, 1886, p. 24, in a leading article on the investigations into the causation of leprosy, undertaken by Dr. Edward Arning in Hawaii at the instance of the Hawaiian Government, observes that this inquiry "is likely to have results of great importance both to science and to practical medicine." This prophecy is indeed likely to be fulfilled, but hardly in the manner anticipated by the writer. Amongst the most important of Dr. Arning's discoveries is that vaccination has been instrumental in widely disseminating leprosy amongst the helpless and confiding population of that beautiful Archipelago.

Leprosy is one of the most loathsome as it is one of the most tissue-destructive diseases known, and when going through the wards of leper hospitals I have frequently noticed with pain the poor afflicted creatures bending their heads and covering their hands to conceal from strangers the sight of their distorted features and mutilated limbs. It is hardly possible to conceive, much less describe, the depth of human misery caused by the spread of this hideous and destructive disease; but some idea of its nature may be gathered from the following description of leprosy, which may well excite the sympathy of the philanthropist. It will be found in a recent work on leprosy by Dr. Thin, pp. 99-100. It is translated from Leloir, an eminent French authority on leprosy, and refers to the tubercular variety of the disease. "If the patient," he remarks, "does not die of some internal disorder or special complication, the unhappy leper becomes a terrible object to look on. The deformed leonine face is covered with tubercles, ulcers, cicatrices, and crusts. His sunken, disfigured nose is reduced to a stump. His respiration is wheezing and difficult; a sanious, stinking fluid, which thickens into crusts, pours from his nostrils. The nasal mucous membrane is completely covered with ulcerations. A part of the cartilaginous and bony framework is carious. The mouth, throat, and larynx are mutilated, deformed, and covered, with ulcerated tubercles. The patient breathes with the greatest difficulty. He is threatened with frequent fits of suffocation, which interrupt his sleep. He has lost his voice, his eyes are destroyed, and not only his sight but his sense of smell and taste have completely gone. Of the five senses hearing alone is usually preserved. In consequence of the great alterations in the skin of the limbs, which are covered with ulcerated tubercles, crusts, and cicatrices, the pachydermic state of skin which gives the limbs the appearance of elephantiasis, and of the lesions of the peripheral nerves which are present at this time, and by which occasionally the symptoms of nerve leprosy are combined with those of tubercular leprosy, the sense of touch is abolished. The patient suffers excruciating pains in the limbs, and even in the face, whilst the ravages of

the disease in his legs render walking difficult and even impossible. From the hypertrophied inguinal and cervical glands pus flows abundantly from fistulous openings. In certain cases the abdomen is increased in size on account of the liver, spleen, and mesenteric glands being involved. With these visceral lesions the appetite is irregular or lost. There are pains in the stomach, diarrhoea, bronchial pulmonary lesions, intermittent febrile attacks, and a hectic state. The peculiar smell, recalling that of the dissecting room, mixed with the odour of goose's feathers, or of a fresh corpse, is indicated, but badly described, by the authors of the Middle Ages, who compared it to that of a male goat."

Dr. John D. Hillis, formerly of British Guiana, says of the anaesthetic variety, that it is "known also as *leuke* of the Greeks, *baras* of the Arabians, joint-evil of the West Indies, *sunbahirii* of the East Indies, and dry leprosy, in contradistinction to the other form also known as humid leprosy; is characterised by a diseased condition of the nerves, and a peculiar eruption, the primary characteristic of which is loss of sensation, or anaesthesia; hence its name. After a time ulcerations form, a sort of dry gangrene of the limbs sets in, and joints drop off, and finally there is more or less paralysis. It would take a large volume to describe the signs or symptoms of leprosy, but the preceding account is -sufficient to show what an alarming affection we have to deal with."

In Mrs. Hayes' little book, "My Leper Friends," is a chapter on leprosy, by Surgeon-Major G. G. Maclaren, M.D., in which the writer observes, pp. 123-4: Acting on the strength of my own convictions as to the transmissibility and communicability of leprosy, I established the Dehra Dun Asylum on the principle already noted (the presence of a *bacillus* in the blood), and it has answered so far admirably; all its inmates living as happily as they can under their unfortunate conditions, and ending their existence contentedly! I have had, of course, ample opportunity of studying the nature of the disease, and its effects on the different organs of the body, and in many examinations I have made, *post-mortem*, I can testify that not a single organ in the whole body is exempt from the attacks and inroads of this dire and, loathsome malady. It invades the brain, spinal nerves, the eyes, tongue, and throat, the lungs, the liver, and other digestive organs. In addition, as is generally known, it maims and deforms the external parts of the body in a manner too revolting to describe. It is painful to witness the amount of deplorable suffering some of these creatures endure. True it is that many feel but little pain—one of the forms of the disease producing *anaesthesia*, or insensibility of the parts affected; but this is the case in a few only. The majority suffer in variously painful degrees, according to the organ or part implicated, and it is a mistake to think that their sufferings are little. Many, in the earlier forms of the ailment, lose their sense of sight, smell, and taste, and when their lungs or throat is attacked (a common form), their agonies are dreadfully distressing and painful to behold. The inroads of the disease are slow and gradual, which makes it all the more trying, and the painful and lingering death to which most are doomed is a condition that one dreads to dwell on." It was the terrible nature of the disease that fostered the growth of the sumajh in India, the leper being accompanied to the grave with tom toms, where, in a sitting posture, he was buried alive.

In the West Indies, in British Guiana, in the Sandwich Islands, and in South Africa, when cases of invaccinated diseases were related to me, I was urged by the sufferers and by their friends to make known their grievances to English people and to the Imperial Parliament, and, if possible, to bring public opinion to bear upon a mistaken and mischievous system which, without doing the least good, has been the cause of such terrible and far-reaching consequences. Acting upon these entreaties, and upon others contained in communications from various leprosy countries, I have presented to the public through the press, and to members of Parliament, such facts on this subject as came before my notice up to July, 1890. I now offer to the public further evidence and testimonies, on behalf especially of the afflicted population of our Crown Colonies and Dependencies, whose grievances have been so long and so flagrantly disregarded. Every attempt to introduce compulsory vaccination in the populous Island of Barbados, British West Indies, has been thwarted, owing to the widespread belief that leprosy and syphilis are communicated by the vaccine virus. In St. Thomas, Danish West Indies, and in Georgetown and other parts of British Guiana, it has, for similar reasons, been found practically impossible to enforce the vaccination law, and, in spite of severe compulsory enactments, entire districts remain unvaccinated by reason of this special danger; while, in the Sandwich Islands, a bill for the repeal of the vaccination law was introduced in the Legislative Assembly, July, 1890, by J. Kalua Kahookano, representative from North Kohala, Island of Hawaii.

Under the head of "The Legislature," the *Daily Commercial Advertiser*, Honolulu, November 9, 1892, publishes the recent report of the Sanitary Committee, as follows:—

"Hon. J. S. WALKER, President of the Legislature.

"SIR,—The Sanitary Committee report consideration of Bills Nos. 9, 13 and 25, and Petitions Nos. 33, 152, and 206, relative to Vaccination.

"The object of all these bills and petitions is to repeal the law compelling parents and guardians to cause the children in their charge to be vaccinated.

"The complaints against the present system were very pronounced, and the repeal of the law making vaccination compulsory was strongly urged."

The committee met the Board of Health and conferred with them upon the subject, and under date of June 25th, addressed a communication to the Board, in which is the following:—

"Hawaiian Legislature, June 25, 1892.

"DAVID DAYTON, Esq., President, Board of Health. "SIR,—An effort is being made in the Legislature to repeal or amend the law relating to vaccination; the object being to leave vaccination optional with parents and individuals.

"The chief objection raised against the present compulsory system appears to be the belief of some that leprosy, and other diseases, have been propagated by means of vaccination.

"It is said that some of the vaccinating officers are careless in the use of vaccinating instruments, operating first upon one person and then another without cleansing the instrument; and that there is distrust of the quality of virus used, in some cases serious inflammation and illness following the inoculation.

"The petitions and proposed measures relating to the subject have been referred to the Sanitary Committee, and the committee desire the views of the Board upon the subject.....

"Any suggestions the Board may be pleased to make will be appreciated.

Respectfully submitted,

WILLIAM O. SMITH, *Chairman Sanitary Committee*

The official report of the Honolulu Board of Health for 1892 shows that resistance to vaccination is spreading in many districts in these islands, and at the same time there is observed a sensible diminution in the number of lepers. In New Zealand, prosecutions for non-vaccination have for some time been abandoned. In the South African Colonies of Natal and Cape Colony the vaccination laws are enforced only during outbreaks of small-pox, and vaccination is everywhere regarded with mistrust. In the Transvaal and Orange Free State vaccination is entirely optional. In England there are about one hundred towns and poor law unions where the vaccination laws are a dead letter. In several of the Swiss cantons compulsory vaccination has been tried and abolished, and in no canton is there any penalty for non-vaccination. An attempt was made to pass a federal vaccination law in 1881, and was defeated in a Referendum by 253,968 votes against 67,820. In the Australasian Colony of Tasmania the compulsory law has been suspended by reason of its deleterious effects on the health of the people. In the Colonies of New South Wales. and Queensland, Australia, the people have successfully resisted every attempt to impose the hotly-disputed Jennerian dogma upon them. Dr. Manning, the medical adviser to the Government of New South Wales, reports that in 1891 vaccination was only partially carried out in thirteen Country districts. In ninety-two districts, no vaccinations were reported. The extent of the mischief already experienced will never be known, but sufficient is already admitted to arrest the attention of all who are seriously concerned for the public health and for the well-being of the community. Is it not, therefore, the duty of every medical practitioner to personally inquire into the matter for himself; and no longer to shelter himself behind the orthodox belief in the benign character of vaccination? For nearly a century Jenner's prescription has been tried and found wanting. Each of the reports of the Royal Commission on Vaccination already published establishes the failure, mischievous effects, and injustice of the compulsory infliction of an artificial disease upon healthy people, while some of the most distinguished names in the profession have testified to its being the certain vehicle for the dissemination of leprosy. These names include Sir Erasmus Wilson (sometimes called the father of dermatologists), Dr. John D. Hillis, Dr. Liveing, Sir Ranald Martin, Professor W. T. Gairdner, Dr. Tilbury Fox, Dr. Gavin Milroy; Dr. R. Hall Bakewell, formerly Physician to the Leper Asylum, Trinidad; Dr. A. S. Black, of Trinidad; Dr. Edward Arning; Dr. Walter M. Gibson, late President of the Honolulu Board of Health; Professor H. G. Piffard, New York; Dr. A. M. Brown, London; Dr. Frances Hoggan, Dr. Blanc, Professor of Dermatology, University of New Orleans; Dr. Bechtinger, of Rio; Professor Montgomery, of California; Dr. Sidney Bourne Swift, late Medical Director, Leper Settlement, Molokai, Hawaii; Dr. P. Hellat, St. Petersburg; Professeur Henri Leloir, Lille; Dr. Mouritz; Surgeon Brunt; Dr. John Freeland, Government Medical Officer, Antigua; Dr. S. P. Impey, Superintendent, Leper Asylum, Robben Island, Cape Colony; and many others.

On the subject of leprosy there are no higher authorities; therefore, considering that the evidence adduced in the following pages is founded upon an accumulation of facts and the testimony of eminent dermatologists, it is hardly open to doubt the intimate relation between the spread of leprosy and the increase of vaccination. May I not, then, urge that a concerted effort—by petitioning Parliaments, Legislative Councils, and other governing bodies, and by the powerful aid of the press—should be made to abolish the compulsory infliction of a disease fraught with such disastrous and far-reaching consequences to the human family? Until vaccination is disestablished and discontinued, and sanitary amelioration substituted for the inoculative experiments, drastic drug medication, and nerve stretching, practised in various leper asylums, I am convinced that this dreaded disease will march onward with accelerated destructive force, and its ultimate extirpation will be rendered well nigh impossible.

No one can be more conscious of the shortcomings of this treatise than the author; but if the painful facts herein disclosed should induce some able and independent pathologist to continue these researches in the interest of the public and regardless of consequences, the author will feel that his efforts have not been altogether fruitless.

REDE HALL, BURSTOW, BY HORLEY, SURREY, *January 2<sup>nd</sup>, 1893*

## CHAPTER 1: THE INCREASE IN LEPROSY

THE awakening of public interest in the leprosy question is due to the accumulation of evidence from nearly all parts of the world, showing that this fearful scourge, for reasons which are now being investigated, has greatly increased, and is still increasing.

At a dinner given at the Hotel Metropole, January, 1890, in aid of the National Leprosy Fund, at which the Prince of Wales presided, Sir Andrew Clark said that, "after making due allowances for the scare and disturbance which had been occasioned, there remained the obvious and indisputable fact that leprosy was a real question. He could produce overwhelming testimony of this fact, and the evidence was conclusive not only that leprosy did exist in larger measure in recent years, but that new germ centres were springing up in various quarters, and the old centres were widening. Before England and the civilised world there was looming a condition of affairs which might by growth threaten civilisation"

Sir Morell Mackenzie, in an article entitled "The Dreadful Revival of Leprosy," which appeared in the *Nineteenth Century* for December, 1889, after referring to, its diffusion in Europe and America, says :—" In almost every other quarter of the globe leprosy is rife at present, and wherever it exists it seems to be slowly but surely extending its ravages. It is impossible to estimate even approximately the total number of lepers now dying by inches throughout the world, but it is certain they must be counted by millions. It cannot be comforting to the pride of England — 'the august Mother of Nations' — to reflect that a very large portion of these wretched sufferers is to be found amongst her own subjects."

Dr. A. M. Brown, in his comments on "Leprosy in its Contagio-Syphilitic and Vaccinal Aspects," says, page 6 :—"From all that we can learn, leprosy is now alarmingly on the increase, particularly in some of our Colonial dependencies, and the fact has been causing much anxiety in later years."

The actual number of lepers throughout the world is far more than is stated in official statistics; for all authorities agree that there are cases, in some countries very numerous, which have never been reported, "the patient and his friends" (in the words of Dr. Charles W. Allen) "knowing with what horror the public regards the disease, naturally shunning publicity, and the physician humanely guarding his secret." From personal inquiries in many countries, particularly in Ceylon, Hawaii, South Africa, British Guiana, Venezuela, and the West Indies, I can fully confirm Dr. Allen's conclusion. In Hawaii leper-hunting is a dangerous business, as many of these unfortunate beings consider death preferable to the best managed lazaretto, where, besides loss of freedom and the companionship of fond relatives, they are obliged to dwell amidst the most repulsive and saddening surroundings. While on a visit to the General Hospital, Honolulu, my attention was called to a police officer, Kealioha Mani, who was lying severely, and probably fatally, wounded by a leper whom he was endeavouring to arrest. A short time ago a party of lepers armed themselves with five new Winchester rifles, and fired upon the police sent in pursuit. The love of freedom burns as brightly in these afflicted people as in their more fortunate countrymen.

In an article on leprosy in Hawaii, in the *Occidental Medical Times*, April, 1889, Dr. F. B. Sutliff, Sacramento, California, who spent four years as Government Physician at Wailuku, on the island of Maui, observes:—"The work of segregation has at no time been faithfully carried out. A large number of milder cases are not disturbed at all, and a good many others have been permitted to go free because of some influence, political or otherwise, that they may have possessed. . . . It is seldom that a leper desires to go away from his home to an hospital, and the study of his life after he knows himself to be a leper is how to live with his friends and keep out of the way of those whose business it is to know all about him. I never before saw a place where the people can hide so easily. . . . They are quick to take alarm, and a look from the Government Physician, an inquiry concerning their name, is enough to cause them to change their residence at once." Dr. Sutliff says he has every reason to believe that there are at least four lepers not reported for every one that is.\*

\*Dr. L. Roussel, Government Medical Officer, in his report dated 30th October, 1888, Port Mathurin, Mauritius, says, "It is seldom lepers come to the Dispensary for treatment. Most of them hide themselves in the mountains, and do not like to move about in public."

Dr. H. S. Orme, President of the State Board of Health, California, in his instructive treatise on Leprosy, says, "I have no doubt that the practice of *secreting lepers is general throughout the world*, wherever the disease prevails; and it is not difficult, in an early stage, for lepers to evade the authorities and go about their usual business."

The largest number of lepers segregated in any one year was in 1873, when the numbers received at the leper settlement, Molokai, according to the official reports, was 487, for several years previous to which arm-to-arm vaccination has been prosecuted with great and unparalleled energy. The destructive results of this misguided policy are everywhere manifest for those who are not too prejudiced to see what is plainly before them.

## RUSSIA.

Leprosy is reported to be increasing in Russia with startling rapidity. A St. Petersburg correspondent of the London *Standard*, January 18, 1891, says:—"The Town Council of Riga, aroused by the rapid spread of leprosy in the neighbourhood, has voted a sum of nearly six thousand roubles for the establishment of an asylum and hospital, which it is hoped will be ready to be opened in August. In 1887, Dr. Bergmann discovered thirty-seven cases in the town, and twenty-one in the environs. There are now over one hundred. In and around Dorpat, where the disease has attained alarming proportions, the late Professor Von Wahl strongly urged the necessity of leper colonies, such a system of compulsory isolation being in conformity with the provisions of the existing, but unenforced, law of Livonia."

As to the prevalence of "prokaza," or leprosy, in Russia, Dr. O. Petersen and Professor Munch have collected eight hundred and seventeen cases, which, however, must be considered far below the actual number. The former observer has noted forty-three cases from the records of the St. Petersburg hospitals in the last sixteen years.

Archdeacon Wright in his instructive work, "Leprosy an Imperial Danger," says that leprosy has increased so much of late in the Russian provinces of the Baltic that last year a "Society for Combating Leprosy" was founded at Dorpat, under the presidency of Professor Wahl, but otherwise composed entirely of lay members. Dr. Hellat, of Dorpat, travelled through the district, and showed that the reports made to the Government were very imperfect. In Livonia, where official statistics reported 108 cases, he found 276. In Courland he discovered 76 cases, and in Esthonia, 26. From other sources I hear that in the neighbourhood of Dorpat the lepers number as many as 17 per 100, and another report says that in certain districts 10 per cent of the population are affected. From more recent

reports (May, 1892) I learn that the Town Council of Riga, alarmed by the ever-increasing proportions attained by the fearful malady, have just erected a leper hospital, at a cost of 60,000 roubles, which already contains 98 authenticated cases. The British Consul at Riga, in his report for 1891, says:—" It is difficult to discover the victims of this dire malady, as their relations and friends hide them from the sanitary inspectors."

In a communication from Dr. P. Hellat to Dr. P. S. Abraham on "Leprosy in the Baltic Provinces," dated 10th October, 1891, St. Petersburg, Mochovaia, 44, the writer says :—" My observations, continued for three consecutive years, gave the astonishing result that leprosy was very widely spread in the Baltic provinces; certainly considerably more than we formerly thought ourselves justified in believing. The number of lepers in certain districts is as much as 2 per cent, of the population. Furthermore, the investigation showed that the disease was steadily on the increase."—*Journal of the Leprosy Investigation Committee, No. 4, December, 1891, pg. 7.*

#### BOKHARA.

The London *Daily Chronicle* of October 29th, 1891, contains the following (per Reuter's telegram):--

"St. Petersburg, October 27th.—The Emir of Bokhara has had several consultations of late with Russian medical men concerning the prevalence of leprosy in his dominions, and especially in the north-eastern quarter of the town of Bokhara, called Gonzari Pissiane, which spot may indeed be considered as the hotbed of leprosy in Central Asia. The lepers are allowed to lead an independent life in this quarter; they are allowed to contract marriages, and no supervision, whether medical or otherwise, is exercised over them. It has resulted from the advice tendered him at these consultations that the Emir has decided upon the foundation of a special hospital for the lepers, at which they will be treated by specialists in their disease."

#### NORWAY.

The present writer has been under the impression that leprosy had diminished in Norway, the diminution being generally admitted to be due to the segregation of lepers in the hospitals at Troudhjem, Molde, and Bergen; but Dr. Vandyke Carter, who has closely investigated the subject, considers that :—" So far from leprosy in Norway showing a natural tendency to subside, there is ample evidence of a present activity equal to that displayed by the disease twenty-five years ago."—*British Medical Journal, Nov. 28th, 1885, p. 1048.*

#### ICELAND.

The Rev. W. T. M'Cornick, in a lecture delivered at Brighton, says:—" Before leaving, I was enabled to gain some details respecting leprosy, which is of a bad kind, and indigenous to the country, from Mr. Patterson, the British Consul, to whom Archdeacon Wright had written for information when publishing his book on this disease, and also Dr. Scheving. I learned here that in the year 1800 there were 150 cases out of a population of 50,000, but that now, out of a population of 72,000, the numbers had decreased to 25. I must state, however, that on further inquiries from an older and more experienced doctor near Laugardalir (Gudmunson, I think, was the name) I was told that the disease was increasing, and that one in every thousand was a sufferer from this hideous complaint. There are no hospitals for leprosy in Iceland, though Dr. Henderson, who travelled through the island in 1814, states that there were four then in existence.—*Journal of the Leprosy Investigation Committee, No. 4, December, 1891, pp. 69, 70.*

#### THE WEST INDIES.

During my visits to the Virgin Islands, the Leeward and Windward Islands, and British Guiana, 1888-89, I had opportunity of conversing with intelligent residents, including governors, medical practitioners, superintendents of leper hospitals, magistrates, prison chaplains, editors of newspapers; and the general opinion was that leprosy was largely on the increase. In some islands, such as Jamaica, St. Kitts, and Trinidad, there are leper communities, which are gradually increasing; and appeals are frequently made in the Colonial Press for their segregation in hospitals.

In a dispatch to the Colonial Secretary, Dr. R. Hall Bakewell, Vaccinator-General, Trinidad, said :—" The very great increase of leprosy in this island, particularly among persons in easy circumstances, is the subject of general remark, and although we have no statistical evidence of the fact, yet it seems admitted on all hands."—*Page 7, Compendium of "Extracts from Report and Returns" in the "Royal Gazette," Trinidad, March 1st, 1871.*

On the 22nd January, 1889, I visited the lazaretto at Barbados, a crowded institution. A new ward was then in course of construction, to accommodate 32 more patients; but the applications from the single parish of St. Michael were greater than the extra beds to be provided. I may mention that the island of Barbados comprises thirteen parishes, with a total population of about 180,000 of which St. Michael's contains about a sixth; and it is estimated that 150 to 200 more beds ought to be provided under the present system of voluntary segregation. If the segregation, which includes only the leprosy poor and pauper class, were compulsory, as some now demand, the alarming spread of the disease, which is endemic in all the islands, would be yet more fully exhibited.

The *Official Gazette*, Barbados, May 5th, 1890, p. 524, says :—"With a daily average of 104 there have been 16 admissions, 3 discharges, and 4 deaths. The Poor Law Inspector, Mr. C. Hutson, says:—"Considering the overcrowding of the wards, it is, I think, wonderful that we keep so clean."

The census returns from Barbados show that while the population during the ten years, 1871 - 81, had only augmented 6 per cent., the

lepers had multiplied 25 per cent.

According to the Surgeon - General's report of hospitals in Trinidad for 1880, No. 41, p. 38, the number of patients in the Leper Asylum on June 30, 1880, was 124.

The report for 1888, *Trinidad Royal Gazette*, p. 1116, says :—" The admissions have been limited to the amount of accommodation, and there were fourteen lepers at the end of the year in the Colonial hospitals, awaiting vacancies for admission to the Asylum."

The Asylum (at Mucurapo, Port of Spain, Trinidad), which I visited in February, 1889, contained at that time 180 patients (under the medical superintendence of Dr. Bevan Rake), who are admirably cared for by the French Dominican Sisters. Every bed is occupied. In his report to the Surgeon-General for 1887, Dr. Rake says:—" The new infirmary at the Asylum was opened in August last, and was quickly filled, 19 patients being admitted on the 19th, and nine more on the 25th. Since then it has been constantly full."

I was informed by the lady superintendent that a new ward was, to be built at once, to contain 30 additional beds. There were then, she said, fourteen lepers in the Colonial (Port of Spain) Hospital awaiting vacancies for admission to the asylum.

In the last report on leprosy in Trinidad, dated March 1st, 1891, by Dr. W. V. M. Koch, acting Medical Superintendent, it is stated (p. 65) that the new infirmary ward, which was finished at the end of 1889, and occupied early in 1890, has been full all the year round. There was a rush of patients to fill it.

The *Trinidad Leprosy Report* for 1890 (p. 31) says that during the year a new ward containing 30 beds has been opened. The asylum contains 210 inmates, "every bed being occupied."

Dr. Bevan Rake says :—" There is, I fear, little doubt that the disease is increasing in Trinidad as in other tropical countries."—*Papers on Leprosy, Trinidad, p. 34.*

In an article entitled the "Dreadful Revival of Leprosy," in the *San Fernando Gazette*, Isle of Trinidad, 22nd February, 1890, the writer says :—" It may not be generally known that as far back as 1805 there were only three lepers in Trinidad; eight years later there were 73 out of a population of 32,000. Twelve years later, when an attempt was made to segregate them upon a small adjacent island, it was found that these afflicted persons had increased so rapidly that the scheme had to be abandoned. In 1878 there were 860 out of a population of 120,000, and later statistics show that the number of lepers was increasing four times as rapidly as the population." The writer arraigns the authorities for their supineness, and urgently calls upon them to take the necessary steps to arrest the progress of this fearful disease.

In a leading article in the *St. Christopher Gazette* (of St. Kitts), the 17th May, 1889, entitled, "The most pressing question in the Colony," the writer quotes Dr. Boon's last quarterly report, which (he says) "clearly and forcibly showed the Government the enormous increase in our leper population during the last six years." Dr. Boon, who held the position of Acting Government Analyser of Vital Statistics, says :—" There is one subject to which I would specially call the attention of the Government, and that is the necessity of legislation with regard to lepers. I am satisfied that the disease is increasing rapidly in this island (St. Kitts)."

In the *Lazaretto*, No. 11, a paper published in the West Indies, the editor asserts that a careful census carried out by medical officers would demonstrate that St. Kitts and Nevis contain more lepers per thousand of the population than any other British possession. He also considers that the disease has increased in Antigua, and there are no fewer than 300 lepers in the Leeward Islands. The *Lazaretto*, No. 21, for April 20th, 1891, estimates the number of lepers in the two islands of St. Kitts and Nevis at 200. In 1871 Dr. Munro discovered, by a personal census, that there were 72 lepers at St. Kitts, a number which has now increased to 135, or at the rate of 90 per cent. in twenty years. To accommodate the growing community of lepers, a large lazaretto has recently been built at Sandy Point, ten miles from Basse Terre, St. Kitts, which already contains eighty inmates. The *British Medical Journal* for June 20th, 1891, says that a petition was lately sent to the Governor, Sir W. F. Haynes-Smith, with the request that it might be sent to the Queen. Amongst other things it states that leprosy is most prevalent in these islands, and that the number of persons afflicted with it is rapidly increasing.

The London *Daily Graphic* for August 15th, 1891, publishes the following:—" Sir Morell Mackenzie writes—' I beg to enclose a copy of a letter recently received by Dr. Munro, formerly medical officer of St. Kitts, West Indies, which shows conclusively that leprosy is extending in that colony.'

"The letter from Dr. Boon, referred to by Sir Morell, runs as follows :—"In your time I believe there were about fifty lepers in St. Kitts; at present there are 120 known lepers, and I think there are a good many more that are kept hidden from the medical men. I am at present getting as complete a list as possible of the lepers here. One thing is very noticeable in Nevis, namely, the way in which the leprosy spreads in each neighbourhood from single cases. It is not easily traced in St. Kitts, as the people there do not own land like the Nevis people, and are consequently more nomadic. One thing has struck me very much, and that is the number of shop-keepers that have contracted the disease.'

"We have also received a letter from Dr. Boon, who says :—"The enclosed photograph of mendicant lepers, subscribed for by a few gentlemen of this island for the purpose of forwarding to you for publication in the *Daily Graphic*, will give a slight idea of the risks by contagion to which the population of this colony is daily subjected. Leprosy has attacked people of all conditions in the West Indies. A few years ago a newly-appointed inspector of police enforced the local 'Vagrant Act,' and prevented the squads of mendicant

lepers from perambulating the town, begging from house to house, and importuning people in the streets. Through the action of the then President of the Island, the inspector was forbidden by the Governor to interfere in any way with these lepers. The fact that a member of the former gentleman's family was afflicted with this disease may have had something to do with his action in the matter. We count among our lepers (other than mendicants) bakers, butchers, salesmen in groceries and provision shops, fishermen, printers, editors, circulating - library keepers, shopkeepers, planters, agricultural labourers, and carpenters. In a lodging-house kept by a leper, members of the Bar lodged when on circuit, and slept on the same bed used by the leper when he had no lodgers. Another leper kept a creche, and tended about twenty infants at a time in his room for over ten years."

In the report of the Blue Book of St. Vincent, British West Indies, 1890, the Acting Administrator observes:—"It is greatly feared that leprosy, which has already proved so great a scourge to some of our colonial possessions, will become a serious trouble in St. Vincent.

Our administrator of the islands, Mr. Irwin C. Maling, reports to the Colonial Office that the disease, though perhaps slowly, is surely on the increase; and though the average of patients treated at the Leper Asylum is only 15, there are many more at large. No law exists to compel those afflicted with the disease to go to the asylum and receive proper medical attention, but the subject is one which will receive the early attention of the Local Government."

On June 2nd, 1890, Mr. Gourley, M.P., called the attention of the Under-Secretary of State for the Colonies to the considerable population of lepers in the West Indies, which, he said, was daily increasing. Sir W. F. Haynes Smith, of the Leeward Islands, who informed me in 1889 that leprosy was seriously on the increase in the West Indies, issued an address to the Federal Council in April, 1891, in which he quotes the opinion of the medical profession that the disease has greatly increased, and that the only satisfactory explanation of the spread of the disease is that under certain conditions it is communicable and contagious. Sir William Robinson, Governor of Trinidad, writing to the Secretary of State from Government House, 9th May, 1889, says :—" After fifteen years' residence in the West Indies, I can fully corroborate Dr. Rake's statement that leprosy is on the increase, and I am not surprised at it."—*Papers on Leprosy, Trinidad, p. 35.*

In the report of the superintending medical officer of Jamaica, dated July, 1891, it is stated that 420 cases of leprosy in the island are known to the district medical officers, but it is conjectured that a good many living in unfrequented districts are not reported, and that some cases in families of the better classes are not to be found in these returns. The actual number is estimated at 450, or one in 1378 of the present population of the island, reckoned at 620,000. This is a decidedly low estimate. A new ward, capable of accommodating forty beds, has just been made ready for the reception of these unfortunate patients.

A communication from Dr. N. Lacary, physician to the lepers in the French Antilles, dated Basse-Terre, Guadeloupe, January 16th, 1892, and sent by request of the chief of the Sanitary Department at Guadeloupe, in reply to an inquiry for the statistics in respect to leprosy, states that it is impossible to report with accuracy the number of persons known to be more or less subject to leprosy throughout the various districts. The island of La Disirade, in which the Lazar-house is situated, may afford some exact figures, and contains one hundred diseased (leprosy) persons from Guadeloupe and its dependencies, and from Martinique. The lepers frequently secrete themselves, and it is impossible to give the exact figures of those who are at large. It is recognised throughout the islands that leprosy is on the increase.

#### JAPAN.

As my communications to the Authorities in Japan requesting information remain unanswered, I have but few details to report. Leprosy has existed from time Immemorial in this country, and there is an old established leper settlement at the hot springs at Kusatsu, to the north of Tokio. Leprosy is reported to be increasing considerably, and according to a communication in the *Liverpool Mercury*, September 22nd, 1891, three leper hospital asylums have been established in Tokio during the past ten years. One of these hospitals, treated in 6 years 4249 cases, of which 3852 were those of Japanese patients. The *Pioneer* (Allahabad) of September 9th, 1891, reports that leprosy has spread in the Japanese villages to an alarming extent during the past few years. In one village near Toimachi, in the Gifu Ken province, every inhabitant is a leper. The Japanese Government is taking steps to look after their afflicted people.

Mr Hamilton Cartwright, in *The Lancet* for May 25th, 1889, states that vaccination was made compulsory in the seventh year of Meiji (1874). It will be noted therefore that the rapid diffusion of leprosy took place shortly after the introduction of the compulsory law, and has kept pace with the progress of vaccination in this community. Dr. Tamanoto, of the Imperial Japanese Navy, says that when leprosy occurs in a family it is the custom to conceal it.

The Rev. Father Vigroux, Missionary Apostolic, in an article in the *Catholic Review*, which also appears in the *Tablet*, May 14th, 1892, says that 44 patients have already been admitted to the Leper Hospital at Gotemba, Japan, founded by the late Father Testevuide. There is accommodation for as many as eighty.

#### THE GRECIAN ARCHIPELAGO, TURKEY, AND SYRIA.

In the Island of Samos, with a population of 42,000, there are 43 registered lepers, and many others unregistered; to segregate whom the Prince of Samos has built an asylum. In Constantinople Dr. Dujardin Beaumetz estimates that there are three thousand, some of them at large, and others in the hospitals.

In Syria lepers abound, and the most repulsive examples I ever saw were in the lazaretto at Damascus, where the supervision and accommodation was of the most wretched description. For their comforts they depended on the alms given by casual visitors. In Palestine I noticed many lepers, in the most hideous state of deformity, begging. This was in 1884. The Constantinople correspondent of the *Times* writes (July 31st, 1889):—" Dr. Zambaco has made a special study of leprosy, and purposes to present to the congress 'the result of his assiduous labours on the subject. Like some others, Dr. Zambaco has come to the conviction that leprosy is non-contagious. He offers practical arguments and proofs in support of his opinion. There are in Constantinople alone upwards of 250 lepers, all of whom Dr. Zambaco has personally attended. Of these, 25 individuals only are isolated in a special locality at Scutari—the remainder are to be seen in the streets, and in contact, without any restraint, with the rest of the population. In the Islands of the Archipelago there are at Crete 8000 lepers; and at Rhodes, Cyprus, Mytilene, Tenedos, and other smaller islands, they are also numerous, and excepting in the larger ones, free in their movements. Dr. Zambaco has prepared to lay before the congress, and for publication, a most interesting work upon the subject of leprosy in the Levant, containing numerous illustrations, portraits, and biographies of patients living and dead, with accounts of curious cases of cure, non-contagion, and remarkable facts observed by him, which cannot fail to attract attention of scientific men with respect to the disease which has come so prominently before the public."—*Times*, August 6, 1889, p. 10.

#### EGYPT

During my visit to Egypt in February, 1891, endeavoured to ascertain the facts as regards leprosy in that country. I called at several hospitals, and conferred with a number of officials connected with Government, but without obtaining much information. Dr. Selim Zeidan, the medical director of the General Hospital at Luxor, informed me that during the past few months five lepers had presented themselves for admission, but he was obliged to refuse them. This was due not to want of space, but to lack of funds. In a communication to Dr Abraham, dated 4th Nov-1890, and published in the *Journal of the Leprosy Investigation Committee*, Dr Greene, of Cairo, director of the Sanitary Department, Egypt, states that the total number of cases reported is 2058, "but this does not by any means represent the whole of the lepers in Egypt, for many districts, where I have reason to suppose some exist, sent in blank returns."

#### THE UNITED STATES

Dr. Blanc, of New Orleans, Clinical Lecturer Dermatology at the Medical College, and Dermatologist to the New Hospitals, has had opportunities for observation. In a report to Louisiana Board of Health, May, 1889, he refers to 42 known cases of leprosy at New Orleans, twelve cases at La Fourcho, and six cases (these doubtful), at St. Martinsville; and in only a very small number could he discover the causation in heredity.

In the *New York Medical Journal*, July 13th, 1889, Dr. R. W. Taylor states that during the past fifteen years he has almost constantly seen from one to three lepers in the crowded wards of the hospitals on Blackwell's Island, New York. Other authorities give similar reports of the New York hospitals.

Dr. Charles W. Allen, Dermatologist, in his article on "Leprosy" in the *New York Medical Journal*, March 24th, 1888, calculates the number of lepers in the United States at 150. "Unquestionably," says Dr. Prince A. Morrow, "is leprosy gaining ground in this country, and the disease prevails over more than a fourth of the habitable globe."

#### THE SANDWICH ISLANDS

In the Sandwich Islands leprosy is allowed to be the chief of the destructive forces which are gradually depopulating the native race of this beautiful archipelago. Its rapid increase is by far the most urgent and anxious question of the hour, and successive Medical Officers of Health seem powerless to cope with it.

In a leading article on "The Nature of Leprosy" *The Lancet*, July 30th, 1881, p. 186, says :—" The great Importance of the subject of the nature and mode of extension of leprosy is evident from the steady increase in certain countries into which it has been introduced. In the Sandwich Islands, for instance, the disease was unknown forty years ago, and now a tenth part of the inhabitants are lepers. In Honolulu, at one time quite free, there are not less than two hundred and fifty cases; and in the United States the number is steadily increasing."

According to the latest returns handed to me (October, 1890) by Mr. Potter, the Secretary to the Board of Health, Honolulu, 1154 lepers were segregated in Molokai, to which must be added thirty, sent from the Hospital of Suspects at Kalihi to Molokai on the 30th of the same month, while there are probably several hundred secreted by relatives in the various islands. On 31st March, 1888, the number officially reported to be at large in the various islands amounted to 644, but, efforts have been made during the past three years to capture these afflicted creatures and segregate them at Molokai.

The experiment of segregation, coupled as it is with enforced separation of relatives and friends amongst a race who are very gregarious and affectionate, is attended with great difficulties, and found impossible to carry out successfully.

A medical practitioner informed me that well-to-do lepers were not interfered with, and he gave me the names of several at large who occupied prominent positions in the island; and he observed that it was not intended to disturb them, notwithstanding the law which imposes segregation upon all lepers regardless of distinction.

Dr. J. H. Kimiball, of Honolulu, ex-President of the Board of Health, in his official report for 1890, observes:---"Some very bad and

unmistakable cases are in hiding in the fastnesses of the mountains or high up in the valleys, fed and secreted by their friends, while some mild cases change their place of residence so often as to baffle the efforts of the officers of the law for their arrest."

Dr. Edward Arning reported that he had visited the remotest gulches and corners of the islands, where few white men penetrate, and had found lepers at large, including some bad cases. He suggests that it may be just-as well to leave these poor wretched creatures where they are, as they are more out of the way there than at Kakuako or Kaluapapa. Dr. John S. M'Grew, in a communication to General James de Comby, the United States Resident Minister, says :—" From political and other influences with officials of the Government, many lepers are permitted (in Hawaii) to go at large without being questioned—really dangerous cases of leprosy."

Dr. White, surgeon to the United States Navy, who visited the islands in 1882, in a report to his Government estimates the concealed cases at 3 per cent. of the population.

Mr. Dayton, the President of the Board of Health, Honolulu (an old resident in the island, who has had a wide experience in the service of the public health), was kind enough to furnish me with facts relating to the introduction, establishment, and increase of leprosy throughout Hawaii, and the steps taken to deal with it by isolation, medical treatment, and hygiene, and also with copies of official reports published by the Board of Health.

According to the same writer on the subject, leprosy was discovered in the island in 1840, but Mr. D. Meyer, Agent for the Honolulu Board of Health, in the appendix to the report presented to the Legislative Assembly of Honolulu in 1886, says it was in 1859 or 1860 that he saw the first case of the disease. That 1840 was the date of its introduction is the opinion of Dr. W. B. Emerson, ex-President of the Board Health, Honolulu, who, in his report published in *Practitioner* of April, 1890, attributes the introduction of the disease to a case reported by the Rev. D.D Baldwin, M.D., to the Minister of the Interior, May 26th, 1864. In 1863 Dr. Baldwin received reports from the deacons of his church at Lahaina with the names of 60 people who were believed to be affected with this disease. In a very few years leprosy increased to an enormous extent, and in 1868 Dr. Hutchinson reported 274 cases.

Dr. Emerson says : —" Leprosy has made fearful strides. It is not necessary to trace with precision the curve that represents the increase of leprosy in these islands from that date to the present time. It is a fearful story, and should teach us that leprosy is undoubtedly communicable."

In his report dated Molokai, March 3 1st, 1888, Mr. Meyer says :—" That the spread of this scourge in these islands has been truly fearful is known to every one here, and that it could not have spread as it has done unless it were communicable, appears to me to admit of no doubt."

To account for the appalling spread of this terrible scourge of humanity within such a short period of time, the evidence points conclusively to one prominent cause--vaccination. There is no evidence to show that leprosy increased in Hawaii until after the introduction and dissemination of the vaccine virus.

Small-pox was introduced from San Francisco in the year 1868. In that year a general vaccination took place, spring lancets being used, which the President of the Board of Health (Mr. David Dayton) informed me were difficult, if not impossible, to disinfect—the operation causing irreparable mischief. The synchronicity of the spread of leprosy with general vaccination is a matter beyond discussion, and this terrible disease soon afterwards obtained such a foothold amongst the Hawaiians that the Government made a first attempt to control it by means of segregation. Another outbreak of small-pox occurred in 1873, and yet another in 1881, both followed by general arm-to-arm vaccination and a rapid and alarming development of leprosy, as may be seen in successive reports of the Board of Health. In 1886 the then President of the Board of Health recorded his conviction, in an official report, to the effect that "to judge by the number of cases in proportion to the population, the disease (leprosy) appears to be more virulent and malignant in the Hawaiian Archipelago than elsewhere on the globe." Leprosy became then, and is now, the most pressing question in these islands.

#### VISIT TO KALIHI

In October, 1890, I started from Honolulu in company with Mr. C. B. Reynolds, the Chief Executive Officer of the Board of Health, to visit Kalihi, a place three miles away, where persons supposed to be tainted with leprosy were incarcerated. It consists of cottages, dispensary and recreation ground, the whole surrounded by a double wall to prevent escape, and is a dreary place of abode. There were 74 patients in the establishment, most of whom exhibited distinct traces of this loathsome malady, including some unusually bad cases. Within this enclosure was a comfortably furnished cottage which Sister Rose Gertrude had recently occupied, but had now vacated. Both the cottage and the dispensary of which this lady had the charge were in a bad state of disorder, and presented a painful contrast to rooms in the care of the Dominican Sisters at Trinidad, and in other Asylums I have visited.

The day after my visit, 31 of the inmates were taken from the Suspect Hospital to Honolulu, and thence from the King's Wharf were forcibly deported to the living grave at Molokai, from whence no traveller returns. The scene was of the most painful description. These afflicted creatures were torn from their friends and relatives, husbands from wives, children from their parents, frantic with uncontrollable grief. Lovers were separated, their lips trembling with emotion, amidst unutterable wailings, wringing of hands in the agony of despair, and heart-breaking experiences which I shall never forget, and which the pen of a Balzac, or Victor Hugo, could only adequately describe. Mr. Reynolds said that at times it seemed more than he could stand and he did all that was possible to mitigate their sufferings. He told me that in ten days time there would be another contingent to undergo the same sorrowful experience. This goes on year after year, and will probably continue until medical men themselves turn their attention from experimental treatment to

preventive measures, and themselves petition Governments to suppress the mistaken system of vaccination, which, it is admitted by the highest authorities, has been a prolific source of this terrible evil.

#### THE MAURITIUS.

In the Mauritius, according to Dr. Seizor, in the *Progres Medical*, 1886, translated by Dr. P. Abraham, and quoted in his work on leprosy, lepers of all races, including Europeans, can be counted by hundreds without difficulty.

#### MADAGASCAR.

The Paris correspondent of the *Daily News* telegraphs, August 12th, 1890, that the French Catholic missions in Madagascar have taken up the lepers there, and have built a lazar-house at Ilafy, near Antananarivo. A second hospital for 200 lepers, who are not so invalided, is at Abohivaraka, where they work in the rice marshes.

#### CANADA

In May, 1885, the lazaretto at Tracadie, New Brunswick, contained 21 lepers, and others were known to be at large.

The *British Medical Journal*, July 18th, 1891, says:—"Owing to the increase of leprosy in British Columbia, the inhabitants recently memorialised the Canadian Government, asking that some steps should be taken to check the progress of the evil. It has accordingly been resolved to found a leper colony in D'Arcy's Island, which lies off the coast. As soon as the arrangements are complete all the lepers in the colony (most of whom are Chinamen) will be transferred to this island. Dr. F. H. Smith, the superintendent of the well-known lazaretto at Tracadie, New Brunswick, has been requested to investigate the alleged increase of leprosy in the towns of the Pacific slope of the Dominion"

#### UNITED STATES OF COLOMBIA.

In the consular report to the Foreign Office, sent by Mr T H Wheeler, the British Consul at Bogota, dated September 26th, 1890, I find various facts confirming previous reports as to the rapid development of this disease Referring to the number of lepers Mr Wheeler says—"A well-known physician of Bogota, the editor of the *Medical Review* of the city, has stated, in an article lately published in that review, that one tenth part of the inhabitants of Santander and Boyaca are lepers. As the population of these two departments is about 1,000,000 this estimate would give 100,000 lepers in that portion of Colombia alone. The medical officer of the principal lazaretto of the country, who has travelled extensively in the departments of Santander and Boyacá, with a special view of studying the question of leprosy, estimates that they contain some 30,000 lepers I believe that both these estimates are very much exaggerated, but the number of lepers must be very great in those two departments, as I am aware from my own observations in travelling through them in 1883. Some months ago the Government of Santander endeavoured to obtain from the various municipal authorities official returns of the number of lepers in the department. Reports were sent in from about half the municipalities, giving notice of 1804 lepers, of whom 388 were living in the lazaretto of the department. But no returns were sent in from the districts known to be most infected with leprosy, and in any case, no satisfactory census upon such a subject can possibly be taken in Colombia. On the merest suspicion that anything of the sort was intended, every leper, who could possibly do so, would at once disappear, and remain hidden until it was all over, for fear of being dragged to a lazaretto and separated from his family and friends, and amongst the population, in general, there is no such dread of the disease as would lead them to give information against any lepers who might be concealed in their neighbourhood.

"Santander and Boyaca are the departments most infected with leprosy; next to these are Cundinamarca, Tolima, and Antioquia, in the order named, but a certain number of cases are to be found in all the other departments. In Cundinamarca, where the number is more easily estimated than in any other part of the country, there are said to be over 4000 cases of leprosy, and in Antioquia from 800 to 1000. In the whole Republic, there cannot, I believe, be less than 20,000 cases, and there are probably many more.

"Leprosy is most common in Colombia amongst the lowest classes, whose homes and mode of life render them liable to exposure to cold and damp, but it is by no means confined to the poorer class, as many people of wealth and position have been attacked by it."

There are two lazarettos in Colombia, one in Agua de Dios, where one consul found 520 lepers in July, 1890, the other at Contratacion, department of Santander, with 390 of these afflicted people. A Bill has recently been laid before Congress asking for an appropriation of £10,000 for the construction of a new lazaretto, but the disease has reached such proportions as to render such a sum quite inadequate to cope with the ravages of the disease. Mr. Wheeler says that it seems inevitable that leprosy should continue to spread more and more throughout the country, unless some great effort is made to arrest its progress. He remarks that in Antioquia not a single case of leprosy was known thirty years ago. Since then, the disease has spread in all directions, and the number in this town is now said to be over 800. I may add that, during the interval, vaccination has been introduced in all the Republics of South America with the usual sinister results.

Mr. Edward H. Hicks, M.R.C.S., practitioner in Bogota, says :—"The local authorities have called attention to the alarming spread of leprosy in the Republic of Colombia, South America. In districts in which the disease was formerly unknown it has appeared to spread with great rapidity. As to articles of diet, the greater number of cases occur where fish cannot be obtained in these places."—*British Medical Journal*, Nov. 8th, 1890.

The *New York Herald*, of April 10th, 1892, says:—"Reports about the spread of leprosy in the Republic of Colombia are of the most alarming character, and should receive the very serious consideration of the United States health authorities. Every district in Colombia is said to be more or less infected."

In the last annual report of the Consul-General of the United States of Colombia (1890-1) it is observed that the question of the great increase of leprosy has become a very grave one for the country. Prior to the year 1860, the numbers of the afflicted were comparatively stationary; but since that time the increase has been much more rapid, and the disease has spread to districts in which it was previously unknown, almost the whole of Colombia being now infected. Children are frequently seen in the lazarettos in a leprosy state, and the mortality is exceedingly high.

Dr. Alzevedo Lima, chief medical officer, Hospital, Rio de Janeiro, says :—" Has leprosy increased in Brazil within the last years? It seems that it has, but we have no exact data to guarantee a positive affirmation. However that may be, it is no exaggeration to say that in Rio de Janeiro there are more than 300 lepers disseminated throughout the city"—*Journal of the Leprosy Investigation Committee, December, 1891, p 25*

The last census of Brazil returned the number of lepers at 5000, but Dr. Lutz, a lepra specialist, estimates it at 10,000 and upwards.

#### BRITISH GUIANA.

In January, 1889, I visited Demerara and Essequibo, British Guiana, but owing to the state of my health I was unable to visit the leper asylums at Mahaica and Gorchum. During my sojourn, the newspaper at Berbice (where the leper asylum is located) published a statement to the effect that, for want of accommodation in the asylum, lepers in the worst stages of the malady had been seen in the streets and bye-ways. In the report of the Surgeon-General of British Guiana for 1887, Dr. C. F. Castor says:—" I hear on all hands that leprosy is spreading — not only here, but all over the world—very considerably." And in a communication to the secretary of the Leprosy Committee, dated 21 November, 1891 (*Journal No. 4, p. 36*), Dr. observes:—" No one for a moment doubts that leprosy is spreading' I was able to obtain only one report of a date earlier than 1887, that of the Surgeon-General for 1879, in which Dr Manguet says—" Many children are brought to me in the incipient stages the disease (leprosy)," and added that the disease was spreading.

When going over the Colonial Hospital, Georgetown, British Guiana, Dr Ferguson spoke to me of the serious increase of leprosy in the colony, and said that they were obliged at the general hospital to receive lepers for whom there was no room at the asylum He pointed out to me five lepers in one ward with other patients Dr J L Veendam, a Government medical officer, who had at that time resided sixteen years in the colony, and has medical charge of four sugar estates, assured me that leprosy was much more widely disseminated in the colony than was generally supposed, and that this was the case amongst all classes of society. Referring to a ball which was to be given that evening to Governor Haynes Smith, he added, 'I know lepers who will mix with the gay throng this evening" Some time ago Dr Veendam medically examined all the labourers on the four estates under his charge, 250 in number, and found about 50 who were more or less tainted with leprosy.

One of the highest authorities, Dr. John D. Hillis, F.R.C.S., for ten years Medical Superintendent of the principal lazaretto in British Guiana, and who has devoted twenty years to the consideration of this important subject, says :—"To the most casual observer (in British Guiana) the increase must be apparent, irrespective of the fact that the asylums cannot be enlarged fast enough to contain the cases that are compelled, by want or the rapid advance of the fell disease, to seek admission and relief within their walls, whilst hundreds of others, it is well known, do not enter but remain outside to mingle with others or contaminate their surroundings. Not only is leprosy on the increase in the colony, but the increase has been greatest in the last decade. . . . Wherever the writer goes, he meets with lepers walking about among, and, mixing with, the people, may be in the church, or in shops. As the signs and symptoms of the disease become better known, they will perhaps be more easily recognised by the uninitiated."

In 1858, the lepers were located at the present Institution at the mouth of the Mahaica Creek, which not very long ago was enlarged to meet the ever increasing demand on its accommodation.

On 31st. December, 1859, there were only 105 inmates at the Asylum. In 1869, they had increased to 300, and the place could hold no more. Increased space was provided, and in 1889 we find, from the official reports, over 500 of these unfortunate inmates. Around this leper asylum, outside its boundaries, there are large numbers of lepers not included in these returns. Dr. Hillis states that, while the increase of the population in twenty years, between 1858 and 1878, was only 45 per cent., the increase of lepers was 160 per cent.

Dr. George Thin, in his work on "Leprosy, p. (1891), says :—" It is estimated that in 1890 the number of lepers in British Guiana was 1000, or one in 250 of the population." My own inquiries led to suppose the number was larger, as from all that could gather there were about 500 lepers in the asylums at Mahaica and Gorchum, and I saw several at the General Hospital, Georgetown, for whom there was no room in the asylum. These were by old medical residents to be far less than the total leper population.

#### DUTCH GUIANA

Leprosy is making rapid progress in Dutch Guiana, and a devoted priest, who has been attending to the temporal and spiritual wants of the people, was reported in October, 1890, to be dying of the disease. Bishop Walfingh, of Surinam, has recently visited Holland, with the object of raising funds to build a suitable hospital, and has met with a successful response to his benevolent appeal.

#### VENEZUELA.

In the early part of 1889 I visited Venezuela, pursuing my inquiries as to leprosy in Carracas, Bolivar, and other places. From all the information I could obtain I learned that its spread, though less conspicuous than in the adjoining territory of British Guiana, is making constant advance. From a report made by the United States Consul at Maracaibo, Mr. F. H. Plumacher, the American Government in 1890, I find that leprosy began to be felt as early as 1828, and in 1841 the National Government, under the direction of President Bolivar, purchased an island four miles east of Maracaibo, and erected an hospital and dwelling-houses for the accommodation of these afflicted people. In 1876 the cases had assumed alarming numbers, so as to seriously to endanger the sanitary future of the State. In the year 1890 there were 125 patients in the lazaretto, and many more at large in the city and environs, and all attempt to segregate them is thwarted by the efforts made by friends for their concealment. This increase here, as in other countries, is coincident with the extension of the practice of vaccination.

#### AUSTRALASIA.

Leprosy is not unknown in the Australasian colonies, and is especially noticed in a report dated 7th May, 1890, and ordered to be printed by the Legislative Assembly of New South Wales. This report was handed to me by the President of the Board of Health. From it I find that, at the close of 1889, there were 30 cases of leprosy under official cognizance.

The *Lancet*, of August 1st, 1891, says that the number of lepers has more than doubled during the past ten years.

Referring to the report for 1891 (which has not yet reached me) the *Sydney Mail* of February 20th, 1892, under the head of "Leprosy," observes :—" Those of the public who are the least disposed to alarmist views will probably regard as highly serious the statements now made public regarding leprosy in New South Wales. The statements give a great shock to the feeling of confidence based on the supposed comparative immunity of persons of European races from the attacks of this terrible disease. Of course, it has always been known that where the conditions are specially favourable to contagion, the supposed racial protection ceases to be a safeguard. But it is, nevertheless, startling to learn that of ten persons found by the Board of Health during the year to be suffering from leprosy five were natives of this colony of European descent, while four were Chinese, and one a Kanaka. At the beginning of the year there were 13 lepers under detention at the lazaretto, while those so detained at the end of the year numbered 21, of whom eight were natives of New South Wales of European descent, 11 Chinese, one Javanese, and one Kanaka. During the time the lazaret has been available there have been 31 patients, of whom one could not be detained, and nine have died."

Our colonists are becoming alarmed at the invasion of leprosy in New Zealand. The *New Zealand Herald*, Auckland, June 14th, 1890, in an article headed "Leprosy Among the Natives," says :—" A gentleman at Hokianga writes to a friend here—'My brother was north a few days ago on a vaccination tour at Herekino, and he reports an outbreak of leprosy at Herekino amongst the natives, several of whom died from it. Others are in a fearful state. Their fingers and toes rot off, their nose, teeth, and jaws are corroding, and their bodies are rotten. He has reported the matter to the Government. Strange to say, it got this length before we heard of it. The natives are scared, and avoid each other. Timoti Puhipi recommends the lepers being deported to the Three Kings' Island.'"

A petition by Dr. Bakewell of Auckland, New Zealand, formerly superintendent of the Leper Asylum, Trinidad, for an inquiry into leprosy in New Zealand, has been presented to the Public Petitions Committee, and referred to the Government for consideration.

Dr. George Thin states that a school in New South Wales has been closed by order of the Minister of Public Instruction, in consequence of reports that some children in it are developing symptoms of leprosy.—*Leprosy*, p. 247.

#### OCEANA.

The *Sydney Morning Herald*, of March 27th, 1891, says :—" The spread of leprosy among the Pacific islanders seems to be going on steadily, judging from the following report, which we take from the *Samoa Times* of January 31st—' We hear (says that journal) that leprosy has established itself at Penrhyn Island, and that there are no less than ten fully-developed cases there. The doctor of H.M.S. Cordelia, which has lately been cruising in that quarter of the Pacific, confirms the statement, and is of opinion that the disease has been brought to Penrhyn from the Hawaiian Islands by a number of refugees from the latter place. The same authority also states there is a case of undoubted leprosy at Manaheke Island. These facts strengthen the argument we have used in our columns, as to the urgent desirability of steps being taken to prevent leprosy becoming an established institution in our midst.'"

#### NEW CALEDONIA

In the French penal colony of New Caledonia, leprosy has made its way with fearful rapidity. Previous to 1853 leprosy was unknown in the colony, but recently two leper asylums have been established. In a report on leprosy, presented to the Parliament of Victoria by the Secretary to the Board of Health, Sydney, it is stated that the Board of Health has received a communication from His Excellency the Governor of New Caledonia, M. Pardon, to the effect that the disease is extremely prevalent in that Colony, where about 500 of the native population are affected, and seven persons of European parentage, six convicts, and one child, all French, have been officially reported as suffering from the malady.

The *Journal of the American Medical Association*, March 22nd, 1890, says :—" Leprosy is reported to have found its way to New Caledonia, the French penal colony, and already there are hundreds of cases among the natives and convicts."

The *British Medical Journal* of April 25th, 1891, has the following :—" Dr. M. A. Legrand has recently published an account of the

introduction of into the French convict settlement of New Caledonia which is at once interesting and instructive. In 1846, when missionaries first landed in the island, the was entirely unknown there, nor did it exist in 1853, when the French formally annexed it. In October, 1880, M. Vauvray, chief of the Health Department, sent back five negroes from the New Hebrides on the ground that they had lost their fingers and toes from leprosy. He at the same time requested the authorities to prevent the introduction of lepers into the colony. In September, 1883, M. Brassac reported that there were several cases of leprosy in the north part of the island, and suggested the establishment of a lazaretto for their reception. The authorities, however, took no steps, and in 1888, Dr. Forne, chief physician and president of the Committee of Hygiene, presented an elaborate report, in which he stated that the cases of leprosy could then be numbered by hundreds, especially in the north. But the committee adopted the ostrich-like policy familiar to such bodies, and it was not till the following year that, yielding to the force of public opinion, the executive decided to establish two leper houses, one at Pic des Morts, near the Bay of Canala, and the other in the Isle of Goats in the Noumea roads. Forty lepers were confined in the former, and twenty in the latter. In May, 1890, the total number segregated was seventy, and there had already been fifteen deaths. A third lazaretto is about to be established not far from Houailou. Though it was not until 1883 that the first cases of true leprosy among the aborigines of New Caledonia were observed, more or less legendary accounts of earlier appearances of the disease are current among them. Thus a Chinaman, covered with hideous sores, is said to have arrived in 1866 or 1867, and to have lived for several years with a native tribe, several of whom afterwards developed disease of the same nature Whatever may be the true history of the importation of leprosy, there can be little doubt that it was imported, and at the present time, according to M Legrand, it exists everywhere in New Caledonia, and has acquired a foothold in the great majority of the native tribes. Europeans have also suffered. The course of the disease appears to be more rapid than elsewhere, a fact which M. Legrand attributes to the habit which the natives have of scarifying the maculae and the tubercules, often to a considerable depth, with pieces of glass, and to their ruthless use of caustics. M. Legrand considers that these barbarous therapeutics, together with tattooing and burning with moxas, which seems to be their fashion of expressing affliction at the loss of relatives, have much to do with the spread of the disease. He explains the ravages made by the disease in virgin soil like New Caledonia by the fact that the people, not being aware ~f the danger, take no precautions against it."—*Archives de Médecine Navale, February, 1891*

*In all the French colonies vaccination has been prosecuted with rigour, and has been followed by the increase of leprosy, just as in England' the increase of infantile syphilis is due to arm-to-arm vaccination, as shown by the Minutes of Evidence with the third report of the Royal Commission on Vaccintion. The barbarous therapeutics, the tattooing and burning, have existed among the natives from time immemorial. Vaccination has been but recently introduced.*

## FRANCE.

M. Besnier, a member of the French Academy of Medicine, has reported that leprosy, far from disappearing by degrees, is spreading rapidly. Since the extension of the French colonial possessions, soldiers, sailors, traders, and missionaries, have fallen victims to it in large numbers.—*British Medical Journal, October 22nd, 1887, p 919.*

According to the *London Evening Standard*, October 26th, 1891, Dr. Besnier reports the number of lepers in Paris at 100, there being at the St. Louis Hospital eight persons afflicted with this disease.

## SPAIN.

"Leprosy has been on the increase in different parts of Spain for some years past, and the extension of the disease has at last aroused the attention of the Government. On February 16th the Director - General of Beneficence and Sanitation sent a circular letter to all governors of provinces calling on them to take such steps as may seem necessary under the circumstances."—*British Medical Journal, March 5th, 1892.*

In a communication to the *Lancet*, January 16th, 1892, "On the Origin and Spread of Leprosy in Parcent, Spain," founded upon investigations by Drs. Codina and Zuriaga, Dr. George Thin introduces the following table and comments :—

*"Table Showing the Cases of Leprosy in the Towns referred to in this Report.*

Towns	No of inhabitants	Date of invasion	Cases up to 1887	Males	Females	Total	Remarks
Parcent	150	1850	65	21	7	28	I gathered the data stated in the present table during my visit to the towns in the district of Parecnt. Although I have endeavoured to obtain my information as accurately as possible, I am unable to guarantee its correctness. the towns sometimes hide the truth as to the number of lepers existing; but if there are any, they will consist in showing too small, rather than too great, a number of lepers.
Languart	400	1868	31	20	5	25	
Pego	1200	17--	---	14	6	20	
Orba	160	1873	25	12	6	18	
Pedreguer	720	1809	79	9	3	12	
Murla	120	1870	14	8	2	10	

## LEPROSY AND VACCINATION by WILLIAM TEBB (Complete)

Sagra	100	1848	13	5	3	8
Benidoleig	80	1869	7	4	1	5
Gata	440	1860	6	3	1	4
Jalon	560	1867	8	2	1	3
Denia	650	17--	---	3	1	4
Oudara	325	1862	7	2	1	3
Tounos	80	1860	10	2	1	3
Beniarbeig	130	1871	6	3	--	3
Sanet	90	1884	3	1	1	2

Jaica	320	--	--	2	1	3
Benichembra	120	1872	3	1	--	1
			285	114	40	154
						---

"There is nothing in the soil, occupation, food, or race to account for any difference in the number of lepers which are to be found in these towns respectively. It also shows that the proportion of lepers to the population of the towns is not connected with the length of time that the disease has lasted, and therefore is not in relation to the opportunities given by heredity, even if it were assumed that heredity was a cause. Parcent, which is the most striking example, shows in twenty-seven years, in a population of 150 inhabitants, 65 cases of leprosy, of whom 28 were living at the end of that period; whilst Pego, with 1200 inhabitants, and where the disease has lasted since last century, had only 20 living lepers. Pedreguer, in which we know there was leprosy in 1809, with a population of 720, had in about forty years 79 lepers, of whom 12 were living at the date of the report whilst Murla, with only 120 inhabitants, had had 14 cases in seventeen years, of whom 10 were living at the date of the report.

"Excluding heredity as an insufficient cause of these cases, and as otherwise being discredited, the difference of the rate of increase of leprosy in these similarly situated villages is best explained by the assumption that the opportunities for contagion have been greater in some cases than in others, even if we did not have the statements which I have collected from two independent sources—namely, from the Mayor of Parcent, referred to by Dr. Zuriaga, and from Dr. Codina's report to the Director-General at Madrid. Another sad fact comes out from a study of this table—namely, that in many of the towns the appearance of the disease is comparatively recent and that in this part of Spain leprosy is spreading. The necessity for a hospital in Parcent seems to have been realised at last, for we find that a commission visited the neighbourhood in June, 1887, for the purpose of finding a site, and were uttered one by the municipal corporation free of cost."

No inquiry appears to have been made, either by Dr. Codina, Dr. Zuriaga, or Dr. Thin, as to vaccination being a possible cause, which, according to a communication to me from Senor U. Montez, the Spanish Consul in London, has been obligatory for many years. This gentleman writes (London, May 26, 1892):—"Apart from previous ordinances on the subject, the law making vaccination obligatory on the whole of Spain is dated the 28th of November, 1855." This mode of propagation, where the contaminating virus enters directly into the blood, is surely more credible than the one suggested by Dr. Thin, of contagion (simple contact), unless Dr. Thin, like other pathologists, interprets the word to include inoculation and vaccination.\*

\* Baron, in his "Life of Jenner," vol i., p. 604, says that Mr. Allen, Secretary to Lord Holland, writing to Jenner from Madrid in 1803, observes:—"There is no country likely to receive more benefits from your labours than Spain; for, on the one hand, the mortality among children from small-pox has always been very great; and, on the other hand, the inoculation for the cow-pox has been received with the same enthusiasm here as in the rest of Europe." . . . The result, however, was the reverse of satisfactory; the writer adding, that "the inoculation of the spurious sort has proved fatal to many children at Seville, who have fallen victims to the small-pox after they had been pronounced secure from that disease."

## THE UNITED KINGDOM.

The following appears in the *British Medical Journal*:—"Dr. T. Colcott Fox, one of the Honorary Secretaries of the Dermatological Society, has been good enough, in reply to an inquiry, to forward for publication the following list of cases of leprosy shown to that Society since its foundation:--

DATE.	EXHIBITOR.	WHERE FROM
July 12th, 1882	Mr. Hutchinson	India
"	Dr. E. B. Baxter	Dutch and Chinese parentage
Oct. 11th	Dr. Crocker	Singapore (shown at International Medical Congress)
Dec. 13th	Dr. Liveing	India

Mar. 14th, 1883	Mr. Hutchinson	?
"	"	?
Oct. 10th	Mr. M. Baker	Antigua
	Dr Sangster	? If English case. Sections of nerves.
Jan. 9th, 1884	Mr. Baker	?
Feb. 13th	Dr. Crocker	?
"	Dr. Stowers	India
Mar. 13th	Dr. Allchin	?
July 11th	Dr. Crocker	?
Jan 9th 1885	"	India
May 1885	Mr Hutchinson	?
July 1885	"	Cape Colony
" "	Dr Crocker	?
Oct 10th 1888	Dr Cavafy	?
Feb 13th 1889	Dr Crocker	?

"Dr Fox adds that he has also seen the following private cases since 1879:---

1. Boy from Demerara. . . .
2. Girl from Demerara. ...
3. Man from Cape Colony.
4. Man from India. . .
5. Lady from Orange Free State.
6. Lady from Honolulu.
7. Lady from Cape Colony.
8. Officer from Bengal.
9. Man from India.

"Dr. Fox adds that he has seen three cases in hospital practice, but all these have also been under the care of other physicians at other hospitals.

"Dr. Larder has now two cases in the Whitechapel Infirmary."—*British Medical Journal, March 30th, 1889.*

#### SOUTH AFRICA.

In consequence of the serious increase of leprosy following the imposition of vaccination in Cape Colony, a Select Committee was appointed by the Legislature in 1883 to take evidence as to the cause of such increase, but, strange to say, no inquiry was made, nor were any interrogatories submitted to the witnesses, as to vaccination being a possible factor in the case. Mr. T. Louw, M.P., was appointed Chairman of the Committee.

Dr. Henry Anderson Ebdon, President of the Medical Board, testified that he had resided many years in India—the Punjaub, the Himalayas, Rajputana, Western India, where leprosy is prevalent, and in other parts. He has been in the Cape, consecutively, close upon 22 years, and during that time had seen a great deal of leprosy. He was sure it was on the increase.

Q.—"As you are inclined to think that the disease is contagious, do you think it dangerous to the health of other people to use food prepared by leper hands?"

"I should be sorry to see a leper cook, and I go further than that. In vaccinating, I think hardly a medical man would take vaccine lymph from the arm of a leper infant. I know it has been our practice for the last twenty years not to do so."

The Rev. Canon James Baker testified that "the increased spreading of the disease in many parts of the colony is now generally admitted. It is spreading among both the white and the coloured races, especially in places near the sea coast."

In the appendix E to this report, is a letter from Dr. Wm. R. Turner, dated Vrendenburgh, 1st Sept., 1883, in which I find the following :—"Leprosy in parts of Saldanha Bay is spreading so rapidly that, if some measures are not at once taken by the Government, all the surrounding districts will probably become infected. I know of more than twenty cases in one place alone, in every stage of the disease, and am sorry to say it is not confined to the coloured portion of the inhabitants."

The conclusion stated in the official report is "that leprosy prevails extensively in this Colony, and is steadily spreading among both white and coloured classes."

In June 11th, 1884, an Act was passed by the Legislative Assembly, Cape of Good Hope, entitled, "The Leprosy Repression Act, 1884," with the following preamble :—"Whereas the disease of leprosy is prevalent in this Colony, and has lately been spreading, and continues to spread, and it is desirable to check the extension of such disease, and, if possible, to exterminate it."

At a public meeting in Cape Town in December, 1890, Sir Gordon Sprigg said that there were between 600 and 700 lepers in Cape Colony.

In a paper read before the Epidemiological Society of London by Dr Phineas S. Abraham, p. 3, I find the following :—" In the South African Reports for 1886, a decided increase of leprosy is stated to have taken place in the districts of Alexandria, Bedford, Clanwilliam, Herschel, Malmesbury, Paarl and Stockenstran; and for 1887 the spread of the disease is reported not only from most of these districts, but also from Wynberg, Stutterheim, and Kokstadt. The majority of the medical officers speak very strongly on the subject. For example, one of them (from Alexandria) writes that 'leprosy is certainly spreading rapidly, and unless some active and efficient measures are soon taken, it will become a matter for the most serious consideration.' - Another (from Bedford)—' I believe it to be considerably on the increase, and should be stringently dealt with.' Another (from Malmesbury)—' With reference to leprosy I cannot but repeat my statements of the last years to the effect that the disease is slowly but surely increasing, each fresh case acting as the nucleus to a more or less extended infection.' Another (from Paarl)—'It is deplorable to see what strides it is making.' And in 1887, 'As for leprosy, although it is making rapid strides, there is no notice taken of it' (*i.e.*, by the authorities). More than one of these district surgeons, indeed, assert or imply that the Boards of Management, and others who have the power to put the Act in force, shirk the duty on the score of expense, and that the Public Health Act is to some extent a dead letter."

In consequence of the continued increase of this disease, another select Committee of Inquiry was appointed in 1889, under the presidency of Chief Justice Sir J. H. de Villiers. In the appendix J to the Report, printed by order of the Legislative Council, pp. xiv. and xv., the Rev. Canon J. Baker, F.L.S., F.S.Sc., says :—" I entertain no doubt that leprosy is spreading in this colony at the present time. Observant and intelligent persons have assured me that they have recently met, in various parts of the colony with more cases than in previous years.

"There are many and great difficulties in getting correct information on the subject. I have known patients to be carefully concealed, and the relations of the affected do not like to be spoken to as to the mode of contraction of the disease. I have given great offence by calling attention to particular cases. I believe the number to be much greater than is known by medical practitioners, or by the Government authorities."

From the minutes of evidence it appears that Dr. H. C. Wright, district surgeon at Wynberg, being under examination, testifies as follows :—

Q. 5 "Will you state roughly the number of cases in your district? "—"About twenty; but it is impossible to state exactly. A great number of cases are concealed. I have not the slightest doubt that there are more cases than have come under my notice. There are, for instance, some cases I suspect to exist, because I am aware that leprosy is in the family, and lately some of these people have disappeared ; they are never seen, and, I believe, are hidden away."

Dr. Simons, District Surgeon of Malmesbury, was asked :—

Q. 75. "Since your appointment as District Surgeon, have you known any increase in the number of persons affected ? "—"Yes; certainly."

Q. 76. "Is the disease principally confined to coloured persons? "—"No; it is not confined to coloured persons. I know of several cases where families of white farmers are affected."

Dr. W. H. Ross, Police Surgeon in Cape Town, was asked :—

Q. 230. "During the time you were Police Surgeon in Cape Town, did you meet with many cases of leprosy?"—"Yes; in going about, I used to see about a dozen a day among the poorer classes."

The Hon. Dr. Atherstone, M.S.C., who has practised in the colony 50 years, chiefly in Graham's Town, where he was District Surgeon for 26 years, and who has always taken a great interest in the subject, said :—

Q. 341. "I am decidedly of opinion that it (leprosy) is spreading."---July 18, 1889.

The following are *Extracts from the Report of the Select Committee on the Spread of Leprosy, President, Sir J. H. de Villiers, July, 1889, p. 8:*—"The result of the inquiry has been, in the first place, to establish the fact that leprosy is on the increase in the colony. Many of the District Surgeons say that, in their particular districts, there is no such increase, and others again are unable to express any opinion upon the question, but in the more populous districts of the colony, such as the Cape and the Paarl, and even in some of the outlying and less populous districts, such as Alexandria and Stockenstran, the District Surgeons report a marked increase in the number of cases. It should be borne in mind that the victims of this loathsome disease naturally endeavour to conceal it from others, as much and as long as possible, and that many more cases are sure to exist than have come under the notice of the medical men, whose answers have been received, or whose evidence has been taken. Your committee estimate the number of lepers in the colony to be upwards of 600."

On page 12 is an extract as follows :—"The committee conclude—(1) 'That leprosy is on the increase in this colony.' (2.) 'That the disease will continue to increase unless effectual measures are adopted to check it, and if possible to stamp it out.'

On the 8th April, 1890, the Governor of Cape Colony and High Commissioner Sir Henry Loch laid the foundation-stone of a new leper hospital at Robben Island, which will provide 200 beds for the unfortunates stricken with a fatal and repulsive disease. A writer in the

*Cape Argus*, May 20th, 1891, who signs himself "Epaminondas," and seems, by the character of his frequent communications, to be much concerned regarding the inadequacy of the measures undertaken to check the ravages of the scourge, concludes his letter thus—"In the cause of humanity; for the suppression of the deadly disease; for the safety of the general bulk of the inhabitants, and, last but not least, the alleviation of the afflicted, it seems to me that it is the bounden duty of the Government to meet the question face to face, and devise some means to cope with this terrible and, if unchecked, disastrous evil now pervading the Colonies, and Transkei particularly."

In the valuable Consular Reports issued by the Government of the United States I find one for June, 1887, from Consul Siler, of Cape Town, which is not without interest and instruction. Mr. Siler says, "Not until 1845 was any attempt made by government to check or -to stamp out the disease. In that year a leper asylum was established at Robben Island, seven miles from Cape Town, and, up to 1884, 744 lepers had been admitted to the institution, and comprised but a very small proportion of the leper population, as the segregation of lepers was not made compulsory. In fact, lepers mingle freely with the other citizens, and their appearance is so common that they attract little attention in the streets. At the Cape Town Fish Market I have seen lepers at work cleaning and curing fish, and the disgusting sight did not seem to deter buyers."

The rapid increase of the disease, particularly among the European population, as described in the recent reports of district surgeons, has aroused the Colonial Government to action, and a second and larger asylum is in process of construction, the present accommodation being -wholly inadequate to provide for all the afflicted applying for admission.

A correspondent writes to the *Cape Argus*, May 21, 1891, and, referring to the alarming increase of leprosy in South Africa, says :—"it is now two - years since the out-cry commenced, and yet, what has the Colony done for the benefit of the wretched people cursed with this insidious disease, and for the protection of their neighbours? Here, in the Transkei, nothing! It is notorious that in every magistracy in the Transkei leprosy is rife and spreading rapidly, and, sad to say, over the lepers themselves there is absolutely no restraint. They frequent the public offices and trading stations unchecked.

By their horrible hospitality, they provide lavish feasts of Kafir beer, invitations to attend the same being scattered broadcast. Fancy drinking Kafir beer, prepared and filtered by leprous hands? And this is done every month in the year!"

Under the head of "The Public Health," the South African Directory for 1891, p. 446, observes that "with a view of checking the spreading of venereal disease and leprosy, which have for some years past been reported to be phenomenally prevalent in various districts of the Colony, Acts were passed in 1884 and 1885 giving the Government powers whereby it was hoped that these disorders would eventually be stamped out." One of these is entitled, "The Leprosy Repression Act," which gives the Colonial Secretary power to forcibly remove and incarcerate any known leper in a leper asylum or hospital. This drastic measure had not then been promulgated or put in force. There are many lepers in good positions in the Colony, of both white and mixed races, whose friends would make any sacrifice rather than have them segregated with their fellow-sufferers, either in Robben Island or elsewhere. Those who advocate the forcible deportation of lepers from their friends (most of whom would willingly keep them from public observation in thinly-settled districts) can know little of the heart-breaking scenes constantly witnessed at the separation of these afflicted persons at Honolulu when about to undergo perpetual banishment to Molokai, Hawaii. Although a terribly repulsive and loathsome disease, leprosy is not communicable by simple contact. The Colonial legislature would have served the cause of the public health more effectually by directing their attention to municipal sanitation, and discouraging the practice of vaccination, which, according to the opinion of district surgeons, and the best informed authorities in South Africa, has been instrumental in largely spreading both syphilis and leprosy. It is hardly possible for a disinterested observer and inquirer to come to any other conclusion.

The Cape Town *Times* of March 5th, 1892, says:

"A correspondent writes to the Orange Free State *Express*, under date February 25: The first batch of these unfortunates (the Theba 'Nchu contingent), twenty in number, were despatched from here on Saturday last, and probably twelve or fifteen more will leave here within a few days. The lepers are all natives, mostly Baralongs. It was hard work for the Landdrost, with the aid of the mounted police, to hunt them up. It would take too much -time to relate all the cunning (in this case excusable) devices resorted to by the families of the lepers to evade the law. It was a heartrending sight to see how mothers and children parted. It must be done, for the sake of the general safety, but it was an awful spectacle to see and hear the cries of distress, especially of the sound relations who remained behind."

Referring later to the same deportation of lepers, the Port Elizabeth *Telegraph*, March 12th, says—"Although the large number of fifty-four lepers have been despatched to Robben Island, it is believed that others have managed to conceal their condition from the authorities." . . . "It is a very remarkable fact that, whilst in the last census the number of lepers were returned (from this district) as four, already fifty-four have been discovered suffering from the loathsome disease of leprosy."

Dr. Alexander Abercromby, author of "Thesis on Tubercular Leprosy," writing to me from Cape Town, April 20th, 1892, says the disease is now "spreading rapidly amongst the white population and better class of people."

#### INDIA.

In the speech delivered at Marlborough House, London, June 17th, 1889, the Prince of Wales stated that one of the chief centres of Leprosy is India, where there are 250,000 lepers, and that our colonies contained unnumbered victims to this loathsome disease. The *British Medical Journal*, September 13th, 1890 (p. 639), reports that "a comparison of statistics regarding lepers during the thirty years

1851-81, shows that their number has been increasing in India at the rate of about 30,000 every ten years. During the last ten years the rate of increase is supposed to have been higher." I have before me communications from staff surgeons, medical officers of health, superintendents of leper hospitals, and medical practitioners, showing the spread of leprosy in various provinces of India, and in other countries. The Rev. G. M'Callum Bullock, of the London Mission, Almora, writing 21st August, 1889, says :—" It is the general opinion of residents, both European and native, that leprosy has increased in Kumaon during the past thirty years, and there are upwards of 1600 lepers in Kumaon alone out of a population of 1 1/8 millions."

Dr. C. T. Peters, in his report on cases of leprosy treated at Belgaum, Presidency of Bombay, dated Bombay, June, 1879, says:—"Judging from Mr. M'Corkhill's figures, there were not less than 22.8 per cent. of the population, in the Belgaum districts alone, afflicted with some form or other of leprosy."

In a paper read before the Calcutta Microscopical Society, December, 1890, Dr. W. J. Simpson said it was certain that leprosy was on the increase, an opinion confirmed in a letter to me, dated August, 2 1st, 1889, by Dr. Chunder Ghose, Medical Superintendent of the Leper Asylum, Calcutta.

The City Coroner of Bombay says that leprosy is vastly increasing in that city. The *Times of India*, February 21st, 1891, estimates the number of lepers at large in Bombay, at 1000. At a meeting of the Municipal Council of Bombay, reported in the *Times of India*, April 12th, 1889, various speakers describe the terrible state of things existing in the city. Mr. Kirkham saw lepers near the public tank dressing their terrible sores, scratching their ulcers against the iron railing of the Elphinstone High School, where the boys sat on coming out of school. Dr. Blaney said, "all over Bombay, in dark corners, in gullies where rats and bandicoots had taken their abode, these lepers were hiding themselves, thrown out by their families, to pine away neglected and forlorn."

At a meeting of the General Committee of the "Homeless Leper Relief Fund," Bombay, held at the Municipal Rooms, the President, Sir Dinshaw M. Petit, said that the hospital (which contains over 200 patients) was overcrowded, and further admissions had to be refused. Having no homes or places of refuge, lepers hang about the bazaars of the large cities in India, forced by their necessities to sell fruit or vegetables, and to expose their maimed bodies to the gaze of the public, in order to obtain a wretched living.

Referring to the newly opened Matoonga Asylum, Bombay, Mr. Commissioner Acworth writes, May 26th, 1891 :—" With accommodation for 190, I had yesterday 226 inmates, but fortunately a new ward has just been completed, and this overcrowding will temporarily cease, though only temporarily. If I had room for 500 I could fill the asylum in a week."

The *Times of India*, May 21st, 1892, says :—"While the Matoonga Asylum is seriously overcrowded with lepers, and there are, besides, between forty and fifty bad cases in the Byculla Leper Dhuramsala, Sir Dinshaw's lakh of rupees and the land for the extension of the asylum lie still idle because of the deadlock between the Government and the Municipality over the police charges question. As the Government decline to budge in this matter, the Corporation, not altogether unjustifiably perhaps, refuses to undertake the responsibility of the Leper Asylum. Unless something is done to remedy this state of things, our streets will again be overrun with homeless lepers, and Mr. Acworth's labours in the cause of these afflicted people will practically be brought to naught."

The *Lahore Civil and Military Gazette*, May 30th, 1891, in a graphic narrative of the suffering caused by leprosy, bearing the signature "A. H.," in the leading article column, observes :—"A great deal has been said and written on the subject of the lepers and leprosy by people who have seen and pitied the miserable condition of native lepers, who parade their affliction before the public in our streets and thoroughfares, soliciting alms from the passer-by. The majority of English ladies and gentlemen who are told such persons are lepers understand and know so little about the horrible disease that they are inclined to regard them as ordinary crippled beggars, afflicted with a disease peculiar to natives, and from which Europeans are happily exempt. This is far from being the case: leprosy seems to have obtained a terrible hold over our white brethren and sisters in India, many of whom are hiding away, alone and forgotten, in the thickly populated slums and by-lanes of our large cities. I could conduct my readers to godowns and huts where English men and women are to be found in Calcutta in a horrible condition; some in the last stage of the disease."

In a Presidential address on the "Geographical Distribution of Diseases in Southern India," delivered at the annual meeting of the South Indian and Madras branches of the British Medical Association, Surgeon-General George Bidie, M.B., C.I.E., speaking on the subject of leprosy, said :—"According to census returns the proportion of lepers amongst the population of Madras is 4.4 per 10,000, against 5.2 in Bengal, and 8.5 in Bombay; but there is reason to believe that these figures fall short of the actual extent of the disease. In Madras it is on the whole slightly more prevalent in coast districts than in inland, the ratios being 4.9 in the former, and 4.4 in the latter, per 10,000 of population. The proportion of lepers in the several districts ranges from 2.0 in Coimbatore to 10.5 in Madras city. The districts showing the highest ratios next to Madras are Nilgiris 8.0, Tanjore 7.0, and Chingleput, Malabar, and North Arcot, each 6.0 per 10,000. The disease attacks Europeans and Eurasians as well as natives, but is most common in natives. The propagation of leprosy is no doubt largely influenced by heredity, but recent observations appear to show that it is also contagious. In localities in which lepers are at large with the disease in an active state, and having open sores, there seems to be an increased tendency to fresh cases amongst the general population."—The *British Medical Journal*, p. 115, July 20, 1889.

#### BURMA.

In a communication from Mr. C. G. Bayne, the Officiating Secretary of the Chief Commissioner of Burma, to the Secretary of the Government of India, dated Rangoon, 6th December, 1889, and published in the *Journal of the Leprosy Investigation Committee* for

February, 1891, it is said that the majority of officers questioned state distinctly that, in their opinion, leprosy is increasing in Burma. Mr. Smeaton, Commissioner of the Central Division, says :—"In the opinion of the majority of the gentlemen consulted, there are more lepers now than there were ten years ago." Mr. Norton, Deputy Commissioner of Rangoon, remarks :—" Those best qualified to form a judgment on the subject are of opinion that lepers are more numerous now than formerly." Surgeon-Major Baker and Dr. Frenchman have come to the same conclusion. Mr. Bayne observes :—" The opinion of these officers is of special value, because both of them, particularly Dr. Baker, have paid much attention to leprosy, and have much experience of it. Dr. Baker gives reasons which are based on observations of actual facts, and are not merely impressions."

#### CEYLON, TONQUIN

In Ceylon, as I learned by personal inquiries made in the island in January, 1891, leprosy is extending rapidly amongst the native population. The Leper Asylum at Hendala, near Colombo, one of the oldest in India, which in 1880 contained only 100 lepers, has now 208; and Dr. Meier, the resident Superintendent, does not hesitate to say that, in his opinion, the disease is steadily increasing.

There are about 200 lepers at large in the city of Colombo, and about 1800 in the island. Dr. Kynsey, the Surgeon-General for Ceylon, reported in 1885 that leprosy had decidedly increased since 1862, as the number of patients then in the asylum was 63, but had increased in 1885 to 151. Dr. Kynsey says :—"I have no doubt that a certain reproduction of the disease is going on, whatever the factors are at work, and that the proportionate growth of leprosy in the colony is by no means diminishing."

In a communication to the Government of Hawaii, Dr. Kynsey remarks that leprosy is not confined to any community, but is more frequently observed among the Singhalese and Tamilins; seldom among the Eurasians, and more rarely among Europeans, and is chiefly found among the poor, ill-fed, ill-housed classes of the community. The Eurasians, I may observe, as well as the better-class Europeans, absolutely decline to be vaccinated from native lymph sources, to which the native population are obliged, reluctantly, to submit.

An Anti-Leprosy Association has recently been organised in Bengal by certain benevolent members of Hindu communities in the Presidency. Their efforts are being directed especially to ameliorate the condition of the lepers in the Santhal Parganas, forming the southern portion of Bhagalpur, a very poor district, where the people can do little to help either themselves or their afflicted neighbours.

The *British Medical Journal* gives an account of a leper village near Hanoi, Tonquin, where, out of a population of 400, nearly one-half are affected with leprosy. The lepers of Hanoi doubt the contagiousness of leprosy, and the chiefs of the village affirm that there has not been a single case of contagion.

#### CHAPTER II: IS LEPROSY CONTAGIOUS?

ONE of the most debatable points in connection with the spread of leprosy is that of contagion, and amongst dermatologists there are rival schools—contagionists and anti-contagionists. In the report of the Committee of the Royal College of Physicians, issued in 1867, thirteen were in favour of contagion, and thirty-four physicians and experts in various parts of the world were convinced that the disease was non-contagious. The chief authorities in Norway, including Boek and Danielsen, who had forty years experience, were opposed to contagion; and this is the prevailing view in Norway at the present time.

Dr. G. A. Hansen says :—"If people wash themselves, and take the least care of themselves, when they come in contact with lepers, I do not think there is any danger whatever. It is a remarkable fact that not one of the nurses or servants in our Asylums (Norway) has caught the disease, although they daily wash and dress the patients."

In the pursuit of my investigation, I have been confronted on every hand by the most conflicting theories with regard to the causation of leprosy, and particularly with regard to this question of contagion. The contagionists, when pressed, I found invariably included inoculation, and interpreted the word in that sense. They admitted that the leprous discharge might be touched with impunity, when the integument is intact, but not otherwise. Every nurse, doctor, attendant or laundress, in the hospital, is bound to come in repeated contact with pus from ulcerated tubercles. It is only by the insertion of the leprous virus into the blood, through a sore, prick or abraded surface, that the disease is communicable. This view is now held by the highest authorities in all parts of the world. At the same time, there are others who hold that the disease is transferable in a lesser degree by inhalation, heredity and cohabitation.

From personal inquiries made at asylums and lazarettos in various countries where leprosy is endemic, I am convinced that, apart from the risk of inoculation, there is little or no danger of contagion, using the word to mean simple contact between unbroken surfaces of the body. So far as my investigations have extended, the only country where the belief in communication by simple contact prevails to a certain extent is Hawaii; but here also I found much diversity of opinion, not a few using the word contagion to include inoculation, both accidental, as in a cut or a sore, and by design, as in vaccination.

I believe that the instances of communication apart from inoculation of this disease (if they exist at all) are extremely rare, but the theory is opposed to the results of most inquiries.

A medical resident of sixteen years' standing in British Guiana told me that the disease was being extensively disseminated in some unexplained and mysterious way, as the infected population had greatly augmented of late years; you encountered them in churches, at balls and public meetings, in the streets, and the market-place. Several leprous patients were pointed out to me at the Colonial Hospital,

in close proximity to the other inmates, and I may observe that only the worst cases (and these belonging to poor families) are segregated at the Leper Hospitals. The lazarettos at Gorchum and Mahaica, British Guiana, at Trinidad and Barbadoes, were full to overflowing; new wings were in progress, or had recently been added, and the demand considerably exceeded the present accommodation in each establishment. No one appeared to be afraid of contagion, and I could not learn of a single case so communicated. After going through the various buildings of the Leper Asylum at Mucurapo, Trinidad, and seeing the unfortunate patients in every form of this hideous and mutilative disease, I said to the lady superintendent (of Dominican Sisters), who had been in charge of the institution for seventeen years, "Have you no fear of contagion?" "Not the slightest," she promptly replied. "And you and your assistants do all that conscientious nursing requires?" (This includes washing the sores and bandaging the limbs of the unfortunate inmates.) "Certainly, and feel it a joy and privilege to be of service to these afflicted people." "Has any case of infection by contact to doctor, nurse, attendant, or laundress ever been reported during your superintendence?" "Not one."

This experience was confirmed at the lazarettos in Barbados and elsewhere; and some of the nurses and attendants have been employed from ten to thirty-two years. At the leper asylum in Ceylon, I learned that the laundry work had been managed by one family for three generations, and no case of infection had ever been recorded of laundress, nurse, or doctor. Similar experiences were related to me in South America, South Africa, and at the leper asylums in Norway.

The officials connected with the leper settlements at Molokai, and the Hospital of Suspects, Kalihi, near Honolulu, where I saw some of the worst cases, have not the slightest fear of contagion. They told me that they had never known a medical attendant or nurse contract the disease by simple contact. Of inoculation through sores, or wounds in the skin, or the entrance into the blood through the minutest prick or abrasion, a wholesome fear is entertained, not only amongst the native population, but by the officials; and not without sufficient reason, as will be seen by the facts detailed in another chapter.

The British Consul in Crete, in a memorandum to Baron Ferdinand de Rothschild, M.P., on the subject of leprosy in that island, concludes that the disease is not contagious, from the fact that there are "several cases of healthy women married to, and living with, lepers for years without being in the least affected. In fact, if the disease were decidedly contagious and hereditary, it would inevitably spread much more than it does, considering that the lepers are perfectly at liberty to marry among themselves or with healthy persons, and that their children remain with them like those of other people, without any precaution being taken on their behalf."

Dr. Arthur Mouritz, in his official report to the Honolulu Board of Health, dated Molokai, February, 1886, says :—" The washerwoman for the hospital Kalowao (Molokai) has washed the soiled clothes of the worst cases, certainly many of them so, in the settlement for the past seventeen years."

In a communication by Dr. Van Deventer Director of the Suburban Hospital, Amsterdam, to the Hawaiian Government, the writer says :—" Not one case of contagion has ever been recorded."

Dr. Trousseau, of Honolulu, who told me he devoted much attention to the causation of leprosy in Hawaii, says :—" Is leprosy infectious or ever contagious in the proper sense of the word, that is, by contact mere and simple? I emphatically say 'No.' I am supported in that opinion by the whole medical world, and by my personal experience."

Dr. Manget, formerly superintendent of the Leper Asylum, British Guiana, observes :—" My own opinion is in favour of the contagiousness of leprosy, and that it may be propagated by the matter of ulcerated tubercles being applied to any raw surface; but I admit that I have met with cases which would seem to preclude the idea that the disease can be considered contagious in the ordinary sense of the term.

In the Leprosy Committee Report of 1887, signed by Dr. C. Handfield-Jones, chairman, it is stated "The committee believe that leprosy is not contagious in the conventional sense of the term, but, if at all, is only so in low degree and under exceptional circumstances."

Dr. Max Sandreczi, director of the Hospital for Children, Jerusalem, says :—" I am obliged to declare that the result of my researches gives me the conviction that leprosy is by no means contagious, and that consequently the exclusion and isolation of the patients is both a useless and a cruel measure."—*Lancet Aug. 31, 1889, pg 423.*

The *Lancet*, June 22, 1889, p. 1252, says :—"There hardly an hospital in London that has not had within its walls cases of leprosy within the past decade—in-patients, it is true, who have contracted the disease in countries where it is indigenous. Nor, so far as we know, has there ever been an instance of the communication of the disease from one of those subjects others in this country."

Mr. Jonathan Hutchinson, F.R.S., LL.D., in answer to the questions published in No. 1 *Journal of the Leprosy Investigation Committee*, "Is leprosy contagious?" suggests to inquirers into this subject the following important considerations :—"A certain number of lepers arrive every year in England from abroad. They usually remain in England and are allowed to mix freely with their friends. Children are permitted to go to schools, married couples continue co-habitation, inmates of hospitals and workhouses are, unless specially loathsome, placed in the general wards; in brief, not a single precaution against contagion is ever taken, and yet the disease never spreads. Precisely the same statements are true of French practice. It is believed that there are six lepers in Paris at the present time, and I am told that two leading Paris surgeons have each a leper employed as a household servant. Yet the disease never spreads in Paris any more than in London.

"The officers of leper hospitals, surgeons, nurses, and students, hardly ever become the subjects of the disease. . . In Norway I believe that no instance of an official becoming a leper has ever been known, although the exposure has been most free."

And in a footnote to his article, page 74, Mr. Hutchinson adds:—"Surgeon-Major Porteous, in 1855, published a list of servants who had been employed in the Leper Hospital, Madras. It included eleven servants who had been employed in the wards in periods varying from ten to fourteen years. None of them had become the subjects of leprosy."

Dr. Van Someron, who had charge of the hospital six years later, says :—" There is no record of any of the medical officers connected with the lazarettos having become affected with the disorder, nor have I heard of its ever having attacked the attendants of those who in private families were its victims."

Dr. W. Munro, the author of a work on leprosy, explains his views of contagion as follows :—" I do not pretend to express any distinct belief as to the probability of the disease being conveyed by simple contact, being more inclined to believe that it is carried by inoculation in most cases."

The *Lancet* of June 28, 1890, referring to the theory of contagion in connection with the spread of leprosy, says :—" But there are conditions and limits to the contagion: probably it occurs only through inoculation." This opinion is supported, according to the *British Medical Journal*, October 11, 1890, in the despatch from the Government of India relating to the isolation of lepers. It particularly notes that many of the medical authorities in India consider that the evidence at present available goes to show that leprosy is contagious only in the sense that it is inoculable. The "Report of the Royal college of Physicians on Leprosy," issued in 1867, states "that the all but unanimous conviction of the most experienced observers in different parts of the world is quite opposed to the belief that leprosy is communicable by proximity or contact."

Sir Erasmus Wilson says leprosy is endemic, but not contagious.

Dr. William B. Atkinson, secretary of the State Board of Health, Philadelphia, in diagnosing the case of John Anderson, a Swedish leper, observes that there is no danger of contagion except by inoculation.

Dr. Shoemaker, of Philadelphia, says leprosy is only contagious through inoculation.

In a study on leprosy, based on personal observation, Dr. L. Duncan Bulkley has arrived at the conclusion that the disease is not in any proper sense of the word contagious, but there is reason to believe that under certain conditions it can be inoculated.—*Family Doctor*, June 11, 1892.

Dr. H. M'Hatton, Macon, Georgia, concludes a paper "On the Propagation of Leprosy," published in the "Transactions of the Medical Association of Georgia," by stating that it is non-contagious, and quotes the report of the committee of the English College of Physicians to the effect that, out of sixty-six answers to their inquiries, only nine speak of it as contagious, forty-five as non-contagious, and twelve are silent.

Dr. John L. Mears, Medical Superintendent of San Francisco Board of Health, says—" Although this disease (leprosy) may not be contagious in the ordinary acceptation of that term, we are satisfied that it is communicated by inoculation."

Drs. Fox and Graham report in the transactions of the American Dermatological Association for 1883, page 197, as a result of their combined investigations, that leprosy is contagious by inoculation, and *there is no reason for believing that it is transmitted in any other way.*

Dr. P. W. Farrar, Nevada, Iowa, W.S., in a communication to Mr. L. F. Andrews, Secretary, State Board of Health, February 21st, 1885, p. 205, says:—" Leprosy is not contagious in the usual acceptance of the term. It requires actual inoculation of pus or blood into the circulation through open vessels or abraded surfaces, and there must be favourable cachectic condition to the action of the virus."

Dr. Bevan Rake in a communication to the Acting Surgeon - General, dated Maraval, 11th July, 1889, says :—"In a paper received from St. Louis, Missouri, only the other day, I saw that Dr. Bockmann estimates that there must be in Minnesota about 100,000 persons of Norwegian descent whose ancestors were lepers; and yet leprosy never appears amongst them; all the leprous Norwegians in the State are imported, so that leprosy does not appear to have spread there either by heredity or contagion."

In an article entitled "Notes on Leprosy as observed in Antigua, West Indies," Mr. John Freeland, Government Medical Officer, observes :—" On the subject of contagion I certainly agree with Mr. Hutchinson when he says that the profession divides itself into two camps, one asserting contagion and the other denying it; but I think that the contagionists, or those who believe that contagion takes an important share in the spread of the disease, are, in this part of the world at least, in a decided minority. No one, I imagine, would absolutely deny that contagion might be artificially effected by inoculation; but the chances of such an event happening accidentally are so remote that it can hardly be taken into account."—*British Medical Journal*, October 5th, 1889.

Dr. James H. Dunn, Professor of Dermatology in the Minnesota Hospital College, in a clinical lecture on leprosy, reported in the *North - Western Lancet*, March 1st, 1888, said :—" The question, Is leprosy contagious? has been a source of much discussion and contention. At times and in some countries it has been looked upon as markedly contagious. Some writers still regard it so; but at the present day the great majority of dermatologists teach that it is not, at least not in the ordinary sense of the term. There is no evidence

to show that the malady. has in any instance spread by contagion in a country where leprosy is not endemic."

Mr. T. H. Wheeler, the British Consul of Bogota, South America, in his Report for 1890 to the Foreign Office, No. 804, observes that although public opinion favours the belief prevalent in Colombia that leprosy is contagious, in the climates of Tocaima and Agua de Dios it is not so :—" For . more than one hundred years that these places have been the chosen resort of lepers in all stages of the disease, who have mixed freely with the other inhabitants of the district, there is no case on record of the disease having been contracted by contagion."

Dr. Alfred Ginders, in a communication to the Inspector-General of Hospitals, etc., Wellington, New Zealand, on Leprosy among the Maoris, dated Rotorua, 4th July, 1890, states his opinion that the disease is not infectious or contagious in the ordinary sense, but "that, in all probability, the worst cases have arisen from direct infection of the blood by inoculation, either accidental or premeditated." The only premeditated form of inoculation in vogue is that induced by the lancet of the vaccinator.

The Medical Superintendent, Leper Asylum, Calcutta, Dr. Madhub Chunder Ghose, in his Report to the Honourable H. Beverly, President of the District Charitable Society of Calcutta, 27th August, 1889, says :—" It seems to me, after an experience of fifteen years in the asylum, that leprosy is not contagious or infectious in the proper acceptation of the term. Recently I have taken the full history of all the lepers in this asylum, and, with one or two exceptions, the origin of the disease could not be traced to contagion; some acquired the disease from an hereditary taint, some from the effects of syphilis, and the indiscriminate use of mercury; but in most of the cases the origin of the disease could not be satisfactorily traced, but I have no doubt that the disease can be communicated by an abraded surface absorbing leprosy matter."

Dr. Ghose adds :—" To prove my assertion as to the non-contagiousness of leprosy, I beg to bring forward the following facts, that is to say, my own personal experience of the disease for over fifteen years. There is an inmate of the asylum, by the name of Doris, who is a non-leper, and who has been at the asylum for over twenty years, sleeping in the same ward, constantly mixing with the lepers, eating with them, etc., and he has not contracted the disease.

"There is also an idiot boy at the asylum, a non-leper, who has been an inmate for over ten years; he also sleeps, eats, and mixes freely with the lepers; this boy, also, has not the slightest trace of the disease.

"The dhoby attached to the asylum, with his father and grandfather before him, have washed the clothes of the lepers for more than thirty-five years; none of those showed any signs of the disease.

"The native doctor, Runchanun Dass, who lived with his family for over ten years in the premises of the asylum, neither contracted the disease, nor did any of his family.

"The dressers, Buddye and Narain, acted, the former for twelve years, and the latter for ten years: they did not suffer from the disease.

"The dressers, Rajjian and Jaddao, have been attached, off and on, the former for eight years, and the latter for ten years (this man is yet at the asylum as a dresser), and I have recent news regarding Rajjian, who has gone to his country: these men are unaffected. The dressers have, daily, to handle sores, wash unhealthy ulcers, apply ointment, etc., besides having to shave the lepers periodically. The present Christian cook and his father have been working at the asylum for over twenty years. The father died a non-leper, and the son is free of the disease.

"Other cooks, who work for a few years and then. go to their country, have never been attacked. The sweepers, Roohon and Bustee, have worked more than seven years without contracting the disease. Both the men have been discharged, and are yet living. Other sweepers, who have been working a short time each, also have not suffered.

"The Durwana have not contracted the disease. The present Durwan has been now over five years in service.

"I have myself been attached to the asylum now for over fifteen years, visiting the lepers daily, cutting and handling them, without having suffered.

"My predecessor, Dr. K. Stewart, was in medical charge of the asylum for over twelve years, and remained free of the disease till his death. My assistant, Dr. H. W. Mitnish, M.R.C.S., England, has been at the asylum for over eight years, and is healthy."—*Report presented to the Hon. H. Beverley, M.A., dated Calcutta, 27th August, 1889.*

Dr. Vandyke Carter, of Bombay, says:—" I have not met with any evidences of the contagious nature of leprosy that bear sifting."

Dr. Day, of Calcutta, who, according to Dr. Balehandra Krishna, L.M. and S. of Bombay, has made leprosy his special study, says, in the *Indian Mirror*, that he does not believe in the contagious nature, of leprosy.

Dr. J. Jackson, Bengal, in reply to a communication from the Royal College of Physicians, writes :—" It is not contagious in the ordinary sense of the term. . .—*Leprosy Report, p. 202.*

When Mr Commissioner Acworth, of the Bombay Municipal Corporation, paid an official visit to the Madras Leper Hospital, he was informed that the sweepers employed to wash the ulcers of the lepers did not contract the disease, although some of them had been doing the work for fourteen years.

Mr. A. Mitra, L. R. C. P., L. R. C. S. (Edinburgh), Chief Medical Officer, Kishmir, in an article in the *American Journal of Medical Sciences*, Philadelphia, 1891, observes :—"Of course, contagion by inoculation is possible, and often takes place in various ways. In India, people usually have their feet and skin bare, and, therefore, there is every likelihood of inoculation."

Mr. A. Mackenzie, Secretary to the Government of India, writing from Simla to the Minister of Foreign Affairs, Honolulu (October, 1885) says:—"On the whole, it is believed that the medical evidence tends to show that the disease is not contagious. In support of this view, it may be mentioned that not a single servant of the asylum at Almora, in the Kumaun District of the North-Eastern Provinces, appears to have contracted the disease during the thirty-one years for which there is information."

Dr. W. A. Kynsey, the Surgeon-General, Ceylon, says:—"It (leprosy) is not considered contagious in Ceylon, and lepers are not generally shunned by their relatives or friends for fear of infection, but are often maintained by them in their own houses. It is, in my opinion, not contagious as syphilis, Parangi, the exanthematous diseases. There is no conclusive evidence in the hospital records of, communicability by direct contact with, in close proximity to, diseased persons. The attendants of the hospital have for years been in close association with lepers in all stages of the disease, the head-servant for more than twenty years; and the washing of the establishment has been performed by a family in the neighbourhood for four generations; but not a trace of the disease, as I have reason to know, has been observed among them."—*Leprosy in Foreign Countries*, p. 9.

Dr. Dixon, Medical Superintendent of Robben Island, Cape of Good Hope, in a report published in the *Journal of the Leprosy Investigation Committee*, No. 3, July, 1891, says :—"The evidence gathered from officials and patients long resident on Robben Island shows that there is no authentic instance, with possibly one exception, of any non-leprous person on the island having contracted the disease, either direct or indirect, with the leper residents."

Dealing first with the possible exception, the circumstances were as follows :—A lad, son of the shoemaker, constantly associated with the lepers; he ate of food given to him by them, and was in the habit of fishing with their tackle; it is stated that on one occasion, when using the lepers' tackle, *he had a wound on his finger*. For about ten years he exhibited symptoms, said to be those of leprosy. He died in 1888, having suffered for about ten years. It cannot be held that there is conclusive proof that this solitary case originated by contagion.

The evidence of the older officers goes to show that, until about the year 1884, all the lepers' soiled and filthy linen was washed by the female lunatics in cold water only, and was often mixed with the underclothing of the lunatic patients in the process of washing. This practice was probably in vogue for upwards of thirty years, yet there is no alleged or recorded instance of any lunatic patient contracting leprosy on Robben Island.

Dr. W. H. Ross, Police Surgeon in Cape Town, was asked—

Q. 252. "You are aware that the bacilli have been in the saliva 'of lepers, would not that render the disease liable to be spread by the act of kissing?"—"Not unless there was some cracked surface on the lips or mouth. I have never known of a case of leprosy having been contracted on the island, although they mix there freely." — *Report of Select Committee on the Spread of Leprosy, Cape of Good Hope, July, 1889. Minutes of Evidence.*

Mr. Davidson of Madagascar says :—"Leprosy is contagious by inoculation only."

Dr. W. V. M. Koch, the Acting Superintendent of the Leper Asylum, Trinidad, writing on the subject of contagion, explains that "the entrance of the (leper) germ into the system will take place if it is brought into contact with an absorbing surface—any abrasion of skin or mucous membrane being sufficient for this purpose."— *Surgeon General's Report for 1891*, pg. 71.

Dr. Alexander Abercromby writes to me from Cape Town, April 20th, 1892, that after thirty years experience he holds that leprosy is partly contagious, and explains that he does not use the word contagion in the strict sense, "but when there is a discharge from a leprous sore, and this coming in contact with the tissues of a healthy person will develop the disease; or the saliva of a person coming into contact with a slight abrasion of cuticle, or healthy mucous surface."

Under the head of "Leprosy in Havana," the *British Medical Journal*, June 18th, 1892, says that the number of cases in the Real Casa Hospital de San Lazaro at the present time averages 80 to 90, but seldom reaches 100. In 32 cases (40 per cent.) no family history of the disease could be obtained. 'In no single case could leprosy be traced to contagion, and of the 25 persons employed in the hospital, only one (a chaplain) contracted the disease during the last 12 years. Dr. Arango, the present medical superintendent, has never known any case in which the disease could be distinctly traced to contagion, and he knows persons who have lived twenty-eight or thirty years in the hospital without contracting it."

### CHAPTER 3: LEPROSY COMMUNICABLE BY INOCULATION

WHILE the preponderance of medical and scientific opinion is against the theory that leprosy is, in the ordinary sense of the word, a contagious disease, the evidence in favour of its being communicable by inoculation is overwhelming. Even those who strongly uphold the theory, of contagion invariably include inoculation as one of the principal means of communication. However widely authorities differ as to the other causes to which leprosy is attributed, such as climatic influences, unwholesome and putrid food, want of salt, a

fish diet, malaria, heredity, contagion, syphilis. and insanitation, we may safely affirm that there is a practical consensus of opinion as to its inoculability.

To the question, Is leprosy inoculable? Sir William Moore, K.C.I.E., late Surgeon-General, Bombay Staff, Hon. Physician to the Queen, says :—"Professors Damisch and Kobner proved by an experiment that leprosy may be communicated to animals by inoculation. There is also the well-authenticated case of a boy, Miller, who pricked himself with a needle used by a leper, from which injury leprosy developed. Then there was a case of a medical student pricking himself when performing a *post-mortem* examination on a leper."

Sir William Moore has himself cited (*Journal of the Leprosy Investigation Committee*, No. .1, p. 28) a case of inoculation in a person with an injured hand who was employed to rub sulphur ointment on leprosy patients, his family being quite free from the disease, and no history of previous association with lepers being obtainable. He considers that the sulphur ointment had no protective influence. "All that is required is the transmission of leprosy discharge, which contains the microbe or germ of leprosy, to the healthy body. But in order that the poison may act it is necessary that it should come in contact with an abrasion or sore on a healthy skin. An infinitesimal portion of leprosy discharge is quite sufficient."—*Leprosy and Leper Houses*, pp. 2 and 3.

In a communication to the secretary of the Leprosy Fund, dated June 2, 1890, Sir William says:—"Leprosy has been attributed to the following causes:—(1) Climatic heat; (2) unsanitary conditions; (3) want of salt; (4) vegetable diet; (5) fish diet; (6) lime in water; (7) malaria. But facts show that none of these are the causes." After giving the reasons for this conclusion, the writer adds :—"My views that leprosy is a phase of inherited syphilis, communicable, however, by inoculation, and the reasons for such views, have been expressed in my 'Manual of the Diseases, of India,' 1887."

This view accords with the most eminent medical authorities in all countries where leprosy prevails. In a report on Leprosy in Cyprus, by Dr. Heidenstam, chief medical officer for the island, transmitted by the High Commissioner, Sir Henry Bulwer, to Lord Knutsford, and presented to both Houses of Parliament, March, 1890, the author, after dismissing various theories put forward to explain the spread of leprosy, such as heredity, the use of putrid food, salt pork, mal-hygiene, malaria, and miasma, says :—"My researches have led me to the conclusion that leprosy is what should be termed an inoculable disease, inasmuch as the virus is transmitted into the system in like manner as many other maladies, notably syphilis, anthrax, glanders, etc.; but it has not the same action in all constitutions, nor in all circumstances of life, and is of a long and slow incubation. My further researches and studies have not in any way altered the opinion I then expressed, and I am more than ever convinced that the direct cause of leprosy is simply and solely due to the inoculation of the virus of a person affected into another up to that time free.

"It has been advocated that instances of the communicability of leprosy have been rare, and so doubtful that it is impossible to rely on their authenticity. In this island, at least, I have met many cases where the slightest doubt could not be entertained."

Dr. Olavide, of Madrid, at the Paris Dermatological Congress of 1889, maintained that leprosy was evidently a parasitic disease, contagious, and inoculable. This authority refers to a curious fact, that it is observed by preference amongst the soldiers and monks who have resided previously in America and in the Philippine Islands. In Spain, while vaccination is not always carried out amongst the civil population, it is rigorously enforced in the army, as I was informed some years ago by the then British Consul; Mr. M'Pherson, of Madrid.

At the same Congress, Dr. Zambaco-Pacha, communicating the results of his inquiries concerning leprosy in the Isle of Mitylene, mentions that while he is an anti-contagionist, the discovery of the leprosy bacillus has somewhat shaken his ideas. He records the curious fact that, of about 120,000 souls in Mitylene, 15,000 are Mussulmans, and amongst these there is not a single leper to his knowledge. Dr. Zambaco omits to note the fact that Mussulmans in most countries have a rooted aversion to, and distrust in, vaccination, and escape the ordeal whenever they can.\*

\*This repugnance was made known to me by means of personal investigations in Ceylon in 1890-91. "The First Triennial Report of the Working of the Vaccination Department in Bengal" mentions, amongst other races, the Mahomedan Ferazis, who display the utmost repugnance (as do also the higher classes in India) to vaccination.

Dr. Sutherland, of Patna, observes that :—"Another test of the prevalence of leprosy in this district was to ascertain the proportion of leprosy persons in Patna gaol. Among Mussulmans, two were affected, or one in twenty-eight; while among the Hindoos there were seventeen persons affected, or one in every sixteen."

"This is certainly a startling assertion, one person in every sixteen affected with the taint of leprosy, and yet it comes from the pen of a careful *observer*."—*Leprosy a Communicable Disease*, by Surgeon C N. Macnamara, p. 15 and 16.\*

\*The *Madras Times*, Nov. 28, 1891, referring to the opposition to vaccination, which, the editor observes, is by no means confined to the ignorant populations, says :—"Official reports show notably that the Lubbays and Mahomedans, as a class, resist vaccination, and do much to prevent the authorities from tracing the age of children over six months, with a view to enforcing the Act. Male vaccinators, it is remarked, are prohibited from entering their houses on the ground that these are *gosha*, and Hindu female vaccinators are unable to cope with the difficulty satisfactorily. It has been proposed to employ a Mahomedan female vaccinator, but a suitable woman who can read, write, and serve notices has not yet been found."

In the *Archives de Médecine Navale et Coloniale*, September, 1890, is an article by Dr. F. Forne on the "Contagiousness of Leprosy," of which theory the writer is a firm adherent. Dr. Forne says:—"One of the arguments invoked for the purpose of denying the contagious character of leprosy consists in saying that the persons attending on the lepers—religious persons, infirmary attendants,

medical men —do not contract leprosy. It is important to refute that assertion by showing that it is contradicted by facts." The writer then proceeds to give details of the case of Father Damien, who, after sixteen years' residence at the leper settlement at Molokai, succumbed to this disease, as Dr. Forne supposes, through contagion. Of this there is not the slightest proof, unless contagion is understood to include inoculation, and that this is intended would appear by the following reference to another case to illustrate the author's theory:—"Dr. Hulin de Goden, medical officer of the leper settlement of Desirade (French Antilles), says that Sister A. became leprosy after having pricked herself in the fingers of her hand with a sewing-needle while mending articles that had been used by lepers. Whether it was after having pricked her fingers matters little, since it is by the skin of the hands that the leprosy contamination would have taken place in both cases. He observes that, in general, the washing of linen is habitually practised under the supervision of the Sisters, while sewing, on the contrary, is more often carried out by themselves.

"The accidental inoculation would have taken place before 1878, the date of the first leprosy manifestations; in 1881 the affection had taken so considerable a development that Dr. Hulin de Goden decided to isolate the patient.

"An analogous fact has been observed in Tahiti, where leprosy has been transferred by passing from the native race to the white race, absolutely in the same manner as we have the fact produced in the Sandwich Islands, in New Caledonia, and in Guiana.

"A religious woman from Europe, free from hereditary taint, who was working at the linen-drapery of the hospital at Tahiti, inoculated into herself the terrible malady with a sewing-needle under the same conditions as the religious woman of Guiana, She was sent back to France in 1881 as being affected with leprosy."

Dr. Woods, cited by Dr. Hahn, expresses himself, thus:—"In the hospitals of Calcutta, and other districts of the East Indies, hospital attendants, positively free from all hereditary taint, have contracted leprosy by means of accidental inoculations undergone in the exercise of their functions; Dr. Robertson, Director of the Leper Settlement of Seychelles, became leprosy during his period of service in that house."

Dr. Forné says: "Dr. Hillebrand cites the following case :—At Borneo a young European boy was in the habit of playing with a child of colour affected with leprosy. One day this latter plunged the point of his knife into an anaesthetised part of his body, an operation which was immediately repeated by his comrade with the same knife. Some time afterwards the European started for Holland, there attained his maturity, and, at the end of nineteen years, returned to Borneo fully affected with leprosy."

In a memoir read by Besnier before the Academy of Medicine, Paris, October 11th, 1887, Leloir, a high authority, is stated 'to have pointed out that lepra would appear to be contracted by inoculation and not by contact, from the fact that the epidermis does not, as a rule, contain bacilli, and that the epidermo-dermic basal membrane apparently constitutes a barrier to the passage of the micro-organism in either direction.

One of the latest contributions to 'this important subject is an able work entitled "Leprosy," by Dr. George Thin (London, 1891), in which the question of contagion is fully discussed. The author has succeeded in bringing together (pp. 139-166) the largest number of examples of alleged contagion of any writer I have met with. Some of these are distinctly traceable to inoculation by means of sores, pricks, gunshot wounds, abraded surfaces. The following are amongst the examples:—

No. 14.—Dr. Duncan, Civil Surgeon, Julpaiguri district, states that a healthy woman sustained a gunshot wound in the thigh. She had no leprosy relations, but her husband was a leper with ulcerations on his hands. The woman became a leper.

No. 53.—A young coloured boy, while suffering from an eruption, played with a boy who was a leper; the previously healthy boy became a leper about a year afterwards, whilst his family remained untainted.

No. 67.—Dr. W. H. Ross cites a case which occurred in a European family without any leprosy taint. J. K., while playing with leper boys, pricked himself with one of their fishing hooks, and became an undoubted leper.

On page 162 Dr. Thin remarks: "No one doubts that syphilis is a contagious disease, because surgeons, nurses, and attendants may fulfil their duties for many years in Lock hospitals without becoming infected; and it is a matter of every-day experience that a member of a large family may pass through all the infectious stages of syphilis, living in constant association with brothers and sisters, without the disease being transmitted; yet it is quite certain that in all those cases the disease could be communicated by an inoculation of the simplest kind." From this illustration we infer that Dr. Thin considers leprosy transmissible by inoculation, and sometimes uses the word contagion in that sense, as I have noticed with many other writers on leprosy.

On page 66 Dr. Thin quotes Dr. Donelan as authority for a case of leprosy due to inoculation.

Professor Cayley, F. R. C. S., says (*Journal of the Leprosy investigation Committee*, p. 36) that leprosy is directly inoculable.

Dr. John Murray, Inspector-General of Hospitals London, in a communication to Dr. P. 5. Abraham, Secretary of the National Leprosy Fund, June 9th, 1890, says: "I consider that it (leprosy) is communicable from the sick to those that are well, probably through a broken surface, as an ulcer or wound, and that it may be communicated by inoculation."

Dr. Liveing, physician to the Middlesex Hospital, in his Gulstonian Lectures for 1873, says:—"Facts, too, are slowly accumulating which tend to prove that the casual inoculation of leprosy matter is one actual means of spreading this fell complaint." Dr. Hoegh, in

his "Report on Leprosy" for 1855, quoted by Liveing, "suggests that the disease is communicable through the *Itch Acarus* (presumably the *acarus scabici*) which in Norway commonly infests the skin of lepers."

In his handbook on the "Diagnoses of Skin Diseases," 1880, p. 284-5, Dr. Liveing writes:—"Leprosy has within the last thirty years been imported and spread rapidly amongst natives of certain islands where it was before quite unknown. It is probable that in a certain stage of the disease it is inoculable. This appears to me the most reasonable explanation of its progress amongst a new population."

In reply to a communication which I addressed to the superintendent of the Leper Asylum, Bergen (which institution I visited in 1889), Dr. G. Armauer Hansen, the Physician General of Leprosy in Norway, the discoverer of the *bacillus leprae*, says :—"I think leprosy to be inoculable; I, moreover, think that leprosy in most cases is transferred by inoculation."

Sir Erasmus Wilson, F.R.S., in his work on "Cutaneous Disease," 1864, says :—"Lepra is a blood disease. The origin of the disease is doubtless an animal poison, but the source and nature of the poison are unknown. One remarkable case lately under our observation has led to the belief that it may be communicated by inoculation."

## INDIA

Dr. Balchandra Krishna, L.M. and S., in his pamphlet entitled "Leprosy in Bombay in its Medical and State Aspects," suggests a mode of reconciling the conflicting opinions as to the contagious nature of leprosy. He quotes the *Lancet* of June 29, 1889, "The discovery of the *bacillus leprae* by Hansen has greatly strengthened the belief in contagion. This bacillus has never been found in any disease or condition other than leprosy, while it has invariably been found by competent observers in the skin of tuberculated lepers from all parts of the world. In the non-tuberculated cases, on the other hand, it is invariably absent in all the sores in the diseased nerves. But, it has been found in the nerves themselves when the disease is not of too old a standing, and in those skin lesions of mixed nerve and skin leprosy not dependent upon disease of the nerve trunks. This goes far to explain the non-transmissibility of nerve leprosy. The evidence, on the whole, then, is strongly in favour of the disease being communicable; but all are agreed that it is only so in the *ulcerating stage* of the *tubercular* or the *mixed form* by inoculation of the pus on an abraded surface, either directly from the patient, or from the stained clothing or other objects contaminated by the secretions from the leprosy sores. It is certainly not communicable by aerial infection in the same way as small-pox or other exanthemata."

"This seems to me," says Dr. Krishna, "to explain satisfactorily the reasons why some observers found cases which convinced them of the contagious nature of the disease, while others met with some which did not show any contagious nature. It also explains the three cases which I have mentioned above, as on no other hypothesis can they be explained."

In a paper on leprosy in the *Times of India* (Bombay), August 13, 1889, Dr. Balchandra Krishna says that the evidence in proof of the communicability of the disease from man to man is overwhelming.

Brigade-Surgeon H. V. Carter, of Bombay, referring to the spread of leprosy, says: "The direct communicability of leprosy is at least a good working hypothesis."

Surgeon-Major Pinkerton, in his evidence before the Royal Commission on Vaccination, testified that leprosy was increasing in the cities of India, and believed that it was inoculable.—*Second R.C. Report*, p. 6.

In a letter to the *Times*, June 12, 1889, Surgeon-Major Pringle, late of the Sanitary Department, Her Majesty's Army, Bengal, refers to the danger of spreading leprosy by both inoculation and vaccination. "The fact is, the amount of the virus of leprosy with which Father Damien was unknowingly fatally inoculated might have been, and probably was, very minute. I am amply justified, from a careful study of smallpox inoculation and vaccination during the whole of my thirty years' Indian service, in stating that, unless prompt and stringent measures are taken in Bombay, leprosy inoculation will become far more possible, and hence probable, than it may appear at present."

Dr. Joq. Frank Periera, Medical Superintendent of the Leper Asylum, Bombay, India, in a communication to the *Times of India*, November 18, 1890, gives his opinion that the contracting of leprosy is mainly due to its inoculation by means of open sores from one person to another, and adds: "In most, if not in nearly all the cases treated by me, their previous histories have, almost without exception, disclosed the fact of the disease being due chiefly to heredity and inoculation."

Dr. Cunningham, the special adviser to the Government of India, admits the principle of the inoculability of the disease.

As to the supposed cause of leprosy, "my experience," says Dr. S. M. Shircore, of Moorshedabad, India, "does not tend to the belief that this disease is contagious in its nature, unless by direct inoculation."

Dr. H. A. Ackworth, Municipal Commissioner, Bombay, who has devoted much attention to the leprosy question, writes to me from Bombay, 24th May, 1891:—"All the medical men that I have met have agreed 'that in whatever of any other methods leprosy may be transmissible, it is certainly so by inoculation.'"

Dr. W. K. Hatch, M.B., Surgeon, Bombay Army, reports in the *British Medical Journal*, June 26th, 1886, p 1713, that on June 27th, 1885, a student, while making a *post-mortem* examination on the body of a confirmed leper, cut his left forefinger at the top, and received a small abrasion, which resulted in certain characteristics of leprosy. This writer has been promised further particulars.

Dr. Neve, of Kashmir, says that in leprosy the *bacillus lepra* is always present; that the period of incubation is so long, "that a few positive instances of inoculation or contagion outweigh an immense amount of negative evidence."—*Leprosy, by Dr. George Thin, p. 62.*

Dr. G. D. M'Reddie, Civil Surgeon, in his letter to Dr. Ghose, dated Hurdor, the 18th February, 1888, states:—"From observations I know leprosy is hereditary. It is also contagious in the sense that it is necessary for the discharge from a leprosy ulcer to come into direct contact with the broken skin of the recipient, or the blood of a leper to be inoculated into the system, as in vaccination."—*Report on Leprosy to the Hon. H. Beverley, MA., by Madhub Chunder Ghose, Leper Asylum, Calcutta, August 27th, 1889.*

Surgeon C. N. Macnamara sums up the question of the communicability of leprosy as follows:—"The arguments, therefore, against the communicability of leprosy do not refute those in favour of it; consequently, I can arrive at no other conclusion than that leprosy is communicable; but it is necessary for the propagation of the disease by this means that the discharge from a leprosy sore should enter the tissues of a healthy person, and, further, the disease may even then (unless under peculiar circumstances) remain undeveloped in the system for years."—*Leprosy a Communicable Disease, p. 43.*

#### SOUTH AFRICA.

In Appendix A to the "Cape of Good Hope Report of the Select Committee on the Spread of Leprosy," 1883, is an interesting communication from the Rev. Canon James Baker, dated Kalk Bay Rectory, August 10, 1883,, as follows:—"My own opportunities for investigation have been rather exceptional, and my advantages considerable. In early life I was a student of Medicine, and subsequently of Chemistry and Natural Philosophy, at University College, London. My appointment as chaplain to the Lunatic Asylum and General Infirmary on Robben Island, where I remained nine years, put me in the way of getting experience among lepers, and I commenced at once and continued to make the nature of this terrible disease a special subject of inquiry. In my present sphere of duty I see, unhappily, many cases for investigation. The increased spreading of the disease in many parts of the colony is now generally admitted; it is spreading among both the white and the , coloured races, especially in places near the sea coast.

"Leprosy is not to be compared with small-pox or scarlet fever, as to contagion, any more than typhoid fever, but this can be conveyed in excreta, finding its *nidus*, or seat of incubation, in one part of the body only; and so, while many will escape leprosy who handle patients as they may handle decomposing corpses, with the skin of their hands unbroken, others may have their blood-vessels or absorbents come in fatal contact with the active poison of the disease."

In the body of the same report I find the evidence of a number of witnesses of wide experience, who have given the subject much attention. Hon. Dr. Atherstone, Member of the Legislative Council, and F.R.C.S., Eng., who has practised in the Colony fifty years, chiefly in Graham's Town, where he was District Surgeon for twenty-six years; also Consulting Physician of the Albany General Hospital, and President of the Leprosy Inquiry Committee of 1889, testified as follows :—"I have formed a very decided opinion as to the nature of the disease, and the manner in which it is transmitted from one to another, and spread all over the country. Recent microscopic investigation has established the fact that the diseased tissues and secretions are invaded by numerous parasitical, rod-like organisms called bacilli, always of the same form and size, no matter from what part of the world the leper comes, or what part of the body is examined, whether the tubercles, lymphatic glands, cartilages, or suppurating sores. This specific bacillus of leprosy is no doubt the true cause, and it is spread by inoculation, either by direct contact with the secretion, or suppurating sores of the leper, or transmitted by the clothes, utensils, pipes, etc., containing these parasitical germs of the disease."

Q. 345. "You are then of opinion that it is contagious?"—"Yes; in the mode I have described; not in the ordinary sense of the word."

On page 8 I find the following :—"Another result of our inquiry has been to remove any doubt that might previously have existed as to the contagiousness of the disease. Your committee are satisfied that where the disease has not been derived by heredity from one of the parents or grandparents, it has in every instance been contracted by means of contagion. It is quite possible that the disease may not be communicable except to a person having some wound or abrasion in the skin; but when it is borne in mind that the victims often suffer from a discharge of matter from the hands or other limbs, it is not difficult to conceive how readily the disease may be communicated to persons coming in contact directly or indirectly with the sufferer."

Dr. Abercrombie, member of the Cape Town Medical Board, says (Answer 6a) :—"It would be communicated to a person who came in contact with a leprosy person if he had a sore or an abrasion. For instance, if he were to touch a leprosy person with a sore finger, use the same knife and fork, or drink out of the same glass."

Sir Samuel Needham, superintendent of the Old Somerset Hospital, says:—"I do not think it is contagious, except in cases of cohabitation, when persons are reduced to a low state of health, through being badly fed, or when they get a cut or wound inoculated by contact with a leprosy patient."

Dr. W. H. Ross, twenty-two years Police Surgeon at Cape Town, in reply to Question 311, "Do you know the case of a little boy who contracted leprosy on the island?" said:—"I know the case. The boy had no leprosy relations. He associated with lepers, and one day, being out fishing with them, he ran a fish hook into his finger. Leprosy shortly afterwards made its appearance."

In the "Report of the Select Committee of the Legislative Assembly on Leprosy," July, 1889, are the following answers from the same

witness :—

Q. 346. "I know of several cases in which the disease was communicated by inoculation."

Q. 351. (1) "It has been conclusively shown that it is always accompanied, if not caused, by a specific bacillus or bacilli, distinctly recognisable under high powers of the microscope in all the stages, in the skin, tissues, glands, secretions, nerves, and bones of the parts affected, undergoing ulceration and destructive degeneration by the pressure of interstitial tubercular deposits. (2) These specific rod-like bacilli, like other fungoid growths of the lowest type of generative life, such as dry rot in old wood, etc., it appears, can only gain access to the system in persons in a low state of vitality, either from poverty and filth, defective nutrition, or depressed nervous energy or constitutional debility, from heredity, or other causes of enfeebled condition of health, admitting of the growth and reproduction of the germs of these low organisms.

(3) In such weakened state of the constitution, hereditary or acquired, these bacilli may be introduced into the system by direct contact with any abraded absorbent surface of the skin or mucous membranes, as in wounds, sores, pricks, etc., or with the mucous surfaces of the lips, mouth, nose, eyes, etc., but chiefly in parts distant from the centre of circulation, as in the toes, fingers, etc., where they may find a lodgment from the diminished vitality of the part being insufficient to destroy them, although sufficient to prevent its rapid growth."

Dr. J. C. Tache, Titular Professor, Laval University, Visiting Physician of the Tracadie Lazaretto, New Brunswick, Canada, reports to the Hawaiian Government ("Leprosy in Foreign Countries," 1886, p. 142-3):—"There is a case, the facts of which are established beyond the possibility of cavil, in which the disease appears to me, as well as it did to those who witnessed it, to have been produced by the absorption of liquid matter discharged from the body of a woman who had been in a cachectic state from leprosy. At the funeral of that woman, the body was carried on the shoulders of four strong young men. The day was hot, and, on a sudden, liquid matter began to ooze out through a joint of the coffin, wetting the shoulder of one of the carriers. The wet, combined with the heat and the pressure of the sharp edge of the coffin, produced an abrasion of the skin of the young man. The contact of the liquid with the abraded surface lasted a part of the time of the procession, and the whole length of the service, as it was only on his way home that the young man washed his sore shoulder, and changed his clothes. Some months after, that man, whose health had always been robust, began to feel unwell. In a short time the symptoms of leprosy made their appearance, and he died of the disease eleven years after the occurrence. There had never been any case of leprosy in his family, whose ancestral genealogy is traced for several generations back. In fact, the disease was not yet known as leprosy, being of recent appearance in the locality, and among these people. He was the fourth case in that place, the other three being the woman spoken of, the husband and sister of the woman, in the ancestry of whom there had never been any trace of the disease. The fifth case in that locality was the sister of the young man." It is noticeable that the incubation of this disease was of comparatively short duration.

Dr. Manget, Surgeon-General, British Guiana, in the Report of the Royal College of Physicians on Leprosy," p. 45, observes:—"My own opinion is in favour of the contagiousness of leprosy, and that it may be propagated by the matter of ulcerated tubercles being applied to any raw surface; but I admit that I have met with cases which would seem to preclude the idea that the disease can be considered contagious in the ordinary sense of the term."

Dr. Charles W. Allen, attending physician to the North Western Dispensary for Skin Diseases, Surgeon to the Charity Hospital, in an article in the *New York Medical Journal*, March 3 1st, 1888, on leprosy, concludes that the disease is transmissible by inoculation from one individual to another.

In a remarkable article on "Leprosy, its Extent and Control," by Dr. H. S. Orme, published in the 20th volume of "Transactions of the Medical Society of the State of California" (1890), page 180, Dr. Saxe is quoted as giving the case of a physician's son who acquired the disease after inserting a pin into his leg which a little Hawaiian leper had just previously thrust into an anaesthetic patch on his own leg.

Dr. S. Kneeland, of Boston, U.S., who visited Honolulu in 1872, says :—"There can be no doubt that it (leprosy) is spread by cohabitation, and inoculation of its diseased fluids, in the same way as syphilis."—*Dr. Hillis on "Leprosy in British Guiana,"* p. 192.

Dr. J. C. Graham concludes an article in the *Canada Medical and Surgical Journal*, October 1883, as follows :—"In all probability the disease is communicated solely by means of inoculation; and opportunities for such inoculation are very few indeed, unless there has been a long and intimate contact with a diseased person."

Dr. Graham here omits from his purview the universal practice of vaccine inoculation, which sometimes carries with it the sources of leprosy and of other diseases.

In a leading article in the Philadelphia, U.S.A., *Medical News* on "Leprosy in its Relation to the State," the writer says:—"From time to time we hear of lepers reaching this country, either from Norway, the West Indies, or from China, and it becomes a very important question how to deal with such cases. Up to a few years ago, opinion was very strongly against the contagious nature of the disease, but since Hansen's discovery of the *bacillus lepra* facts have been accumulating to show that the virus is a fixed contagion, communicable by inoculation, like syphilis and glanders."

Dr. William B. Atkinson, Secretary to the State Board of Health, Philadelphia, in his official report for 1890 of a case of leprosy (John Anderson, a Swede), observes: "There is no danger of contagion except by inoculation. The transmission of leprosy by inoculation or contact has been a debatable point with the profession for many years; but since the disease has been better studied, and the discovery of the *bacillus leprae*, a minute organism found in every case of true leprosy, opinion is gradually but surely coming round to the recognition that leprosy may be communicated by the unhealthy to the healthy to a much greater extent than has hitherto been considered probable."

The *American Journal of the Medical Sciences*, October, 1882, has a communication on "The Question of Contagion in Leprosy," by Dr. White, who remarks that heredity as the only, or as an important factor is out of the question. "It would have required several generations to have accomplished such results; we must look, then, to the customs of the race as exceptionally favourable to inoculation, and as the only possible explanation. It is probable that leprosy, like syphilis, may be communicated under all circumstances by which some of the fluids and other products of the infected *foci* of a diseased person come in contact with abraded or excoriated, possibly with the uninjured surface of a healthy person. It would be necessary that the diseased products should be at the surface of the skin, or mucous membrane, and this would generally be accompanied during the process of softening by which the impermeable layers were removed. Thus the nodular form in its ulcerative stage would necessarily be the most dangerous phase of disease, whereas the anaesthetic form might exist for years with little danger of communicating itself to its surroundings. In this sense we may conclude that leprosy is contagious, and in these ways, probably, the disease mostly spreads in a family, a community, a nation."

Mr. Plumacher, United States Consul at Maracaibo, Venezuela, observes in his official report for 1890 (p. 695) with reference to leprosy :—" I confess freely that I am not a believer in the theory of contagion properly so called. It will be easily understood that should matter from a leprosy ulcer come into absolute contact with the blood of a healthy person inevitable infection would result, and leprosy be engendered, in the same manner that the surgeon at times meets his death through blood poisoning contracted in the dissection of a cadaver."

The United States Consul to Cape Colony, Mr. James W. Siler, in the official report on leprosy to his Government, dated March 24th, 1887, observes :—"This specific bacillus of leprosy is no doubt the true cause, and it is spread by inoculation by direct contact with the secretion or suppurating sores of the leper."

In a paper read before the State Medical Society by Dr. R. J. Farquharson, Secretary of the Iowa State Board of Health, Des Moines, and published in the *New York Sanitarian*, July, 1884, the author says:---

"Leprosy is not contagious in the ordinary acceptance of that term. It requires an absolute inoculation of pus or blood into the circulation through open vessels or abraded surfaces, and at the same time it is assumed that we must have the cachectic conditions favourable to the action of the virus."

Dr. Wood, of the United States Navy, in the Fourth Report, Navy Department, says that the dressers in the hospitals of Calcutta and other portions of the East, positively free from hereditary disease, have in many instances developed it, under circumstances connecting the inoculation with their duties.

The *New Orleans Medical and Surgical Journal* 1880, published a communication from Dr. T. H. Bemiss, Lahaina, Hawaii, on the introduction and spread of leprosy in these islands. "Alarmed," says the writer, "by an invasion of small-pox in 1853, a general vaccination of the whole population was ordered, and physicians being at that time very few on the islands, non-professionals aided in the work. It is charged by some that, as a natural result of the labours of the heterogeneous force so appointed, not only syphilis but also leprosy was greatly increased. In my last circuit trip in my district, I found very few adults who had never been vaccinated. This involves the question of inoculability, in my opinion the main, if not the only means of propagation, other than inheritance."

The same journal, 1888, says that "leprosy may be communicated from a leprosy to a non-leprosy person by means of a specific virus, which acts somewhat like the specific poison of syphilis, depending upon thin or denuded surfaces for its absorption, and which remains potent, very probably for an indefinite period of time."

Dr. R. Hall Bakewell, formerly Superintendent of the Leper Asylum, Trinidad, testified before the Select Committee of the House of Commons in 1871, that the inoculation of leprosy was proved as much as any fact in medical science.

In a paper read before the Auckland (New Zealand) Institute, July 20, 1891, and printed in vol. xxiv. of the "Transactions of the New Zealand Institute," Dr. Bakewell says :—" That bacilli exist in both leprosy and tubercle is beyond all dispute; that the bacilli of these diseases may be grown and cultivated in suitable media is ascertained as a fact respecting one of them—tubercle— and, although not experimentally proved as regards the bacillus of leprosy, yet is almost beyond doubt. Artificial nutrient materials have hitherto failed, and it is not allowable to try the only natural medium—the blood and tissues of a person living under conditions likely to develop leprosy. I have no doubt, from seeing the origin of leprosy cases, and studying several hundred cases of the disease, that it is not only inoculable, but that it spreads by inoculation or absolute contiguity, and I have no hesitation, after twenty years' consideration of the subject, in affirming again the opinion given before the Committee of the House of Commons."

Dr. N. B. Emerson, President of the Honolulu Board of Health, says :—" The great problem that confronts the Board of Health is the

leprosy question, and the medical profession in the Hawaiian Islands are, I believe, unanimous in the belief that leprosy is a communicable disease, and a transplantable disease, communicable by inoculation."

In a communication to the Secretary of the National Leprosy Fund, dated Dublin, 6th October, 1890, Dr. John D. Hillis, F.R.C.S.I., late Medical Superintendent, Leper Asylum, Demerara, says :—" My views on leprosy are explained in my work, 'Leprosy in British Guiana,' published by Churchill & Son. A further experience of ten years has convinced me more firmly than ever that leprosy is a communicable disease, most probably by inoculation. In tropical climates, many suffer from ulcers, excoriations, etc., which may render them more susceptible when brought so much into contact with lepers."

Dr. Arthur Mouritz, who occupied the position of physician to the Leper Settlement, Kalawao, Molokai, in 1886, says :—" The *contagium* of leprosy enters the system by inoculation at broken surfaces of the skin, fissures, or chaps, on external mucous surfaces, and possibly by punctures of insects, or the presence of parasites, scabies, etc." In his report to the President of the Board of Health, Honolulu, dated February, 1886, the doctor says:—" Some weight must be attached to the views of the foreigners themselves. They, one and all, such as are now alive, emphatically declare their belief that the disease is contagious. Some give evidence of contact (immediately followed by local symptoms—direct inoculation), infection of the whole system speedily following, this again succeeded by external manifestations of leprosy within a comparatively short period."

In his "Biennial Report to the Legislature of the Hawaiian Kingdom," session 1890, Dr. T. H. Kimball considers the fact of the inoculation or transplantation of leprosy to have been proved in those islands, and that the *bacillus lepra* carries the infection.

Dr. Ginder, who investigated cases of Maori leprosy at Taupo and Rotorua, New Zealand, in his "Report to the Inspector-General of Hospitals, etc., Wellington," dated 4th July, 1890, concludes "that in all probability the worst cases have arisen from direct infection of the blood by inoculation, either accidental or premeditated."

From inquiries made from those who were intimately acquainted with the late Father Damien, I have no doubt that in his case the disease was induced by means of inoculation of leprosy virus from other patients, when he resided in Molokai, through sores on the skin. While possessed of many noble traits, this worthy and self-sacrificing missionary was conspicuous for neglect of ordinary hygienic precautions.

Dr. W. Munro, in his work on leprosy, quotes a series of cases to show that leprosy is spread by contagion, but explains in page 80 the wide interpretation he gives to this much misunderstood word. He observes "that by using the word 'contagion' I do not pretend to express any distinct belief as to the probability of the disease being conveyed by simple contact, being more inclined to believe that it is carried by inoculation in most cases, though long-continued contact even of unbroken healthy with diseased skin may be sufficient."

The doctor gives particulars (p. 84) of several cases of inoculation, all of which, he says, tend to show that inoculation is the chief, if not the only, manner by which the disease is propagated, such propagation taking place quickly only when some special circumstance, as the person being wounded, makes inoculation easy and certain. This writer does not believe there is any evidence of its being communicated in food or drinks, and the only danger from association with lepers is "*when the healthy person has any cut or sore about his hands by which he might be inoculated.*"

Dr. John Freeland, Government Medical Officer, Antigua, in a communication dated Antigua, Sept. 15, 1890, says :—"When I wrote to the *British Medical Journal* in October last that no one would deny that contagion might be artificially produced by inoculation, I meant, of course, inoculation by means of the actual introduction of secretion from the leper's sore into the skin of the healthy, effected either directly by the lancet, or accidentally conveyed through the broken surfaces of the leper and the healthy coming in contact." Dr. Freeland relates how that "T. S., a healthy and robust lad, who was denied board and lodging by his relatives on account of his irregular and late hours, sought accommodation and residence in an out-room situated in a leper's yard. After a time, he received rather a severe wound on one of his feet, and I was called upon to attend him, when I naturally protested against his surroundings, and wished him to go into hospital, not only that he might have every comfort and care, but that he might also be at once removed from his diseased neighbours. He would not, however, consent to leave his house, and I continued attendance long enough to discover that my patient had, since his accident, been systematically using the same basin, the lotion, and even the very rags and bandages that were, perhaps, but a few hours removed from the ulcerated surfaces of his leprosy companion. I need not tell you that the healthy wound soon developed into an intractable and sloughing sore, and was, after some time, followed by those general, but unmistakable, symptoms of leprosy, which went on progressing until the disease was fully formed, and the lad died, an ulcerated and necrosed leper." — *The Lazaretto, St. Kitts, West Indies, October 6, 1890.*

#### THE INOCULATION OF THE CONVICT KEANU.

Whatever doubts have heretofore existed as to the inoculability of leprosy, there can hardly be any after a dispassionate consideration of the facts connected with the experiment on the condemned convict at Honolulu. The prisoner Keanu was inoculated with leprosy by Dr. Edward Arning on the 30th September, 1884, and again in November, 1885, *after previously making a most searching inquiry as to any leprosy taint in his family, and a dose examination of his own body.* This examination satisfied Dr. Arning that no trace of the disease could be found in him. Every precaution was taken to secure his isolation from contaminating surroundings, and means were adopted to ensure that he was not employed outside the prison walls. On the 2nd September, 1888, Dr. N. B. Emerson, then President of the Board of Health, and Dr. T. H. Kimball, Government Physician, examined the prisoner and signed the following certificate :—

"This is to certify that we have this day carefully examined Keanu, who was inoculated in November, 1885, and we find his condition as follows:— "Ears tubercular and considerably hypertrophied; forehead the same; face, nose, and chin show flattened tubercular infiltration; mouth clean, no tubercles; face generally presents a leonine aspect.

"Hands puffed, fingers swollen at proximal phalanges, tapering to distal phalanges; tips of forefinger and thumb of left hand are ulcerated from handling hot tin cups of tea or coffee, indicating anaesthesia.

"Body—Back thickly mottled with flattened tubercles and the surface uneven to feel, colour of the same—a yellowish brown; front of the body, chest and abdomen, presents plaques of tubercular infiltration of larger size than back, separated from each other by wider intervals and of a brighter colour, in some cases a ruddy pink, especially over upper part of sternum.

"Legs—The infiltration thins out as far down as the knees, there being one large bright patch on the inside of the left thigh ; legs below knees quite clean and skin smooth and even to touch.

"Feet — (Edematous; have poor circulation; bluish colour; soles of feet clean.

"Seat of inoculation, outer aspect of left forearm, upper third, shows a dark purplish scar, about one-and-a-half inches long by five-eighths of an inch wide, irregular in shape, keloid in aspect, dense and inelastic.

"The tests for anaesthesia were not made. Eyes with sclerotitis, muddy and infected.

"No signs of palsy about muscles of face, orbiculares palpebrarum, hands, or forearms.

"It is our decided opinion that this man is a tubercular leper.

"N. B. EMERSON, M.D., *President of the Board of Health.*

"J. H. KIMBALL, *Government Physician, Honolulu.*"

In the spring of 1890 Dr. D. W. Montgomery, Professor of Pathology, California University, microscopically examined a piece of Keanu's skin, and discovered the *bacillus leprae* both singly and in groups. This bacillus has been found, according to the *Lancel*, by competent observers in the tuberculated form of leprosy in all parts of the world, and has never been found in any other disease or condition. Keanu has since been sent to the lazaretto, Molokai, a confirmed and incurable leper—a punishment ten times more severe than the death penalty, and, in my judgment, utterly unjustifiable. In a letter on "Leprosy" in the *British Medical Journal*, September 24, 1887, Dr. William Jelly observes :—" I daresay the poor Kanaka convict (Keanu), had he known what leprosy is, would, without hesitation, have preferred the guillotine, the garotte, or the hangman's rope."

Regarding this official declaration, Dr. C. N. Macnamara says:—"This report establishes unequivocally the fact that the inoculated man has become leprosy; and, as he had been inoculated three years previously, there is every reason to believe that the disease is the result of the inoculation. This is very much borne out by the fact that at the seat of inoculation there is what is described as a dark, purplish scar of about one inch wide, keloid in aspect, dense and inelastic.

"The importance of a positive result like this cannot be outweighed by a considerable number of negative experiments; although, so far as we know, this is as yet the only direct experiment that has been made from a leper to a sound individual, and we do not believe that its importance is lessened by the fact that inoculations made from a diseased part of the body to an apparently unaffected part of the body of the same person have, in some cases, not led to development of the disease in the inoculated part within a comparatively short lapse of time.

"The communication of leprosy in this case confirms the views generally entertained by those who hold that the disease is contagious, the idea being that it can only be conveyed from one person to another by a direct communication of leprosy tissue into the moist, living tissue of the person infected; in short, that when it is contagious, it is contagious in the same way that syphilis is understood to be contagious."—*Leprosy a Communicable Disease*, p. 45.

In an article in the April (1890) number of the *Occidental Medical Times*, Dr. Sidney Bourne Swift, Resident Physician, Leper Settlement, Molokai, reports the present condition of Keanu as follows :—"Age 70 years; weight 178 pounds; leprosy infiltration beneath integument of face and forehead; tubercular enlargement of lobes of both ears, the right more than the left; ulceration of palate, and extensive ulceration of pharynx; tubercular enlargement of uvula; tubercular enlargement of alae of nose; partial occlusion of nasal fossae, due to leprosy infiltration beneath pituitary membrane; chronic conjunctivitis and pharyngium-like growth on both eyes; almost deaf; voice hoarse, and with a nasal inflection. Anaesthesia of both hands and feet, although no pronounced enlargement of ulnar or tibial nerves; numerous tubercles distributed over the entire body, but most marked on the upper and lower extremities; three small but angry-looking ulcers on outer aspect of left leg; softened tubercle on dorsum old age."

In an article on "Personal Observations of Leprosy in the *New York Medical Journal* for July 27th, 1889, Dr. Prince A. Morrow, after describing the results of the inoculation by Dr. Arning and the development of tubercular leprosy in the convict, observes that, during his visit to Molokai, he excised a small sub-cutaneous tubercle and a portion of the underlying skin. Numerous sections of this specimen were made by Dr. Fordyce, and in all of them the presence of bacilli was exhibited under a microscope. Dr. Morrow estimates that in the Sandwich Islands "about one half the cases are tubercular, about one-third are anaesthetic, and the remaining

sixth represent the mixed form; the tubercular type is the most rapidly fatal."

Dr. F. B. Sutliff, who spent four years studying cases of leprosy in Maui, Hawaii, says, referring to Keanu's inoculation :—" This case will always stand alone; I suppose no other man will ever be purposely inoculated with leprosy. The facts in the case that point towards the inoculation as having been the direct and only cause of the disease are many and strong. Still they will be attacked by those who would rather maintain their own ideas than discover the truth.\*

\*In an article on Keanu's inoculation, the *Occidental Medical Times*, April, 1892, Dr Sidney Bourne Swift intimates that the case made out by Dr Arning is inconclusive, inasmuch as other members of Keanu's family have been found to be affected with leprosy. Keanu's own son, Eokepa, aged about 23 years, and his first cousin, Maleka, on his mother's side, are lepers, living in the leper settlement. Eokepa left school in 1873 on account of this affliction. These cases are by no means inconsistent with the facts contained in the reports above quoted, and it must not be forgotten that the lepra disease was first discernible at the points of inoculation. Nor can they be considered remarkable, knowing how the disease had been propagated by the vaccination lancet. In one instance reported to Queen Liliuokokalani, an entire school in Hawaii was swept away, with the exception of a single survivor, by this means. However, the case for inoculation does not rest upon Dr. Arning's experiment, but on the un impeachable evidence of numerous reputable witnesses in all parts of the world, and on the fact admitted by pathologists that, given suitable conditions, all bacterial diseases are inoculable.

A well-known medical practitioner at Honolulu gave me a photograph of Keanu, which distinctly shows the appearances peculiar to inoculated tubercular leprosy at the point of insertion in the arm, as well as in other parts of the body. And he considered the experiment an absolute demonstration of the inoculability of the disease. He also unhesitatingly expressed the opinion that the dissemination of leprosy in Hawaii was largely due to inoculation by the lancet of the public vaccinator, a most serious matter not only for Hawaii, but for all other countries where the repulsive and destructive disease is endemic. Dr. Arthur Mouritz, Medical Superintendent of the Leper Settlement, Molokai, says it is doubtful whether one per cent, of the Hawaiians would resist intentional inoculation.

#### LEPROSY COMMUNICATED BY INSECTS.

Both in the West Indies, and in British Guiana, I found the belief prevailing amongst the people, as well as, to a certain extent, amongst medical practitioners, that leprosy was inoculated into the blood by mosquitos.

Nor is there anything improbable in the idea. Sir William Moore, late Surgeon-General, Bombay Staff, "is of opinion that one of the chief sources of danger is due to flies and mosquitos. These pests of Indian life may carry enough leprosy discharge to communicate the disease to a healthy person. None of us can make sure that the fly or mosquito, which irritates by its persistent attention, has not come from a leper. A fly investigates a leprous sore or discharge, carries a particle of poison in its proboscis, or feet, and next settles on some abrasion of the skin of a healthy person !" Dr. Manson, in China, says that elephantiasis has been conveyed by a mosquito. (The "elephantiasis" conveyed by mosquitoes appears to have been another kind of disease than leprosy).

In Dr. Wilson's communication on leprosy in *The Lancet*, Nov. 13, 1880, p. 779, the writer says:—" Dr. Manson received some reward from the Chinese Government a few years ago, for the discovery that leprosy was caused through the introduction of a poison into the blood by the bite of the mosquito, and although little has been heard of this discovery since, the idea seems to receive support from many facts, and explains the curious occurrence of that dreadful malady in the arctic regions, where the mosquito abounds."

Dr. Albert S. Ashmead has an article on "Leprosy in Japan" in the *Journal of Cutaneous and GenitoUrinary Diseases*, vol. viii. page 220, copied into the *Journal of the Leprosy Investigation Committee* for July, 1891, in which the danger of minute inoculation by insects is referred to as follows :—" The Japanese guard carefully against mosquitos and other insects, and wherever insects most abound the most endemic leprosy is found. In addition, those parts exposed to insect foraging are the seat of primary skin lesions of leprosy, as also mucous membranes most exposed to germs in food and water."

And it may be remarked that, if leprosy may be communicated by means of mosquitos and other insects, where the inoculated virus is infinitesimal in quantity, how much greater in proportion is the danger of such contamination in vaccination? In' the latter case the vaccine lymph may, and often is, taken from children where the disease lies dormant, in the incubating stage, without declaring itself by the smallest signal to the eye of the most experienced physician. In all countries where leprosy is endemic, Europeans resolutely object to be vaccinated with lymph from native sources; and, notwithstanding the law, when imported lymph cannot be obtained they and their children remain unvaccinated. As a consequence, the population of Europeans attacked with leprosy is comparatively small and, indeed, of rare occurrence, except in the case of soldiers who are subject to the military regulation of revaccination. This repugnance to native lymph on the part of Europeans in the West Indies was pointed out by Dr. R. Hall Bakewell, Vaccinator - General, Trinidad, in his remarkable evidence before the Select Parliamentary Committee of 1871, and has been referred to by Dr. Castor, of British Guiana, and other authorities.

#### CHAPTER 4: VACCINATION WITH REFERENCE TO LEPROSY

HAVING shown, on the authority of some of the most eminent dermatologists and superintendents of leper asylums, and from the testimony of those who have devoted special attention to the study of leprosy, that the disease is inoculable and spread by inoculation, we proceed to inquire whether there is evidence that this inoculation may be due in whole or in part to vaccination. When dealing with this question, I am aware that I am treading on delicate ground, inasmuch as vaccination has been lauded as an operation benign in its nature, free from peril, "the greatest discovery in the history of medicine," \*

\*Sir John Simon, late Chief Medical Officer to the Local Government Board, speaking of Jenner and vaccination in his "English Sanitary Institutions,"

London, 1890, p.123, *note* says :—"I venture to predict that the new evidence [before the Royal Commission on Vaccination], so far as it may regard the merit of his discovery, will establish more firmly than ever that Jenner's services to mankind, in respect of the saving of life, have been such that no other man in the history of the world has ever been within measurable distance of him."

and, out of half-a-million prescriptions or so, the only one possessing such transcendent merits as to justify its universal compulsory enforcement. It is, moreover, considered by many ardent advocates to be impolitic to do or say anything calculated to discredit vaccination. It is hardly necessary to remind our readers that there has never been a scarcity of medical inventions which have held out similar promises. Smallpox inoculation, which, according to Dr. Moore, cost the nation millions of lives, was universally accepted by the profession for the best part of a century as a discovery "highly beneficial to mankind;" and it would not have been difficult, had it been originally an English discovery, to have obtained a munificent grant from Parliament, and possibly to have persuaded the Government to make it obligatory and universal. The practice of bleeding and cupping was in vogue for at least three centuries, and the use of huge doses of mixed and noxious drugs for nearly as long a period. Jenner received a reward of £30,000 from Government on his explicit assurance that vaccination would make an end of small-pox. The evidence brought before the Royal Vaccination Commission in London, by statisticians and able pathologists, abundantly shows that, while it has had no effect in diminishing either sporadic or epidemic small-pox, it has been a prolific source of the spread of inoculable maladies, such as skin disease, pyaemia, eczema, phlegmon, and, notably, leprosy and syphilis.

#### THE WEST INDIES.

One of the earliest medical practitioners to call public attention to the spread of leprosy by vaccination was Dr. R. Hall Bakewell, president of the Board of Health, Trinidad, who, as Vaccinator-General of that island and Visiting Physician of the Leper Hospital, possessed unusual opportunities for observing the effects of vaccination upon the health of the people. In a communication dated 31st December, 1870, Trinidad, to the Colonial Secretary, London, Dr. Bakewell says :—" The question is not as simple as it appears. It is not a question of half-a-dozen minute punctures in an infant's arm *versus* an attack of small-pox. It is a question of performing on every child that is born into the world, and that lives to be three months old, an operation sometimes, though very rarely; fatal; sometimes, but not frequently, attended with severe illness, always accompanied by considerable constitutional disturbance in the form of fever; sometimes, in an unknown proportion of cases, introducing into the system of a healthy child constitutional syphilis, but suspected in the West Indies of introducing a poison even more dreaded than that of syphilis—leprosy. And the parent is required by law to subject his child to these evils, most of which are only possible, but one of which is certain (the fever), for the purpose of avoiding the chance of an epidemic of small-pox, which, when it does occur, may or may not attack the child.

"It may be taken as proved that the syphilitic poison may be, and has been, introduced into the system of a previously healthy child by means of vaccination. But we know that leprosy is a constitutional disease, in many respects singularly resembling constitutional syphilis; like it, attended by stainings and diseases of the skin; like it, attacking the mucous membrane of the nose, throat, and mouth; like it, producing falling off of the hair, diseases of the nails and bones; and, like it, hereditary. Why should not the blood of a leprosy child, whether the leprosy be developed or not, contaminate a healthy one?

"It seems to me not merely a popular opinion, but a medical one also. In returning to Europe in the spring of this year, I met several medical men from Demerara and other tropical countries, and they all considered that leprosy might be, and is, propagated by vaccination.

"Such cases as the following are difficult to account for, unless one adopts the hypothesis that leprosy is contagious (and, if contagious, *a fortiori* inoculable). The daughter of a colonel in the army, who held a staff appointment in one of our tropical colonies, contracted leprosy while in the colony. There could be no hereditary tendency, for both the parents are English, and it could not have arisen from bad diet. The young lady herself was a creole, but I was not able to discover whether she had been vaccinated from a creole or not. When I called in to see her in England, the disease was so far advanced that nothing could be done for her.

"Four cases at this moment in this colony are whites, both of whose parents are Europeans."—*Royal Gazette, Trinidad, March 1, 1871.*\*

\*Since the above was written I have been informed by the father of one of the patients that Sir Ranald Martin, on being consulted after seeing the case, pronounced that the leprosy had been caused by vaccination.—*Footnote to Dr. Bakewell's Report.*

Dr. Bakewell was summoned on behalf of the Government to give evidence before the Select Vaccination Parliamentary Committee in 1871, and testified as follows (Answer 3563, p. 207 Official Report) :—"There is a very strong opinion prevalent in Trinidad, and in the West Indies generally, that leprosy has been introduced into the system by vaccination; and I may say that, as Vaccinator-General of Trinidad, I found that all the medical men, when they had occasion to vaccinate either their own children or those of patients in whom they were specially interested, applied to me for English lymph; and that was so marked that in one instance a man, who had never spoken to me before, wrote me quite a friendly letter, in order to get lymph from England when he had to vaccinate his own child. It is quite evident that the only reason for wanting lymph from England must be that they consider it free from contaminating the system by leprosy; because, of course, there is an equal chance, and probably a greater chance in England, of the lymph being contaminated by syphilis."

Question 3564 and Dr. Bakewell's answer (pp. 207-8) are as follows :— Q.—" Have you had experience of any case in which Leprosy has been introduced by vaccination?"

A.—" I have seen several cases in which it seemed to be the only explanation. I have a case, now under treatment, of the son of a gentleman from India who has contracted leprosy, both the parents being of English origin. I saw the case of a child last year, who, though a creole of the Island of Trinidad, is born of English parents, and is a leper, and there is no other cause to which it is attributable. Sir Ranald Martin, who is a great authority on these points, agreed with me that the leprosy arose from vaccination." \*

\*Since the above evidence was communicated, twenty years ago, Dr. Bakewell has availed himself of opportunities for extending his researches into the causation of leprosy in New Zealand, which have served only to confirm and strengthen his previous conclusions. In a paper read before the Auckland (New Zealand) Institute, 20th July, 1891, and printed in vol. xxiv. of the "Transactions of the New Zealand Institute," Dr. Bakewell observes that the inoculation of leprosy by means of vaccination is now exciting much attention, and he gives the results of his more recent Inquiries into the subject of vaccination, citations from which will be found in the appendix to this volume.

In a State paper addressed to Earl Granville, consisting of correspondence on the subject of leprosy, presented to both Houses of Parliament by command of Her Majesty, May, 1871, Dr. Bakewell refers to a boy, aged 15, brought from Guadaloupe by Dr. Brassac at the expense of the French Government, in which the disease was attributed to vaccination from a leprous source.

No notice seems to have been taken of this startling testimony by the Select Vaccination Committee in their Report; and it was not until the publication of Professor Gairdner's remarkable cases in the *British Medical Journal*, June 11, 1887, that further inquiry was attempted. In the same year Governor Robinson, of Trinidad, issued a circular to medical men in the Colony, referring to these cases. This letter contained the query, "whether the disease (leprosy) is communicable by vaccination, lymph from healthy vesicles alone being used." It is obvious that the form in which the question was submitted was, but little calculated to elicit the true facts. If "healthy vesicles" alone were used, it is clear that no disease, other than *vaccinia*, could result, and vaccination would be acquitted from a serious indictment, which was the evident intention of the experts who formulated the question. To discuss whether, and how far, impure lymph; or the arm-to-arm lymph in general use in countries like Trinidad, where leprosy is endemic, could convey leprosy, would have been to travel beyond the scope of the inquiry. To this circular twenty-seven replies were received, which may be summarised as follows :—

(a) Upon the matters of experience, two of the witnesses, Dr. Alston and Dr. Chittenden, do not clearly indicate how far their experience warrants them in expressing an opinion upon the question. Of the remainder, four, Dr. de Verteuil, Dr. R. F. Black, Dr. R. H. Knaggs, and Dr. Bevan Rake, appeal confidently to their own practice. The others do not appear to have had sufficiently extensive experience to warrant a conclusion.

(b) As to the communicability of leprosy by vaccination, two of the writers, Dr. de Verteuil, and Dr. Bevan Rake, consider that leprosy cannot be inoculated by vaccination, if pure lymph be used. Dr. Black is of opinion that leprosy can be inoculated, though lymph from healthy vesicles alone be used. All the others express themselves with uncertainty and hesitation, or else disclaim having an opinion worth expressing upon the subject. Dr. de Montbrun, senr., says that leprosy would not be inoculable if every medical practitioner selected very healthy infants, born from healthy parents, and used only the lymph which exudes spontaneously after the puncture of the vesicles. Hardly any of the witnesses refer to the notorious difficulty, not to say impossibility, of ascertaining what families are leprous; concealment, for prudential reasons, being the rule, as admitted by intelligent inhabitants in all the leprous districts I have visited. Dr. Robert Francis Black, who has resided sixteen years at Port of Spain, Trinidad, informed me that his attention had been directed to the subject, and he had not the smallest doubt as to the invaccination of leprosy. He replied to the circular as follows:--

76 Queen Street, Trinidad,

July 16, 1887.

SIR,—I have the honour to acknowledge the receipt of your confidential circular, No. 1818, dated 12th instant, and beg to state, for the information of His Excellency the Governor, that my experience of leprosy agrees with the statements of Professor W. T. Gairdner, of Glasgow, contained in your circular, and that I am of opinion that the disease in question is communicable by vaccination, lymph from healthy vesicles alone being used.

I myself have seen two or three cases of leprosy following vaccination, and have questioned the parents closely, but failed to ascertain or detect any family taint in either. Both the parents were respectively from Africa and China, the other was of creole parentage, but all the children were born here. With reference to these facts, I may mention here that, as far as I can recollect, the periods of incubation after vaccination were from two to three years; in fact, immediately after vaccination all were seized with obstinate cutaneous eruptions. As these were casual cases, I kept no memoranda, and as they did not return I lost sight of them, they probably concluding that it was hopeless to do so. I am also of opinion, for the reasons here stated, that arm-to-arm vaccination, at least in Trinidad, where leprosy is decidedly on the increase, is bad, as many very respectable families here are tainted with the disease, and nearly all the Portuguese have some member of their families actually diseased.

In conclusion, I may mention that I am also of the opinion that leprosy, like syphilis, tubercular phthisis, and cancer, is hereditary and contagious.

I have the honour to be, Sir,

Your obedient servant, R. F. BLACK,

Dr. C. B. Pasley, Acting Surgeon-General, etc.

Dr. Gairdner's cases are reported in the *British Medical Journal*, June 11th, 1887, with the following title: "A Remarkable Experience concerning Leprosy; involving certain Facts and Statements bearing on the, Question—Is Leprosy Communicable through Vaccination?" By W. T. Gairdner, M.D., LL.D., Professor of Medicine in the University of Glasgow :—

"The time seems to have arrived when, without injury or offence to anyone concerned, it is possible to bring under the notice of my

medical brethren some facts, and some inferences arising more or less directly out of the facts, in a case which occurred to me some years ago, but which I have found it necessary hitherto to deal with as involving matters of professional confidence not suitable for publication. Even now I shall deem it expedient to frame this mere narrative in such terms as shall not point to any definite locality, or to any recognisable person, among those chiefly concerned; although, by a formal certificate granted only the other day, I feel, as it were, absolved from the last tie that bound me, even under the most fastidious sense of professional duty, to reticence.

"Six or seven years ago, the parents of a young boy, fairly healthy in appearance, but with a peculiar eruption on the skin, brought him to me, and along with him a letter from a medical gentleman whom I had entirely, or almost entirely, forgotten, but who stated himself to have been a pupil of mine in Edinburgh considerably over twenty years before. It is unnecessary to enlarge on the particulars of this case, further than to state that, after more than one most careful examination, in which I had the assistance of my colleague, Professor M'Call Anderson, we came to the conclusion which we announced to the parents, that the boy was suffering from incipient, but still quite well-marked, leprosy in its exanthematous form; a diagnosis afterwards amply confirmed. What struck me at the time as most peculiar was, that this case, coming from a well-known endemic seat of leprosy (an island within the tropics) and with a letter involving medical details by a medical practitioner of many years' local experience—sent to me, moreover, for medical opinion and guidance—should not have been more frankly dealt with by a diagnosis announced even to the parents, before they left the island. The father of the child was a sea-captain constantly engaged in long voyages—for the most part between this country and the island alluded to. Both father and mother were Scotch, and there were several other children, all reported as quite healthy, as also were both the parents. Under these circumstances I wrote to the medical man—who in the sequel may be called, for brevity, Doctor X.—simply stating the diagnosis arrived at, and indicating the line of treatment proposed. The parents were informed that it would be best for the child to live in this country, and his mother agreed to remain with him accordingly. And, as they appeared anxious to have every available suggestion and advice, I mentioned the name of Dr. Robert Liveing as having given much attention to the subject, and offered to write to him if they would take the boy to London, as they appeared desirous of doing. Although I wrote to Dr. Liveing, circumstances unknown to me led to a change in their plans, and, instead of going to London, they went to Manchester, where I believe some physician was consulted, but I do not remember who he was. Ultimately, the mother determined for a while to settle in Greenock, and I placed her accordingly in communication with Dr. Wilson of that town, who for some time thereafter remained in medical charge of the case.

"Meanwhile, the course of post brought me in a few months a reply from Dr. X., not only entirely assenting to our diagnosis as communicated to him, but stating that he had been perfectly well aware from the first of the case being one of leprosy, but had deliberately chosen not to affirm the fact or even to allude to it in any way, either in his communications with the parents or in his letter to me. No reason was assigned for this (as it appeared to me) very remarkable reticence; but, as I did not wish to have the credit of having discovered for the first time what a gentleman so much more familiar with the disease might have been supposed to have overlooked, I took means to inform the parents of Dr. X.'s reply, and of his having been all along of the same opinion with regard to the disease as we were.

"After this the matter passed out of my mind, and for several years I neither saw nor heard of this child except accidentally and in a way entirely to confirm first impressions. About three years ago, however, while engaged in lecturing on specific diseases, and among others, briefly, on leprosy, I made an effort to find out something more about this patient. The mother had removed to Greenock, and had brought over the whole family to Helensburgh, where, as I learned, they were visited by Drs. Reid and Sewell, and from the latter I now learned that the poor boy had gone steadily to the worse, and was extremely feeble, covered with sores, and in a most deplorable condition physically, but still receiving every attention and care that constant medical treatment, with the most faithful and loving maternal nursing, could afford to lighten his sufferings. I accordingly proposed, within the next few days, a visit to my old patient, as a matter of satisfaction to myself. Unhappily there was no other apparent object, either as regards diagnosis or treatment, for a visit which was, nevertheless, very gratefully accepted.

"The case was now in the most advanced stage of leprosy, proceeding to mutilation of the extremities, and accompanied not only by external sores, but presumably by internal lesions, which had reduced the patient to the last stage of emaciation. It was on this visit that the curious particulars now to be related were first brought to my knowledge by Dr. Sewell, and afterwards confirmed by the statement of the mother, showing very clearly, though, of course, upon second-hand information to a certain extent, that Dr. X. had a very special reason for his extraordinary reticence in the first instance. Her husband, who in his frequent voyages had opportunities of coming into communication with Dr. X., had remarked to him how very strange it was that, even in writing to a medical man about the case, he had given no hint of his opinion about it. The Doctor's reply to this was, in the end, to the effect that he had kept silence because he did not wish to compromise a boy of his own, whom he (Dr. X.) believed to be a leper, and from whom he believed at the time that the boy he had sent to this country had become infected with the disease. He further explained that he had vaccinated his own boy with virus derived from a native child in a leprosy family, and, as I understood (though perhaps not definitely so stated) that leprosy had declared itself in the native child after the vaccination; and, further, that (using his own child as a *vaccinifer*) he had vaccinated our patient directly from him. Before sending the last-named patient away with his parents, he had satisfied his own mind not only that his own boy was leprosy, but that he had in this way become the source of the disease to another; but, the disease in his own child being in a very mild form, he was anxious not to disclose its existence. Meanwhile Dr. X. had died; his estate had passed into the hands of trustees; and I was informed that this reputed leper-boy had been, under the instructions of his father and his guardian, placed and retained at a public-school well known to me in this country, and that the boy was pursuing the usual course of a public-school education, in entire unconsciousness of the disease with which he was supposed to be affected.

"This information, so communicated, placed me in rather a difficult dilemma, namely—was I justified in taking steps to ascertain the truth of the story as regards Dr. X.'s boy, either by personal investigation or, at least, by inquiries conducted so as to result in a well-grounded and scientifically exact opinion as to the facts? And, further, supposing that such opinion should turn out to be that Dr. X.'s boy was a leper, was it a matter of duty on account of others to formally disclose the fact, be the consequences to the boy what they might? It was hardly probable that a boy generally known to be a leper would be retained permanently in any public school in this country, even had it been unquestionably a matter of medical doctrine that such a proceeding was quite safe. On the other hand, the boy was receiving the benefits of an English education at the express wish and on the responsibility of his father and guardian, and without (so far as appeared) any misgivings on the part of anyone. He was an orphan, and in what was to him a foreign land; his remaining under instruction might be, and probably was, a matter of the greatest possible importance to him. To bring him, therefore, even by an indiscreet inquiry, under the ban which in many or most countries still attaches to leprosy was certainly no part of the business of an outsider, and could only be justified at all by an overwhelming sense of duty to others.

"Under these circumstances I thought it well to consult, privately, one or two of those friends in London whom I believed to know most about leprosy, and among others Dr. Liveing, whom I was able to remind, at this stage, of my previous letter. These friends concurred in assuring me that, in the rather improbable event of their being personally consulted as to the retention of a leper in a public school (it being presumed, of course, that he was physically fit otherwise), they would have no hesitation at all in affirming that the other boys would not be endangered by such proceeding. As I happened to be very well acquainted with one of the medical officers (though not the ordinary medical officer) of the school in question, I communicated these opinions to him, and stated to him at the same time the extraordinary circumstances which had begotten, for me, such a lively interest in the son of Dr. X. In the course of a few days I was informed that an inquiry had been held by the medical staff; that the boy had been sent for and privately examined (though not ostensibly ill in any sense); and that it was, beyond all doubt, considered to be a case of leprosy. The medical authorities decided, however, that under the circumstances it was not their duty to sound the alarm, or in any way to disturb the boy's education.

"From this time onwards (except the death of the first patient soon afterwards) I heard nothing more of these matters till a few weeks ago, when I was asked to see Dr. X.'s son professionally on behalf of the school authorities; and, if so advised, to request Dr. Anderson also to give an opinion as to the present state of health of this young man, who happened at the time to be visiting some friends in Glasgow. It was represented to me that he had maintained, on the whole, fairly good health since I last heard of him through my medical friend, and had not been incapacitated from school work except on account of a contagious eczema which had been prevailing, and with which he had been affected in common with other boys. Apparently, however, the opinion had arisen that his general health was not quite so good, and that, in view of a cutaneous affection of this kind, apparently communicable, existing, it was no longer expedient that he should remain at the school. Indeed, I could not but come to the conclusion that his removal, on public grounds, had been practically settled; and with every desire to soften the blow as much as possible to the poor boy, it was felt to be necessary that his guardian, at least, should receive unequivocal and unbiased testimony as to the actual state of the facts and circumstances under which the decision was arrived at. Under these circumstances I saw and examined this boy, and made a report, along with Dr. Anderson, to the effect that the disease was evidently leprosy, though of a remarkably mild type, as shown by discolorations and cicatrices, and also by large, anaesthetic areas on the back of one limb. All breaches of surface, however, and all discharge had ceased at the time of our report, and Dr. Anderson felt still in a position to affirm that no danger to others could occur from the boy's remaining at school. On this last point I did not feel able to give an unqualified assent to my colleague's opinion; but as regards the matters of fact and observation there was no doubt whatever, and our report accordingly on these was substantially as above."

In further explanation Professor Gairdner, in a letter to the *British Medical Journal* August 8, 1887, says :— "In submitting to you some curious facts and statements which had been brought under my notice as bearing on the above subject ("Leprosy and Vaccination": *British Medical Journal* June 11, 1887)I was exceedingly careful not to obtrude any opinion of my own. It was clear from the first that the mere statement of such detail would waken up some old controversies, and would perhaps involve very serious practical issues; but these considerations did not appear to me to justify withholding the facts, but rather the public statement of them in as unbiased a form as was possible."

Referring to these cases, Dr. C. Burgoyne Pasley, Acting Surgeon General, Trinidad, observes :—" The fact remains, that an unlucky boy, of undoubted European parentage, acquired a most loathsome disease, and died a miserable death as the result of vaccination, carefully or carelessly performed as the case may have been."—*Papers on Leprosy, Government Printing Office, Trinidad. 1890.*

The same medical authority says :—" If by accident I draw blood in puncturing the vesicle on the arm of any child, I invariably reject the child as a vaccinifer, no matter how healthy it may appear, or how abundant the supply of lymph may be, fearing to inoculate any constitutional disease, leprosy, syphilis, etc."—*British Medical Journal* 1p. 270, July 30th, 1887.

A correspondent of the London *Daily Graphic*, writing from St. Kitts, 5th June, 1890, reports the following under the title of

#### "A SAD CASE."

"A sad case occurred here a short time ago, which shows the danger that arises from the practice of vaccination in an island where leprosy is treated as of no account. A few months ago a little girl, the daughter of the Rev. Mr. —, a Wesleyan missionary, who came to the West Indies from England two or three years before, fell ill. On examination by the doctors it was found that the poor child had contracted leprosy. The only probable means of communication was by inoculation; and thus the parents, endeavouring to save their

daughter from the very remote danger of small-pox, inoculated her with the horrible poison that will make her life a living death and herself a loathsome and repulsive, spectacle. Hoping that by returning to England he might get something done for his daughter, the missionary resigned his charge and made preparations for his departure. But a new trouble awaited him. The Royal Mail Company's steamers could not take a leper as a passenger; but one of Messrs. Scrutton's vessels agreed to take the sorely distressed family to England. They got on board, and started on their voyage. But ill luck again attended them, for, while leaving the island, and when nearly opposite their old home, the ship struck on a reef; and, although all on board were saved, the missionary and his family remain here, where they have been so sorely tried."

While in Trinidad, I made inquiries of a highly intelligent merchant, who has resided forty-three years in the West Indies, and has always been much interested in the public health. He says the belief is general in the islands that leprosy is being extensively disseminated by vaccination, and he furnished me with particulars of a number of healthy families where leprosy and other diseases have broken out after vaccination, of others who, in spite of a law enforcing vaccination, have preferred to undergo the worry and penalties of prosecution to the terrible risks of this hideous and incurable malady. In some instances the children infected with leprosy have been sent by their parents to France and England, where, after treatment by some of the most distinguished physicians, they have either succumbed to the disease or returned to die at home; and in one case the mother died of a broken heart on seeing her eldest son come back a complete wreck, loathsome to the sight. All the victims described by my informant were in good circumstances, and none were even sent to the Leper Asylum, where only the poor are interned. He says that had he kept a record he would have been in a position to have given details of very many cases, with all the attending circumstances, and adds, "I have come to the conclusion that we are indebted to vaccination for not only this (leprosy), but many other diseases, especially those of a scrofulous nature, as well as syphilis."

In a communication to the *Lazaretto*, St. Kitts, August 25, 1890, Dr. John Freeland, Government Medical Officer, Antigua, West Indies, says:--"In some of these islands leprosy has no doubt spread for the want of precautions to separate the diseased from the healthy, from poverty, overcrowding, or decomposed food, and from, I fear, the system of arm-to-arm vaccination which now so universally prevails."

The following letters, read before the Royal Vaccination Commission, from Dr. Charles E. Taylor, of St. Thomas, Danish West Indies, secretary and member of the Colonial Council of St. Thomas and St. John, member of the Board of Health, etc., illustrate the difficulties which obstruct the investigation into this momentous subject, owing to the dread which is generally felt by inhabitants of its becoming known that members of their family are tainted with this fearful malady, and probably also to an unwillingness to cast reproach on a prescription so extensively recommended by the profession as vaccination:--

St. Thomas, Danish West Indies

Virgin Islands, Jan. 2 1890.

DEAR Sir to your inquiry with reference to the spread of leprosy in the West Indies, I beg to say that it is difficult to obtain testimony with regard to this disease having been conveyed into families either by vaccination or otherwise.

There is such a dread of the hideous fact becoming known, and though parents will talk about such and such a case, when it is pushed home to themselves, and their evidence requested for public purposes, even so important as a Royal Commission, they beg to be excused.

My own experience has compelled the conviction that leprosy has on numerous occasions been propagated by the vaccinator's lancet in these islands. Children have been brought to me a year or two after vaccination who have shown unmistakable signs of leprosy, and whose parents assured me that such had never been in their family before. On the other hand, inquiry into the antecedents of the child from whom the lymph had been selected revealed the existence of leprosy taint either on the paternal or maternal side.

My own experiences have been confirmed by Dr. Bechtinger, formerly a resident and practising physician here, whose extensive researches entitle his opinion to great weight amongst pathologists.

The belief also, in the British West Indies as to the conveyance of leprosy in this way is widespread, and forms one of the strongest grounds against compulsory vaccination that I know of.

In view of such a fact, and in face of such a terrible danger it is my conscientious opinion that every physician should hesitate before subscribing to such a doctrine.

I have the honour to be,  
Yours very respectfully,  
CHARLES E. TAYLOR, M.D., F.R.G.S., etc.

A later communication from Dr. Charles Taylor is published in the *Public Opinion* of Nov. 27th, 1891.

It is dated :—

St. Thomas, Danish West Indies, October 20.

I have read the report of the evidence given before the Royal Commission on Vaccination in London with much interest, and with regard to the connection between vaccination and leprosy, an experience in these islands of over twenty years enables me to confirm the truth of this terrible indictment. On more than one occasion cases have come before my notice of leprosy in families which could

only have been inoculated with the vaccine virus, none of the family having previous to vaccination been afflicted with this malady. Leading dermatologists in all parts of the world, and the most experienced physicians in the West Indies, are of the opinion that leprosy is spread most readily by means of inoculation, either through a wound or an abraded surface, and still more readily by puncturing contaminated vaccine virus into the arms of healthy persons. The reports of the medical officers of health and physicians to the leper asylums in the West Indies show that leprosy, which thirty years ago was stationary or subsiding, has increased. This, I have every reason to believe, and it is also the opinion of other competent medical men, is coincident with the introduction and spread of vaccination, for there are a number of islands where the disease was almost unknown previous to its inoculation in this way. Were it not for the reluctance which all physicians, have to expose families tainted with leprosy, they could give evidence as startling as the cases mentioned by John D. Hillis, of British Guiana; Dr. Bechtinger, formerly of St. Thomas; Dr. R. Hall Bakewell; and Dr. Black, of Trinidad. The possibility of spreading such a dire disease by means of the lancet is one too grave to be longer disregarded, and, it is needless to say, a serious matter for these islands, the most lovely in the world, where children, whose parents may be the most healthy, are liable to leprosy through arm-to-arm compulsory vaccination. May I venture to hope that the English Press will have the humanity and courage to speak out and compel colonial authorities to withdraw the vaccination enactments, which on these grounds alone are so dangerous to ourselves and our families. CHARLES E. TAYLOR, M.D.

So great is the dread of the invaccination of leprosy and syphilis, that when I visited the island of Granada in January, 1889, a gentleman connected with one of the public institutions of the island told me that he had two unvaccinated children, and, that rather than incur the risk of invaccinated leprosy or syphilis, he had sent them with his wife to a place of refuge in the mountains. He was not sure, he said, whether this *ruse* would succeed, as the authorities were very sharp.

When I visited Barbados in January, 1889, Mr. E. Racker, the proprietor of the *Agricultural Reporter*, Bridgetown, informed me of a case of leprosy communicated by vaccination, which he had personally investigated. Mr. Racker was intimately acquainted with the father, a member of the Legislative Council, and on one occasion, when visiting his house, noticed that his friend's youngest child was afflicted with leprosy. The father said it was due to vaccination with lymph taken from a child subsequently discovered to be leprosy. Though he believed in the benefits of Jenner's discovery, he declared that there should be no more vaccination in his family. I may observe that so widespread is the belief in Barbados that leprosy and syphilis are communicated by vaccination, that every attempt to make it compulsory has been defeated. Nevertheless the advantage of vaccination is believed in by several men with whom I conversed, and there is a considerable amount of vaccination practised, to which I attribute no small share in the admitted augmentation of this disease before referred to. The hideous risk, attending the practice of vaccination is illustrated by the following letter of Mr. Racker, who writes .2nd May, 1890:—" I know all about the case reported in the *British Medical Journal* by Dr. W. T. Gairdner. I am one of the executors to the will of Dr. J. C., but I had no idea that the boy was suffering from leprosy until I .got a letter from the head master of Dollar, enclosing a letter from Dr. Gairdner.

"I think I told you how I once consented to have my children vaccinated, and how at the last moment I changed my mind, and would not allow them to be operated on, Well, that boy, Dr. J. C.'s son, was the one from whom they were to be vaccinated. What a narrow escape I had!"

Mr. Alexander Henry, Vice-Chairman of the Council of the British and West Indian Alliance, and formerly editor of the *St. Kitts Gazette*, who has resided some years in the West Indies, and has devoted much attention to the spread and causation of leprosy, writing 12th June, 1890, says :—" A medical officer of health cautiously admitted to me that leprosy was contracted by means of careless vaccination. Now, careless vaccination means vaccination from arm to arm, which is almost universal in these islands. I do not believe there is a doctor of any standing in the West. Indies who would deny that leprosy can be inoculated. It is admitted that owing to the slow incubation of the disease it is difficult to distinguish a leper; and when you take into account that medical officers are constantly complaining to the Government 'that they cannot get a supply of calf-lymph,' and add to this the indiscriminate and careless yet vigorous manner in which they carry out the vaccination laws upon an ignorant and simple people, who have no means of asserting themselves, I think we may safely conclude there is a high probability that leprosy is spread by vaccination."

When or how leprosy entered this island is perhaps unknown. Certain it is, however, that the dread disease has recently been advancing by leaps and bounds. In proof of its increase here I quote the following passage from a recent quarterly report of Dr. Alfred Boon, one of the Government medical officers and acting analysts of Government statistics. Dr. Boon says :—"The opinion that it is, as many hold, increasing in the island, is supported by the fact that in the four years 1885 to 1888 thirty-four such deaths were registered."

In a later communication received by me from Mr. Henry, dated October 8, 1891, he declares his conviction that vaccination is one of the chief factors in the spread of this fearful disease in the West Indies. After referring to the small-pox epidemic in Martinique, in 1887, and the consequent extensive re-vaccination propagated in St. Kitts, the writer proceeds :—" But, you may ask, how did that affect the labouring class, who are known to have a strong prejudice against vaccination, and among whom the disease of leprosy is most common? This is the incident to which I wish to draw your attention. There is in force in St. Kitts (and in most of the other islands) a law to compel all boatmen and porters to take out a yearly license. Now, it so happened that, at the time when the boatmen and porters required to renew their yearly badge, the small-pox was raging in Martinique, with, of course, the usual panic in St. Kitts. The boatmen and porters were informed by the Inspector of Police, or by his authority, that no one could have his license renewed unless he had been re-vaccinated that year. I need not point out the unspeakable dangers which such a system of indiscriminate—almost reckless—arm-to-arm vaccination exposed adults of the class among whom leprosy is rampant. In considering the medical aspect of the practice, you must bear in mind that the defence of the arm-to-arm vaccination by the medical officers is their

admission that it is almost impossible to obtain pure calf lymph in the islands. Can you wonder, then, that there should exist a strong prejudice and an unspeakable dread of vaccination among the lower classes in the West Indies?" In support of this contention, that the majority of the West Indian islanders fear the practice of vaccination, Mr. Henry adduces the evidence of the medical officers themselves :—" Dr. Gavin Milroy, in his 'Report on Leprosy and Yaws in the West Indies' (House of Commons Command Papers, c. 729) states on pages 32, 33, 'In the frequent conversations which I subsequently had with many of these gentlemen (the medical officers in the West Indies) I learned the fact that the European and most of the higher creole families were always extremely anxious about the source of the lymph to be used in the vaccination of their children, from the dread of a leprous taint being thus acquired. None of my informants appeared to partake of this belief themselves, but all recognised the propriety of avoiding the use of lymph from children of families known or believed to be afflicted, especially as infants themselves rarely, if ever, exhibit any outward manifestations of the malady.' "Dr. Milroy says that the Vaccinator-General, Dr. Bakewell seemed to give countenance to the *popular belief* as to the transmissibility of leprosy by vaccination."

Dr. de Verteuil, of Trinidad, in replying to the views of Dr. Bakewell, says (p. 34) that "it is necessary to take certain precautions. The vaccinifer should be healthy, and born of parents free from any syphilitic or leprous taint, and, as hereditary syphilis generally manifests itself after the age of four or five months, it would be as well to choose as vaccinifers children of five or six months and above." The only comment I need make on the "defence" of Dr. de Verteuil's is to point out that it is well nigh impossible to take the necessary and certain precautions to know if the vaccinifers are *leprous*.

Dr. Bowerbank, of Jamaica, in pp. 34, 35, says:—"I have frequently heard of a case of leprosy occurring in a family, alleged to have been the result of vaccination. I know of two instances in one family (a Jewish one), in which the parents and friends are thoroughly convinced in their own minds that such was the case. In Barbados we find a strong prejudice against vaccination, for Dr Browne writes:—"It has been a general rule not to vaccinate from the *apparently unhealthy*, or those of leprous taint, not so much from any opinion founded on fact of the possibility of conveying the disease, as *from respect to the general prejudice prevailing*. For the Leeward Islands, I refer you to a letter to the editor of the *St. Kitts Lazaretto*, 23rd August, 1890, by Dr. Freeland, Government Medical Officer of Antigua :—" In some of these islands, leprosy had no doubt spread from the want of precautions to separate the diseased from the healthy, from poverty, from overcrowding, or from decomposed food, *and from, I fear the system of arm-to-arm vaccination, which now so universally prevails.*"

Mr. Henry says that the only point on which medical men seem to be unanimous regarding leprosy is that, whether it is contagious or not, it is inoculable; and, after citing various medical testimonies, showing the connection between leprosy and vaccination, he observes :—" If ever a case was proved it is this one that there is a universal belief in the West Indies that leprosy is spread by means of vaccination. And I, for one, place far more reliance upon a popular belief of this kind, and especially upon this subject, than I place upon medical testimony, because the neighbours of a leper are far more likely to know when and how he contracted the disease: they know his pedigree, family history, and the whole condition of his life and its surroundings, whereas the medical officer simply pays a casual visit, and often does not hear or know of the leper till the disease manifests itself to such an extent that the leper becomes a burden and a danger to his relations and his neighbours.

"But what was the answer of the College of Physicians to the inquiry of the Chief Secretary of State for the Colonies, as to 'whether there was any ground for the belief that leprosy was spread by vaccination (in the West Indies)?' On page 86, same Report, in their answers and advice to Lord Kimberley:—" The College of Physicians feel they cannot press too strongly on your Lordship the importance of enforcing the practice of vaccination for the protection of those who are too ignorant to protect themselves.' As the people become a little wiser, they will be able to protect themselves from the prejudice of the College of Physicians."

#### SANDWICH ISLANDS.

Leprosy is a disease of relatively slow incubation. Children pronounced perfectly healthy, and represented as approved subjects both for vaccination and for vaccinifers, may, in a few months, exhibit the unmistakable signs of leprosy. In a report by Dr. Edward Arning, dated Honolulu, H.I., November 14, 1885, presented to the president and members of the Board of Health, p. 52, this distinguished observer says:—" The next point touches the vaccination question, with which I have dealt at length under the heading of experimental work. I would further urge that the medical examinations of school children, which have led to the elimination of quite a number of cases, should be kept up regularly and carefully. As an instance of their necessity, I may quote a case which has quite recently come under my observation. A little girl (native) belonging to one of our large schools passed my close examination a year and a half ago as healthy, but now presents initial symptoms of leprosy. We must not rely on general healthy appearance in these examinations, and on a furtive glance at hands and arms. I have found unmistakable marks of leprosy on the back of a child that held a recent health certificate. Moreover, we shall have to extend our examinations even to the very young children, in spite of Dr. Fitch's assertion that leprosy does not make its appearance before the period of second dentition. I have seen a child with clear signs of leprosy at three and a half years of age, and -know of another boy who was a marked case at four years old."

This eminent bacteriologist, in a letter before me, dated September 6, 1889, says:—" During my stay on the Hawaiian Islands for the bacteriological study of leprosy, I was naturally drawn to a scrutiny of the question whether leprosy is transmissible, and had been there transmitted by vaccination; all the more so as there is a general opinion prevailing on these islands that the unusually rapid spread of the disease about thirty years ago may possibly be attributed to the great amount of indiscriminate vaccination carried on about that period. And there is no mistake about the actual synchronicity of the spread of vaccination and of leprosy in the Hawaiian

Islands; but many a mistake is possible as to the real causal relation between the two.

"I could trace the first authenticated cases of leprosy back to about 1830, but the terrible spread all over the islands did not take place until very nearly thirty years later, at a time when an epidemic of small-pox had given rise to very general and very careless vaccinations throughout the group . . . . . attach far more importance to an instance of an increase of leprosy soon after vaccination on a much smaller scale, and during a much more recent period than the above. I have it on good authority that a very remarkable new crop of leprosy cases sprang up at Lahaina, on the island of Maui, about a year after most careless vaccination had been practised there."

The impossibility of detecting leprosy in its early stages is a matter of common notoriety amongst physicians, so that many who believe in the prophylaxis of vaccination refuse to incur the terrible risks involved by its practice in leprosy countries.

Dr. E. Kaurin, in "Notes on the Etiology of Leprosy," in the *Lancet*, January 25th, 1890, observes :—" We must bear in mind that the duration of the disease is much longer than is generally supposed. The patients, as a rule, take no account of the long prodromal stage, marked by indefinite subjective phenomena and temporary affections of the skin. The physicians themselves often overlook the early symptoms of the disease; indeed, it is sometimes impossible to form a diagnosis in the early stages. The whole period of the disease, from the onset to the time when distinct signs are noticeable, amounts to at least from three to four years."

Mr. H. A. Acworth, writing to me from the Municipal Commissioner's Office, Bombay, July 29th, 1891, says:—"I have plenty of lepers in my hospital here who could not be identified as such, unless they were completely stripped and examined by a trained eye."

Dr. Mitra, in his Report on Leprosy in Kashmir, refers to the recorded statistics of lepers, and says that the enumerators "might have overlooked many cases in the incipient stages," whereupon the Lahore *Civil and Military Gazette* calls attention to the consequent dangers of communicating organic or other diseases by means of vaccination.

Dr. E. Arning says :—" When in Hawaii I attended a German boy, aged 12, who suffered from leprosy, from whom, when he was seven years old, several white families had been vaccinated."—*Journal of the Leprosy Investigation Committee, February, 1891, p. 131.*

In the report of Dr. Webb, medical inspector, on the condition of the schools, April 1st, 1886, are recorded five-cases of incipient leprosy in the Royal School, and two in the Fort School, Honolulu.

Dr. F. B. Sutliff, of Sacramento, California, who has studied the disease as Government physician on the Island of Maui, says:—" I very seldom visited a school without excluding some (children), while the spots just beginning to show in others made it only too probable that they would not long be doubtful cases. It did not seem to me a difficult task to read the fate of Hawaii in the little dark faces that looked up from their books."— *Occidental Medical Times, April, 1889.*

In Dr. Arning's report, dated Honolulu, Nov. 14, 1885, p. 14, we read :—" Closely allied to inoculation is the subject of vaccination. You are doubtless aware of the very prevalent opinion among medical men that the unusually rapid spread of the disease may possibly be attributed to the great amount of indiscriminate vaccination which has been carried on in these islands. If my information is correct, unquestionably new centres of leprosy have developed after vaccination was practised and several old inhabitants have told me how they themselves used no precautions whatever in vaccinating during a small-pox scare.

"To bring some light on this moot point I vaccinated a number of lepers. The vaccination only took in three cases, one tubercular and two anaesthetic. Both the lymph and crust of the tubercular case contained the *bacillus leprae*; in the anaesthetic cases I could not detect it."

Dr. Arthur Mouritz, then Resident Physician and Medical Superintendent of the Leper Settlement, Mokai, in his Report for 1886 to the Board of Health, after alluding to contagious and hereditary predisposition, says:—" The third cause to which I attach some importance, and which has undoubtedly spread the disease, is vaccination. I can bring forward no case personally, but I have reliable hearsay evidence that after the operation of vaccination had been performed on several white children, they manifested signs of leprosy, and finally developed the disease. Evidence on this same point is put forward by Sir Ranald Martin in India, and by Professor H. G. Piffard, of New York, both reliable authorities."

An Appendix to the "Report on Leprosy" addressed to the Legislative Assembly of Hawaii, in 1886, is an interesting account of Queen Kapiolani's visit to the Leper Settlement at Molokai, by the Princess (now Queen) Liliuokalani, in July, 1884. Amongst other incidents, the Princess refers to an interview with one, Kehikapau, in the presence of several persons. - Kehikapau called the Princess's attention to the circumstance of his having contracted the disease from vaccination. He also mentioned that, through the same agency, all his schoolmates had died of the disease, induced in this way.

According to the Report of Surgeon J. R. Tryon, of the United States Navy, leprosy has spread "from year to year in Hawaii, and has increased to a marked degree since the indiscriminate and careless vaccination practised during the severe epidemic of small-pox in 1853." — *Medical and Surgical Memoirs, 1887, vol. 2, ft. 1252, by Dr. Joseph Jones, President of the State Board of Health, Louisiana.*"

In a summary of reports furnished by foreign Governments to His Hawaiian Majesty's authorities as to the prevalence of leprosy in India and in other countries, and as to the measures adopted for the social and medical treatment of persons afflicted with the disease (Honolulu, 1886), I find the following extracts, p. 238 and 239, from the *New Orleans Medical and Surgical Journal, April, 1880.*

After referring to the relation of leprosy with syphilis in the Hawaiian Islands, the author says :—"Vaccination was also inquired into. Alarmed by an invasion of small-pox in 1853, a general vaccination of the whole population was ordered, and physicians being at that time very few on the islands, non-professionals aided in the work.

"It is charged by some that, as a natural result of the labours of the heterogeneous force so appointed, not only syphilis, but also leprosy, was greatly increased. In my last circuit trip in my district, I found very few adults who had never been vaccinated. This involves the question of inoculability—in my opinion the main, if not the only, means of propagation other than inheritance—that is, like syphilis, it depends for its propagation upon the direct introduction of virus into the blood."

The fact that an increase in the practice of vaccination in leprosy countries is often accompanied by an increase in the dissemination of leprosy is shown by the following evidence :— Mr. George C. Potter the Secretary to the Honolulu Board of Health, writing to me on behalf of the President of the Board of Health, Dr. J. H. Kimball, in a letter dated Honolulu, H.I., June 1st, 1890, says :—" It is an opinion among the laity and some of the profession that the extensive arm-to-arm vaccination that was practised in the years 1852 and 1868 during small-pox epidemics was a prolific cause of the spread of leprosy" In a report of the Board of Health to the Legislative Assembly of 1886, by the then president, Mr Walter M Gibson, I read, p 35, "There are two more causes which, in my judgment, have had a great effect in the propagation of leprosy, or diseases closely allied to it, although, medically, it be a disease *sui generis*. The first was the ignorance of some of the early and unqualified medical practitioners who were permitted to spread disease broadcast, and to do irretrievable injury before retribution overtook them; but the second and chief cause was the indiscriminate and, to my mind, careless vaccination that began about 1868

Dr H S Orme, President of the State Board of Health, California, in an able memoir on "Leprosy: its Extent and Control," says:—" There can be no doubt that the lowering of the vital stamina of the race by the great prevalence of syphilis (at Hawaii) prepared them for the inroads of any disease that might threaten. During this period small pox also scourged the people, and in 1868 there began a general vaccination, in which virus was taken indiscriminately from human subjects. This reckless practice doubtless contributed greatly to the spread of both syphilis and leprosy."

In an article on "Personal Observations of Leprosy in Mexico and the Sandwich Islands," in the *New York Medical Journal* for July 17, 1889, the author, Dr Prince A Morrow, M A, says —"Vaccination is believed by the natives, as well as by many intelligent physicians, to be a potent agent in the rapid diffusion of leprosy through the islands It must be remembered that until recently vaccination was performed by unskilful persons, human virus was used, and no distinction was made between a healthy person and a leper as a vaccifer. The fact is incontestable that, after the general vaccination of the natives, numerous leprosy centres developed in various parts of the islands where the disease had previously been unknown. Arning demonstrated the plentiful presence of *bacilli* in the lymph and crusts of vaccine pustules in lepers."

In the *Archiv fur Dermatologie und Syphilidologie* for January, 1891, we read that at the Berlin Medical Congress of 1890 Dr. Arning read a paper on "The Transmission of Leprosy," wherein he scouts the idea of hereditary transmission. He proceeds to ask the question raised by the late Dr. Hillebrand, "Has leprosy been spread in the Hawaiian Islands by means of universal vaccination?" And he declares:—"There can be no doubt as regards the synchronousness of the diffusion of leprosy and the introduction of vaccination into the Hawaiian Islands.

"I am able to state—having excellent authority for so doing, though, unfortunately, no statistics—that a very remarkable accumulation of fresh leprosy cases took place in 1871-72, in a place called Lahaina, on the Island of Maui. This happened about one year after a universal arm-to-arm -vaccination, which had been most carelessly performed. About fifty to sixty cases occurred suddenly in this locality, which up to that time had been comparatively free from the disease."

Dr. Arning concludes :—"Arm -to-arm vaccination should be prohibited in countries in which leprosy abounds."

When, during my visit to -Honolulu in October, 1890, it became known that I was seeking information concerning the spread of leprosy, in the interest of the public health, and not to support any medical theory or foregone conclusion, several gentlemen who had devoted much attention to these subjects called upon me, and others gave me introductions to those who were conversant with them. The President of the Board of Health, the Hon. David Dayton, and the Secretary, Mr. Potter, afforded me valuable assistance, and supplied me with copies of their various official reports relating to the introduction and dissemination of leprosy and the methods adopted for dealing with the scourge, which, with other European diseases, bids fair, unless arrested, to destroy the entire native race. They incidentally showed me copies, cut from the Press, of my own communications on the subject of leprosy and vaccination in the West Indies, thus illustrating their desire to inform themselves upon the subject by evidence from all quarters of the globe.

I have, in this monograph, made free use of the facts and testimonies contained in these important official documents, and I take this opportunity of expressing my thanks for the courtesy' and information furnished by the gentlemen connected with the Board of Health, resident physicians, the Executive Officers at Molokai and Kalihi, and members of both Houses of the Legislature.

According to all the evidence which I have been able to obtain, leprosy was unknown in the Sandwich Islands until many years after the advent of Europeans and Americans, who introduced vaccination ; and there is no aboriginal word in the Hawaiian language for this disease. Mr. Dayton, President of the Board of Health, says that the natives, having no words of their own, used the Chinese words *maipake* ?—" what is this disease?"

In Captain Cook's time (1770-79 ED) these islands were supposed to contain a population of 400,000 at the present time they do not number more than 40,000, and are rapidly diminishing. In all quarters, both native and European, lay and medical, among members of both Houses of the Legislature, I found the belief all but universal that leprosy was considered to be communicable, and that the propagation of the disease during the last twenty-three years was largely due to vaccination.

One medical authority told me that he had no doubt that the disease was inoculable and spread by vaccination, but he did not think it would be prudent to disclose the fact amongst the natives, as he would not be responsible for what they would do. He expressed his own convictions freely on the subject, which are confirmed by Dr. Edward Arning's inoculation experiment on the condemned convict Keanu, of whom he gave me a photograph, showing the development of the tubercular form of this disease. No other intelligent resident shared the fear of such an exposure, the incriminating facts having already been acknowledged both in the official reports and in various communications by medical practitioners to American medical journals. On the contrary, when it became known that I was there not to institute experiments but to collect facts in the interest of those afflicted people, I was urged by influential citizens, and particularly by members of the Legislature, to do what was possible to make known the evils under which they suffered, and to bring an enlightened public opinion to aid them in putting an end to a mistaken medical procedure, which had led to such disastrous results. One of the gentlemen who besought my intervention was Mr. J. Kalua Kahookano, a barrister-at-law, and representative of North Kahala, Island of-Hawaii (the largest in the Archipelago), who introduced a bill (July, 1890) in the Hawaiian Legislative Assembly to repeal the vaccination laws. This bill was supported by a petition from Mr. Kahookano's constituents, showing how leprosy, syphilis, and other diseases had been scattered broadcast in these islands by means of the vaccinator's lancet, and new centres of the diseases thus established. The truth of this fearful indictment is now admitted by several medical practitioners of high standing, who have visited the islands to study the cause of the rapid spread of this destructive malady.

Amongst other old residents who kindly volunteered information was Mr. H. G. Crabbe, a member of the Upper House of Legislature, who had resided in the islands for forty-three years, and had always taken an active interest in the public health. He said it was time that the true facts concerning the propagation of this disease in Hawaii were made known, as the people were being decimated by leprosy conveyed to the blood by vaccinators. Mr. Crabbe detailed various facts in proof of this serious charge, and expressed the utmost anxiety that the truth should be made manifest in countries where public opinion was a potent factor for the wellbeing of the community. He had met with many cases of leprosy clearly traceable to vaccination in the islands, and the facts were admitted by those who, like himself, had taken the trouble to investigate them; but the evil was being perpetuated by those who ought to know better, partly through apathy on the part of the authorities, and partly through the ignorance of the natives, who accepted whatever kind of vaccine virus was most handy when wanted for use. Mr. Crabbe was a believer in vaccination as a prophylactic against small-pox, but considered that, as at present administered, it was a most cruel and mischievous infliction upon a confiding population.

In a statement handed to me by Mr. Crabbe, dated Honolulu, Hawaii, Oct. 22, 1890, the writer says:—"In the year 1866 there was an indiscriminate vaccination of young and old amongst the natives; this vaccination was compulsory, but, thank heaven, I did not allow my children to be vaccinated with the common herd. From that time the leprosy cases became more frequent; many natives who had previously been healthy were afflicted with leprosy. The spread of the loathsome disease was more pronounced in the years following this indiscriminate vaccination. I can recall one case in particular of a native girl by the name of Kapeka, as healthy and as nice looking as 'tis possible for a native to be, who was forced to be vaccinated in the year 1866. In the year 1871 or 1872 Kapeka was sent up to the Molokai Leper Asylum by order of Dr. Robert M'Kibbin. In this particular case I have always contended that this girl was inoculated with the germs, not only of leprosy, but also of syphilis, from this fact. Long before she exhibited any signs of leprosy (some three years), if she hurt herself, so as to make an abrasion of the skin, the place would inflame and suppurate, and would take a long time in healing, presenting an appearance like a syphilitic sore. She died at the Leper Settlement."

The appropriation by the Government for the Molokai Lazaretto is £10,000 a year—a large sum for a poor and comparatively thinly populated country. During the past twenty-five years, about a million and a quarter dollars have been expended by the Hawaiian Government in making provision to benefit these afflicted people. It is, however, melancholy to reflect that one source of the dissemination of the disease, viz.—vaccination, is still permitted, and, there is reason to believe, is encouraged both by the misguided Government and, notably, by certain official members of the medical profession. The latter have inherited such a deeply-rooted prejudice in favour of the merits of the Jennerian practice as to blind them to its destructive potency in countries where leprosy is endemic. The great majority of medical practitioners take their views from the medical journals, which most unfairly refuse to give their readers the adverse side of the Jennerian practice.

Notwithstanding the evidence of the disastrous results of vaccination in spreading and establishing new centres of leprosy, we are told in the "Biennial Report of the President of the Board of Health to the Hawaiian Legislature for 1888" (in which the depopulation of the islands, and the spread of leprosy, is frequently referred to) that "the work of vaccination has been pushed with vigour;" and, "The Board would recommend the passage of a more stringent law, imposing heavier penalties and giving the vaccination authorities all necessary authority."

In his remarkable work, "Traite Pratique et Theoretique de la Lèpre," p. 306, Professor Henri Leloir refers to the introduction and progressive increase of leprosy in the Sandwich Islands, and states that vaccination, compulsory and *en masse*, contributed to the spread of the disease.

Coincident with the activity with which vaccination has been extended in Hawaii, there have been several very severe outbreaks of

small-pox. In the year 1881, according to official reports, 500 persons died of smallpox, a large majority of whom had been vaccinated. Each of these epidemics has been accompanied by a more stringent enforcement of vaccination, and has been followed by the development of new centres of leprosy and the more rapid spread of this destructive scourge.

## BRITISH GUIANA.

In the pursuit of my inquiries in British Guiana in 1888-89, the public librarian, Mr. Rodway, expressed himself much interested in the subject of leprosy, which, considering the remarkable increase of the disease in that colony, has been neglected of late years. He called my attention to a work entitled "Leprosy in British Guiana," by a careful scientific observer, Dr. John D. Hillis, formerly Superintendent of the Leper Asylum in that country. Mr. Rodway said this was regarded as the standard work on the subject. From it I extract the following particulars of invaccinated cases

Case IV., p. 30.—*Confirmed Tubercular Lepra, supposed to have been contracted by Vaccination.*—Joseph Francis C—, a fair Portuguese, born in Demerara, now aged twenty years. His parents are alive and healthy. He has been suffering for the last ten years from tuberculated lepra. He has a sister, aged eighteen years, at present (1879) an inmate of the asylum, suffering from the same form of leprosy. They were both admitted on July 30th, 1877, from Murray Street, Georgetown. They have three sisters and one brother, who are alive and well. Our patient, J. F. C—, and his sister were vaccinated with lymph obtained from a member of a Portuguese family, ("It is within the knowledge of Dr. Manget, surgeon-general, and the author, that this family are at present afflicted with tuberculated lepra.") in whom leprosy was afterwards found to exist. They were the only members of the C— family vaccinated with this lymph. Within 18 months of the performance of the operation by Dr. —, a reddish brown spot appeared on the inner side of the right thigh, preceded, it is stated, by some constitutional disturbance. This spot was raised and tender, accompanied by profuse sweating all over the body, and remained for some time. Subsequently other spots made their appearance on the right buttock (which disappeared shortly after), between the shoulders, and on each cheek. They were all ushered in by more or less well-marked febrile symptoms. A red patch next appeared on the forehead, and epistaxis set in, periodically occurring to this day. Tubercles then made their appearance on the face, the other patches continuing to increase in thickness and roughness, and forming tubercular infiltration."

"The latter was removed by gurjun oil, under which treatment many of the symptoms were ameliorated." State and condition on November 30th, 1879 :— "He has a light brown irregular patch on the front of his chest; this had been larger, thicker, and mahogany-coloured, and has evidently undergone partial absorption. There is a patch of tubercular infiltration on the back of the arms, and at the back of the elbows. The fingers are swollen, shining, and dark-looking, a solitary tubercle forming on the back of the hand. The swollen condition of the fingers and hands is very characteristic. There are two tubercles on each cheek the size of marbles; the lobes of the ears are thickened, and a tubercle is forming on the upper lip.

"There is no appearance of hair growing on the face. There are reddish-brown discolourations on the front and back of the legs. There are a few small scattered tubercles on the dorsum of the feet, and the lower parts of the legs are swollen and hard to the touch. There are tubercles on the scrotum, an ulcer on the leg where a tubercle has ulcerated, and the larger tubercles are slightly anaesthetic. This young man is one of the carpenters of the Institution; he is in hopes the treatment now being adopted may arrest the disease, which is, however, making slow but sure progress."

On page 191 of Dr. Hillis's book, a passage is cited from the work of Dr. Vandyke Carter (p. 178), one of the greatest authorities on the disease, in which vaccination is instanced as one mode of communicating leprosy. On page 192, we read :—" The subject of leprosy was brought forward at the stated meeting of the New York Academy of Medicine, January 20, 1881, in a communication by Dr. H. G. Piffard, in which the author, who is not himself a believer in the contagiousness of leprosy, states :—' A review of the evidence bearing on the contagiousness of leprosy led the speaker to the conclusion that this disease, like syphilis, is not contagious by ordinary contact, *but it may be transmitted by tile blood and secretions. Vaccination may transmit it.*"

A case in the speaker's own experience was cited in proof of this."— *The Medical Record, February 19, 1881 p 212.*

Sir Ranald Martin states :—" The dangers to Europeans arise chiefly from vaccination and from wet-nursing. I felt that very early in my career in India and I took the precautions which are here recorded. I saw an English lady last year in a horrible condition (she said) from having been vaccinated from a leprous child." — *Leprosy in British Guiana, by Dr. Hillis, p 182.*

On page 208 we read :—" I have already given some cases in which there could be no reasonable doubt but that the disease was produced by vaccination with tainted lymph. Those of the brother and sister mentioned are conclusive on the point, and we have the testimony in favour of this mode of propagation from such men as Tilbury Fox and Erasmus Wilson. I will therefore conclude this chapter with a case from the work of a recent writer, Dr. Piffard, of New York " :—" Case III.—William T—, aged 25 years, was admitted into Bell Hospital in May, 1864. He was of English parentage, but was born and passed his early life in British Guiana. After vaccination, performed when young, his arm became greatly swollen and inflamed, and large sloughs separated. Investigation revealed the fact that the vaccine virus had been taken from a negro whose mother was a leper. At the age of seven years some brownish spots appeared upon his back and arms; and at the age of eleven a blister formed on the palm of the right hand, followed by permanent contraction of the flexor tendons. A few months later he felt a tingling sensation around the nail of the right index finger, followed by a line of suppuration and loss of the nail. The finger soon healed, but the same morbid process separated itself in the other fingers of the same hand. After a few months, according to his statement, the skin of the distal phalanges split, and the flesh shrank away from the bones, leaving them exposed. The bones separated at the joints, and the stumps healed. These various processes occupied eighteen

months or two years.

"The disease then affected the distal phalanges of the left hand in the same manner. After this it attacked the right foot, and a slough formed over the lower part of the instep. The great toe then became swollen, the skin split, and its distal bone separated; then, without much regularity, the remaining phalangeal bones of fingers and toes necrosed and came away."—*Diseases of the Skin*, p. 209.

"On examination," adds Dr. Hillis, "the patient was found to have *maculae* or other spots, and anaesthesia of the parts affected."

On the 31st March, 1890, I wrote Dr. Hillis, referring to the cases of invaccinated leprosy mentioned in his book, and asked if he could furnish me with any other facts, and whether he would be willing to give evidence before the Royal Commission. To this I received the following reply:—

134 Leinster Road, Dublin, 2nd April, 1890.

DEAR Sir,—Yours to hand. I have no further reliable evidence as to the transmission of leprosy by vaccination than that contained in my book. These cases, however, may be relied on. I got the particulars from the medical man who performed the vaccination in question, and the parents of the children. I enclose a reprint from *Timehri*.—I am, Yours faithfully, -JOHN D. HILLIS.

Wm. Tebb, Esq

*The British Medical Journal* of November 5, 1887, contains a letter from Dr. Hillis, repeating his conviction as to the communicability of leprosy by means of vaccination. Dr. Hillis says he has had more than twenty years' experience of the disease (leprosy), and half of this time he was superintendent of the largest leper asylum in the West Indies. In this remarkable work, Dr. Hillis quotes Dr. George Hoggan, whose testimony I have adduced, as an authority on the subject of leprosy, and few persons have had greater opportunities of studying the pathology of this disease.

In a recently published work by the late Archdeacon Wright, entitled "Leprosy an Imperial Danger" (Churchill, 1889) the writer, p. 85, reluctantly admits the danger of leprosy vaccination. "Much, very much," he says, "seems to imply that leprosy can be communicated by inoculation, and is communicated by vaccination."

Dr. C. F. Castor, the Medical Superintendent of the Leper Asylum, Mahaica, British Guiana, in his report for the year 1887, p. 43, says :—"Another manner in which the disease (leprosy) may be produced in the healthy with no taint is vaccination. This seems a most probable means of communicating the disease, nor can there be any doubt, I fancy, after reading the admirably recorded case by Professor Gairdner, of Glasgow, in the *British Medical Journal* of the 11th June, 1887. Dr. Rake, of Trinidad, disputes the obvious conclusion of the professor, and marshals a number of facts that do not in any way, to my mind, overthrow the fact that in that case vaccination was the cause of introducing the disease in the child."

Again, in paragraph 86 of the same report, Dr. Castor says :—" I have noted these points because I consider they are important, and as needlessly obscuring a palpable fact which should be made known far and wide in countries where leprosy is endemic and widespread, as with us, that there is every certainty of inoculation through vaccination."\*

\*Since the above was written Dr. Castor has given evidence before the Royal Commission on Vaccination (December 2nd. 1895), and in some particulars modified this opinion as to the danger of communicating leprosy by means of vaccination. In an article in No. 4 of the "Journal," December, 1891, in reply to my evidence on this subject before the Royal Commission, p. 4, Dr. Castor observes:—"The opinion expressed that vaccination from a tainted source will produce the disease is, I believe, a true one." Surgeon Brunt, R.N., testified, March 2nd, 1892, before the Royal Commission, to actual cases of invaccinated leprosy within his own experience. Positive evidence and a body of unimpeachable facts cannot be set aside by wavering and contradictory statements like those of Dr. Castor.

The dread of communicating leprosy at Georgetown by means of vaccination is very general, and, as a consequence, the vaccination laws are, to a large extent, inoperative. Dr. Robert Grieve, Surgeon-General for British Guiana, in his report for 1887, referring to vaccination, p. 7, says :—" In the beginning of the year vaccination, which had been carried on energetically in the latter part of 1886 in Georgetown, came practically to an end, owing to the unwillingness of the people to bring their children for the purpose."

On inquiry from both medical practitioners and intelligent residents, I found that this objection was mainly due to a wholesome dread of infection of leprosy, when the vaccination was performed with arm-to-arm virus, and of syphilis with various cutaneous eruptions, when imported lymph was used.

In the "Report on Leprosy and Yaws in the West Indies," by Dr. Gavin Milroy (House of Commons papers, C 729), the Surgeon-General of British Guiana says (p. 33) :—" As far as my own opinion goes, I am inclined to believe in the possibility of such communicability—i.e., of leprosy by means of vaccination. There is no objection in Guiana to vaccination, if the parties know the children from whom the lymph is to be taken." But against this there is the testimony of Drs. Hackett, Watkins, Stevenson, and Allison, who state that vaccination has hitherto been practised to a very limited extent among the lower classes in Guiana. Dr. Allison says that "this is principally, if not entirely, due to the difficulty of obtaining vaccine lymph ;" while Dr. Stevenson admits (p. 35) that "the prejudice of the lower classes against vaccination, on account of the supposed communicability of leprosy by it, was, until the recent epidemic of small-pox in Trinidad, insurmountable."

## UNITED STATES.

The origin of various recent outbreaks of leprosy in the United States is veiled in obscurity, only because medical men do not know where to look for it; though they have admitted that, since the discovery of the *beth/us leprce*, vaccination appears to be the most probable cause. Reluctant to impugn the Jennerian practice, and with opportunities at command, they have preferred to extend their researches in other directions.

Dr. H. S. Orme, President, State Board of Health, California, considers the ordinary explanations given to account for the dissemination of this disease inadequate, and observes:—" Not heredity, nor syphilis, nor endemic conditions, could have given rise to the group of sixty cases in the village of Spain; to the outbreaks in New Brunswick and Cape Breton Island; to the sixteen cases at Charlestown between 1846 and 1876; to the forty-two now at New Orleans, or to the two at Galveston. It is often impossible to trace the source and mode of contagion, but the same is true with all the disorders whose contagiousness is disputed."---*Leprosy: its Extent and Control*, p. 29.

In the "Transactions of the Medical Society of the State of California" for 1890, vol. XX., Dr. Orme, referring to the general vaccination of the people of the Sandwich Islands in 1868 with human lymph, consequent upon an outbreak of small-pox, says:—" This reckless practice doubtless contributed greatly to the spread of both syphilis and leprosy."

"At a meeting of the New York Academy of Medicine, June 6, 1889, Dr. Prince A. Morrow gave an account of his personal observations on Leprosy. Referring to his visit to the Leper Asylum at Molokai, he said he considered it probable that a number of the cases which had arisen in the Sandwich Islands had been caused by impure vaccine."—*British Medical Journal*, Aug. 31, 1889.

Dr. T. B. Sutliff of Sacramento, California, has sent me the following narrative of a case of invaccinated leprosy, contracted in California :—" Boy, native of California; never been out of this State; no family history of any constitutional disease; was well until about eight years ago; was then vaccinated. The arm became very sore, and was swollen in its entire length. An abscess formed in the axilla, and subsequently broke, discharging pus freely. Recovery ensued, the arm becoming well again. Soon after it was noticed that there were numerous patches of 'ringworm' on the body. This condition continued for several months. Several persons, himself included, were vaccinated by the father directly from the boy. The father, and one other of the persons vaccinated, subsequently had 'ringworm.' The father has since had 'tetter' from time to time. One year after vaccination the boy's ears became slightly enlarged. The nose was noticed to have become broadened, and tubercles formed on it and on other parts of the face.

"The ears are markedly enlarged, the nose broadened, and the *alce* are thickened. The hands show the disease quite plainly, the fingers being clubbed. There are a few small ulcers. There is a sore on the shoulder. The feet are beginning to be affected."

In the report of Dr. H. W. Blanc, Professor of Dermatology and the Chief Sanitary Inspector for the city of New Orleans, November 27, 1889, addressed to the President of the Board of Health for the State of Louisiana, where leprosy has been provokingly prevalent, it is stated that leprosy, syphilis, and tuberculosis are transmitted by vaccination. Dr. Blanc says that, "in his two-fold capacity of Dermatologist to the Charity Hospital of the city and Chief Sanitary Inspector of the city, he has had unusual opportunities for the study of leprosy and vaccination. During the past eight years he had observed over sixty cases of *bona-fide* leprosy (anaesthetic and tubercular). The disease is slowly increasing, it is inoculable and communicable by vaccination, and humanised virus should be avoided. Most of the vaccinations are performed by me and my assistants, and I will not on any account allow humanised virus to be used."

*The Occidental Medical Times*, Sacramento, California, of September, 1890, publishes "An Interesting Case of Anaesthetic Leprosy apparently following Vaccination," by Sidney Bourne Swift, Resident Physician, Leper Settlement, Molokai, H.I., and D. W. Montgomery, Professor of Pathology and Clinician for Diseases of the Skin in the Medical Department of the University of California. The writers say that "one of the most interesting points in this case is that Peke (the leper) had been vaccinated one year before developing symptoms of leprosy, and that the vaccination scar became anaesthetic. Might it not be that with the vaccine virus the virus of leprosy has also been inoculated?"

This question is answered by Dr. Chr. Uronwald, Chairman of the Sanitary Committee on Leprosy, Minnesota, Wisconsin, U.S., who says in the official report of the State Board of Health, "Vaccination has undoubtedly originated leprosy."

In a paper read before the California State Medical Society, in 1881, Dr. A. W. Saxe gives an instance of three children in Honolulu, born of American parents, who became lepers.

In consequence of the serious development of leprosy in Hawaii, there has arisen, during the past two or three years, a determined opposition to vaccination, to which the increase of leprosy is naturally attributed. The President of the Board of Health, the Hon. David Dayton, in the Report to the Board of Health, Honolulu, for 1892 (p. 27), says "that notices were inserted in the newspapers offering vaccination, but there were no applicants." In the same report (p. 67) Dr. R. B. Williams, Government Physician for Hilo and Puna, Hawaii, says:—" There is among natives great prejudice and opposition to vaccination. . . . Hence voluntary vaccination is almost impossible." The existing law renders vaccination obligatory upon all the inhabitants of these islands, and has heretofore been enforced with great rigour, particularly during outbreaks of small-pox. During the past two years it appears to have been relaxed, and objectors have been humanely suffered to escape the dreaded ordeal. It is interesting and instructive to note the result. On page 41, the President of the Board of Health, observes :—" On December 31st, 1890, there were 1213 lepers in the custody of the Board, that being the

highest number ever reached; and on March 3 1st, 1892, there were only 1115, a decrease of 98 during the period." A recommendation is thrown out in the report, that the vaccination law should be amended, as the present laws are entirely unsuited to the times. In view of the evidence brought before the Royal Commission on Vaccination in London, showing the futility of vaccination as a preventive of small-pox, and its fertility in disseminating every inoculable disease, the only reasonable alteration in the vaccination laws that will be acceptable to an enlightened public opinion is their entire- and permanent abrogation.

Personally I have heard of many cases, which I have no doubt have been due to leprosy vaccination. There is, however, it is to be regretted, manifest reluctance on the part of the profession to look for causation in this direction; it is generally pooh-poohed as soon as mentioned; and when it appears to be the only way of accounting for a particular case, the attending physician prefers to hold his peace rather than discredit a practice which he has been educated to believe is the greatest discovery in the history of medicine. Professor Gairdner, of Glasgow, introduces his cases of invaccinated leprosy in the *British Medical Journal* with an apology and evident reluctance.

It is generally admitted that, given the right conditions as to environment, temperament, or idiosyncrasy, all bacterial diseases are transmissible from one human being to another; and as no single authority that I have met with, since the discovery of Hansen, pretends that leprosy does not belong to this category, the danger of vaccination is obvious. I am aware that this objection is attempted to be met by the introduction of animal lymph; but animal lymph is admitted to be too active, especially in tropical countries, to be used direct; and in general, therefore, it is available only after one or two removes, when it carries with it diseases both animal and human, as has been shown in evidence before the Royal Commission on Vaccination.

#### BRITISH INDIA.

An uneasy feeling is beginning to be exhibited in India on this momentous subject, owing to the accumulation of -evidence tending to show the sinister connection between the extension of the State-provided remedy against small-pox and leprosy. The synchronicity between the spread of leprosy and the extension of vaccination has given rise, in some districts, to such a dread of vaccination, that every device is resorted to by thoughtful parents to prevent their children being vaccinated. Attempts have been made to remove the dread of leprosy inoculation by the substitution of cow, calf, sheep, lamb, and donkey lymph; various compounds (one described by the medical purveyor as the Madras paste, and another as Lanoline) have been introduced; and some of the leading journals now energetically demand a safer and better system of vaccination. Dr.N. Boral, Chief of the Vaccine Department in the Jubbulpore district, has come to the rescue of the Jennerian *cultus* in the columns of the Allahabad *Morning Post*, but he sees clearly the weight of the incriminating testimony, and admits that to deny- the possibility of vaccinal syphilis or vaccinal leprosy would be tantamount to denying the value of human testimony altogether.

The authorities in India are well aware of the widespread repugnance to vaccination in that country, and of the cause of this repugnance, in the mischievous results known to every vaccinator; but all mention of these evils is carefully omitted in their official reports. Now, however, that the dangers attending the most carefully conducted vaccination have been so fully disclosed in the voluminous evidence taken before the Royal Commission on Vaccination, the culpability of such reticence is inexcusable. *The Statesman*, of Calcutta, August 22, 1891, commenting upon the "Resolution on the Statistical Returns of Vaccination in Bengal for 1890-1," in the *Calcutta Gazette*, August 21, 1891, observes:—"It has been stated that one of the greatest objections to vaccination among the natives of India, and other Oriental peoples, is that diseases such as leprosy, and other terrible blood diseases, have been inoculated with the vaccine virus. We think that some opinion should have been expressed under this head, and the omission of it is to be regretted in what is supposed to be a report given for the general edification of the Government as well as the public." And in a leading article, November 22, 1891, this same influential Indian journal, referring to leprosy vaccination, observes:—"There seems to be no possible room for doubting the reality of the very grave danger to which attention is drawn. . . . . It is notorious that inoculation, that is, the direct introduction of the virus into the blood, is the chief, if - not the sole, means by which leprosy is communicated. Throughout the greater part of Europe, at least, and in all the principal British Colonies and Dependencies, including India, vaccination is not merely the most common means of inoculation, but in most of the countries in question it is a means which, practically, is universally adopted, and enforced by legal penalties. It seems, then, to follow, almost of necessity, that, unless special precautions are taken to prevent so terrible a calamity, leprosy, wherever it prevails in these countries, must inevitably, in a certain proportion of cases, be communicated through the medium of vaccination. . . . When vaccination from the human subject is practised, it is quite possible that, in a few generations, it might lead to an enormous multiplication of cases, and that without implying any want of ordinary care on the part of operators. For it should be remembered—and herein, it seems to us, lies the real gravity of the danger—the disease is not one that commonly shows itself in infancy. The child from whom the lymph was taken might, to all appearance, be perfectly healthy, and yet its blood might be infected with this fatal and loathsome poison, and the operation thus make it a focus of contagion."

*The Calcutta Daily News*, August 7th, 1891, referring to the allegations that vaccination is responsible for the transmission of insanity, leprosy, and other diseases, observes :—"The question is an important one; and while it is a great gain to humanity to even modify such a scourge as small-pox, it is largely discounted by the consideration that immunity from it may be purchased at the price of other diseases as bad or worse than that affliction itself."

*The Bombay Guardian* of April 6th, 1889, commenting upon the spread of leprosy by vaccination, observes :—"If we have to choose - between the danger of leprosy and small-pox, let us by all means have the latter. The ghastly sights to be seen in every Indian public thoroughfare, of the scabious, handless arms, and footless legs of begging lepers, forbid any other alternative. Small-pox is bad, 'but

leprosy is a hundred times worse."\*

\* *The Indian Spectator*, Bombay, December 27, 1891, in a leading article, calls attention to a strong reaction that has set in against vaccination, and points out that the opponents of the Jennerian method of preventing small-pox contend that vaccination is answerable for much of the spread of leprosy in recent times, and that this view, which has the support of men considered as high authorities on the subject, is of vital importance. The article concludes by observing that "The Leprosy Commission seem to have thrown away a fine opportunity in omitting to direct its researches into the alleged connection between vaccination and leprosy."

When similar charges have been made against vaccination in Europe, the usual course of the official propagandists is to ignore the terrible indictment as long as possible, and then, when questioned in Parliament, either to minimise its character and attribute the results to other causes, or to deny them altogether. Those who are concerned for the public well-being in India may study with profit the pages of the Third Report of the Royal Commission, to see what lengths the official supporters of vaccination are prepared to go in their advocacy of the Jennerian *cultus*.\*

\*On December 30, 1880, fifty-eight young recruits belonging to the 4th Regiment of Zouaves were vaccinated from a Spanish child at the Dey Hospital, Algiers. In a few weeks all the vaccinated developed syphilis, to which about one half subsequently succumbed. The Minister of War, General Farre, instituted an inquiry, but no report has been published. Five times questions were submitted in Parliament with a view of eliciting the facts. The President of the Local Government Board promised to institute inquiries through the Foreign Office, but, on receipt of a reply, excused himself from giving particulars by declaring that "the information was incomplete," and promised to make another application. Finally, on the 27th October, 1882, Mr. C. H. Hopwood repeated his question, which was answered by Mr. Dodson (Lord Monk Bretton) by a categorical denial of the facts. At this time *the Local Government Board were in possession of full details of this vaccine tragedy (supplied by a Member of Parliament), including the names of the unfortunate sufferers, their grade, matriculation numbers, and nationality, as furnished by a medical witness, after a personal and painstaking investigation of the facts at the Hopital du Dey.*

A report of a "Scheme for obtaining a better knowledge of the Endemic Skin Diseases of India" has been prepared by Mr. Tilbury Fox, M.D., F.R.C.P., Fellow of University College, Physician of the Department for Diseases of the Skin at University College Hospital, London, etc., and Dr. F. Farquhar, Surgeon - Major, Bengal Medical Service. Under the title of Propagation these authors include inoculation and vaccination, and observe that there is by no means a slight body of facts which seem to show that the inoculation with matter from a leprosy sore—and this may occur in cohabitation and constant contact, and in vaccinations—may give rise to the disease. The authors propound a series of fifteen questions, with the view of elucidating the presence and cause of leprosy in different districts and individuals. It is noticeable that, while they allow that vaccination is a cause of the propagation of leprosy, inquiry on this point is not demanded. The Secretary of the Leprosy Investigation Committee, in his address before the International Congress on Hygiene and Demography, states that the cases of invaccinated leprosy are few in number. But, inasmuch as all the cases have cropped up accidentally and not as the result of research, it is impossible to estimate their number. An incalculable service to humanity will be performed when medical practitioners of high qualifications, not committed to any preconceived theory, will, in the interest of the public health, undertake this important investigation.

*The British Medical Journal*, Sept. 19th, 1891, reports an paper read at the meeting of the British Medical Association, on "Leprosy and Vaccination," by Dr. R. Pringle, surgeon-major, late of the Sanitary Department of the Bengal Army, who said "that of all charges which had been brought against vaccination, none approached in seriousness — especially as it related to India—the charge that the present admitted increase of leprosy in certain countries was due to the increase of vaccination, which was stated to be not infrequently in those countries little else than leprosy inoculation." Dr. Pringle, in recording this statement, fully admitted that in the main it rested on the evidence of medical officers of the, highest rank and authority in the West Indies, and that one Indian medical officer (Surgeon-General C. R. Francis) distinctly admitted, in an important public document, that this was not only possible but probable. Surgeon-General Francis, in the *Journal of the Leprosy Investigation Committee*, No. 1, August, 1890, had written that leprosy may be propagated by inter - marriage and hereditary transmission is undoubted. I believe, too, in its propagation by vaccination or inoculation, but I am very sceptical as to mere contact being the cause. . . . I would advocate an investigation into the effects of vaccination, there being some who are still dubious on this point, though the statement made two or three years ago by Professor Gairdner on the subject would seem to be conclusive in favour of vaccination as a factor." The inoculation alluded to by Dr. Francis was stated by Dr. Pringle not to be inoculation by flies, as seen in ophthalmia—a fact which he remarked in passing was both recognised and dreaded by the Jews of old as one of the most certain and probable means of spreading leprosy—contact, as pointed out, being to them a Levitical uncleanness, and not, therefore, necessarily risking the consequences of contagion. The inoculation alluded to by Surgeon-General Francis was small-pox inoculation, as practised in the Himalayas as a preventive against spontaneous small-pox. Dr. Pringle severely criticised the circumstances attending vaccination in the case recorded by Professor Gairdner in the *British Medical Journal* June 11th, 1887. It was hardly to be expected that the opponents of vaccination would fail to take advantage to the full of such damaging statements regarding vaccination in India as recorded by Surgeon-General Francis; but Dr. Pringle stated that Surgeon-General - Francis' experience was entirely the reverse of his own. The main object of his paper was to point out the means available for subjecting these two conflicting experiences to the most searching investigation on the spot by the Leprosy Commission now in India."

Dr. Pringle proceeds to explain that for twenty years he had collected vaccine lymph in Tern, in the Himalayas, where leprosy was very gravely endemic, and used this lymph in districts where the population was 500 to the square mile. Over two millions of these vaccinations had been performed, and - he had never seen a case of leprosy traceable to vaccination. Dr. Pringle- omits to say whether he ever searched for such cases, or inspected the vaccinated subjects a year or two after the operation, or inquired whether those attacked with leprosy traced their affliction to vaccination. As Dr. Pringle urges upon the Leprosy Investigation Commission the

importance of inquiry to test the validity of the charges now brought from all quarters, it would seem that he had not made this investigation himself.

Dr. Vandyke Carter, of Bombay, allowed to be one of the greatest authorities on the subject, includes vaccination among the list of causations, of which he says he has found recorded a few affirmative examples, at least, of each one method or means.—*Report on Leprosy and Leper Asylums in Norway, with reference to India, p. 178.*

Mr. H. Brown, of Simla, writes to me Oct. 2, 1889:—"Experiments have proved - leprosy to be inoculable. There must necessarily be a dread of vaccination in India, since the subject from whom lymph is taken for the operation may be a leper. In India native village vaccinators are not over careful from whom they procure their lymph. In Malabar and various districts of the Madras Presidency, where I have lived hitherto, it has been no uncommon thing to see the lymph extracted from the arms of itchy native boys. Leprosy has increased- alarmingly since the introduction of vaccination. I know of some cases where perfectly healthy persons, whose parents also are healthy, and who have been accustomed to live in healthy localities, have been smitten with leprosy after vaccination. I can also quote cases similar where children have died, or have become very seriously ill, immediately after vaccination, from hideous eruptions and swellings. One lady, the wife of a respectable merchant in Cochin, assured me that *vaccination* and *nothing else* killed her baby. It was perfectly healthy until vaccination. The Surgeon-General, Dr. Brodie, in his report for last year on the 'Distribution of Diseases in the Presidency,' declared that syphilis was on the increase throughout. This increase is coincident with the introduction of compulsory vaccination in a large number of municipalities, and with the more energetic action on the part of vaccination officers in the Madras Presidency."

Dr Chunder Ghose, in medical charge of the Leper Asylum, Calcutta, in a communication to the Secretary of the District Charitable Society of Calcutta, dated August 2 1st, 1889, states his opinion that leprosy is increasing in India, that it is communicable by vaccination, and that there is a dread of the operation on this account.

Dr. Roger S. Chew, of Calcutta, who was for six years in the Medical Department of Her Majesty's Army in British India, and has devoted fourteen years to the study of leprosy in India and other countries, furnishes, in his pamphlet on leprosy, a table giving the results of his investigations into the causation of the 1034 cases which have come under his treatment. Of these, he says, insanitation is responsible for 105 cases, vaccination for 148, and 72 cases are due to other forms of inoculation. Dr. Chew has been kind enough to supply me with the following particulars from his case-book, in which, according to his diagnosis and careful inquiries, the disease is directly traceable to vaccination.

The cases here quoted are samples of a large number collected by Dr. Roger S. Chew, in which the connection between the onset of leprosy and a previous vaccination is well determined. With reference to this, I am advised by high medical authority that a secondary development of the results of an inoculation frequently coincides with a re-awakening of disturbance at the point of inoculation. *Also, that when a secondary and constitutional disease first indicates its existence at the scar of vaccination, it may be taken as conclusive evidence that it is consequential to that vaccination.* It will be noticed that, in almost all of these cases, the place of inoculation is first attacked, and in all of them it is affected.

Another point in the evidence adduced should be noted, namely, that it does not seem to matter whether the vaccination "took" or not for the secondary effects to be manifested in due course. The probability is that, if a vaccination is immediately "successful," a portion of the poison is discharged, and the rest retained. If there is no immediate result, the poison may still lie dormant for a variable period, concerning which practically nothing is known.

*Extracts from Memoranda in case book by Dr. Roger S. Chew, Calcutta, showing connection between vaccination and the commencement of leprosy*

1.—"Jahoorie, aged twenty - eight. Married; no children. Duration of leprosy, twenty years.

"There is no history of syphilis, either with himself or his relatives. - When he was about seven years old, he was vaccinated on his right arm. About six months after he- noticed a white patch over vaccine site; a similar patch appeared on his right buttock, and he soon after lost sensation in his left foot. The marks gradually faded away, broke out afresh in - other portions of his body, and again disappeared to reappear, *et seq.*; but wherever these marks appeared, they were accompanied by loss of sensation, which remained permanent throughout. About sixteen years ago he suffered from enlarged spleen, for which he was fired (*i.e.*, burned with hot iron). Ten years ago the fingers of both hands began to be flexed on themselves.

"Present state :—Perpendicular of ankylosed fingers is 1/8 inch on right hand, and 7/8inch on left. Fingers and thumbs of both hands much ankylosed, discoloured, and anaesthetic. Dry ulcer at inner flexion of right thumb. Open and entirely painless ulcer on tip of nose, extending 1 1/4-inch inwards. Amesthetic discoloured patches all over chest and abdomen. Two large (burn) scars over splenic region. Right foot has three large open sinuses, freely discharging a viscous, stinking, purulent fluid. On inserting little finger into the largest of these three sinuses, free vent was obtained, and the finger, striking against the astragalus, not only caused the patient a great deal of pain, but also brought away a quantity of foetid caseous-looking matter, due to caries of the bone. There are three discharging sinuses — the largest one inch in diameter at the opening—in the left foot also. Raw, ulcerated, and entirely painless stump, marking where middle toe of left foot has recently fallen off. Second toe of same foot has also dropped off, and on outer side of little toe of same foot is a peculiar blistered surface. Both shins largely covered with scaly and desquamating cuticle, with absolute loss of sensation. Hacking cough, and great pain in left thorax, with frequent and bloody *sputa*, beginning some two years ago, but aggravated

during the last month. Caseous degeneration at extreme apex of right lobe of left lung.

2.—"Daidas, a male, aged forty-three; a native paliki bearer. Duration of leprosy, twenty years.

"There is no history whatever of syphilis or syphilitic or leprous hereditation, nor are any of his relatives similarly afflicted. He was forcibly vaccinated about twenty-one years ago. The operation was not successful, but a year afterwards the vaccine pock grew rough, lost sensation, and gave place to a small crop of *papillae*, which spread, grew larger, and became entirely anaesthetic. He never had fever of spleen. About four years ago he used to get peculiar cramping sensations all along the course of the right ulnar (nerve) accompanied by extremes of cold and heat in fourth and little fingers. Contractions began to supervene, and these two fingers, entirely losing sensation and their power of grip, became permanently flexed on themselves. At this time his brows began to protrude and his upper lip to get thick.

"Present condition :—Permanent and rigid ankylosis of fourth and little fingers of right hand, with total anaesthesia. Tumoid, discoloured, anaesthetic patches and papules all over hand and arm from finger tips to clavicular articulation. Large tumoid and anaesthetic patch, 5 X 4 in., on anterior aspect of right shoulder; another, 3 x 1 in., over vaccination site; and a third, 3 X 2 1/2 in., on elbow of same side. Upper lips very tumoid with paralysis of left side and partial anaesthesia of right. Uvula elongated and anaemic; fauces very anaemic. Sense of smell and taste are unimpaired. Left inguinal glands are indurated and slightly enlarged. Scrotum and prepuce elephantoid and anaesthetic. Posterior portion of scrotum is ulcerated. There are a few white spots over buttocks, whitish mark over left second toe, with loss of feeling. Ears are rather swollen. Features leonine, the supraorbital ridges being very tumoid and perfectly anaesthetic.

3.—" 1. Chundar Ghoral, a male, aged forty-two; a Brahmin, and farmer by occupation. Duration of leprosy, twelve years.

"There is no history whatever of heredity, syphilis, impure living, or irregular habits. He was vaccinated seventeen years ago (the operation did not take), and five years afterwards a small rash broke out on that portion of his right arm where he had been punctured. This rash spread, ulcerated, healed, and left behind a thick warty lump, 3 1/2 in. long and 1 3/4 in. broad, which was utterly devoid of feeling. Similar excrescences appeared on various parts of his body, and about seven years ago he noticed some peculiar white patches appear.

"Present condition ;—Open sinuses under ball of both great toes. Nodes all along course of lymphatics. Anaesthetic patches over several parts of body. Excoriation on left elbow. Leucoderma in patches of rather large areas in different parts of back and thorax. Features leonine and feet slightly swollen and oedematous. Knees swollen and marked with tubercular ridges. Complete loss of power and sensation in the fingers of both hands, but no ankylosis.

4.—" Rohim Bux, a male Mahomedan, aged twenty-five, a hackney carriage driver, stated on the 18th August, 1889, that, a fortnight after vaccination, which did not 'take,' eighteen years ago, his parents noticed whitish patches occupying the site where the vaccine pits should have appeared, and remaining persistent for two years, after which they increased in size, coalesced, and steadily kept increasing to their present extent . . . On his forehead, half of right arm and hand, and on his right shin, are pinkish-white patches that do not itch; leprous ulcers on his right foot, implicating the great toe, the nail of which has sloughed off. A painless ulcer, 2 1/2 inches by 1 3/4 inches, occupies the surface of right hip joint. These ulcers are all perfectly anaesthetic. The ulcer on his hip joint is nearly three years old, scabbing, and breaking out afresh at irregular intervals.

5.—" Meer Mahomed, a Mahomedan male, aged thirty-four years, married, with eight children; a clerk by profession. His parents were quite healthy, and so are his wife and six of his children, but two daughters are lepers. On the 23rd August he showed bright silvery lines on the palmar surfaces of both hands, while on the dorsal surfaces were several small annular patches, together with three large crusted patches, the largest 1 in. by 3/4 in. First joint of left fourth finger had sloughed off, leaving a very angry stump. Running ulcers in right leg and thigh. Angles of mouth tough and thickened. Both ears nodular and tumoid (thickness, 1 1/4 in.). On chest and left arm were white patches, three of which formed a peculiar triangle which covered the vaccine pits, *in which the disease first appeared*. The lymph for the operation was taken from the arm of an apparently healthy native child. Patient has never had syphilis, nor does he know of any member of his family being afflicted with any blood disorder.

6.—" Bundaban Mullick, a Hindu male child of seven years, exhibited on the 27th August, 1889, several leprous ulcers on left wrist and at the angle of his mouth. On left arm was an oblong whitish-pink patch that entirely obliterated the vaccine pits. The boy's father, who is perfectly healthy, says that two and a half years ago the boy was vaccinated, and about four months after the operation he noticed the puncture sites occupied by three small white patches, which in the course of one year extended and coalesced to form the single patch now seen. The ulcers appeared about a year ago, and refused to heal up.

7.—" A Hindu male, Bhaleshur, aged ten years. Six months after vaccination, three and a half years ago, a white patch appeared over his left clavicle and on vaccine site. Half of the patch on clavicle ulcerated, and the ulcer, finch broad and 3/4 inch long, refused to yield to either arsenic or mercury, both of which he had taken for two years. The clavicle is denuded of flesh, and plainly visible to the naked eye, while the ulcer itself is of a leprous type.

8.—" A Hindu female, Gowrah, aged nineteen, stated that she was vaccinated in her seventh year (as far as she remembers). The operation did not 'take,' and, five months after, three whitish spots appeared on her right arm, where the vaccine pits should have been.

These spots extended, coalesced, and, spreading downwards, disfigured her arm as far as the wrist. Her lips thickened, menses became irregular, and obstinate sores, which are still open, broke out on her feet.

9.—" Vincent D'C., an East Indian clerk, aged thirty. A year after vaccination (six years ago) he felt a peculiar constant itching in the vaccine pits, and, a short time after, noticed on this left arm a curious rash, which subsequently gave place to obstinate ulcers, for which he was unsuccessfully treated by three different doctors. On his left arm are three irregular-margined annular patches, averaging 1 1/2 inches in diameter.

10.—" Da Singh, a Hindu schoolboy, aged twelve, told me (Dr. Chew) on the 11th December, 1889, that he had been vaccinated in his seventh year. About eight months after the operation, the vaccine pits ulcerated, and the ulcers spread and coalesced, to form a large annular patch which has obstinately remained open. On same arm (right), a little above the elbow joint, appeared a long pinkish white patch, which gradually enlarged, and now occupies a space, 9 1/2 x 3 1/4 inches wide, running over flexor aspect of portions of both arm and forearm. .

11.—" Francis G—, an East Indian male child, aged three; admitted on 21st December, 1889, has eczema of the scalp of three months' duration. He was vaccinated when only eleven months old. The operation did not 'take,' and a month afterwards the whole of that left arm became perfectly anaesthetic. An annular patch of the size of a rupee occupies the left angle of his mouth, and close by this annular patch are two small anaesthetic tumoid ridges.

12.—" Ameer Hoosein, a Mahommedan lad, aged fifteen, was vaccinated in his seventh year. The operation 'took,' but in his eighth year the vaccine pits turned into little ulcers, which enlarged, scabbed, cleared, and finally coalesced to form one large annular patch on his left arm. Smaller annular patches exist on left shoulder, right hand, and right foot.

13.—" Doorie, a male, aged 18, is a leper, and attributes his disease, from which he has suffered for the past nine years, to impure vaccination. The vaccine pits are badly ulcerated, and he has an anaesthetic patch covering the entire elbow joint of the same arm. Both lungs are implicated.

14.—" Kasmini Bibi, a married Mahommedan female, the mother of two healthy children, deposed, on the 29th December, 1889, that she was vaccinated on her right arm in her thirteenth year. The operation 'took,' but five years afterwards the pits ulcerated, and these ulcers remained obstinately open. At this time crops of *paapillae* accompanied by total anaesthesia, began to show themselves on her chin, right breast, right thigh, and right knee. About one and a half years ago a tiny white spot appeared in the centre of her forehead, and this spot has now increased to a circular patch the size of a shilling piece.

15.—" Goolburee, a married Mahommedan female, aged forty-seven, with pemphigus (five blotches on right foot) of one and a half years' and leprosy of thirteen years' standing. The latter disease she attributes to improper vaccination. She has been five times vaccinated—the last occasion when thirty years of age. Four years after this the leprosy manifested itself. There are nodosities in both ears, in her nose, on her left arm, and along the left sternocleido-mastoid; one ulcer, 1 1/2 x 1 1/4 inches, on right ankle, and another twice this size covers last vaccine site on right arm.

16.—" Mabel P—, a Scotch lassie, aged seventeen, and a leper for the last eight years, was brought by her mother, who stated that she was vaccinated when she was seven and a half years old. About six months after the operation, which was successful, symptoms of leprosy began to develop, and she flew here and there to every medical practitioner that money could procure to save her child, but to no avail, as the disease kept increasing. The girl's present condition is :—Ears tumefied, and 2 1/2 inches thick. Face marked with ridges like cooled lava (volcanic). Sores on hands and feet and angles of mouth. Eyesight impaired. . . Tonsils indurated. Uvula ulcerated.

Ankylosis of little and fourth, fingers of both hands. Ulcer in left nostril, the right being entirely blocked, arid external nares flattened out. Lips protruding, thick, and hardened. Slight contraction of right knee, and anaesthesia well marked everywhere.

17.—" M. T—, a Eurasian female, aged fifteen, whose father stated that three years ago—at the time of the great scare caused by an expected epidemic of small-pox—he had his daughter vaccinated. The operation "took," but a year after the pits ulcerated and refused to yield to treatment. 'At the same time a few white spots appeared on her back, her sides, the nape of her neck, and over her face.' Those on her face grew larger, till, impinging on each other, they finally coalesced to form one large blotch of pinky-white, which, contrasting against her olive brown complexion, terribly disfigured her.

18.—" A. A—n, a Chinese carpenter, aged forty-three, married, and the father of four healthy children, deposed on the 22nd December, 1890, that four months after vaccination, eleven years ago, the vaccine pits broke down into ulcers, which are still open. His ears are tumoid (1 1/4 inches) and perfectly anaesthetic. Tubercular deposit, and welt marked anaesthesia in patches all over body.

19.—" Imrato J. Ghose, a Hindu male, aged twenty-eight years, stated, on 14th Feb., 1891, that he had been three times vaccinated, in infancy, at six years, and at twenty-one years of age, at each of which times the operation was very successful. Fifteen months after the last vaccination his leprosy showed itself. His body is covered with hypertrophied anaesthetic patches of various sizes and contiguous to each other. Mercurial foetor of breath. Ears tumoid., *Alae nasi* partially affected, and anaesthetic. Brows very slightly leonine; pains in loins in rising, and drawing up the legs; ulcer on ball of great toe of left foot, freely discharging serum. Vaccine pits are badly

implicated in the hypertrophies on left arm.

20.—" Sibhoo, a Hindu male, aged forty, and a widower, stated on the 14th March, 1891, that he was vaccinated when thirty-six years old. A year afterwards the vaccine pits ulcerated (ulcers still open). He has never had syphilis in any stage; his people are healthy; his body is well nourished, with patches of discoloured (whitish) hypertrophied and anaesthetic cuticle—the smallest 4 x 5 inches—scattered all over. Black anaesthetic patch over surface of lower half of left "tensor vaginm femoris." Little toe of left foot has dropped off. Both ankles are much swollen and inflamed; there is entire loss of sensation in fingers, feet, and ulcers. Under the balls of both great toes are running ulcers.

"21.—William J. C—, an East Indian male, aged twenty-one, admitted on 31st August, 1891, was vaccinated three years ago, and a year afterwards noticed some pimples break out in vicinity of the pits, on back of hands, and on his back. These at first itched a great deal, but, breaking down into pustules, became devoid of feeling, and extended to various portions of his body. The left, fourth, and little fingers are also anaesthetic.

22.—" Khyroo, a Mahomedan male, aged fifty, applied for treatment on the 20th October, 1891. Has been married twenty years, and has four male and two female children, all healthy. Leprosy showed itself nearly a year after he was vaccinated. Prior to this he was always hale and hearty. Had small-pox eight years ago (*i.e.*, four years after he was a leper). Present condition :—Ears are slightly tubercular, their hypertrophy measuring about 1/32 inch, while their long and short diameters are normal, without sore or abrasion, and with slight anaesthesia. Face marked with small-pox pits, hypertrophy over malar ridges, angles of mouth and bridge of nose, the *aloe* of which are thickened, and tubercular anaesthesia is well marked. Arms covered with patches of tubercular deposit and vesicles, with well-marked anaesthesia.

"Hands—Thumb, ring and little finger of right hand permanently flexed; burn on thumb and forefinger, proving anaesthesia; nails deformed and splitting up; tubercular infiltration. Left forefinger much swollen, and a small ulcer on back of first joint, which is bent. Little finger also swollen and flexed on itself; fourth finger slightly flexed. Anaesthesia well marked in all the fingers, and in the palms and wrists. Small patches of tubercular growth all over wrists and dorsal surface of hands.

"Body, legs, and feet all show well-marked developments of tubercular leprosy, with anaesthesia.

23.—" G. D'R—, an East Indian of thirty years, admitted 3rd January, 1892, stated that one year after vaccination his disease appeared. Present condition :—Ears wrinkled and elongated, with irregular nodes. Features leonine. Brows tumoid and tubercular, malar ridges hypertrophied and anaesthetic. Tubercular deposit at angles of mouth; nose flattened out, anaesthetic, and depressed at bridge. Tubercular deposit and anaesthetic patches along the entire length of both arms. Fingers contracted, ulcerated, and anaesthetic. Body also affected. Right leg elephantoid; the left anaesthetic. Feet well marked with the disease, being ulcerated and mutilated.

24.—" R. B. M—, a Brahmin of thirty-eight years of age, stated that three years subsequent to vaccination the pits ulcerated and became anaesthetic. Features leonine, angles of mouth hypertrophied and anaesthetic. Arms ulcerated, with hypertrophied cuticle: ankylosis of elbow joint of left arm. Fingers of both hands badly ankylosed. A few patches of leucoderma on his back, and one on thorax. Large anaesthetic sinus under ball of great toe, of both feet.

25.—" Ishar Ghosal, a male Hindu, forty years of age, admitted 3rd January, 1892, deposed that he was vaccinated when twenty years of age, and five years afterwards the pits ulcerated. The ulcers healed, their site entirely lost feeling, and the anaesthesia spread till it implicated the entire length of right arm. Present condition :—Features slightly leonine; face shows scars of old sores; hypertrophy and anaesthesia of malar ridges and angles of mouth. Besides the anaesthesia of right arm, there is a large whitish patch (5 x 2 1/4 inches), just above elbow. Ankylosis of fourth and little finger of both hands. Large patches of leucoderma on back, and one large white patch covers the entire thorax. The interspaces are hypertrophied and anaesthetic. Feet badly ulcerated, the ulcers being anaesthetic and discharging freely."

Dr. A., Mitra, Chief Medical Officer, Kashmir, says:—"I have on three occasions searched for bacilli. In one instance I found them in lymph from a vaccinated leper."—*American Journal of Medical Sciences, July, 1891.*

In the year 1888 the Government of India adopted and issued a series of resolutions on the subject of leprosy, admitting the increase of the disease, and acknowledging the impossibility of dealing with it in any effective manner. No word of warning was then, or has been since, uttered as to the inoculability of the disease, now so generally admitted by medical authorities, and the consequent dangers of its dissemination at the hand of the public vaccinator, nor is it likely that this source of infection will be officially condemned until the people in India, as in many parts of England, stand upon their parental rights, and refuse at all costs to imperil the health and lives of their offspring by this irrational and disease-engendering rite.

Some medical authorities, while admitting that leprosy is inoculable, and disseminated by vaccination, insist, for the credit of the Jennerian practice, that such cases are very rare, and are due entirely to the carelessness of the operator, and that, therefore, it is unreasonable to throw discredit on so beneficent a discovery on this account. This mode of reasoning may satisfy, the unreflecting; but if it be once allowed that leprosy is transmissible by vaccination, who can estimate the extent of the resulting mischief? Vaccination is practised in all the colonies and dependencies of our empire, and in all countries -where leprosy prevails. The disease is usually of slow incubation, and, until external indications of the malady are exhibited, a child may be, and often is, used as a vaccinifer without inquiry. Here, then, in leprous countries, are all the conditions necessary for inoculating the germs of leprosy into the blood of present

and future generations. The late Dr. George Hoggan, of Beaulieu, France, who devoted many years to the study of leprosy, has examined many lepers in Europe, and he attributes the disease in nearly all cases to vaccination.

The following letter explains Dr. Hoggan's view on this part of the subject :— .

Beaulieu, Alps Maritimes,  
December 29th, 1889

DEAR MR. TEBB—Upon the connection between vaccination and leprosy I hold a very strong opinion. Apart from the opportunities which I have had in Egypt, Palestine, and elsewhere of studying leprosy in the mass, I think that my extensive researches into the minute pathology of the disease, as evidenced by the papers published in the "Pathological Transactions" for 1879 and "Archives de Physiologie" for 1882, warrant me fully in expressing a firm conviction on the subject. At pages 88 and 90 of the latter work I refer to the relations between vaccination and leprosy infection, only, however, to show the difficulty of connecting the two in the history of the case. Taking all the factors into consideration, I hold that, in the cases of leprosy I was then investigating, the disease was conveyed through vaccination. I further believe that, in the majority of cases of leprosy developing in children, the leprosy infection is transmitted along with the vaccine virus. In adults, on the contrary, I have had evidence that leprosy is often conveyed along with syphilis; and this, taken in connection with vaccinal infection in the young, had led me to suggest the following explanation of infection in leprosy :—Hitherto all untainted evidence has shown that leprosy cannot be inoculated *per se* into a healthy body. \*

\*Dr. Hoggan, no doubt, refers to the negative results mentioned by Leloir in "De La Lépre," p. 237, where a doctor inoculated twenty healthy persons with leprosy pus, blood, and tubercle, and to Profeta's inoculations (p. 238) of twelve persons, including himself, with blood and pus from leprosy ulcers in wounds made by scarification and surfaces laid bare by blisters, and to his subcutaneous injections of matter from leprosy tubercle. He overlooks, however, the numerous recorded cases of accidental leprosy inoculations. Failures in intentional inoculations in countries free from leprosy cannot be set against cases of inoculation through abrasions of the skin or when the leprosy poison is introduced into the blood by means of the vaccinators lancet.

Combined, however, with the virus of small-pox, syphilis, or other diseases, it seems to be easily transmissible into the system, and it is in this direction that future investigations should be pursued.—I am, dear sir, yours faithfully, GEORGE HOGGAN, M.B.

In page 74 of the "Report of the Royal College of Physicians on Leprosy," dated 1867, is the following important suggestion:—

"The question alluded to in the communications from Dr. Erasmus Wilson and Sir R. Martin (*vide* Appendix to Report) as to the transmission of leprosy disease by vaccination and wet-nursing, is one of special interest to Europeans resident in India and other tropical countries, and calls for searching examination."

The cases referred to are—Case 1, p. 235—*Elephantiasis tuberculosa*; duration of latent period, two years; total duration, five years; no pains; febrile attack, simulating rubeola; vaccinated from a native child:—

"A young gentleman, age 16, with fair hair and complexion, and somewhat more youthful in appearance than might be expected of his age, has been afflicted with the tubercular form of leprosy about five years. He was born in Ceylon, is the son of European parents, and one of six children, all of whom are healthy. His father and mother have always enjoyed good health, the father having resided in Ceylon for twenty years, the mother since her marriage. He was nursed by his mother, but vaccinated from a native child."—*College of Physicians' Report*.

Page 239, Case 9—*Elephantiasis anaesthetica* following vaccination (given in Dr. Erasmus Wilson's work, 1867, pp. 620-2):—

"A lady, aged 26, the wife of an officer in the Indian army, became affected with elephantiasis in 1861. She was born in Calcutta of European parents, and brought to England when two years old. She returned to India in 1853; was married in 1855; has been eight years married, and has now (1863) revisited England for medical treatment. In 1861, then being in Oudh, she, was vaccinated from a native child, and shortly after vaccination "a slight spot came on her cheek, and increased in size to the diameter of a shilling." It was hard to the touch, a little raised above the level of the surrounding skin, and of a dull red colour, without pain or tenderness. The swelling was painted with iodine, and afterwards blistered several times, and the blister kept open; but although somewhat reduced in size, the prominence was not removed. About six months later dull red flat spots appeared, dispersed over the greater part of her body. Her hands and feet became swollen, and she had pains of some severity in her joints and feet."

The same author gives the following on p. 650 (p. 86 of the Leprosy Committee Report):--

"Dr. Bolton, of Mauritius, mentions the case of a boy of fourteen, afflicted with leprosy from the age of seven, the son of British parents, whose father ascribed the origin of the disease to vaccination. . . . Several medical men, who have had the opportunity of watching the disease closely, expressed their belief that leprosy may be conveyed to sound persons through the medium of the discharges of ulcers."

Referring to the series of papers which he reports, Dr. Erasmus Wilson says ("Royal College of Physicians' Report," 1867, p. 234) :—"Our cases also favour the suppositions of the existence of other modes of transmission (transmission by generation—*supra*), namely, by lactation, by vaccine inoculation, and by syphilitic inoculation. The first of these methods of contagion lies beyond the reach of remedy; the others are preventible."

In the December number of the *Nineteenth Century* for 1889, p. 929, Sir Morell Mackenzie, in an article entitled "The Dreadful

Revival of Leprosy," says :— "There is, or was quite lately, a boy in a large public school, in whom there are the strongest grounds for suspecting the existence of leprosy in the early stage; the disease is supposed to have been communicated by vaccination in the West Indies. It is beyond question also that there are many other cases in this country at the present moment, which are carefully concealed from the knowledge of every one but the medical adviser. Nearly every skin specialist must be able to attest this fact."

Dr. Suzor, of Mauritius, stated in the *Progrès Medical*, No. 14, that "in one instance two children of healthy parents became lepers, apparently as the result of having been vaccinated with lymph taken from a child belonging to a leprous family," and he thought the cases furnished conclusive proof of the communicability of the disease by vaccination.

In the *British Medical Journal* for Nov. 29, 1890, there is given a tolerably full report of the discussion on "Vaccination Eruptions" at the annual meeting of the British Medical Association held in Birmingham.

The discussion was opened by Mr. Malcolm Morris, M.R.C.S. (Edin.), who presented a formidable classification of vaccinal eruptions, including constitutional diseases of the most serious character, amongst which he included leprosy.

Dr. A. M. Brown observes in his pamphlet on "Leprosy in its Contagio-Syphilitic and Vaccinal Aspects," 1888, pp. 12, 16, 17: "When we come to note a recent medical disclosure bearing on this point (inoculation of leprosy by vaccine virus) and which has been allowed to pass unheeded for the reason, I presume, that it tells against the Jennerian and Pasteurian theory and practice, the necessity for strictest caution will be obvious. Hypothesis and specific *bacilli* apart, the observations of Arning, and alas, of too many who do not care to confess it, prove that vaccination is capable of actually transmitting *lepra* from the leprous to the non-leprous. The fact is unmistakable, and our duty is to make mankind and the medical profession dearly comprehend what this implies. . . . The unanimity and persistency with which vaccination in markedly leprous countries is charged with propagating and disseminating the malady, the well confirmed coincidence of leprous centres with vaccination centres, and the discovery of the specific *bacilli* in those leprously vaccinated, ought to satisfy all who are capable of weighing evidence, or of rational reflection, that controversy on the question must, and will, ere long, be silenced."

In a communication which I received from Dr. Brown, June, 1891, he refers to the communicability of leprosy by vaccination, and the attitude of the medical profession as a body towards the ever-increasing weight of evidence. "The fact of leprosy being communicable by inoculation is clearly shown by evidence to be beyond cavil or question. Medical men, seriously interested in their profession, who fail to see this are unfortunate, and their position must be charitably attributed to indifference to the whole question of leprosy, or a dread of the overthrow of some pathological doctrine to which they are practically pledged. The evidence of the fact that leprosy is communicable through vaccination is rapidly accumulating, and the force of its importance on the medical mind, as exhibited in its special journals, is anything but welcome. The fact of the exclusion of numerous well-known cases of invaccinated leprosy from the published papers of the Leprosy Investigation Committee, though most regrettable, is not surprising; the still ignoring of experimental data by inoculating bacillo grafters is quite as little so. It is certainly amazing to find that probably the chief factor in the dissemination of leprosy in the present day—Jennerian vaccination—should have been practically set aside by the Indian Commissioners. Considering the amount of conclusive evidence now before us, many, like myself, must have felt appalled to find that this was so. Still, we may feel perfectly assured that such a performance can no more score than the proverbial Hamlet-play where the leading role has been left out."

The *Hospital Gazette*, London, Oct. 1, 1890, contains the following, under the heading, "Leprosy and Vaccination":—"We know now that it is possible to transmit leprosy by inoculation, and it therefore behoves those who practise in countries where the disease is endemic to be very careful whence they take their vaccine. Leprosy is about as frightful a disease as any that poor man is exposed to, and beside it syphilis—the vaccinator's bugbear—sinks into comparative insignificance. A contemporary recalls the case of a native of the Sandwich Islands, who developed leprosy a year after vaccination, and seems disposed to raise the question as to whether the vaccination might not have been the means of conveying the infection."

Dr. Bechtinger, of Vienna, who has devoted thirty years to the study of leprosy in many countries, says :— "No scientific man will deny that leprosy, like all bacterial diseases, is inoculable;" and he attributes the present increase of leprosy to the vaccinator's lancet.

Dr. W. Munro says :—"I am decidedly of opinion that by careless vaccination, bloody matter being taken with the vaccine lymph, leprosy can and most certainly would be propagated. .... I decidedly consider that leprosy can be inoculated."—*Leprosy an Imperial Danger*, by Archdeacon Wright p. 72.

Referring to an alleged case of infection by means of vaccination, the *British Medical Journal*, October 25, 1890, says:—"Remembering Arning's important observations of leprosy bacilli in vaccine lymph taken from a leper, it is not to be denied that such inoculation may be occasionally possible." Perhaps this admission from the editor of a journal which has defended vaccination against all attacks and organised a powerful medical opposition against any modification of a most stringent and cruel law goes as far as could be expected. Mr. Ernest Hart has not thought it expedient, however, to submit the extraordinary statements in his "Truth Concerning Vaccination" to the test of cross-examination before the Royal Commission.

"Chambers' Encyclopedia," 1891, vol. 6, page 585, says :—"Evidence has recently been adduced which seems to show that it (leprosy) may be communicated by vaccination from a leprous child."

In the appendix to his work on "Leprosy," p. 274, Dr. George Thin has the following :—"In the 'Monats. f. Prakt. Derm.,' Vol. XIII.,

No. 1, the report of a case is extracted from the *Occidental Medical Times*, of a leper who was vaccinated in 1878, who a year afterwards became leprosy, and who at present has a large anaesthetic scar at the point of vaccination. This man had healthy parents, and of two brothers and three sisters, one had died of tubercular leprosy. He is twenty-five years of age, and has mixed with lepers all his life."

In his work of 280 pages on "Leprosy" (Percival & Co., 1891), Dr. Thin devotes four pages to "Vaccination in Relation to Leprosy," and refers to Dr. Gairdner's cases. "The presumption," says Dr. Thin, "that the disease was conveyed to the second and third child in the vaccine lymph is strong, but the case is by no means proved." Amongst others, Dr. Thin, p. 194, quotes the following from Dr. Daubler "Monats. f. Prakt. Dermi.," Vol. VIII., p. 123), who "relates two cases of leprosy at Robben Island, in South Africa, in which he believes it to be proven that the disease was conveyed by vaccination" :—

"The first case is that of a woman, H., thirty-six years old, married, and the mother of a healthy child of twelve. There was no leprosy in the family. Several years previously, on account of an epidemic of small-pox, she was re-vaccinated, the first vaccination having been effected when she was two years old. In the course of the two months following the re-vaccination, she experienced attacks of shivering and fever three to five times weekly, was frequently thirsty, but passed less urine than usual, and whilst the points of vaccination swelled and became brown, she grew dull and weak. She had been vaccinated on both arms over the insertion of the deltoid. No pustules formed, and when she saw the medical man two months after the vaccination, the parts were swollen. The swelling had begun three days after the insertion of the lymph, and reached its greatest extent eight days afterwards. At this time the parts became yellowish, and within fourteen days of the vaccination on each point there was a raised, discoloured skin, of a yellowish brown colour, and as large as a two-shilling piece. These swellings gradually increased, and, ten weeks after the vaccination, her physician found the skin of the arms and upper third of the forearm brown in colour and uneven. The brown spots extended lower down, when, after three more weeks, in which she was feverish and ill, the spots became swollen and smaller, but the skin did not resume its normal colour. In the fourteenth week after vaccination she had a violent rigor, repeated twice within the following week. Subsequent attacks of fever were at longer intervals, and not so severe. At and shortly after the severe rigors, brownish spots developed on the cheeks and forehead. Eighteen weeks after the vaccination leprosy tubercles developed on the brow and on the cheeks. Two years later the woman was sent to the leper asylum at Robben Island, where she was seen and photographed by Dr. Daubler, tubercular leprosy being fully developed.

"The other case was that of a girl, fifteen years old, who was re-vaccinated at the same time and by the same medical man who vaccinated the woman H. The same local appearances followed on the arms as those described in the woman.

"After two months there were maculae on the forehead and cheeks, and after three months more, leprosy tubercles on the forehead. When seen and photographed by Dr. Daubler, the disease had lasted three and a-half years. Inquiries made at the homes of both patients, and from the medical man who vaccinated them, showed that the person from whom the lymph was taken had died of tubercular leprosy several months before, other members of the family being leprosy, . . . facts of which the practitioner was ignorant when he took the lymph with which he vaccinated the patients."

These cases have been carefully investigated, and their description in the "Monats. f. Prakt. Derm." is accompanied by photographs. On my visit to Robben Island, February 10th, 1892, I met Dr. P. Travers Stubbs, who is much interested in the leprosy question, and believes that the disease is inoculable and spread by vaccination. Dr. Stubbs was at that time acting as *locum tenens* for one of the medical officers at the Leper Settlement, and has since been kind enough to furnish me with the following further details concerning these remarkable cases of invaccinated leprosy :—

NOTES OF THE TWO CASES OF LEPROSY ON ROBBEN ISLAND,  
AS REPORTED BY DR. DAUBLER.

—————  
*Elizabeth Hart, aged 39.*

European. Born at Cape Town.  
Date of admission—26th April, 1887.  
Race—English. Came from Wynberg (*i.e.*, eight miles from Cape Town).  
Disease—Tubercular leprosy.  
When contracted—When small-pox was prevalent at the Cape in 1885.  
Where—  
Hereditary—No.  
Complications—

*Particulars as taken from the Case-book, Medical Department, Robben Island.*

The patient says :—"I was quite healthy until vaccinated at Wynberg by Dr. Silke in 1885. I was living with my husband in good circumstances, and had never come in contact with leprosy. About a year after vaccination a large livid patch began to appear round the vaccination mark. A few months later a creeping sensation on both sides of the face, worse on the left. Soon after this the face gradually began to swell."

*Present Condition, May 3rd, 1890.*

Tubercular condition of both sides of face and ears—the left more so; loss of eyebrows; some loss of hair. Tongue a little affected in front. Both hands rather

## LEPROSY AND VACCINATION by WILLIAM TEBB (Complete)

swelled and tender. Infiltration of forearms and upper arms up to shoulders. Legs same as arms. Ulceration about both ankles. There is no marked anaesthesia. No special indication at seat of vaccination on left arm, which, patient says, ran its usual course.

Has been under treatment about six months. First, iodides; gurjun about four months. The appearance of patient has much improved; also general health.

*February 10, 1891.*

Elizabeth Hart, aged 39, married 16 years. Occupation, housewife. One son born one year after marriage. No miscarriages. Menstruation irregular. Last unwell three years ago. Her husband is still living; also the son; both at work. Her father died—the result of an accident. Mother died of phthisis, aged 40. No sisters. Three brothers—one living, healthy; two dead—one of dropsy, other found dead.

She states she was healthy until one year after vaccination, when her attention was drawn to a peculiar lividness of her left arm around the vaccination scar, which is still visible, and skin around quite healthy. There is no infiltration around the scar, which is of ordinary size and clearly visible. She consulted a doctor about this lividness, and then she went to the new Somerset Hospital, and attended for some six months, taking medicine all the time. She had pains in her legs at this time. She had no rash over her body. No sore throat, tongue, etc. Her nose, fingers, and hands became affected two years ago, 1888. Her hair began to fall out before she went to the hospital; eyelashes before she was admitted to the Robben Island Leper Asylum.

At present she has very little hair—no eyelashes and eyebrows. Her nose is very much disfigured by old ulceration. Tongue— nothing abnormal seen. No affection of her shoulder or elbow joints. Both her wrist joints are swollen, painful, and infiltrated.

There are small ulcerated spots about the size of a threepenny—piece, which are beginning to discharge; are not deep, nor are the edges undermined. The palms of both hands were sound. The last phalanges of all the fingers 'and thumbs were destroyed, and the finger nails are cracked and shrivelled. No anaesthesia of fingers. Her legs from her knees downwards were in a similar condition. No periostitis of tibia. No, enlargement of glands (occipital).

In my opinion, this woman has leprosy, plus evidences of syphilis, but I am unable to find out when the latter was contracted or how.

P.B. TRAVERS STUBBS.

---

*Ellen Wangell, 16 years.*

English.

Admitted November 1, 1889, from Old Somerset Hospital.

Disease—Tuberculated leprosy.

Has lived in Cape Town and Clairmont all her life.

Contracted about 1885 at Clairmont.

Parents and brother healthy.

Tertiary rupial sores.

Patient says :—" I was quite healthy till re-vaccinated at Clairmont in 1885 by Dr. Murray. I was living with my mother. We were in pretty comfortable circumstances. We were living by, ourselves. I had never seen anyone with leprosy to my knowledge. I first noticed my nose begin to swell, and afterwards the rest of my face. I was taken to New Somerset Hospital in July, 1889, for what, Dr. Eaton said, was leprosy in my legs. Afterwards to the Old Somerset Hospital ; then brought here." ‘

*Present Condition, 9th May, 1890.*

Symmetrical enlargement of face; right ear more than left; left cheek, large scar of ulceration, which broke out soon after admission, but soon healed; some infiltration and thickening of tongue; fingers of right hand numb, another contracted; left hand comparatively free; some remains of infiltration in forearms, but this has much diminished; some infiltration about the ankles, which are at present suppurating. Infiltration extends nearly as far as knees. Body free; no special indication at seat of vaccination. Has been under treatment since admission. First, iodide and oil gurjun from date of admission, then gurjun alone. General health much improved. Condition of arms and legs much improved.

*As copied from case-book.*

P.B. TRAVERS STUBBS.

Dr. S. P. Impey, Medical Superintendent, Leper Settlement, Robben Island, South Africa, says :—" I wish to draw your attention to one very serious matter in respect to the spread of leprosy. It is contagious, and can be communicated from one patient to another by inoculation. In South Africa the reprehensible practice of arm-to-arm vaccination is carried on to an enormous extent. I have always held very strong opinions on this subject, and consider that many loathsome diseases are spread by means of the vaccinator's lancet. No medical man would take lymph from a patient in whom the disease is visible; 'but in how many of these cases is it not latent? For years I have not vaccinated except with animal lymph, and, think that some means should be adopted to stop the dangerous practice of vaccinating with humanised lymph; rather allow the patients to have small-pox, where there is a chance of recovery, than force leprosy upon them. It is a noteworthy fact that, since the introduction of the art of vaccination, leprosy is spreading with rapidity. I am a firm' believer in the efficacy of vaccine, but consider the arm-to-arm vaccination is a most dangerous practice and one which has led to untold misery."—*Extract from Special Report on Leprosy, from Robben Island, for 1891, in Reports presented to both Houses of Parliament by command of His Excellency the Governor of the Cape of Good Hope, Capetown.*

Dr. Alexander Abercromby, of Cape Colony, writing from Capetown, April 20th, 1892, says that, if a drop of blood gets mixed with the vaccine lymph in the operation of vaccination, then the disease (leprosy) may be transmitted in this way, but he is of opinion that, without the blood, there is no danger. So far as the transference of syphilis and other deadly diseases is concerned, we know that this can be done with lymph of unimpeachable quality and without admixture of blood. In the January (1890) number of the "Archives of Surgery" Mr. Jonathan Hutchinson records several fatal cases, and another fatal case in July, 1890 (p. 23), all following vaccination. Mr. Hutchinson observes :—" There is not the least reason to suspect any want of care in the vaccination or defect in the lymph." On

July 6th, 1881, Dr. Robert Cory, Superintendent of the Calf Lymph Department, London, succeeded experimentally in transferring syphilis to himself with lymph free from admixture of blood.

Rev. Canon Baker, formerly. Chaplain at the Leper Colony, Robben Island, writes to me, June 1st, 1892:—"I have not met with any medical man who has been any considerable time in this Colony who affirmed that vaccination, from arm to arm especially, was not attended with danger in the direction of your inquiry."

Dr. P. Hellat, the leader of the movement for stamping out leprosy in the Baltic Provinces, Russia, writes to me from St. Petersburg, May 1st, 1892, that at the time when he published the result of his investigations into the spread of leprosy, he had omitted to take into account "what might be ascribed to the spread of vaccination." The matter "was of great importance, and one that cannot be considered an open question." Dr. Hellat says that in Russia no one is admitted to school without the marks of vaccination. Re-vaccination is resorted to on the occurrence of serious small - pox epidemics.

## CHAPTER 5: LEPROSY AND RE-VACCINATION

THOSE who have studied the literature relating to the remarkable recrudescence of leprosy in tropical countries, or made personal inquiries where the disease is prevalent, must have been struck with the number of cases of persons whose family history has been shown to have been entirely free from all taint of this disease. In some instances the afflicted persons state they have never seen or come in contact with a leper. It is usual amongst the well-to-do classes to keep the malady a profound secret as long as possible; but a time comes when the disease discloses itself to the family physician or casual observer, and the friends are then led to inquire as to how the disease originated. Close inquiries reveal the fact that with them it is not hereditary, and the afflicted member is free from sore or abrasion of the skin. How, then, could the dreadful leprosy poison have been contracted? The doctor then suggests the vague and much misunderstood word "contagion," or malaria, or diet, all of which theories are now rejected by leading lepra authorities. The unfortunate patient remembers that during a smallpox scare by the advice of his doctor he was re-vaccinated. Inquiries are made as to the vacciner, and it is not seldom discovered that the vaccine virus was taken from a subject in which the leprosy taint—then not discernible—has since fully disclosed the ulcerations of unmistakable tubercular leprosy. It will be said that this is a hypothetical case. From much conversation with intelligent observers in many countries where this disease prevails, including both English and native medical practitioners, public vaccinators, and army surgeons, I am convinced that this is by no means an uncommon experience. So strong is the belief in the existence of this danger, that soldiers in our tropical colonies, when subjected to vaccination, often resort to the practice of squeezing out the virus, if they can do so without observation, and use carbonate of soda, borax, and other disinfectants in order to neutralise the effects of the poison. This dread of vaccination is due to the knowledge amongst our troops, often born of bitter experience, that vaccination is not seldom the factor of disgusting and intractable diseases, the fatal cases of which are invariably registered under secondary causes, without disclosing the originating source of the malady. The leprosy taint is more common in the army than is generally supposed. In my various inquiries I have heard of several soldiers being so affected. In his work on "Leprosy" (p. 71), Dr. Munro refers to the case reported by Dr. Liveing of a private soldier, a leper, in British India, who had several brothers and sisters all older than himself and all healthy. The same authority cites "the case of an officer mentioned in the Report of the College of Physicians, p. 241. Landre speaks of Dutch private soldiers being affected, while ladies never are, they never being exposed to contagion" (p. 45). If Dr. Munro had explained that ladies are not exposed to compulsory re-vaccination, he would have touched the solution of one source of infection. Dr. Sutherland, of Patra, says :—" When serving with the native army, I found repeatedly that men who had in early life the character which I regard as a proof of the existence of a leprosy taint, which I have already described, frequently had to be invalided in after years for leprosy, and subsequent observation and inquiry have led me to the conclusion that the opinion I have formed regarding what I have named a leprosy taint was correct, and that this condition precedes the appearance of the disease in its aggravated form; and I think I am warranted in concluding, from the data given above, that this leprosy taint exists in one out of every ten of the adult rural population of this district. In stating this, I am aware that my views will probably astonish persons who have not given the subject the attention I have."—*Royal College of Physicians Report*, p. 188.

In a note, entitled, "Leprosy in Livonia," the *British Medical Journal* of August 20, 1887, p. 423, says:—" The disease (leprosy) was introduced by a discharged soldier from Southern Russia." The same journal, in its issue of October 22, 1887, in a note on "The Spread of Leprosy," quotes M. Besnier, a member of the French Academy of Medicine, to the effect that, since the extension of the French Colonial possessions, soldiers, sailors, and missionaries, have fallen victims to leprosy in large numbers. The *British Medical Journal*, January 12, 1889, p. 93, in an article entitled "Transmission of Leprosy," mentions several cases of leprosy, including two young soldiers who became lepers. And the number for March 23, 1889, pp. 668-9, publishes the details of a case of mixed leprosy—tubercular and macular—reported by Dr. O. Carroll to the Royal Academy of Medicine in Ireland. The patient was an army pensioner, who had served in India and the Cape, "but he had not been, so far as he is aware, in contact with any leprosy person." Again, on April 13, 1889, the same journal publishes a letter on "Leprosy in the United Kingdom," in which the writer says :—"T. H., after a service of twenty-two years in India under the East India Company, returned home, and soon became a victim to tubercular leprosy." Another case of a soldier, formerly in India, who is now a leper in the wards of a large general hospital, is mentioned by Mr. C. S. Loch in the *British Medical Journal*, July 13, 1889. And in its issue of December 21, 1889, the same journal gives the fatal experience of this re-vaccinated part of the population, observing, on the authority of Dr. Olavide, of Madrid, that in the (leprosy) infected provinces of Spain—Jaen, Cordova, and Guadalura—"most of the sufferers are missionaries or soldiers."

Madhub Chunder Ghose, Medical Officer in charge of the Leper Asylum, Calcutta, in a communication to the Hon. H. Beverley, dated Calcutta, 27th August, 1889, says :—" It is well known that a distinguished officer of the Indian Medical Service became affected by

leprosy during his residence in India."

These cases are too numerous to be explained by the theory of coincidence, and similar instances can be heard of by inquiry in every country where leprosy is endemic. In none of the foregoing instances does it appear that any inquiries were made as to re-vaccination being a possible source of the infection. No doubt the medical practitioners had their private opinions as to the causation of the cases examined, which, however, they have carefully withheld. In one of the cases a press reporter remarked on the reticence of the doctor, who, he said, "absolutely refused to give me any details beyond those which may be said to be available to any member of the public." He admitted, however, that the case was undoubtedly one of leprosy.

Soldiers, it should be observed, are picked men, living amidst healthy surroundings under superior hygienic conditions. They do not associate with lepers, but, on the contrary, carefully shun them. Nor can the disease in the instances I have cited be due to heredity. Re-vaccinated soldiers appear to be more liable to the disease than the European residents in countries where the disease prevails. However much opinions may differ as to other sources of causation, all authorities admit that leprosy is an inoculable disease and communicable by vaccination. Is it not probable, therefore, that the cases I have quoted are due to contamination at the point of the lancet in re-vaccination? Since the terrible disaster at Algiers in December, 1880, when 58 soldiers of the 4th Regiment of Zouaves were syphilitised by re-vaccination from a Spanish child "of remarkably healthy appearance," I have made it a practice in all tropical countries which I have visited to interview soldiers and question them on the results of vaccination in the army. I could fill a long chapter of this book with details of disastrous consequences where soldiers; have been invalided at hospital with tumours, abscesses, and sometimes intractable maladies directly due to vaccination. Some have had their arms amputated and been discharged from the service, and others have sustained lifelong injuries. It must be noted that soldiers, when quartered in tropical countries where leprosy and syphilis prevail, are often obliged to submit to several re-vaccinations. In Capetown, a soldier belonging to the North Stafford Regiment, on duty near Government House, informed me (February 9th, 1892) that since he joined the army he had been vaccinated thirteen times. He was badly pitted with small-pox.

In an article on "Leprosy in the Baltic Provinces," by Dr. P. Hellat, dated St. Petersburg, in the *Journal of the Leprosy Investigation Committee*, December, 1891, the writer cites the following case which he considers speaks "very strongly for infection":—"A young man coming from a leprosy-free district is called for military service, through which he comes to the South of the Empire to a leprosy village, gets ill after two years with *lepra tuberosa*, returns home, lives with his mother, who after two years is attacked with *lepra ancaesthetica*." Dr. Hellat omits here to note that the first danger to which the recruit is subjected on joining the army is that of being inoculated with contaminated virus in the process of vaccination. All other risks, unless he has sores or wounds on his body (very improbable in a recruit who has recently undergone medical examination), are comparatively infinitesimal. For the serious risks incurred by re-vaccination our troops receive no compensating advantage in the way of immunity from small-pox, either of a sporadic or epidemic nature. According to the army medical reports, we find that among troops in Egypt in 1889 there were 42 cases and 6 deaths from small-pox. In the Bengal army in 1889 there were 71 cases and 8 deaths. In the Bombay contingent there were 49 cases and 3 deaths; and among the troops in Madras 32 cases and 6 deaths. In all, there were, in 1889, among this picked body of healthy re-vaccinated men, 202 cases and 23 deaths. How many cases of erysipelas, eczema syphilis, tuberculosis, and leprosy were due to re-vaccination is not stated, but we know that after every general vaccination order, a number of soldiers are disabled for a time, some more or less seriously. I produced evidence before the Royal Commission on Vaccination (Vol. III., p. 116) that in 1882 the Federal Government of Switzerland, owing to re-vaccination disasters, rescinded the regulation in the army, and in 1883 M. Weitzel, the Minister, of War for Holland, for similar reasons, issued an order to the effect that re-vaccination was no longer obligatory in the army of that country.

## CHAPTER 6: OTHER ALLEGED CAUSES OF LEPROSY

I CAN only refer very briefly to causes of leprosy other than those detailed in previous chapters. Next in importance to that of contagion is the question of heredity. The theory of heredity, as a factor in the propagation of leprosy, is rejected by leading authorities such as Hansen, Hjort, and Arning, and by many writers it is not even mentioned. Dr. Arning, while failing to discover evidence that the disease is congenital, is of opinion that a certain weakness to resist its attacks may be transmitted.

Dr. G. Armour Hansen, who discovered the *bacillus leproe* in 1873, has devoted much attention and research to the question of heredity, and failed to find a decided and indisputable proof of its influence in the United States, though hundreds of thousands of immigrants had leprosy parents in Norway. — *Minnesota State Board of Health Report, 1889-90, p. 43.*

Dr. W. Munro says :—"I do not deny that leprosy may be occasionally hereditary, but only say that it has never been proved to be so."

Dealing with the subject of the alarming increase of leprosy in Hawaii, the victims amongst a clean nation multiplying faster as the years roll on, until it has invaded nearly every district in the Archipelago, Dr. W. Hillebrand observes :—"And, mark well, in all this, hereditary taint, from the nature of the case, has no share, or, if any, only a most subordinate one."—*Leprosy a Communicable Disease, by Dr. Macnamara, p. 59.*

The *Lancet*, March 3 1st, 1883, p. 555, observes "Morehead, as well as Lewis and Cunningham at Almora, came to the conclusion that heredity could not be a great factor in the increase of leprosy in a district, inasmuch as lepers have comparatively small families, who suffer a high rate of mortality, and therefore the survivors are only just numerous enough to replace their defunct progenitors."

Dr. George L. Fitch, in his report addressed to the president and members of the Board of Health, Honolulu, in 1884, says:—"Hereditry plays but little figure in the spread of the disease, because we find that, after sending more than 2800 lepers, during a period of eighteen years, to Kalawao Leper Settlement, there are only twenty-six children alive, and only two of these children are lepers."—*Appendix to Report on Leprosy in Hawaii, 1886, p. 31.*

In a note to the Secretary of the State Board of Health,, Minnesota, U.S., December, 1888, Dr. Christian Gronvold observes:—" Our experience in the North-West has made it probable that the disease is not hereditary. Not a single case has been discovered, after forty years of immigration, where a child, born in these States of leprous parents, has inherited the disease."

The same authority concludes an article on "Leprosy in Minnesota" as follows:—" I cannot here relate all my observations in detail. I will only tell what I have found in regard to the occurrence, or rather the disappearance, of *lepra* in America (N.W. States). Of about 160 lepers who have immigrated into the three States named (Wisconsin, Iowa, Minnesota), thirteen are alive, whom I have seen myself, and perhaps three or four more. All the others are dead. Of all the descendants of lepers (and that includes the great-grandchildren of some of them), not a single one has become leprous. This is, in short, the result of my investigations."—*Lancet, March 26, 1892.*

*Report of the Select Committee on the Spread of Leprosy, Cape of Good Hope, July 15, 1889. Minutes of Evidence:--*

The Hon. Dr. Atherstone, M.L.C., who has practised in the Colony fifty years, chiefly in Graham's Town, where he was District Surgeon for twenty-six years, and who has always taken a great interest in the subject, said, in answer to Q. 352 concerning heredity, that "it is the constitutional diathesis, or cachexia, which, I consider, is inherited; not the dormant germs rendering the individual less able to resist its attacks and subsequent reproduction."

In an article on the "Cause of Leprosy," by Sir William Moore, K.C.I.E., Hon. Physician to the Queen, late Surgeon-General with the Government of Bombay, the author says :—"We are told that leprosy is caused by eating fish, and, therefore, cannot possibly be syphilis. Now, I lived and worked many years among the inhabitants of the semi-desert districts of Western India, who never see fish. The sea is hundreds of miles away, and there are no lakes or rivers. Even dried fish did not penetrate into those remote districts. Fish was practically unknown as an article of diet. Yet there is a considerable amount of leprosy in those countries. At recent meet ings of the Medical and Physical Society of Bombay, the subject of leprosy was exhaustively discussed, and the members were unanimous in discrediting fish as a cause of leprosy. The members, being both native and European practitioners, private and in the public services, who are constantly seeing leprosy, are perhaps better qualified than any body of men to give an opinion on this matter. In the districts of Western India above referred to, salt is made from the earth at most villages. The people have as much salt as they want. Yet leprosy has been attributed to an absence of salt. It has always been ascribed to a vegetable diet, to new rice, and to diseased grain. But the kind of food does not appear to influence the disease further than, like insanitary conditions, insufficient food, and food deficient in required elements, that it induces a state of constitution rendering the subject more liable to almost any malady. Again, it has been advanced that leprosy is not, like syphilis, contagious. But the communication of leprosy has certainly been proved. Direct proof seems to have been afforded by the experiment on the criminal at Honolulu. In the case of Keanu, *bacilli* were found to have multiplied at the seat of inoculation. ....Leprosy very frequently commences on the extremities. Natives in India do not generally wear shoes and stockings; their feet are thus very liable to become abraded or wounded; a leper's slippers may easily be taken by mistake, and conveyance of discharge is, I believe, thus frequently accomplished."

In an article in the Fourth Annual Report of the State Board of Health for Massachusetts, U.S., by Dr. Samuel W. Abbott, reprinted in the Hawaiian "Report on Leprosy in Foreign Countries," 1886, is the following, under the title of "Leprosy in its Relation to Public Health ":—"The questions which render leprosy a matter of special interest, as affecting public health, are those of etiology, modes of propagation, and the question of contagion.

"The causes of leprosy have been sought for in the peculiarities of climate, soil, diet, and habits of life. As regards climate and soil, the wide geographical distribution of the disease would seem to preclude them as elements or factors of causation. Opinions differ much as to the question of diet. The eating of tainted fish has been strongly urged as a cause. Leprosy is found in a most aggravated form among fish-eating people, as in Norway and Crete, and, on the other hand, it also prevails in inland districts where fish is but little used.

"Doubtless an improper diet and bad hygienic surroundings aggravate the disease.

"All these causes acting together for centuries did not produce the disease in the Hawaiian Islands, nor was it known until some time after the islands were open to foreign trade and commerce with other nations."

Mr. Jonathan Hutchinson says :—" The suspicion that vaccination has been the means of spreading the disease in the case of the Sandwich Islands has been entertained." The spread of leprosy, according to this distinguished surgeon, is due to eating fish, a theory which finds very few supporters amongst those who have studied the disease in leprous countries. The Parsees are great consumers of fish, and leprosy amongst them is of rare occurrence. With regard to the fish theory, which has obtained currency owing to the eminence of its author, I may observe that in my travels in leprous countries I have hardly met with a single advocate of it, and those most practically conversant with the disease at leper institutions consider it both far-fetched and irrational. In an article on "Leprosy in Kashmir," by Dr. A. Mitra, Chief Medical Officer in that country, in the *American Journal of Medical Sciences*, Philadelphia, pp. 22

and 23, the author says :—"As to Hutchinson's fish theory, the Goojurs do not get fish. Since this theory first came to my notice in the pages of the *Lancet* I have always asked lepers if they have been fish-eating, and in the large majority of instances the reply was in the negative. The theory is untenable in India, where we do not find the disease more prevalent among fish-eating people than among abstainers from such food, as *vaisnabs*. The Kashmiris, among whom leprosy is rare, eat fish, fresh, dried, and salted. In India European sportsmen, planters, etc., use largely preserved fish, but there are no facts to show that fish-eating ever produced leprosy, among them. High-class Hindu widows are strictly prohibited from taking fish, but I have seen several cases of leprosy among them. But the fact that the leprosy is common among Goojurs completely disproves the fish theory." In "Notes on Leprosy in Norway," Dr. Hercules MacDonnell observes :—"Nowhere did I perceive that any credence was attached to the fish-origin 'theory. Dr. Kaurin's writings on this special subject are widely known abroad."—*Lancet, August 31, 1889*.

Dr. C. N. Macnamara says:—"Among the Norwegians putrid and dried fish are said to give rise to leprosy; others fancy that rice prepared in a particular way is at the root of the evil. We may be sure that the theory of bad and salted food being a cause of leprosy does not apply to many parts of India, for the natives, as a rule, do not eat salted food, and certainly are not in the habit of consuming putrid fish."—*Leprosy a Communicable Disease, p. 48*.

In a paper read before the New Brunswick Medical Society, July, 1889, by Dr. Murray MacLaren, M.R.C.S., on "Leprosy in New Brunswick," Mr. Jonathan Hutchinson's Fish and Food theory is dealt with. After quoting Mr. Hutchinson, the writer says:—"This view is not at all borne out by what can be observed, in our own affected district, which is only 45 miles in length, and of the 82 cases already mentioned, 58 have arisen in the parish of Tracadie alone, which has been the headquarters of the disease, while the remainder come from the other parishes: Niguac, 3; Pokemonde, 9; Shippegan, 6; Caraquette, 6. It does not seem possible that this district, and especially Tracadie, should have food in any way different from a large part of the extensive northern and eastern coast, which is quite similar to the leprosy district in soil, climate, food, including fish, and inhabited by a similar race of people' with the same manners of life. Besides this, the fact that no case is known to have occurred among the Indians dwelling within the affected area helps to disprove this theory."—*Maritime Medical News, July, 1890, p. 50*.

Dr. Julius Goldschmidt, in a communication on "The Madeira Leprosy," says :—"Those districts where mostly fish is consumed, and sometimes in an unhealthy state (coast villages), are freer from the disease than in other parts of the island."—*Journal of the Leprosy Investigation Committee, No. 4, December 1891*.

Dr. Max Sandreczki, Director of the Children's Hospital, Jerusalem, says :—"Leprosy in Palestine is developed by insanitary conditions, of which I will enumerate the chief: impure air; the tainted exhalations which prevail in the villages and unhealthy habitations of the fellaheen; the water supply, often stagnant and deteriorated; the oil and fat (used for food), rancid, or salted beyond measure; olives and cheese in a state of decomposition; meat rotten, or coming from animals diseased, or worse still. Add to all this extreme uncleanness, the utter absence of skin action, and then one 'may easily explain derangements in the tissues of the skin, in the lymphatic and ganglionic systems, and, in a word, complete disorder of all the nutritive functions.'"—*The Lancet, August 31st, 1889*.

The Hon., David Dayton, President of the Board of Health, Honolulu, says :—"I am not of the opinion that leprosy 'is always hereditary, so many cases proving to the contrary. By referring to tables in Mr. C. B. Reynolds' reports, it will be seen that a large proportion of the girls in the Kapeolani Home were children of leprosy parents without becoming diseased themselves."—*Report, Board of Health, Honolulu, 1892, p. 42*

## CHAPTER 7: INADEQUACY OF MEDICAL THEORIES OF CAUSATION.

IN conversation with leprosy specialists in countries where leprosy is endemic, nothing is more common than the admission that the alleged exciting causes of the disease, such as contagion, heredity, or malaria, are quite inadequate to account for the rapid progress of leprosy over a wide area in recent years. Dr. Alzevedo Lima, chief medical officer of the hospital, Rio de Janeiro, observes:—"Even at the present time, in spite of the progress in sanitation, and the more favourable conditions of life among the Brazilians, there are still centres of contagion, whence we receive patients for the hospital in larger numbers than from other places. Throughout the whole country, in fact, this terrible disease is still rife. This being so, if we consider the differences in climate, the food, the habits of life, the sanitary conditions, etc., of the various regions of this vast country, it is difficult to believe that the etiological factors still given as determining causes of the disease can be in themselves a sufficient explanation. At the most, they can only act as favouring conditions, and explain the greater or less frequency of the malady, its predilection for certain places or for certain classes of the people."—*Journal of the Leprosy Investigation Committee, December 1891, p24*

Alluding to this subject, Dr. Alzevedo Lima, writing to me from Rio de Janeiro, May 20th, 1892, says :—"None of the ordinary etiological factors explains satisfactorily the spread of leprosy in this country, where one finds focuses in places altogether different in the climate-telluric conditions, and where, besides the sick people who live in bad conditions of feeding, etc., there are many others who live in luxury and belong and dwell amongst the best society. The inheritance also does not account for it in a very large scale. About this last point I always take very great care to inquire of the sick people who are taken to the Hospital dos Lazaros, where we have had 242 patients during these fourteen years past that it has been under my direction. . . ." Referring to the inoculation of leprosy by means of vaccine virus, Dr. Lima says :—"I believe in the possibility of the fact, not seldom, and I suspect this may have been the cause of the spread of the disease amongst our people, specially in the country, where, with the absence of a doctor, the vaccination is done by someone not professional, and therefore incapable of distinguishing whether they are using the vaccine taken from a pure source or not. Moreover, to those who know how long it takes for the incubation of leprosy, and how difficult it is to diagnose it in its

initial stages and in several of its forms and varieties, it is easy to know that even the professional man may have given rise to the spread of the disease in that way.

"Amongst 62 persons affected with this disease now in treatment in the Hospital dos Lazaros, in this city, 26 were vaccinated, being 8 in Rio de Janeiro, 8 in the State of St. Paul, 6 in the State of Minas, and 2 in Portugal; the remaining 36 have never been vaccinated. Abstracting the 10 of Rio de Janeiro, where the vaccination is gone through with every care and the vaccine taken directly from the cow, we have 8 come from St. Paul, either from the country or from small villages where the vaccination is performed, as a rule, by people not competent, and with the lymph taken at random from any person amongst their own people, where leprosy prevails endemically. In any of these States, in the absence of a physician, any clever man undertakes the duty of vaccinating amongst the people, and this may very likely be one way of propagating the leprosy."

Dr. Alexander Abercromby, of Cape Colony, referring to the causation of leprosy, says :—"It is evidently dependent on some vitiated state of the blood, and that acquired in many instances, as has been clearly ascertained, by hereditary predisposition. In many cases, however, it occurs where no such predisposition can be traced, and in persons whose parents were perfectly healthy, and who evinced during their lives no trace of the disease whatever. In these cases we are led, therefore, to seek for other causes to account for it."—*Thesis on Tubercular Leprosy, p. 15.*

In the Report on the Annual Returns of the Civic Hospitals and Dispensaries in Madras for 1888, p. 14, under the head of Vizagapatam, Surgeon-Major Sturmer says that leprosy is on the increase in the district, and observes :—" This year I have seen many fresh cases of leprosy in adults as well as in children, in whom no hereditary taint could be traced. They evidently had contracted the disease from some outside source, for in each case it was ascertained that no other member of the family was affected."

The "Report on Leprosy in New South Wales," May 13th, 1891, forcibly exhibits the unsatisfactory condition of modern inquiry into the etiology of the disease. No mention is made as to the chief factor of causation.

The Secretary of the Board of Health in New South Wales, Mr. Henry Sager, observes :—" The detailed history of the cases given in Appendix C., though of very considerable interest, does not furnish any grounds for definite conclusions as to the causation and spread of the disease. There are no data on which to advance a view of spontaneous, climatic, dietetic, mal-hygienic, or hereditary origin of the malady, and nothing of scientific accuracy to be adduced as to contagion, though the evidence in several cases points more or less strongly in this direction."—*Journal of the Leprosy Investigation Committee, No.4, December, 1891, p.50.*

The Report of the Inspector of Asylums for 1890, presented to both Houses of Parliament, Cape of Good Hope, under the head of "Female Leper Wards," p. 32, says :—" The fact which stands out most prominently in making these records is the absence of any history of direct contagion, or even with contact of a known source of the disease in almost all of the cases which have been investigated."

When, about a year later, Dr. S. P. Impey, the present medical superintendent of the asylum, Robben Island, unable to account for the spread of leprosy by popular medical theories, began a more careful and exhaustive investigation than his predecessors had ventured upon, and included vaccination, hitherto ignored, as one of the possible factors, he had no difficulty in tracing a number of cases directly to this source. Dr. Impey felt it his duty to warn the Government of this danger.

In concluding a second paper on "Notes on Acquired leprosy as observed in England," by Mr. Jonathan Hutchinson, in the *British Medical Journal, July 6, 1889*, this distinguished pathologist observes :—

"The twelve cases which I have quoted do not, I believe, comprise by any means all the examples of leprosy beginning in patients of British birth and descent which have come under my observation. They are all, however, of which I am able at present to find record in my note-books. One and the same criticism may be said to apply to all. They are the examples of the acquisition of a specific disease by healthy persons who had no inherited predisposition. In no single instance had the person so acquiring it been exposed to any degree of hardship, or deviated in any definite manner from the ordinary conditions of a cleanly and well-regulated life. In every case the acquisition of the disease had occurred in some country where it was known to be prevalent, the East and the West Indies being the chief localities. I submit—as, indeed, I have already suggested—that there are only two suppositions open to us by which to explain the *de novo* acquisition of such a disease in cases such as these. The patients must either have received the specific contagion of leprosy on some part of the skin or mucous membrane, or they must have swallowed it in connection with food. Both these suppositions are possible. I may confess, however, that to my own mind one of them seems far more probable than the other. In no single instance had there been any known exposure to contagion. In no case had the patient associated with anyone suffering from leprosy, and in most instances the statement given was that they had but rarely seen lepers, and had certainly never come near them."

Amongst the possible sources of leprosy contamination, Mr. Hutchinson, while inclining to what is known as "the fish theory," mentions "the perils of vaccination."

## CHAPTER 8: LEPROSY AND VACCINATION AT THE INTERNATIONAL HYGIENIC CONGRESS.

IN the month of June, 1890, I presented before the Royal Commission on Vaccination certain facts tending to show the increase of leprosy in various countries which I had visited, and that this, increase was largely due to vaccination. In the following autumn I extended my inquiries to other countries, and discovered the same sinister results; and in the following April I published my

conclusions in a pamphlet entitled "Leprosy and Vaccination," which has been widely circulated in the countries where the alleged cases of leprosy have occurred. But no attempt was made to reply to the allegations until August, 1891, when Dr. Phineas S. Abraham, the Secretary of the Leprosy Investigation Committee, read a paper on the subject before the International Congress of Hygiene and Demography in London. The following is the report of his address, from the *Lancet* of August 22, 1891 :—

"On the Alleged Connection of Vaccination with Leprosy.— Phineas S. Abraham, M.D., read a paper on this subject. Accepting the bacillary theory of leprosy, and believing that instances have occasionally been reasonably demonstrated of its communication from one infected person to another previously healthy, Dr. Abraham has sought for evidence as to every possible means of inoculation, vaccination included. In this paper he gave a short account of the principal inquiries bearing upon the subject, and discussed the facts which have been alleged to connect leprosy with vaccination. The statements, or supposed cases, of the following observers were among others alluded to :—Sir Erasmus Wilson, Sir R. Martin, Dr. Bakewell, Dr. Tilbury Fox, Dr. Castor, Dr. Ebdon, Mr. Malcolm Morris, Dr. Bemiss, Dr. Hildebrandt, Dr. Arning, Dr. Mouritz, Dr. Rake, Archdeacon Wright, Professor Gairdner, Dr. Black, Drs. Swift and Montgomery, Surgeon Brunt Dr. Piffard, Mr. Hillis, and Professor Leloir. It was pointed out that the question had been in the minds of inquirers for many years past, and that the supposed instances brought forward were comparatively few. Even the most suspicious cases, such as those adduced by Professor Gairdner, Mr. Hillis, and others, were open to the objection that there was nothing to show that the subjects had never been exposed to any other possible means of inoculation or contagion, had never been in contact with lepers, or had never had to do with food or anything else which might have become contaminated by lepers; in short, we could not be sure that, having been born, or having lived for some time in a leper land, they had not been exposed to other pathogenic conditions of the disease. Dr. Arning's and some of the other observations were quoted in full because they had been much twisted, and false deductions have been drawn from them. The evidence from Scandinavia was significant; vaccination had been compulsory in Norway for many years, and largely practised from arm to arm in the leprosy districts, and, as Dr. Hansen stated, no case of transferring leprosy therefrom had been hitherto known. Leprosy, indeed, was there steadily decreasing. In China, according to Dr. Manson, leprosy was common in the district where vaccination had been practised for the last sixty or seventy years; but, on the other hand, it was more common in districts where vaccination had only been recently introduced, and was practised to a very limited extent only. Some fresh facts and definite information on the subject were hoped for from Mr. William Tebb's late evidence before the Vaccination Commission. A great deal was, of course, made of the observations of Professor Gairdner, Dr. Arning, Dr. Castor, Mr. Hillis, and of some of the others alluded to above. One of them held the view that the spread of leprosy might be due to *syphilitic* vaccine lymph, and another had written a pamphlet on the subject which was full of inaccuracies. In point of fact, although *a priori* the possibility of an occasional accidental inoculation of the disease by vaccination might be admitted, up to the present time no absolutely clear and incontrovertible evidence connecting vaccination with leprosy had been forthcoming; and, in Dr. Abraham's opinion, anyone who said that vaccination was to any extent responsible for the spread of leprosy talked arrant nonsense. Nevertheless, from what was known concerning the introduction of bacillary diseases in man and animals, it certainly behoved medical men to be extremely careful in the selection of their lymph for vaccination; and in a country where leprosy was rife it seemed to him that it would be advisable to exercise particular caution, and, if possible, avoid, as was now being done in Hawaii, an indiscriminate arm-to-arm vaccination among the natives. The question of the possibility of transmitting leprosy bacilli by vaccine is receiving attention on the part of the Indian Leprosy Commission, and a paper on the subject by Drs. Bevan Rake and Buckmaster will appear in the next number of the *Leprosy Journal*"

In answer to this statement I sent the following to the *Lancet*:—

#### LEPROSY AND VACCINATION.

(To the Editor of the *Lancet*.)

SIR,—Dr. P. Abraham's address before the recent International Congress of Hygiene and Demography on the alleged connection of vaccination with leprosy, reported in the *Lancet* of 22nd August, is hardly calculated to allay public anxiety in our tropical colonies where the disease is endemic. As he has referred to the evidence which I gave on this subject before the Royal Commission, I shall be glad if you will kindly allow me a short space for explanation. Dr. Abraham has furnished a tolerably large list of authorities who have either pointed out this particular danger or supplied particulars of cases where leprosy has in their opinion been invaccinated, but he adds that these cases are comparatively few. Allow me to observe that Dr. Abraham has omitted to mention that, of the distinguished medical witnesses, some have adduced several cases of invaccinated leprosy, and others refer to a "prolific," "serious," "alarming" increase of leprosy due to vaccination. Some of the cases are introduced with reluctance by practitioners, who know the damaging effect of these allegations upon a prescription lauded as "the greatest discovery in the history of medicine." Dr. Abraham quotes Dr. Hansen as stating that in Norway no case had been hitherto known of the communication of leprosy by vaccination. Permit me to say that this well-known pathologist has given his emphatic opinion, which I quoted before the Royal Vaccination Commission, that the chief means of disseminating leprosy is by inoculation, and that in Norway the greatest possible care is observed to prevent lymph being taken from leprosy subjects. Dr. Abraham advises medical men to be "extremely careful" in the selection of their lymph, especially in countries where leprosy is rife, and to avoid arm-to-arm vaccination, "as is now being done in Hawaii." I beg to state that less than a year ago, as I know from personal inquiry, the bulk of the vaccinations in Hawaii were performed with humanised virus, it having been found that animal lymph produced excessive inflammation and many terrible cases of ulceration. In Ceylon, where leprosy is endemic, and, according to Dr. Kynsey, the Surgeon-General, increasing from some occult cause, arm-to-arm vaccination is principally in vogue, as it is also in the West Indies. If leprosy is spread chiefly by inoculation (and this source of infection is more generally accepted amongst dermatologists than any other), there is no mode of inoculation so widely prevalent as vaccination; and,

having investigated the subject in all quarters of the globe, I attribute largely to this cause the alarming recrudescence of the disease which has taken place during the last thirty years in our colonies and most other leprosy countries., WILLIAM TEBB., Devonshire Club, St. James's, London, 5th September, 1891

*This letter was refused insertion*

It is clear by Dr. Abraham's mode of argument that leprosy vaccination, as an important factor in the increase of the disease, is the last thing he will admit. All other possible sources of dissemination must be excluded before a theory so fatal to medical prestige can be tolerated. Any other of the numerous theories promulgated to account for new centres of leprosy contamination the doctor is ready to consider, but vaccination (to use a classic phrase) "must be preserved from reproach," and the reputations of its distinguished advocates maintained. His opinions, however, do not seem to meet universal approbation, even amongst the medical profession. Commenting upon Dr. Abraham's address, the *Hospital Gazette*, London, of August 22nd, 1891, observes :—" Dr. Abraham has gone to a great deal of trouble to prove, or attempt to prove, that, though leprosy is probably as susceptible of being conveyed by vaccination as is syphilis, there is no well authenticated case of the kind on record. It is admitted that quite a number of suspicious instances have been reported by competent observers, but Dr. Abraham rules them all out of court on the ground that other possible sources of infection have not been eliminated. This seems to be asking too much. Leprosy vaccine is obviously only obtainable in countries where leprosy is common, so that, theoretically, the victims must necessarily have been exposed to the special pathogenic influences. It has, we believe, been scientifically demonstrated that the disease can be conveyed by inoculation, and we shall require something more than this specious special pleading of Dr. Abraham before acquiescing in his conclusions."

### CHAPTER 9: VACCINATION IGNORED IN OFFICIAL LEPROSY REPORTS.

Now that evidence is accumulating in all directions regarding vaccine virus as a propagator of leprosy, attempts are made to minimise the effects of this evidence on public opinion, by alleging that the instances of such infection are few in number, and of no account when put in the scales against the enormous benefits arising out of the application of Jenner's great discovery. This is not the place to enter into the *pros* and *cons* of this much-veiled question, but those who wish to study the facts may do so advantageously in the reports of the Royal Commission on vaccination; in the article on vaccination by Dr. Charles Creighton in the ninth edition of the "Encyclopedia Britannica"; in the able monograph, "Jenner and Vaccination," by the same author, and in Professor Crookshank's instructive treatise, "The History and Pathology of Vaccination." My own views on this subject—the results of a lengthened experience—may be found in the *Westminster Review* for December, 1888, and January, 1889. While I do not admit with Dr. P. Abraham, Dr. George Thin, Dr. Beavan Rake, and others, that the cases of leprosy due to vaccination are few in number, it should be borne in mind that the subject has never been submitted to searching and impartial investigation. In 1862, by request of the Government, a Committee of the College of Physicians prepared a series of seventeen interrogatories which were sent to leprosy specialists in all parts of the world, but all reference to vaccination as a possible or probable factor was strictly excluded.

In consequence of the rumours of the spread of leprosy, by means of vaccination, in the Island of Trinidad, Governor J. R. Longden felt it his duty to call the attention of the English Government to the subject, and on the 4th March, 1871, he addressed a dispatch to the Right Hon. the Earl of Kimberley, then Secretary of State to the Colonies. In confirmation of this serious charge against vaccination Governor Longden referred to the report of Dr. Bakewell, the Vaccinator-General of Trinidad, and to certain cases of unvaccinated leprosy, and to Sir Ranald Martin and other eminent physicians as authorities for his statements, and added, "This part of Dr. Bakewell's report appears to me to be deserving of your Lordship's attention in connection with the increase of leprosy, which I fear must be admitted to have taken place in the last few years." In paragraph 13 of the dispatch Governor Longden says: "The danger of introducing disease into the system of a previously healthy child by vaccination is possibly a real one, and it is very important, as regards tropical colonies at least, that it should receive the attention of the medical profession." In paragraph 14, Governor Longden pertinently observes that the special danger of spreading broadcast the seeds of leprosy would be worse than the perpetuation of small-pox. Governor Longden's dispatch was referred by the Colonial Department to the Royal College of Physicians, who were anxious to get rid of the most damaging indictment yet preferred against vaccination. This they, sought to accomplish, as far as possible, by ignoring it altogether.

That learned body nominated, Dr. Gavin Milroy, F.R.C.S., who arrived at Georgetown, British Guiana, on the 22nd July, 1871, and prosecuted inquiries mainly as to the contagiousness of leprosy in that Colony, and on the 17th October, 1871, he submitted to the Earl of Kimberley a report confirming the conclusion of the College of Physicians, as given in p. xix. of their report as follows :—" The all but unanimous conclusion of the most experienced observers in different parts of the world is 'quite opposed to the belief that leprosy is contagious or communicable by proximity or contact with the diseased.'" Dr. Milroy adds :—" My personal observations and inquiries in the Colony all tend in the strongest manner to the same result" No question as to vaccination was submitted for consideration. On the 25th October, 1871, Dr. Milroy reached Barbados, and from thence proceeded to Antigua, and later on visited Trinidad, Dominica, and Jamaica. On reaching Trinidad in November, 1871, he discovered that Dr. R. H. Bakewell in his report had given "countenance to the popular belief as to the transmissibility of leprosy by vaccination," and, with the consent of Governor Longden, inserted an additional question to the Interrogatories for circulation in that Colony. This question, then submitted for the first time, elicited answers abundantly confirming Dr. Bakewell's contention. These answers will be found cited in the communication from Mr. Alexander Henry, and elsewhere, in this volume.

Dr. Milroy's report on this part of the subject is mainly directed to answer and, if possible, disprove Dr. Bakewell's allegation, which,

if unanswered, might prejudice the continuance of vaccination. Dr. Milroy says, "What is contended for is, that pure, genuine, vaccine virus, unmixed with blood, cannot be the medium of any contagion but cow-pox:" conditions, as every public vaccinator knows, impossible of fulfilment. At this period the transference of syphilis by means of vaccination was publicly acknowledged, but Dr. de Verteuil of Trinidad, in his reply to Dr. Bakewell, observes: "It is an illogical deduction that, because syphilis is inoculable, leprosy is, or might be, inoculable, the diseases being essentially different." Dr. Browne of Barbados, one of the witnesses, has misgivings on the point, and writes to Governor Rawson, November 8th, 1871, as follows:

"It has been a general rule not to vaccinate from the apparently unhealthy, or those of leprosy taint, not so much from any opinion founded on fact of the possibility of conveying disease, as from a respect for the general prejudices prevailing." Public opinion, as shown by Dr. Bakewell's evidence, was even at that time in advance of medical opinion regarding the danger attending vaccination. Dr. Reade, the Colonial Surgeon of Singapore, cautiously observes (Dr. Gavin Milroy's report, p. 36):

"There is a possibility that the disease (leprosy) may be transmitted from children hereditarily tainted with leprosy, and I strongly advise the continuance of importing lymph from England by every mail, and carefully selecting only healthy children as vaccinifers."

The testimonies elicited by this inquiry as to the communicability of leprosy and syphilis seem to have had no practical effect on the College of Physicians. In a letter from that body on "Vaccination and Leprosy," dated London, August 17, 1871, and addressed to the Earl of Kimberley, it is stated that, while it is admitted that in a few instances syphilis has been transmitted by vaccination, "yet with reference to leprosy it must be observed that there is no evidence adduced beyond the merest presumption that this disease has ever been transmitted by vaccination." And so far from cautioning the public against this fearful danger, and petitioning Parliament to repeal a law which had been productive of so much mischief, the College of Physicians reaffirmed their belief in the benign character of vaccination, and declared "that they cannot press too strongly on your lordship the importance of enforcing the practice of vaccination for the protection of those who are too ignorant to protect themselves, and it would be a grievous wrong to forego so great a public benefit on the mere speculative grounds advanced by Dr. Bakewell."—*Report on Leprosy and Yaws*, p. 86.

The next inquiry emanated from the India office, and is entitled "Scheme for obtaining a better knowledge of the endemic skin diseases of India," prepared by Tilbury Fox, M.D., F.R.C.P., and T. Farquhar, M.D., 1872. Two chapters in the report of this inquiry are devoted to leprosy. The authors here furnish a list of twelve questions for elucidation in regard to the presence and cause of leprosy in different districts, and three questions for leprosy in individuals. In none of these is either inoculation or vaccination specified.

The alarming increase of leprosy in Hawaii, which took place after the introduction of vaccination by the missionaries, once more called public attention to the subject, not only in that group of islands, but throughout the civilised world. In 1885 the Department of Foreign Affairs in Honolulu instituted the most extensive inquiry made up to that time into the causation of leprosy, and the means of its treatment and prevention. The deplorable position of affairs is briefly stated in the introduction to the official report, entitled, "Leprosy in Foreign Countries: Summary of Reports furnished by Foreign Governments to His Hawaiian Majesty's Authorities, as to the prevalence of Leprosy in India and other Countries, and the measures adopted for the social and medical treatment of persons afflicted with the disease." . . . "It is about thirty years since leprosy first attracted any serious attention in the Hawaiian Islands. In the year 1866 the dread disease had gained such a deadly hold upon the native race, that the Hawaiian Government began to attempt to stamp out the scourge by segregation, for it had become a contest for the preservation or destruction of the aboriginal race. To judge by the number of cases in proportion to the population, the disease appears to be more virulent and malignant in the Hawaiian Archipelago than elsewhere on the face of the globe. What has been attempted and accomplished in this twenty years struggle with a great national calamity appears elsewhere."

"His Hawaiian Majesty's Government being anxious to provide every possible means for the treatment and understanding of the fearful malady, His Excellency Walter M. Gibson, His Majesty's Minister of Foreign Affairs and President of the Board of Health, addressed letters of inquiry to the Secretary of Legation at Ceylon and to the diplomatic and consular representatives of the Hawaiian kingdom in various parts of the world where leprosy was known to exist, making inquiry in respect to the character and treatment of the disease." It is stated that the response to these inquiries has been most generous, more especially from governments of dependencies of Her Majesty Queen Victoria. This interesting document gives reports from every section of the vast Empire of India and its dependencies, from Ceylon, Hong Kong, Siam, the Netherlands and their colonies, the Canary Islands, Norway, Spain, Mexico, Chili, and Guatemala, and an extremely interesting and valuable report from the famous Leper Institution of Tracadie, New Brunswick, Canada. The report from the Secretary to the Government of India being so comprehensive and voluminous, it has been considered expedient to separate it from the other reports.

"In grateful recognition of the sympathy of other afflicted nations, this collection of reports, together with the sad history of its own affliction, is presented to the world by the Hawaiian Government in the devout hope that the Almighty, in his great mercy, may ere long permit suffering humanity to find the means of mitigating the terrible scourge."

From this little known compilation I have made extracts on various matters dealt with in this volume.

In this important inquiry, although at that time the facts had become known throughout the Hawaiian Archipelago as to the spread of leprosy by vaccination, yet such was the reluctance to bring so grave a charge against a practice proclaimed far and wide as "the greatest discovery in the history of medicine," that it was thought expedient to make no mention of vaccination in the interrogatories, and to specify only those points drawn up by the Committee of the College of Physicians in 1862.

Owing to the increase of leprosy in South Africa, inquiries by Select Committees of the Legislative Assembly were instituted in 1883 and 1889, but the interrogatories relate chiefly to the spread of the disease, and to its contagious or non-contagious character. The questions were submitted *viva voce*, and vaccination as a possible factor in the dissemination of leprosy is carefully ignored.

An important report by Dr. S. P. Impey, Medical Superintendent of the Leper Settlement, Robben Island, on the dangers of spreading leprosy by means of vaccination, was in June, 1891, sent to the Colonial Office, Capetown. Of this report I have attempted, by repeated personal applications at the Colonial Office, Capetown, and at the Stationery Department of the colony, to obtain a copy, but without success.\* (\*An extract from this report, through the intervention of a correspondent in South Africa, has since been obtained).

In the "Report of the Leprosy Inquiry Commission" for the Colony of Mauritius, published 26th October, 1888, I find the following request in the circular of instructions sent to medical practitioners:—"We would be glad to obtain any facts bearing upon the question of its heredity or contagiousness, upon the conditions favouring its diffusion, upon its treatment, and, finally, upon the best means of preventing its spread in the community.—T. LOVELL, Chief Medical Officer," etc.

Nothing is said as to the inoculability of the disease, nor is there any inquiry suggested as to vaccination, which has been the means of spreading leprosy in this colony.

The Royal College of Physicians published another report on leprosy in 1889, concerning which the *Lancet*, April 20th, 1889, says:—"A report from the Leprosy Committee was read. It stated that the documents forwarded by the Government on the subject of leprosy since 1887 did not contain much, if any, new information. In view of the fact that there is increasing evidence respecting the communicability of leprosy, the committee repeated 'with greater urgency' the recommendation made in 1887, that the Government should institute a full and careful scientific investigation, which would entail expense and require considerable time. The adoption of the report was moved by Dr. Symes Thompson, who said that the disease was spreading very much among communities in South Africa, and was seconded by Dr. Handfield Jones, who thought that the College should express more definitely its opinion of the contagiousness of the disease and the need for compulsory segregation. This view was not accepted by other speakers, but all concurred in the urgency for a thorough scientific investigation, and it was referred to the committee to draw up a statement respecting the scope of such inquiry, for submission to the Government."

This report was, founded upon official and other documents collected up to that date and forwarded by the Government to the College of Physicians. Of these documents I have been unable to obtain copies or even permission to inspect them. The report is signed, "James Risdon Bennett, Chairman," and is dated April 5th, 1889. It was then four years since the disastrous effects of vaccination in Hawaii had been published by Dr. Edward Arning, and two years since Professor Gairdner's remarkable cases of invaccinated leprosy had been made known in the *British Medical Journal*. These and other facts showing the danger of invaccinating leprosy had been laid before the Dermatological Congress of Europe by eminent specialists. And soon after the publication of Dr. Gairdner's cases, Sir William Robinson, Governor of Trinidad, issued a confidential circular to about 30 medical practitioners of that island, containing the question as to whether leprosy is communicable by vaccination, "lymph from healthy vesicles alone being used." Dr. A. S. Black, a well known practitioner, gave particulars of several cases in his own experience, and stated that leprosy was increasing in the island. In his report to the Surgeon General for 1890, p. 34, Dr. Beavan Rake says:—"Some thirty or more Trinidad doctors to whom the same circular was addressed returned negative replies." Dr. Rake omits to state that those who doubt or deny the risk qualify their answers by remarks such as that there is no danger "if pure lymph only is used, and precautions taken in the selection of the vaccinifer and the examination of the pustule," "if there be no admixture of blood" and "healthy lymph is used," "provided the lymph is clear" and "the vaccinifer is free from hereditary taint," "if bovine virus is selected," "with perfect cleanliness of the lancet," etc. Dr. Woodlock mentions that he takes the precautions of constantly importing fresh certified lymph from England. Dr. D. de Montbrun "dreads vaccination on the ground that syphilis and other cutaneous diseases have been transmitted by it." He also states that nearly all the families in Trinidad strongly object to vaccination with lymph taken from the children of the island, from fear that leprosy may be thereby communicated. Dr. Chitterton says:—"Vaccination is performed in Trinidad in a very unsatisfactory way." It is obvious that the value of the answers is seriously vitiated by the form in which the question is worded. The use of clean lancets and healthy vaccinifers without hereditary taint, however much insisted upon, cannot be made compulsory; and the people are obliged under severe penalties to submit to whatever vaccination is offered, which is chiefly of the leprosy and syphilitic variety, collected from miscellaneous native vaccinifers by perfunctory public vaccinators. Indeed, as I have found by personal inquiries in the West Indies, South Africa, and Hawaii, all the precautions admitted to be indispensable for the safe performance of the official rite are habitually disregarded.

The latest inquiry is due to the extraordinary amount of public interest awakened by the published reports of the labours, devotion, and death of the late Father Damien in the Sandwich Islands, and to the accumulation of evidence from many English and French Colonies showing conclusively the increase of this frightful malady. The first meeting was held at Marlborough House, June 17th, 1889, under the presidency of H.R.H. The Prince of Wales; and a dinner in aid of the National Leprosy Fund was held at the Hotel Metropole, London, on the 13th January, 1890, at which also the Prince of Wales presided. A highly influential Committee was subsequently appointed, with Dr. Phineas S. Abraham as secretary. The following letter, with a view of eliciting suggestions, was published in the *Lancet* of the 31st May, 1890, also in the *British Medical Journal* and in the first number of the *Journal of the Leprosy Investigation Committee*:—

SIR,—With the object of eliciting by correspondence as much information as possible on the subject of leprosy, it is proposed as a

preliminary investigation to address a series of questions to the officers of the various leper asylums and to others who may be able to throw some light upon the matter. I am requested to ask you to allow me to invite the co-operation in this inquiry of those of your readers who, from their knowledge of the disease, may be in a position to offer suggestions as to matters of, inquiry and as to points of elucidation. Any observations with which the Committee may be favoured will be gladly received and incorporated in the "Journal of the Leprosy Investigation Committee," of which the first number will be shortly published.—I am, sir, yours faithfully, P. S. ABRAHAM, Med. Sec. May 26th, 1890.

Dr. Abraham further explains that "although all information bearing on leprosy will be deemed of interest, it will be desirable for observers to direct particular attention to questions relating to the cause or causes and propagation of the disease, as well as to those referring to remedial measures." "It is to be noted that this 'Journal' is published for the purpose of obtaining reliable scientific information on the subject of leprosy, and that it will not be carried on in the interest of any one particular theory. Views from all sides will be admitted; and that the truth may be arrived at, full and free discussion is invited."

Nothing could be fairer, more explicit, or more promising for establishing public confidence and support than these announcements. Realising the importance of the subject and the limitations laid down by Dr. Abraham, I addressed to him, as Secretary of this Inquiry, the following brief communication on the principal point referred to—the causation of leprosy :—

Rede Hall, Burstow, near Honey, Surrey,  
June 10th, 1890

SIR,—Observing your note in the *Lancet* of the 31st tilt., requesting suggestions as to methods of inquiry, and as to points of elucidation, with regard to the remarkable spread of leprosy, I beg to point out that amongst the questions which it is proposed by your committee to issue to the superintendents of Leper Hospitals, dermatologists, and others, that of the connection of the disease with vaccination should be included. That there is a connection is now admitted by some of the most eminent authorities of the day, including Professor W. T. Gairdner, Dr. Liveing, Sir Morell Mackenzie, Dr. John D. Hillis, Dr. Edward Arning, Dr. Armaur Hansen, and others. Some of these writers admit that not only is leprosy communicable with the vaccine virus, but that new centres of contagion of this hideous disease have been created by vaccination, with most disastrous and far-reaching consequences. Trusting that this important feature of the question will not be overlooked by your committee, and awaiting the favour of a reply, I am, sir, yours faithfully, WILLIAM TEBB.

Dr. Phineas Abraham, National Leprosy Fund, Adam Street, W.C.

To this letter the following reply was received :—

2 Henrietta Street, Cavendish Square, W. July 2nd, 1890.

DEAR SIR,—I must apologise for not answering your letter before this. With regard to the alleged connection with leprosy, this question will certainly be one of the points to which special attention will be directed on the part of the committee, and an attempt will be made to sift the evidence in an impartial manner.—I am, dear sir, yours faithfully,  
PHIN. S. ABRAHAM, M.D.

W. Tebb, Esq.

This correspondence, implicating vaccination, and pointing out a much-neglected source of danger, is absolutely ignored in the *Journal of the Leprosy Investigation Committee*; while communications from all parts of the world, in which the most diverse and conflicting theories are advanced by persons whose opportunities for observation and inquiry have necessarily been of a very meagre description, have found insertion in its pages.

In a notice of a recent able work, "Leprosy," by G. Thin, M.D. (London: Percival & Co.), in No. 4 of the *Journal of the Leprosy Investigation Committee*, p. 71, no mention is made of the cases of invaccinated leprosy introduced by the author, which occupy several pages of the work. On the other hand, three articles against the theory that leprosy is spread by vaccination are inserted. It is also to be observed that, while numerous communications, pointing out the dangers of vaccination in countries where leprosy is prevalent, have, since the Leprosy Commission was appointed, appeared both in the home and colonial press (some of the writers citing cases of the disease disseminated in this way, and others furnishing the results of their painstaking investigations), no notice of such communications has been taken in the *Journal of the Leprosy Investigation Committee*. Three pamphlets dealing with the subject—two of them by medical writers—have been treated in a similar fashion. What amount of confidence the public, who have subscribed largely to the National Leprosy Fund, will place on an inquiry so manifestly one-sided, remains to be seen. It is certain that those who have looked for the impartial treatment of this serious phase of the question at the hands of the Leprosy Investigation committee will be grievously disappointed. Counsel holding a brief for the perpetuation of the Jennerian *cultus* could hardly have exhibited a less judicial attitude than disclosed by the official documents relating to this latest leprosy inquiry.

## CHAPTER 10: OFFICIAL STATISTICS.

### THE LEPER CENSUS IN INDIA, 1881, 1891.

MR. J. A. BAINES, Census Commissioner, India Office, has been kind enough to furnish me with the following Table showing the results of the Census in

## LEPROSY AND VACCINATION by WILLIAM TEBB (Complete)

relation to Leprosy in the decades 1881 and 1891.

PROVINCE	Males 1881	Females 1881	Males 1891	Female 1891
1. Ajmir	23	6	20	7
2. Assam,	2,409	906	5,128	1,599
3. Bengal,	40,484	13,490	32,957	11,029

\* Nos. 7, 15, and 16.

From the foregoing analysis, it appears that the number of male lepers has during the decade increased in fifteen places and decreased in fourteen. The number of female lepers has increased in thirteen places and decreased in thirteen: while in three places they are *in statu quo*. In seven places no returns are given for 1881.

The total number of lepers returned are as follows:---In the census for 1881, 131,660; in the census for 1891, 127,056.

It will be remembered that at a meeting held at Marlborough House on the 17th of June, 1889, His Royal Highness the Prince of Wales declared that there were 250,000 lepers in India, an estimate nearly double that which is indicated by the figures derived from the censuses of 1881 and 1891. That the estimate given by His Royal Highness is far nearer the mark than are the figures derived from the census, will appear probable from the following facts and considerations.

On the perusal of the census forms issued by the Indian Government, we find in Rule 14 that "white leprosy" is to be excluded from the infirmities to be returned by the enumerators. That rule is as follows:—"If any person be blind of both eyes, or deaf and dumb from birth, or insane, or suffering from corrosive leprosy, enter the name of the infirmity in this column. Do not enter those blind of one eye only, or who have become deaf and dumb after birth, or who are suffering from white leprosy only."

Mr. J. A. Baines, Census Commissioner, writing 21st June, 1892, says that in the recent census, "the instructions were clearer (as to leucoderma, or white leprosy), and the exclusion far more strict."

The census form also contains the following direction:

"You are to make all the entries as the person himself or his guardian, states, and not to dispute his statement."

Coupling this direction with the fact that now, for the first time within thirty years, the report has been widely circulated, that all lepers at large were to be segregated, that is, to be separated from their friends and from all they hold dear, we should infer that a large number of cases of leprosy would be suppressed, and not returned to the census enumerators, who are much more in sympathy with the afflicted members of their own race than with their official chiefs, and would be slow to aid in the perpetual incarceration of their friends; and among the respectable classes no one will admit that he is a leper, as an admission of this kind would involve loss of caste and social ostracism.

Moreover, leprosy is an insidious disease, and in its early stages cannot be diagnosed and detected save by experienced medical practitioners accustomed to treat this particular malady. Of the enumerators, not one in a hundred could detect a case of leprosy if he saw it, except when presented in its most aggravated and repulsive form.

Mr. H. A. Ackworth, Municipal Commissioner, Bom— bay, in a communication to me, dated 29th July, 1891, says :—" I have plenty of lepers in my hospital here who could not be identified as such unless they were completely stripped and examined by a trained eye." And a correspondent of the *Calcutta Daily News*, October 20th, 1891, writes:—" To my personal knowledge there are at least twenty-three lepers in this town who are not entered as such in the census papers. And it is quite probable that there are many more who have not been numbered."

A medical correspondent connected with the Army Medical Department writes to me, January 27th, 1892, "that the census form used in the census of 1891 is an enigma that the enumerators could not properly explain; and the remuneration offered was so small that it failed to tempt any of the better educated classes to volunteer for the census work. Consequently the papers were handed over to men who, for the most part, were too devoid of understanding to enable them to ascertain facts or comprehend the nature of the information required for filling in the returns." My correspondent adds that the wide-spread belief in India, that leprosy is a disease of venereal origin, induces all but the lowest classes to carefully guard against it becoming known, either to officials or to others, that any member of the family is a leper, and "even the threat of prosecution would not frighten them into publishing their terrible secret for census information." For these and other reasons there can be no doubt that a considerable portion of the leper population in India has been omitted from these returns.

Without endorsing the accuracy of the leper census in India, which is clearly misleading, it may be incidentally remarked that the proportion of vaccinations to population in India, as a whole, is less than in any of our crown colonies and dependencies, but is increasing every year, and, unless arrested, will soon produce the calamitous consequences exhibited in tropical countries where vaccination is general.\*

\* The births in India in 1899-1 were officially estimated at 40 per cent. of the population, or 8,244,101, and the number of children under one year returned as vaccinated in 1890-1 was 2,268,922, being about 27 per cent. on the total number of births.

#### THE LEPER CENSUS IN THE LEEWARD ISLANDS, WEST INDIES, 1891.

A census has recently been taken for the Leeward Islands, which also minimises the number of lepers in a similar fashion. Referring to this, the *St. Kitts Lazaretto* of February 22nd, 1892, says:—"The census return for the Colony is at length out, and a copy may be seen at the Public Library. It is openly said all over the Colony that this particular census is utterly unreliable; indeed, Mr. Fred Evans, the Colonial Secretary, says as much of the returns from Dominica. A glance at the tables which pretend to show the number of lepers in the Colony satisfies us that, in this particular, the returns are worthless.

"Some time ago, the doctors here were called upon to send in returns of the lepers in their districts. They did so, and sent in a list of 51 lepers. That this list was necessarily incomplete we fully demonstrated at the time. Since then, we have heard of several other lepers of whose existence no one here knew, and a few have been committed to the Leper Asylum. But in the face of the reports from the doctors, the compiler of these precious returns sets down the number of lepers at large in St. Kitts as thirteen and in Nevis as five!! How could Mr. Fred Evans or his clerk have got these figures? The census forms that had to be filled in by each householder contained no space in which the number of lepers could be entered. Therefore, we are forced to the conclusion that the opportunity of misrepresenting the leprous condition of this Colony was seized by those who were on the look-out for such a chance, the doctors' reports disregarded, and that some one invented these figures. . .

"We guarantee to produce fully 50 (and perhaps 60) lepers who are now at large in this little island (St. Kitts).

"There are considerably more than 13 in Basseterre alone. As regards Nevis, the inaccuracy of the Colonial Secretary's figures is equally striking.

"We can give off-hand the names of a half-dozen lepers living there, and we have heard of many more, of whose existence we are assured by gentlemen who are above, lying, and who have no motive for suppressing the truth.

"The figures for the other islands are also palpably incorrect and misleading. In Antigua 34 lepers are said to be under restraint. This is not true as regards the restraint, for according to Dr. Freeland they cannot legally be restrained, and as a fact they go and come from the so-called Lazaretto as they please. Only last month we saw several of them promenading the streets of St. John's. Then to set down 11 lepers only as being at large is a gross misstatement, as every one in Antigua knows. We were up there quite recently, and satisfied ourselves that there are probably in all over a hundred lepers in that island.

"We accept the return of 3 lepers to about 500 people in Barbuda, but we confidently challenge the assertion that there are only 9 lepers in Montserrat and 3 in the Virgin Islands. .

"Anguilla, the Government says, contains 8 lepers. Will Mr. Fred Evans be surprised to hear that he has made the trifling error of only eighty per cent? We happen to know that if he had guessed 40 (for the whole thing is evidently pure guess work) he would have been pretty near the mark.

"The total for the Leeward Islands is, according to this eccentric statistician, 172. That for St. Kitts and Nevis is 98. We declare, speaking with a knowledge of the subject which is infinite compared to that possessed by Mr. Fred Evans, that there are at least 200 lepers in St. Kitts and Nevis; and that Sir William Haynes Smith knows. Taking St. Kitts, Nevis, and Anguilla, we would not be surprised if 250 free lepers could be ferretted out. Of Dominica and Montserrat we cannot speak so confidently, but we have interviewed many gentlemen from them, and the sum of our inquiries is that no one knows how many lepers there are in any one of them. It has been no one's business to find out, and therefore no one has given the least attention to the subject."

### CHAPTER 11: LEPROSY AND THE ABORIGINAL RACES.

IN 1889, during a visit up the river Essequibo, in British Guiana, the British Commissioner and resident Magistrate, Mr. Michael M'Turk, of Kalacoon, informed me that he had not the slightest doubt that leprosy was disseminated with the vaccine virus. He was intimately acquainted with a healthy family, in which one of the children was affected with leprosy by means of lymph taken from a child afterwards proved to be tainted with leprosy. The unfortunate victim of the state-enforced operation was isolated in a small building at the end of the garden at the parents' house, and ultimately succumbed to the disease. As an explorer, Mr. M'Turk has been much among the Indians, all his servants and boatman belonging to that race, and he had never known or heard of a case of leprosy amongst them. The truth of this statement is confirmed by a communication to me from Mr. Herman Klein, Acting Assistant Medical Officer, H. M. P. 5., Potosi, British Guiana, dated June, 1891—"I have been about eleven years up the Essequibo, river, and have never seen an Indian afflicted with leprosy." I received similar testimony at Bartica Grove from Mr. John Bracey, an Indian trader of twenty-nine years' experience among the Macousi and Wapisiana tribes. Dr. John D. Hillis, F.R.C.S., formerly the Superintendent General of the Leper Asylum, Mahaica, in his work, entitled "Leprosy in British Guiana" (1881), says, p. 148:—"With regard to this country one important fact is the immunity from leprosy enjoyed by the aboriginal tribes of British Guiana." This immunity from the disease is attributed to the circumstance that no Indian will allow himself or his children to be vaccinated. Dr. T. C. Taché, Titulary Professor to the Laval University, writing from Ottawa, Canada, in reply to questions submitted by the Hawaiian Government, June, 1885, says:—"There never was any case of leprosy among the Indians, although one of their principal villages is located in the endemic section, being contiguous to the parish of Nigavrick." Professor T. C. White says that in Tracadie, New Brunswick, more than too lepers were received at the hospital between 1849 and 1882; nearly all the cases were of French descent, and no Indian had fallen a victim.

Dr. J. E. Graham, in a report from the Government of Hawaii as to leprosy in New Brunswick (1886, pp. 114 and 140), observes:—"That the Indians have been the only race, of those inhabiting these localities in any number, which have remained so far exempt from leprosy. . . . The places in which the Indians dwell bear precisely the same character as those inhabited by their neighbours among whom the ailment has exercised its ravages."

Dr. Miguel Valladores, physician to the Lazaretto, Guatemala, says, in his report to the Hawaiian Government, 1886, p. 174, "that it is almost an unheard of thing for an Indian to be afflicted with leprosy."

Drs. Vlagthoes and Mayrinck state that, previous to the discovery of Brazil, leprosy was unknown among the Indians.

Dr. Alzevedo Lima, in a letter on "The Leper Hospital of Rio de Janeiro," dated June 1st, 1891, Rio de Janeiro, says:—"On consulting all the documents and books written by travellers and missionaries in Brazil, we find no mention, either direct or indirect, of any prevalent complaint among the Indians which might be attributed to leprosy. Even nowadays those who live a savage life away from all contact with civilised society are not attacked by this disease, while those who have left their woods for peopled centres, together with their descendants, are, according to observations, occasional victims."—*Journal of the Leprosy Investigation Committee, December, 1891, p22.*

In a communication to me, dated Rio de Janeiro, May 20th, 1892, Dr. Lima says:—"Now, about the Indian races, those who live away altogether, without any interference or intercourse with civilisation, their freedom from leprosy can be explained not only by the absence of the Jennerian vaccination, but also by the non-intercourse with people capable of being the conductors of the germs of the disease." I have personally met with races of Indians in South America, amongst whom, though living amongst lepers up to this date, no cases of leprosy have occurred. This immunity is attributed by old residents, one a physician, to the circumstance that they will not allow themselves or their families to be vaccinated.

Dr. J. Z. Currie, secretary of the Provincial Board of Health, Fredericton, New Brunswick, in reply to a communication from me, dated January 2, 1892, as to the vaccination of Indians in New Brunswick, Canada, says:—"There has been no outbreak of small-pox among the Indians for some time. However, in almost all instances they object to vaccination. Four cases of small-pox occurred in this Province during the past year among white people."

The main object of this evidence is to show that in countries where leprosy is endemic, the Indian tribes who reject vaccination escape the plague. In New Brunswick it would appear that they also escaped smallpox, while vaccinated white persons have been attacked with the disease.

### CHAPTER 12: VACCINAL DISEASES IN SOUTH AFRICA.

VACCINATION was made compulsory in Cape colony by Act of the Legislature in 1882. Very soon the deleterious effects of the virus were exhibited. The London *Daily News*, March 5, 1884, says that owing to impure lymph there had been many cases of illness

from vaccination; but, later on, the natives were vaccinated on an extensive scale. The Public Health Act, No. 4, Cape of Good Hope, dated September 6, 1883, contains the provisions of a vaccination law of a stringent and despotic character. Section 60 states—"No person who has not been vaccinated shall be appointed, or, if appointed prior to the taking effect of this Act, promoted to any office in the public service." Section 60 provides that "Every child, admitted to any school which shall be maintained or aided by any grant from the public funds, shall be vaccinated by the District Surgeon or by a vaccinator specially appointed, unless such child shall have been previously vaccinated." The penalty for non-vaccination is £2. The law contains other oppressive clauses, thus incorporating in one act the worst features of the English, American, and Continental vaccination enactments.

All this time, while the vaccine poison was being forced into the blood of the defenceless natives, laying the foundation for the disorders which speedily followed, nothing was said or done to remove the causes which developed the outbreaks of small-pox, the fearfully insanitary condition of the town in which the pestilence abounded, the fruit of long-continued filth and neglect, scarcity of water, foul, unkempt streets, seas of mud in the winter and hurricanes of dust in summer, and, worst of all, a population ignorant of the commonest instincts of decency.

The *Cape Times* reported that Cape Town was buying its experience at a heavy price. Within a short time of the introduction of compulsory vaccination, spreading with accelerated industry this tainted virus distilled from the bodies of a filthy population, we read of the spread of leprosy, and of the alarm created in the Colony among those who had observed its destructive progress. A not uncommon experience is to hear of cases of leprosy in families where there is no taint of the disease, and where the afflicted member has never come into contact with lepers. The late American Consul, Mr. James W. Siler, of Cape Town, in his official report to his Government, No. 79, June, 1887, records a case of this description; and, as vaccination is obligatory, the obvious causation is that the disease has been transferred in the vaccine virus. Mr. Suer says :—" A case with which I am well acquainted will illustrate its seemingly mysterious power of propagation. In one of the oldest and wealthiest Dutch families in this Colony the mother is a confirmed leper, of the type described as 'tubercular' by Dr. Atherstone, before alluded to. The father and a large family of strong, healthy, grown-up sons and daughters show not the slightest taint. I have several times enjoyed the hospitality of this family, and availed myself of the opportunity thus afforded of inquiring into this melancholy case, with the view of a possible solution. I am assured that neither on the side of the father nor mother a case of leprosy had ever occurred in their families, and they are able to trace their genealogy back at least one hundred years."\*

\*The *British Medical Journal*, July 5, 1890, under the head of "Reports — Liverpool Workhouse Hospital," communicated by Dr. Cunningham, Senior Medical Officer, gives particulars, with copy of photograph, of an "interesting case." C — L —, aged 46, who has a husband and six children, all of whom are healthy, and, until she became affected with leprosy, had never suffered from any disease. "*She has never known or seen anybody with the same or similar disease.*" The italics are mine.

The conclusions of the Select Committee regarding the increase of leprosy in South Africa\* (\*Chap. I.; pp. 68 and 69 of this report.) derive confirmation from the individual reports of missionaries, clergy travellers, and district surgeons in South Africa, and this increase is specially observable where vaccination has been extensively practised: Referring to the reports of district surgeons, published at the Colonial Office, Cape Town, and presented to both Houses of Parliament, I find the following relating to leprosy and to syphilis, a disease, according to various authorities, pathologically allied to leprosy:—

The medical officer for *Herbert* (Report, 1885), says:—"During the year, small-pox, syphilis of a particular type, and leprosy, have been the prevailing epidemics. The two last named are still prevailing to an alarming extent." It would appear that vaccination, as usual, was resorted to on account of the smallpox, but the medical officer reports that "the difficulties in carrying out arm—to--arm vaccination seem insurmountable."

*Cala*.—The District Surgeon (Report, 1885), says:—"About two. years since, there were many cases of swollen arms, and some deaths after vaccination," and observes: "There is also the danger of inoculating syphilis."

*Aliwal North* (Report, 1885).—"Vaccination has been extensively performed amongst both Europeans and natives." In the following year (Report, 1886), the same officer remarks that "small-pox has raged," of which he has treated about 450 cases, and adds that "syphilis has made vast strides." Two years later (Report, 1888), we read :—" Syphilis is still very prevalent. I have frequently drawn the earnest attention of the Government to the sad havoc this disease is dealing amongst the inhabitants."

While showing the utter failure of the extensive vaccination practised in 1884 to prevent the serious epidemic of small-pox which occurred the following year, these three official reports show how the most loathsome of diseases are disseminated by the vaccinator's lancet. The District Surgeon urges the Government to appoint a Commission of Inquiry.

*Alexandria* (Report, 1887).—" Leprosy is certainly spreading rapidly." In 1890, the District Surgeon reports that the state of leprosy demands urgent attention.

*Port Elizabeth*.—The medical officer says (1887):—"There is a growing aversion to it (vaccination), partly due to an underlying current of belief in the possibility of obnoxious disease being propagated by it." The Report for 1891 states that during the year the presence of leprosy was gone into, and six cases reported to the Government.

*Caledon*.—The District Surgeon reports (1888) that he has vaccinated close upon 800. There are about twelve cases of leprosy in the district, and it appears that syphilis is so increasingly prevalent that an hospital is needed for syphilitic patients.

*Cape-Wynberg.*—(Reports, 1887-8). The medical officer says:—"Of the great increase of leprosy there can be no doubt; it is obvious to the casual observer that Europeans as well as natives are afflicted with it. . . . The number of cases vaccinated has been about 100." The following year (1889), the District Surgeon says :—" Leprosy is becoming far more frequent in the neighbourhood" . . . and adds :—" The question of leprosy is one of the most serious the Government have to deal with. . . . Vaccination has been thoroughly carried out throughout the district."

*Malmesbury* (Report, 1888).—" Leprosy is slowly but surely gaining ground." This officer reports that he does not think it advisable to vaccinate in the district.

*Cradock* (Report, 1887).—" Fifteen cases of leprosy have occurred, all in an early stage."

*Paarl* (Report, 1887).—" Leprosy is on the increase." Report, 1890.—" Leprosy is spreading."

*Glen Grey* (Report, 1889).—The District Surgeon says:—" I have incidentally about a dozen cases of leprosy, some of these of quite recent origin." . . . "A centrally situated leper hospital is imperatively required."

*Kokstad* (Report, 1886).—" Vaccination during the past year has been in several districts well carried out." Two years later (Report, 1888).—The Medical Officer for this district writes as follows :—" Leprosy is still very much on the increase. There are at least fifty cases in Kokstad itself." . . . "It is deplorable to see these wretched victims dependent on the public charity for a bite, whilst the Government will do nothing for their alleviation."

*Stellenbosch.*—The District Surgeon (Report, 1889) remarks that he has just vaccinated two hundred children. He reports 20 cases of syphilis and six cases. of leprosy. In 1890 the same officer returns nine cases of leprosy, and adds "but no doubt there are a few more unknown to me."

*Stockenström.*—Referring to leprosy (Report, 1890) "I have seen persons without hands paying their quit rents, holding the money on the stumps of their arms."

*Somerset East* (Report, 1890).—" We have a good few lepers here, as already reported."

One experienced district surgeon told me that he had, again and again, year after year, called the attention of the Board of Health to proofs of this terrible havoc wrought by arm-to-arm vaccination, and had advocated its suppression in the interests of public health. A careful examination of the official documents would show that the facts incriminating vaccination have not been allowed to appear.

When making inquiries regarding etiology and spread of leprosy in South Africa, I was generally referred to the Rev. Canon Baker, of Kalk Bay, Cape Colony, as a high authority on the subject, and one who had probably devoted more attention to it than any other resident in the Colony. Canon Baker had in 1883 given evidence before the Select Committee of the House of Assembly, Cape Town, and presented a statement of his views, which appeared in Appendix A, pp. 1-9. Since then he has continued his investigations and accumulated a considerable body of facts bearing on the subject. Vaccination, he says, is carried out in the Colonies in a most careless and perfunctory manner. He has seen the operator pass his lancet from one arm to another without the smallest attempt to disinfect the instrument or discriminate between the diseased and the healthy, in districts where both leprosy and syphilis are endemic. From other reliable sources I am satisfied that this is the rule rather than the exception. Canon Baker believes that leprosy is chiefly communicated by means of inoculation, and that arm-to-arm vaccination is a prolific cause of the spread of this fearful plague in South Africa.

The Colony of Natal passed Vaccination Law No. 3 in 1882, and Law No. 10 in 1885. Penalties for non-vaccination £5. In a communication from Archdeacon Colley, dated Natal, August 25, 1885, I learn that hundreds of summonses were issued in vain upon the colonists, but the natives were vaccinated by thousands; one operator would get through two hundred a day.

While the vaccination laws for several years have not been enforced against the white population in Natal, all the natives are vaccinated either under persuasion or threats, the operation being carried out in the usual careless manner, with arm-to-arm virus taken from native children without previous examination, and not the slightest attempt is made to clean or disinfect the lancets after each operation. Hundreds of natives, as I am informed on unimpeachable authority, have died of blood-poisoning and of inoculated diseases.

A member of the Legislative Council, Sir John Bisset, reported in Parliament that many were "blood poisoned, presenting a horrible sight, and dying masses of corruption." In January, 1891, leprosy disseminated in this way was discovered in fifty kraals in one electoral division alone. The natives in their simplicity submit to vaccination, being told that it was the "Incosi" (King) that ordered it, and this was the way the white man secured himself against the plague of small-pox.

As the Government of Natal does not publish reports from the District Surgeons, and appears to be indifferent as to the suffering and mischief caused by the vaccinators, I found it difficult to obtain further details.

### CHAPTER 13: A VISIT TO THE LAZARETTO, ROBBEN ISLAND, SOUTH AFRICA

ON the 9th of February, 1892, after obtaining a permit from the Colonial Office, I took passage in the small but stoutly-built little tri-weekly steamer "Tiger," from Dock Basin, Cape Town, for Robben Island. Amongst our fellow-passengers were visitors, merchants, a clergyman, a singing lunatic in the custody of a warder, and officials connected with the island. Our cargo consisted of

fruit, poultry, beef, and other stores for a population of about 700 persons. In less than an hour after starting, we cast anchor opposite the island; and, there being no landing-stage or jetty, we found small-boats, managed by convicts clad and numbered in penal costume, awaiting our arrival.

These singular-looking boatmen rowed us near the shore, and then carried the male passengers on their backs and the women in chairs through the surf on to *terra firma*. The convicts on the island, about one hundred in number, are said to be chiefly murderers and diamond stealers. There is a strong current between the island and the mainland. Only one attempt has ever been made by a convict to escape by swimming, and the attempt cost him his life.

The first building I entered for the purpose of making inquiries proved to be the female ward of the lunatic asylum. Here I was referred by the attendant to the office of the medical superintendent for another permit, which was granted. Dr. S. P. Impey has medical charge of the convicts, lunatics, lepers, and attendants, comprising the entire population of the island. I found him busily occupied with one caller after another, examining and signing papers from different departments; and, instead of engaging his attention at the moment, I expressed a hope that, as I was interested in what is popularly known as the leprosy question, he would be able to see me later in the day. He readily agreed to see me for this purpose at two o'clock.

On my way to the leper wards I looked in at the little church, a rather pretty edifice, adorned with scripture mottoes disposed in large letters around the galleries, where the Rev. W. W. Watkins, the successor to the late Mr. Wiltshire, ministers to his singular congregation. I then proceeded to the male leper wards, meeting with convicts and lunatics on my way. The sun was scorchingly hot, but there was a good breeze blowing, and the ozonised air from the ocean was gratefully invigorating. I should think that the island, although only a sandbank of about 1200 acres in extent arid almost devoid of vegetation during the hot season, would be very salubrious if the conditions for health were observed. The water supply is excellent.

The first lazaretto building I entered—one of the old wards devoted to male lepers—was by no means an inviting structure. It was a large shed with low-studded walls containing a double row of beds, upon which the lepers were reclining in every variety of posture. The air was close and noisome with the evil effluvia of decaying living bodies—death in life—supplemented by the odour of influenza, which at this time was raging throughout the island. Of one hundred male lepers, no fewer than eighty, on the day of my visit, were down with this distressing disease. It has been said that a leper hospital, with its handless, footless, ulcerated, feature-swollen, and distorted patients, is as horrible a sight as a field of battle; and to the misery inseparable from a repulsive and incurable disease were now added the effects of a depressing epidemic—a most heart-breaking spectacle surely. Investigation as to the causation of leprosy under such circumstances was not a promising outlook. The majority of the inmates belong to the poorer classes of the native or mixed races, and are unable to speak English. In some cases the destructive disease had invaded the larynx, and they could only converse in a whisper. It was as painful to hear as to look at them. I must add that a new and much more spacious and suitable hospital, substantially built of stone, has been erected and is now used for the accommodation of fifty patients. Here I found a better state of things. Another building of like character is in course of erection; so it is evident that the authorities, while apathetic as to the causation of leprosy, have begun to realise the importance of doing what they can to render the condition of these helpless patients as tolerable as possible.

I shall make no attempt to describe the state of the sufferers. I have seen more repulsive cases in lazarettos in other countries, and have seen them both under more favourable and under less favourable conditions. I am of opinion that the lepers and lunatics should be removed to separate quarters, and this barren island should be used exclusively for convicts. Leprosy and lunacy are not criminal, though the former is often caused by the criminal conduct of those responsible for vaccination and for insanitary neglect, and the latter by the temptations of the dram shops, where the vilest and most health - destroying liquors are regularly dispensed. The sufferings of these unfortunate people are sufficiently severe without their being compelled to associate and spend their unhappy lives with convicts. Notwithstanding these difficulties, I was able to hold a brief converse with about fourteen of the inmates who were well enough, amidst their complicated maladies, to understand and reply to a few simple questions. One of the three leper cooks of the establishment kindly acted as my conductor, and pointed out to me those who could speak English. Several were at work as shoemakers and tailors, but the rest had no employment—and, I was informed, did not want any—to relieve the terrible monotony of their painful existence. Some of the inmates were suffering acutely, and needed tender nursing and such devotion as the Moravian Brothers and Dominican Sisters bestow upon lepers in other hospitals. Several of the patients make pets of a harmless snake, a variety of python common to the island, which they keep in cages near their beds.

After I had been introduced by my conductor, and had exchanged salutations with a few words of inquiry, my interrogatories were as follows :—Where were you born? How long have you been a leper? When did you come to Robben Island? Have you had the smallpox? Have you been vaccinated? How long after vaccination did the leprosy appear?

The cook, Christian Choutsee, a native of Cape Town, said he had been a leper four years, and the leprosy broke out "two years after the doctor stuck me in the arms." The answers to the last question were "two years," "three years," "a few years," "two or three years," "after the second vaccination." "Was vaccinated in 1879; leprosy appeared in 1883." "Vaccinated three times, last vaccination during small-pox epidemic in 1878; leprosy attacked me in 1887." "Vaccinated twice, first when twenty years of age. Leprosy appeared between first and second vaccination." "Vaccinated during small-pox epidemic of 1878. Leprosy broke out on me about a year after." "Vaccinated when a boy of between eight and nine years of age; have been a leper fourteen years; present age, twenty-six."

After going through the several male wards, I took an opportunity of making calls upon several persons, including the clergyman, the

superintendent of the male wards, and other officials. No one seemed to doubt that leprosy was spread by vaccination. The superintendent of the dispensary, who requested me not to publish his name, gave me particulars of the case of Augustus Lewis, of Cape Colony, who died of leprosy at Robben Island, the disease having been induced by vaccination. I had now been pursuing my inquiries several hours, and as the female leper ward was about a mile distant, and approached only by a rough, stony track, I was obliged, in order to keep my appointment with Dr. Impey, to forego my intended inspection of this department.

Dr. Impey is deeply interested in the pathological side of the leprosy question, and his position as superintendent of the largest leper institution in Africa affords him ample opportunity of pursuing his investigations. He has practised twelve years in South Africa as a District surgeon and Physician, and apart from his clinical experience gained through observations, and the medical care of the population of the island, he has found time to study the literature of the subject. He regards Dr. John D. Hillis's "Leprosy in British Guiana" as the most valuable and important work he has read. I called his attention to the cases of invaccinated leprosy cited by Dr. Hillis in the volume referred to, and he expressed no surprise at this, having come to a similar conclusion through his own personal researches in different parts of the Colony. Dr. Impey informed me that after careful investigation he had clearly traced to vaccination four out of twenty-eight cases of leprosy, which he had examined in the female ward. One of these still shows leprous discolourations at the point of vaccine inoculation, the disease having exhibited itself two years after vaccination. Dr. Impey will continue his investigations as to the causation of leprosy amongst the remainder of the patients; a procedure, let me observe, almost unknown at similar institutions. It is needless to say that the report of these investigations will be awaited with much interest. Although a believer in the protective value of vaccination as a mitigator of small-pox, Dr. Impey has met with so many cases of invaccinated syphilis and leprosy that he has felt it his duty in his reports, extending over a period of eleven years, to point out the mischief already perpetrated by this mistaken procedure; and he has called upon the Government to legislate for the immediate and total suppression of arm-to-arm vaccination. Dr. Impey considers that leprosy is contagious by actual inoculation, cases of which had occurred at Robben Island, and that to a certain limited extent it is hereditary.

#### CHAPTER 14: THE SEGREGATION OF LEPERS.

So far, I have said nothing concerning the growing demand for compulsory segregation of lepers. It is admitted on all sides that the forcible deportation and confinement of well-to-do lepers would be impracticable, and already there are too many laws which are cruel and oppressive to the poor, but which, by the wealthy, are easily evaded. So far as the well-to-do are concerned, the law of enforcing segregation of lepers at Molokai, as I have already shown, is an admitted failure, and the act of separation of the poor from their friends is the most heart-rending and painful experience which, in a tolerably long life, I have ever witnessed.

In the "Report on Leprosy by the Royal College of Physicians, 1862," I find the following:—"The Committee, having carefully considered the replies already received, are of the opinion that the weight and value of the evidence they furnish is very greatly in favour of the non-contagiousness of leprosy. The Committee can only repeat the statement made in their former report to the College, that the replies already received contained no evidence which, in their opinion, justified any measure for the compulsory segregation of lepers." Acting on this opinion, the Duke of Newcastle issued a circular to the Governors of the Colonies, stating "that any laws affecting the personal liberty of lepers ought to be repealed, and any action of the Executive Government in enforcement of them, which is merely authorised and not enjoined by the law, ought to cease."

Dr. George L. Fitch, formerly Medical Superintendent, Leper Settlement, Molokai, Hawaii, says :—"Segregation began in 1866 in Hawaii, and since that time has been followed out with a really brutal severity. At no time since the inauguration of the system has the proportion of cases segregated fallen as low as one-half, so far as I could find out, and I had the fullest opportunity to know of any one. The white population there are terribly in earnest, and, as they control the policy of the country, they have exercised every ingenuity in this matter, so that it may be considered certain that an average of two-thirds, at least, have been for the entire period under a restraint much more pronounced than is the case in Norway. Yet there is not the slightest evidence that the disease has decreased; at least, I know of no such evidence. From all I hear from there, the proportion of lepers continues as great, if not greater, than it has been for years. That the disease does not manifest as severe symptoms as formerly is certain, but I know of no reason to believe that the percentage of those afflicted has lessened at all. On the contrary, both the total number, and the proportionate number of cases, would seem to have steadily increased. . . . Of late years, so bitter a feeling has grown up among them in opposition to segregation, that in quite a number of instances the lepers and their friends have risen in arms to resist the officers sent to apprehend them. . . . Bring these three facts together. In India, up to 1815, lepers were buried alive to get rid of them; and still the disease persists. In Norway the disease is disappearing without segregation, for putting two cases out of five into hospitals, where they are allowed to carry on their handicrafts, and selling the products to those outside, cannot be called segregation. In Hawaii, where as thorough segregation as the Government, aided by public opinion, can enforce, is carried out, the disease steadily increases." — *New York Medical Record*, September 10, 1892. Art., "Etiology of Leprosy," p. 301.

Dr. George Thin, in his recent work on "Leprosy," though an advocate for the seclusion of lepers, shows himself alive to the difficulties of compulsion. In pp. 257-8 he says :—"A law enforcing the compulsory isolation of lepers can only be effective in any country where leprosy is common, if it is strongly supported by public opinion. Those who have little practical experience of lepers and leprosy must not forget that for a considerable time, and often for years, the stricken member of a family suffers comparatively little, requires little attention, is not specially repulsive in appearance, is as full of love for his parents and brothers and sisters, and in return is as much loved by them, as if he were not afflicted by the disease. To realise what compulsory isolation in an asylum of all the lepers in a country would mean, when such cases are considered, it is only necessary to apply in imagination the same law to

consumptives when their disease runs a slow insidious course. What would the consequences be in England if a law were passed that every husband, or wife, or child, who developed a slight cough, attended with weakness, and in whom slight physical changes were detected in the apex of one lung, should, on the strength of what his probable fate would be several years afterwards, be immediately and forcibly conveyed from his family with no, or scarcely any, hope of ever again rejoining them? Imagine the evasion, concealment, and subterfuge that would be practised, and the difficulty, if not impossibility, of passing a law which would be effective! As a matter of fact, already, and with no compulsory isolation, in all but the very poor, leprosy is in most countries concealed as long as it is possible."

A medical practitioner who has resided several years at Honolulu and Molokai informed me that he personally knew of a number of well-to-do lepers, some occupying prominent positions, including several Europeans, who from political and other influences with officials of the Government were allowed to be at large, and it was not intended to disturb them. Nor is it considered possible to amend this partial method of dealing with the difficulty, especially as the natives do not believe in contagion. At the Leper Asylum in Ceylon, as also in the West Indies, I found that only the poor were segregated in the lazarettos, and in every country I have visited, the compulsory segregation of *all* lepers is considered impracticable. Moreover, the experience in Hawaii has been the reverse of encouraging. Mr. R. W. Meyer, agent of the Board of Health at the Leper Settlement, Molokai, in his report dated April, 1886, observes that segregation has now been practised for twenty years, and the result is that there are as many lepers as ever; more than at the commencement.

In an article in *The Lancet*, August 26, 1882, p. 318, commenting on a report on leprosy in Hawaii, and referring to the segregation of lepers, the writer says: "Nothing can, we think, call for action such as is described in certain parts of the report, and which has also called forth a protest by the Assistant Attorney-General of the kingdom. This gentleman describes how people supposed to have leprosy have been taken summarily from their houses by the police authorities, and have, without a moment's preparation, been ordered into boats, and conveyed across to one of the island settlements, where, as he says, they, are practically doomed to death."

That compulsory segregation cannot be carried out save by setting aside every humane feeling is admitted by those who are familiar with its operation. Thus, in his official report to the Board of Health, Honolulu, Mr. R. W. Meyer observes: "After the most careful consideration, I find that this is a question which involves a great principle, and which duty to oneself and his fellow-men alone should decide; a question which demands the absolute setting aside of every influence resulting from a feeling of sympathy with the unfortunate sufferers."

In the "Report of the Select Committee on the Spread of Leprosy in South Africa" I find the following:--

Q. 52. "Do you believe there will be much difficulty in compulsorily removing these people?"—"Yes, there will be great difficulty. They will do what they can to conceal cases. They will steadily deny that any one in the house is affected by the disease I have found the most undoubted and notorious cases denied. They have a great aversion to remove. Most of them are married, and, in addition to the natural repugnance at parting from their wives, their sexual passions are particularly strong—in fact, they become, both mentally and physically, a lower type."— *Witness*, Dr. H. C. Wright, June 27th, 1889, District Surgeon at Wynberg.

Q. 92. "Take the case of a respectable man, educated and intelligent, would you separate him from his wife and family and remove him from his home?"—"I am afraid there is no help for it."— *Witness*, Dr. Simons, District Surgeon of Malmesbury, July 4th, 1889.

Q. 192. "I think that husband and wife should be separated, and that is a hard case, but necessary."— *Witness*, Dr. Beck, of Roudebosch, July 4th, 1889.

#### LEPROSY REPRESSION ACT.

Under this heading, the *Cape Times* of April 22, 1892, gives the following :—

##### ACT OF 1884 TO BE ENFORCED.

The Government have decided to promulgate the Leprosy Repression Act of 1884, and as at present decided the enforcement of the provisions of the Act will take place during the ensuing month. This action has doubtless been suggested by the disclosures of the census of a year ago, when the number of lepers in the Colony and the Transkei was shown to be 625—at least double the number casually reported from the various districts of the Colony. Since the taking of the census the number of known lepers has been increased to 664, and the promulgation of the Act will therefore necessitate the immediate provision of accommodation for the large number of sufferers who are still at large. The following will show the distribution of lepers in and out of hospital at the date of the census, in April, 1891 :—

##### IN HOSPITAL.

The Colony proper, as constituted in 1875: European or white, 21 —14 males and 7 females; other than European, 97 ;—77 males and 20 females.

##### OUT OF HOSPITAL.

The Colony, as constituted in 1875: Europeans, 30 ;—15 males and 15 females; other than Europeans, 256 ;—130 males and 126 females. Province of Griqualand West: Europeans, nil; other than Europeans, 17 ;—males, 12; females, 5. Transkeian Territories: Europeans, nil; other than Europeans, 204 ;—118 males and 86 females.

##### ROBBEN ISLAND.

A special report upon the lepers and accommodation for such upon Robben Island shows that, excluding the 54 coloured sufferers recently received from the Orange Free State, the number now on the Island is 162, of whom 16 are Europeans and 146 coloured persons. There are therefore over 500 lepers in the Colony, Griqualand West, and the Transkei still to be provided for. It is interesting in this connection to note that during the past year no fewer than 139 persons have voluntarily sought refuge within the leper wards of Robben Island Hospital. Of these 85 were males, 6 being European and 79 coloured persons. The European females admitted number 3 and the coloured females 51. During the same period 1 coloured male and 1 coloured female have been discharged from the island, whilst there have been 29 deaths, viz. Five European males and 16 coloured males, and 8 females, 1 white and 7 coloured. In view of the demand for accommodation, which will arise upon the promulgation of the Leprosy Repression Act, the wards at Robben Island are being largely extended, and we are informed that by the end of May the leper hospital will be completed and provision made for all the lepers known to exist in the Colony and the Province of Griqualand West. The Transkeian lepers, all of whom are coloured, will be centred at Engoobo, where a large asylum is now in course of construction.

The Leprosy Repression Act has since been promulgated in Cape Colony, and a systematic hunt for lepers has been carried on with the usual distressing concomitants—separation of parents from children, husbands from wives, friend from friend. A considerable number of lepers are in close concealment, carefully hidden by their friends. The well-to-do lepers have not been molested.

## CHAPTER 15: SELF-DEVOTION TO LEPERS

HEROISM and self-sacrifice in the interest of humanity, like that displayed by the brave Father Damien, are, happily for the human race, by no means of unusual occurrence, as is shown by the devotion of the Dominican Sisters at the Leper Hospital, Port of Spain, Trinidad; that of the Franciscan Sisters, from Syracuse, United States, at Molokai, Hawaii; and the Sisters from Montreal, who tend the lepers at Tracadie, New Brunswick.

Dr. M'Laren, Nova Scotia, in a paper on "Leprosy in New Brunswick," read before the Medical Society of that Province, says:—"In 1868 a community of nuns from the Hotel Dieu, Montreal, most unselfishly took charge of the nursing of the sick, and the work is done faithfully and cheerfully under the Sister-Superior Mother, Saint Jean, and the lepers are much better attended to 'than formerly. The patients have plenty of freedom with grounds of eleven acres to garden, fish, etc.'" —*Maritime Medical News, Halifax, Nova Scotia, July, 1890.*

Of another hero, the *St. James's Gazette*, London, September 30, 1891, says :—"The last mail from Japan brings news of the death of Father Testevuide, a Japanese Father Damien. He was a member of one of the French congregations, and was sent to work in the Japan mission field. In 1886, during his labours in the interior, he came across a case of leprosy, which so aroused his feelings that he determined to give himself up to the task of ameliorating the condition of Japanese lepers. A woman of about thirty years of age, having developed leprosy, was abandoned by her husband, and, as the disease advanced rapidly, she was placed in solitude in a loft over a rice mill. In course of time the ravages of the disease rapidly increased, and she lost her sight. In this condition she was found by Father Testevuide, who was working in the district. He visited her constantly and by reading and conversation sought to alleviate her misery; but he soon came to the conclusion that in her then condition she could receive but little relief unless she were placed in a hospital. There was no leper hospital in Japan, and the ordinary hospitals were naturally, for the most part, closed to such cases. From that time he devoted all his energies to the establishment and organisation of a leper hospital. Having succeeded in awakening public sympathy in the country, he collected sufficient money to build on the lower slopes of Mount Fujii a hospital which has for some years past been in full working order. His example was followed by some native philanthropists, and there are now three leper hospitals in the country. Father Testevuide's labours had undermined his health, which a visit to Hong Kong failed to restore, and he died there on the 3rd of August"

The Moravian Brothers have been sending missionaries of both sexes to live with and work among the lepers in the West Indies, in South Africa, and in Syria, devoting themselves sedulously but unostentatiously to this noble service during the past half-century. They were the pioneers in the effort to ameliorate the condition of these unfortunate sufferers. The Moravians have a leper asylum in Jerusalem, founded, managed, and largely supported by themselves.

The *Yorkshire Post* (Leeds), January 7, 1892, briefly refers to the death of an Anglo-Indian Father Damien reported from India. The victim was the Rev. W. D. Dalrymple, a Presbyterian missionary, who, having gone on a mission to lepers, contracted the disease some two years ago, and died last month at Rampur Beaulah, Bengal. Although his sufferings were indescribably great, he is said to have borne them with fortitude and resignation, and never once turned from the task he had set himself. Truly the age of martyrs is not past.

In the description of a visit to the Leper Hospital at Maracaibo, Venezuela, Consul Plumacher, of the American Legation, in a recent report to his Government, says :—"It was truly a sad sight to see deformed, mutilated trunks, with scarcely vestiges of extremities, seated before the camera; and there was something pathetic in the almost universal request to be supplied with pictures of themselves, which could only be constant reminders of their hopeless afflictions. In addition to the individual photographs, various large groups were taken, with an effect both sad and grotesque. There is one bright spot, however, in the dark picture of misery; this being the devotion and self-abnegation displayed by the near relatives of many of the sufferers, who, although enjoying themselves the blessings of health and strength, cheerfully submit to perpetual imprisonment, in order to minister to the wants of their husbands, mothers, and other relatives, thus alleviating their woes by their companionship and care. Many examples of this are seen to-day on the lazaretto island, and it speaks well for human affection that, even when the loved one has become a loathsome mass, conjugal ties and the claims of blood rise superior to the fear of contagion and the repulsive surroundings."

Miss Kate Marsden's labours among the Maories in New Zealand, and her extraordinary journeys through Russia, and among the wild tribes in remote parts of Siberia, with a view of learning the condition of the outcast lepers in districts where the disease is prevalent,

are well known through the reports in the *Times* and *Pall Mall Gazette*, which have been extensively copied in English and colonial journals. Miss Marsden's object is to learn by personal observation the condition of the lepers; to discover, if possible, methods of mitigating their sufferings, and to collect funds for the establishment of leper hospitals. Some time ago, Miss Marsden consulted M. Pasteur to see whether inoculation as a cure of the disease might not be resorted to. M. Pasteur held out no hopes of amelioration in that direction, nor did he suggest any other. It does not appear that Miss Marsden has made any inquiries regarding the effect of vaccine inoculation in disseminating the scourge, although, in districts like Dorpat in the Baltic provinces, the lepers are reported to be rapidly increasing, and already form as large a portion of the population as 17 per thousand. The growth of the disease has been co-incident with the development of the Jennerian practice. Miss Marsden's knowledge of the Russian language, and her earnest desire to get at the root of the evil, would enable her to break through official apathy, so obstructive of truthful research, should she be induced to undertake such a mission. It is surely as laudable to arrest one admitted source of the mischief as to prosecute an almost hopeless search for remedies.

Another lady, Mrs. Alice Hayes, has also done much to direct public attention to the neglected condition of the lepers in India, particularly the Europeans and Eurasians of Calcutta, who hide themselves and their sufferings from the public in the large cities, and refuse to consort with native inmates of existing institutions.

### CHAPTER 16: THE LEPROSY INVESTIGATION COMMITTEE.

By reason of the reports of the serious increase of leprosy in various countries, and the public interest excited by the self-sacrificing labours and death of Father Damien, an influential committee was convened for the purpose of investigating the causes of this recrudescence.

The first meeting was held on the 17th June, 1889, at Marlborough House, under the presidency of the Prince of Wales. On the 13th January, 1890, a subscription dinner was held at the Hotel Metropole, London, at which more than a hundred persons interested in the project sat down, and subscriptions amounting to over £2500 were announced.

This fund ultimately reached about £7000. The following resolutions were adopted at a meeting of the General Committee held at Marlborough House on the 30th June, 1889:—

- (1) That a sum of £500 be appropriated to a memorial to be erected to Father Damien in some public place in the Hawaiian Islands.
- (2) (a) That a fund be formed, the interest of which shall be devoted to the medical treatment and care of indigent British lepers in the United Kingdom. (b) And that a sum of money be set apart and placed under the control of trustees for the endowment of two student-ships, one student to make the United Kingdom and the remainder of Europe his field of investigation, and the other to go abroad and study the disease in China, the Colonies, and elsewhere. The studentships to be held for a period of three years, to be renewed by the trustees if thought desirable.
- (3) That a Commission be appointed, for not less than one year, consisting of three members, one to be named by the Royal College of Physicians, one by the Royal College of Surgeons, and one by the General Committee of the National Leprosy Fund, to go out to India for the purpose of investigating the disease of leprosy there, and that the Indian Auxiliary Committee be requested to add two members to this Commission.

The following Commissioners were appointed :— *Nominated by the Royal College of Physicians*—

BEAVEN NEAVE RAKE, Esq., M.D. (London), M.R.C.S. (England), L.R.C.P. (London), Government Medical Officer and Medical Superintendent of the Trinidad Leper Asylum.

*Nominated by the Executive Committee of the National Leprosy Fund*— GEORGE ALFRED BUCKMASTER, Esq., M.A., B.Ch., M.D. (Oxford), D.P.H. (Diploma of Public Health, Oxford), M.R.C.S., L.R.C.P. (London), formerly Radcliffe Fellow Magdalen College, Oxford, Lecturer on Physiology, St. George's Hospital, London.

*Nominated by the Royal College of Surgeons*— ALFRED ANTUNES KANTHACK, Esq., B.A., B.Sc., M.B., B. S. (London), F. R. C. S. (England), and L. R. C. P. (London), late Clinical Assistant Royal Ophthalmic Hospital, London, and Midwifery Assistant, St. Bartholomew's Hospital, London.

*Appointed by the Viceroy of India*—

(The late) Surgeon-Major BARCLAY, Secretary to the Surgeon-General to the Government of India.  
Surgeon-Major S. J. THOMSON, Deputy Sanitary Commissioner of the Second Circle in the North - West Provinces and Oudh.

The following order appeared in the *Indian Government Gazette* of the 21st November, 1890:— EXTRACT from the Proceedings of the Government of India in the Home Department (Medical), under date, Calcutta, the 21st November, 1890.

#### RESOLUTION.

The Executive Committee of the National Leprosy Fund having determined to appoint a Commission for the purpose of investigating the disease of leprosy in India, it is notified for general information that Dr. Beaven Rake, Mr. Kanthack, and Dr. Buckmaster (their full titles and qualifications are set out in the resolution) have been appointed Commissioners. These gentlemen have now arrived at Bombay, and have been joined there by Surgeon-Major A. Barclay, M.D., Secretary to the Surgeon-General with the Government of India, and Surgeon-Major S.J. Thompson, Deputy Sanitary Commissioner, North-Western Provinces and Oudh, who have been appointed by the Government of India to co-operate with them. The Governor-General in Council will feel obliged if public bodies and individuals desirous of producing evidence before the Commissioners will address the Local Government of the Province to which they may belong, in order that arrangements may be made for the presentation of such evidence before the Commissioners. Each Local Government has already been requested to depute an officer to assist the Commission in collecting and arranging the evidence that may be procurable in the territories under its control, and instructions should be given to all the civil and medical officers to give to the Commissioners any aid which they may ask for in the course of their inquiries. The Government of India will, on learning from the Commissioners the programme which they intend to follow, notify it for public

information.

#### ORDER

Ordered, that a copy of this resolution be forwarded to Local-Governments and Administrations, in continuation of the communication from this office, No. 11 Medical, 596-605, dated 15th September, 1890, to the Surgeon-General with the Government of India, and to the Members of the Leprosy Commission for information. It will be convenient if the Commissioners will address the Surgeon-General with the Government of India on any point on which they may desire to receive further assistance or information.

Also, that the resolution be published in the supplement to the "Gazette of India." (True Extract). (Signed) C. J. YALL, *Officiating Secretary to the Government of India.*

The Leprosy Commissioners, who left England for India on the 23rd October, 1890, completed their inquiries in the autumn of 1891, and prepared their report; but its publication has been delayed, ostensibly on the ground that the Committee of the National Leprosy Fund were waiting the issue of the Indian census returns as regards leprosy. It appears, however, from the facts disclosed in the following circular, issued in June, 1892, that several of the most important conclusions arrived at by the Commission are strongly objected to.

#### NATIONAL LEPROSY FUND.

##### *Memorandum on the Report of the Leprosy Commissioners.*

Your Committee, having been instructed to consider and report to you upon the publication of the Report of the Leprosy Commissioners in India, in 1890-91, beg to submit the following considerations :—

I. They desire to place on record their sense of the ability with which the Commissioners conducted their investigations while in India, and of the comprehensive and valuable nature of their Report.

II. The conclusions at which the Commissioners arrived have been summarised by them at the end of their report as follows—the evidence upon which these conclusions rest being displayed at length in the earlier pages of the Report :—

(1) "Leprosy is a disease *sui generis*; it is not a form of syphilis or tuberculosis, but has striking aetiological analogies with the latter."

(2) "Leprosy is not diffused by hereditary transmission ; and for this reason, and the established amount of sterility among lepers, the disease has a natural tendency to die out."

(3) "Though, in a scientific classification of diseases, leprosy must be regarded as contagious, and also inoculable, yet the extent to which it is propagated by these means is exceedingly small."

(4) Leprosy is not directly originated by the use of any particular article of food, nor by any climatic or telluric conditions, nor by insanitary surroundings; neither does it peculiarly affect any race or caste."

(5) "Leprosy is indirectly influenced by insanitary surroundings, such as poverty, bad food, or deficient drainage or ventilation; for these, by causing a predisposition, increase the susceptibility of the individual to the disease."

(6) "Leprosy, in the great majority of cases, originates *de novo*, that is, from a sequence or concurrence of causes and conditions, dealt with in the report, and which are related to each other in ways at present imperfectly known."

III. Thirdly, the Commissioners having been instructed to report upon the practical measures to be taken for the control or restriction of the disease in India, have suggested the regulation of lepers and leprosy by means of bye-laws framed by the various municipalities, which point they write as follows :—

(a) "The Commission are of opinion that the sale of articles of food and drink by lepers should be prohibited, and that they should be prevented from practising prostitution, and from following such occupations as those of barber and washerman, which concern the food, drink, and clothing of the people generally, quite apart from the dread a possible infection."

(b) "The Commission consider that the best policy in dealing with the concentration of lepers in towns and cities is to discourage it, and to this end would suggest that municipal authorities be empowered to pass bye-laws preventing vagrants suffering from leprosy from begging on or frequenting places of public resort, or using public conveyances."

(c) "The large presidency towns and the capitals of provinces in many cases already possess leper asylums, which might be enlarged by municipal funds or private subscriptions. Asylums should be built near towns where they do not already exist, and the authorities should have of ordering lepers infringing the regulations either return to their homes or to enter an asylum."

(d) "Competent medical authority should always be consulted before action is taken under such bye-laws."

IV. Upon the afore-mentioned conclusions of Commissioners, numbered 1, 2, 3, 4, 5, and 6, your Committee offer the following remarks :—

They desire to express their disagreement with the concluding words of No. 3—

"That the extent to which leprosy is propagated by contagion and inoculation is exceedingly small"—

not being satisfied with the evidence offered by the Commissioners for this opinion.

They cannot concur in the views expressed in No. 6,— namely, that

\* "Leprosy, in the majority of cases, originates *de novo*, that is, from a sequence or concurrence of causes and conditions, dealt with in the report, and which are related to each other in ways at present imperfectly known,"

[\\* See page 304](#)

being of opinion that the evidence adduced does not justify such conclusions.

V. The Commissioners, in the section of their Report entitled "Practical Suggestions," pp. 45 2-7, as also in other parts of the Report, have expressed opinions strongly adverse to compulsory segregation, either complete or partial. For instance, they say on p. 258—

"No legislation is called for on the lines either of segregation or of interdiction of marriages with lepers."

And on p. 453— "For India, complete compulsory segregation of lepers may be considered to be absolutely impracticable. Neither do the conclusions given before as to the nature of the disease justify any recommendation for absolute segregation."

And on p. 454— "It is impossible, for the same reasons, to advise compulsory partial isolation. Voluntary isolation is therefore the only measure left for consideration."

And on p. 456—

"In no case would the Commissioners suggest an Imperial Act especially directed against lepers as such."

And again on p. 456—

\*\* "In conclusion, the Commissioners believe, from the considerations and arguments adduced in the foregoing report, neither compulsory nor voluntary segregation would at pro effectually stamp out the disease, or even markedly diminish leper population, under the existing conditions of life in India."

[\\* \\*see page 304](#)

Your Committee, having already expressed inability to accept the reasoning upon which Commissioners have based the above conclusions, equally unable to accept the corollary that in any case of leprosy in India is either impracticable or undesirable. They entertain a precisely opposite opinion, and would be sorry if the Government of India encouraged by the report of the Commissioners to from taking the necessary steps in the direction of such segregation of lepers as may be found possible. opinions upon segregation are in accord with expressed in the following extract from a by Dr. Vandyke Carter :—

#### MODES OF SEGREGATION.

I. "By erecting plain asylums at certain centres, each of which would be a refuge common to several districts, and a place detention, tinder due management and supervision."

II. "By founding leper colonies, or village communities of the affected, who, while allowed more liberty of movement, should yet be prevented from mingling with the peasantry around: hence still the need of strict supervision. Many spots would serve—such as deserted forts, decayed villages, and places waste, yet not far from other sources of supply, or not without resources easily resuscitated."

III. "By requiring the strict isolation of leprosy subjects retained in their homes at express wish of friends. Suitable separate lodgment would be indispensable; unsuitable shelter is even now sometimes supplied. Joining of such home-isolation with more public measures should not be overlooked, for to it experience in Norway seems to point as a means essential to complete success within a moderate period of time; and in India it would have to be still more largely resorted to."

IV. "For carrying out the above, in addition to funds, legislative authority is needed to take up the vagrant sick, to remove the sorely diseased who is insufficiently guarded at home, and at times to enforce continued isolation of the infected until medical sanction of liberty be granted."

VI. Reserving their opinions as expressed in the foregoing paragraph and extract, your Committee give a general approval to the minor recommendations of the Commissioners, numbered above as (a) (b) (c) (d), for the regulation of lepers and leprosy in India, which they consider might with advantage be carried out; though they do not concur in the opinion that municipalities will be necessarily or universally the best means of effecting that object.

*Nominated by the Executive Committee of the National Leprosy Fund—*

GEORGE N. CUEZON (Under-Secretary for India), *Chairman.*

EDWARD CLIFFORD.

*Nominated by the Royal College of Physicians—*

DYCE DUCKWORTH, M.D., LL.D.

G. A. HERON, M.D., F.R.C.P.

*Nominated by the Royal College of Surgeons—*

JONATHAN HUTCHINSON, LL.D., F.R.S. (*With the exceptions noted below.*)

N.C. MACNAMARA, F.R.C.S.

\* Upon this paragraph Mr. Hutchinson appends a dissentient opinion, as follows :—

"I understand the Commissioners to mean by the expression '*de novo*' in reference to the origin of leprosy, that they believe that the disease may begin independently of personal contagion and in connection with climatic and dietetic causes. In that belief I entirely share. I also agree in the main with the rest of

the statements in the Commissioners' Report to which exception has been taken in our Committee. I feel convinced that if leprosy be contagious at all, it depends but to an almost infinitesimal extent upon contagion for its spread." JONATHAN HUTCHINSON, LL.D., F.R.S.

\*\* Upon this paragraph of the Report, Sir Dyce Duckworth and Mr. Hutchinson append independent or dissentient opinions, as follows :—

"I am in agreement generally with the recommendations of the Commission respecting *voluntary isolation*, and the issue of *Municipal Bye-Laws* regulating the habits of lepers. I know of no trustworthy evidence to prove that a leper in any community is a source of greater danger than is a consumptive patient, and I know that a person suffering from syphilis is a real and very positive source of danger anywhere. It would therefore be absurd on the face of it to adopt stringent laws for the leper and to let the syphilitic person go free.

"The intelligent layman now imagines that because bacilli are an essential feature of leprosy, therefore the disease *must* be readily contagious. This is simply quite contrary to fact. The same thing holds good exactly for consumption.

"I think a well-empowered and vigorously-supported Government Medical Executive Officer should be appointed in every large town, and in certain districts, to supervise the leprosy populations and report regularly upon them. It should be his business to see that the local regulations are fully carried out, and on his requisition only should any action be taken when necessary.

"Suitable asylums should be provided, and those now existing be sufficiently enlarged to meet the needs that will arise under suitable bye-laws.

"The project of leper-farms is, I think, a good one. More than this is, I believe, not within any practical scheme for amending the condition of lepers, and for diminishing the spread of the malady." DYCE DUCKWORTH, M.D., LL.D.

"I am strongly in favour of the maintenance (by Government or otherwise) of voluntary homes for lepers, but do not believe that segregation would effect anything in diminishing the prevalence of the disease. Compulsory segregation would I think involve injustice and entail much social misery. I believe that our Commissioners Report well expresses not alone the opinions of those who have signed it, but, in a general way, those of the educated classes of the present day throughout India." JONATHAN HUTCHINSON, LL.D., F.R.S.

#### ADDITIONAL REPORT.

"Your Committee having also been instructed to report upon the disposal of the balance of £800 still remaining to the account of the Executive Committee, recommend that a sum of £250 should be set apart for the prosecution of further investigations and the continued half-yearly publication of the journal for a period of five years, or until such time as this sum is exhausted; and that the remaining £550 should be devoted to the encouragement of local research in countries where there is reasonable evidence for believing that leprosy has recently originated, or where it exists under very exceptional circumstances—with the view of tracing the disease to its alleged origin."

It may be observed that for the Commissioners to have allowed that leprosy is easily inoculable (as is shown in this volume upon the evidence of accepted authorities in all parts of the world) would have been equivalent to the admission of the danger in all leprosy countries of the invaccination of leprosy. Such an avowal would have been inconsistent with the course adopted by the Commissioners and by the Committee of the National Leprosy Fund during the whole of this important inquiry, both of whom have practically ignored the evidence bearing upon the subject. When visiting Calcutta, for example, nothing would have been easier than for the Commissioners to have investigated the cases circumstantially reported by Dr. Roger S. Chew, which will be found in another chapter of this book. Having ignored these cases, one of the Commissioners, Dr. Beaven Rake, immediately on his return from India, gave evidence before the Royal Commission on Vaccination to show that leprosy was not communicable by vaccination, or, if so, only to so slight a degree that the danger might be disregarded. How far Dr. Rake's testimony has stood the test of cross-examination will be gathered by reference to the evidence in the Blue Book which had not been issued at the time of this writing.

On the subject of inoculation, the Commissioners conclude :—" The extent to which leprosy is propagated by contagion and inoculation is exceedingly small." It is a pity that the Commission should have bundled these two dissimilar sources of alleged causation together, as they cannot consistently be so treated. Nor have they defined the word "contagion," which many authorities, as I have shown, habitually use to cover inoculation. The dissemination of leprosy by *contagion*, using the word in its proper sense—i.e., by simple contact—has been disproved by eminent authorities, including superintendents of leper asylums of wide experience in all countries, as will be seen by reference to the chapter in this book entitled "Is Leprosy Contagious?" On the other hand it is conclusively established by a similar weight of evidence that leprosy is inoculable, and like other transmissible diseases can be propagated through a cut, sore, wound, or abraded surface, or be inoculated by flies and mosquitos, or spread by vaccination. Another point in which the Committee dissent from the views of the Commissioners is that of compulsory segregation or compulsory isolation, which they consider uncalled for by the evidence collected during their tours of investigation, or by the nature of the disease, and are of opinion that it would be impossible to stamp out the disease by either voluntary or compulsory segregation. The Committee of the National Leprosy Fund do not accept either the reasoning or conclusions upon which these recommendations of the Commissioners are founded. On the contrary, they are of the opinion that the segregation of lepers should be encouraged as far as possible in the interest both of the lepers and of the public. The Committee conclude by declaring that they can give only "a general 'approval to the minor recommendations of the Commissioners" on this point. Both the Committee and the Commissioners accept the important fact that leprosy is not diffused by hereditary transmission.

Setting aside the alleged leading causes of leprosy, such as heredity, contagion, and inoculation, as contributing little or nothing to the spread of this disease, the Commissioners resort to a theory which, up to the present time, has received but little countenance from the medical profession, that "leprosy in the great majority of cases originates *de novo*, that is from a sequence or concurrence of causes and conditions, dealt with in the Report." The present writer considers it highly probable that leprosy as well as other diseases may in numerous instances be accounted for in this way, but it must be observed that the factors, which are various forms of insanitation, have been in operation time out of mind, and do not in any way account for the remarkable recrudescence of the disease shown in this

volume. On the contrary the danger from malaria, overcrowding, impure water, unwholesome food, filthy deposits, has, under the instructive teachings of the late Dr. Southwood Smith, Sir Edwin Chadwick, and their followers, been gradually and sensibly diminishing, and it is triumphantly claimed that various diseases due to these causes have been decreasing also. It is obvious, therefore, that some other factor or factors, peculiar to this century and previously unknown, are at work. This factor, as high authorities now reluctantly avow, has been omitted by the Commission from the list of causations in their summary of conclusions—the latest and most daring official effort, to use a classic phrase, "to preserve vaccination from reproach."

Amidst this divergence of opinion between the conclusions of the Leprosy Commissioners and those of the Committee, the public will want to know what useful object has been realised by the large expenditure of time and money in promoting this lengthened inquiry. Will the authorities accept the conclusions of the Leprosy Commission, when they affirm that "the extent to which leprosy is propagated by contagion and inoculation is exceedingly small ;" or the opposite views entertained by the eminent members of the Committee of the National Leprosy Fund, who declare their disagreement with these amongst others of their conclusions?

The Leprosy Commissioners (all ardent supporters of the Jennerian practice) have searched far and wide for a rational theory that will account for the recent spread of leprosy in certain countries, but have utterly failed to discover one, and are almost driven to the conclusion that touches closely upon the facts collected in this volume. Under the head of "Transmission through an Intermediary Host," one of their number, Dr. Beaven Rake, says :—" There is at present no direct evidence to support this hypothesis, but it seems that some such theory might explain the alleged rapid increase of leprosy in Hawaii and New Caledonia."—*Journal of the Leprosy Investigation Committee., No. 1, Aug., 1890, pp. 50,51.*

To the present writer, vaccination seems to be the only intermediary host that passes direct into the blood (except in rare instances of accidental inoculation), and which covers all the facts of the case.

It appears that of the £7000 collected £800 remains, part of which it is suggested should be devoted to further investigation. It is to be hoped, if this is adopted, that less prejudiced and more competent inquirers will be appointed, and that in the future numbers of the *Journal* the accumulation of evidence, so shamefully ignored, showing how leprosy has been spread at the point of the vaccinator's lancet will find a place.

## CHAPTER 17: LEPROSY INCURABLE—HYGIENE THE ONLY PALLIATIVE.

LEPROSY has been regarded in every age and in every country as an incurable disease.

In the *Encyclopaedia Britannica*, leprosy is described as an incurable constitutional disease, marked externally by discoloured patches and nodules on the skin, and deeply implicating the structure and function of the peripheral nervous system.

How improbable was all hope of cure of leprosy may be inferred from ancient customs in various countries, notably in France.

Dr. Macnamara in his work on "Leprosy," p. 36, cites authorities to show that the leper was expelled from society, and looked upon as dead.

He observes :—" The leper was not looked upon in the eye of the law alone as defunct, for the Church also took the same view, and performed the solemn ceremonials of the burial of the dead over him on the day on which he was separated from his fellow-creatures and consigned to a lazar-house. He was from that moment regarded as a man dead amongst the living, and legally buried, though still breathing and alive. The ritual of the French Church retained till a late period the various forms and ceremonies to which the leper was subjected on the day of his living funeral. Ogee and Ploucquet have both described them.

"A priest robed with surplice and stole went with the cross to the house of the doomed leper. The minister of the church began the necessary ceremonies by exhorting him to suffer, with a patient and penitent spirit, the incurable plague with which God had stricken him. He then sprinkled the unfortunate leper with holy water, and afterwards conducted him to the church, the usual burial verses being sung during their march thither. In the church the ordinary habiliments of the leper were removed; he was clothed in a funeral pall; and while placed before the altar between two trestles, the *Libera* was sung, and the mass for the dead celebrated over him. After this service he was again sprinkled with holy water, and led from the church, to the house or hospital destined for his future abode. A pair of clappers, a barrel, a stick, cowl, and dress, etc., etc., were given to him. Before leaving the leper, the priest solemnly interdicted him from appearing in public without his leper's garb; from entering inns, churches, mills, and bake-houses; from touching children, or giving them aught he had touched; from washing his hands, or anything pertaining to him, in the common fountains and streams; from touching in the markets the goods he wished to buy with anything except his stick; from eating or drinking with others than lepers; and he especially forbade him from walking in narrow paths, or from answering those who spoke to him in the roads and streets unless in a whisper, that they might not be annoyed with his pestilent breath, and with the infectious odour which exhaled from his body; and last of all, before taking his departure and leaving the leper for ever to the seclusion of the lazar-house, the official of the church terminated the ceremony of his separation from his living fellow-creatures, by throwing upon the body of the poor outcast a shovelful of earth, in imitation of the closure of the grave."

Referring to more recent events, I find that in the report of the Special Sanitary Committee on the state of the Leper Settlement at Kalawao, Hawaii, 1878, addressed to the Hon. G. Rhodes, President of the Legislative Assembly, so little expectation of cure was there, "that lepers have to pay for their own coffins, and have formed a coffin association in order to provide a common fund for their

proper interment, and these sad creatures get up, as shown by the register of the Hospital, 'Coffin Feasts,' on which occasion money is contributed to provide for a decent termination of their woes."

Alluding to the disappearance of leprosy in England, Gilbert White observes in a letter to Mr. Barrington

"This happy change perhaps may have originated and been continued from the much smaller quantity of salt meat and fish now eaten in these kingdoms; from the use of linen next the skin; from the plenty of better bread; and from the profusion of fruits, roots, legumes, and greens, so common in every family." It may also be added that, at the time when leprosy disappeared from this country, the practice of inoculation and vaccination was unknown, otherwise there is little doubt that leprosy would have been perpetuated in England by the empoisoned lancet, as it is now in the West Indies, British Guiana, India, New Caledonia, the United States of Colombia, Venezuela, and Hawaii.

Commenting upon the Royal College of Physicians' Report, Drs. Tilbury Fox and Farquhar observe that:

"The cause of leprosy is as obscure as ever, and upon this particular matter the leprosy report gives us very little satisfactory explanation, beyond illustrations of the general statement that leprosy disappears *pan passu* with an improvement in the hygienic condition and diet of a people, and the cultivation of land in districts where it has abounded."—*India Office Report, London, 1872, p. 28.*

Sir Erasmus Wilson, in his article on "Leprosy" in Quain's "Dictionary of Medicine," refers to the various drugs which are recommended and used by one physician or another—quinine, strychnine, phosphates, nitric acid, acetic and carbolic acid, iodine, arsenic, perchloride of mercury, *asclepias gigantea*, *hydrocotyle asiatica*, *veronica quinquefolia*, *plumbago rosea*, acid nitrate of mercury, *potassa fusa*, acrid irritating oil of the shell of the cashew nut, chloride of zinc, etc. In no case is it mentioned that a cure is effected, or even to be expected, but rather the other way. "Hope," he says, "will gleam in the mind of the physician and patient; but cure, alas! is as distant as ever."

Dr. P. Abraham, the Secretary of the Leprosy Investigation Committee, who is familiar with all medical literature on the subject, gave his opinion at a discussion "On the Cure of Leprosy" before the Royal Medical and Chirurgical Society, May 27, 1890, that "the disease was probably not curable; though it might abort and die out."—(*British Medical Journal* May 31st, 1890.) And on another occasion he observed that therapeutic agents had proved failures and that there was no specific for the disease.

In a report of the Paris Congress of Dermatology, 1889, printed in the *Journal d Hygiène*, October 23rd, 1890, the subject of leprosy was discussed.

M. Cornil observed: "We must not confound a passing amelioration, a diminution or attenuation of the malady, more or less prolonged, with cure properly so called."

Consul-General Abbott, in a letter dated June 8th, 1891, Rio de Janeiro, says: "I do not think any radical cure for leprosy has yet been discovered."—*Journal of the Leprosy Investigation Committee, No. 4., December 1891i, p. 18.*

## HAWAII.

The health authorities in Hawaii, as well as the most experienced medical residents elsewhere, consider leprosy as practically incurable, though they acknowledge that life may be prolonged by good food, pure water, healthy habitations, and other favourable sanitary conditions. On one occasion, referring to the reports of certain medical practitioners as to their alleged and officially reported cures, I was told by one of the responsible officials that the cures were mythical, the particular cases cited having since exhibited further development of the disease.,

It is alleged that the external manifestations of leprosy, like those of some other maladies, disappear for a time, either with or without treatment, and cures are noised abroad; but the disease invariably reappears, and shows itself when least expected.

In the year 1866, the disease had begun to assume alarming proportions in the Sandwich Islands, and the people strongly suspected that the increase was partly, if not largely, due to vaccination. I am unable, however, to find any medical admission of the fact, until some years later. A law was passed in 1868, declaring the disease to be contagious, and requiring all lepers to be removed to the Island of Molokai, where the Government had set aside a piece of land on the northern side for a leper settlement. The preparations for the reception of these unfortunate people were, at first, of the rudest description. The patients were lodged in the cottages of the few Kamaainas, or freeholders on the estate, and were without any appropriate nursing or attendance; and, according to the evidence of Mr. Ambrose Hutchinson, who in 1884 was Under-Superintendent, as the disease was considered incurable, it was the custom to send along with each patient, by the same conveyance, the coffin he was soon to occupy.

The report of the Honolulu Board of Health to the Minister of the Interior for 1876 states (page 77) that the Legislature of 1874 made an appropriation of six thousand dollars towards the expenses (for curing leprosy) of Drs. Powell and Akana, who were offered every facility to try their skill. Six patients were experimented upon with various drugs. Dr. Akana claimed to have cured one, who was subsequently examined by a number of physicians and sent to Kalawao as a confirmed leper. The Board reported that all attempts to cure any patient afflicted with leprosy had failed.

In an address delivered by Mr. Dole on the subject of "Leprosy in the Hawaiian Islands," which the *Boston Medical and Surgical Journal* of May 15, 1884, commends to the attention of the National Board of Health, United States, is the following description of this malady :— "Leprosy is the worst known disease of the present and historic times. It has successfully defied medical skill. Physicians have not been able to say whence it comes, or to explain its laws. It has always and every where been found to be incurable. It attacks all races and all classes; no rank in life is safe—adults and children are alike exposed to its ravages. Medical skill can , make no limit; no assurance can be given from the lessons of experience against this most terrible, most loathsome, and most hopeless of all human diseases."

Dr. A. W. Saxe, in a card published in the *Hawaiian Gazette* of May 23, 1883, says that for leprosy there is no known cure.

In a paper on "Leprosy in Hawaii," published in the *Occidental Medical Times*, April, 1889, Dr. F. B. Sutliff, the writer, sums up the results of his experience in the Island of Maui, Hawaii. "Treatment," he observes, 'of any kind had, so far, proved useless. Improvement which has been noted in many cases is only temporary;" and again, p. 208, "The disease is hopelessly incurable, and certainly fatal."

In the biennial period ending 1881, the report of the Board of Health states that an appropriation of \$20,000 was made by the Legislature of Honolulu for the cure of lepers, or \$200 each; but no cures were effected, though numberless experiments on these unfortunates were tried, causing much suffering, and in one case the suicide of the victim experimented upon.

In his report to the Board of Health, dated November 14, 1885, and addressed to His Excellency W. M. Gibson, Dr. Edward Arning observes :—" There is scarcely a drug in the pharmacopoeia, at least scarcely a class of drugs, that has not been most systematically tried in the treatment of leprosy. Over and over again men of sanguine temperament have found what they called, a specific cure, but in every instance calm and unbiased judgment has afterwards pronounced a verdict of uselessness."

This distinguished authority also observes :—" I am fully satisfied that Dr. Unna has as yet not succeeded in perfecting a cure of leprosy in a single case. He himself has told me that one of the published cases of complete cure has since suffered a relapse."—*Biennial Report, Board of Health, Honolulu, 1892, p. 5.*

Leprosy is not confined, as many suppose, to native Hawaiians. Dr. E. Arning says :—" Among the white population, numbering 17,935, I knew of thirty-five leprosy cases."

Dr. N. B. Emerson, a lepra specialist of Hawaii, says:—" In spite of a number of claims to the contrary, we believe it safe to say. that no one has been able to prove, to the satisfaction of the medical profession, that a single case of this disease has been definitely cured."

In a volume entitled "Leprosy in Hawaii," published by the Hawaiian Government at Honolulu, 1886, p. 73, it is said :—" Experiments are carried on constantly on patients at Kalihi, and on very incipient, or rather doubtful cases, at their own homes. Though some patients have certainly improved a .great deal under careful treatment, we cannot, for the present, state one case of cure."

Dr. Prince A. Morrow, of New York, in "Personal Observations of Leprosy in Mexico and the Sandwich Islands," says, p.5:—" We know that leprosy has a prolonged, but somewhat indefinite, period of incubation, a slow and irregular course of development, a characteristic and well-defined symptomatology rendering its diagnosis easy, and that its prognostic significance' is most grave. It progresses almost invariably to a fatal termination."

Dr. Hoffman, of Honolulu, alluding to the Leper Hospital at Kalihi, of which he had charge for some years, reports that generally fifty cases were under treatment from time to time, these being 'equally divided between the tubercular and the anaesthetic. He says :—"I found no permanent benefit from treatment; better food and cleanliness, medicine suited to improve the general health of the leper, ameliorated the disease temporarily."—*Report on Leprosy, Honolulu, 1886 p 75.*

Dr. Arthur Mounitz, Resident Physician and Medical Superintendent of the Leper Settlement, Molokai, in his Report, dated Molokai, February, 1886, says of the Kalawao Hospital, where the worst cases are supposed to be accommodated :—"Of course, there are no cases of cure, and those who enter its portals remain until death releases them ;" and under the head of "Treatment," says:

"This is the briefest question of any to deal, with, but the most disheartening to a physician; for, so far, no remedy has been found beneficial." Dr. E. Cook Webb physician to a branch hospital at Kakaoko, in his report, dated March 1st, 1886, says:—" As regards the treatment of leprosy, I have but little to say. Notwithstanding any treatment which I have used, or seen used,. 'I cannot see any change in any single case.' I am fully convinced, after considerable study and experience, that personal cleanliness, good nourishing food, and regular habits have done more towards the relief of these unfortunates than all the medicines that have ever been prescribed for them in the past. In all the cases of leprosy. I have seen, the disease has steadily progressed to a fatal termination, notwithstanding all treatment. I am aware that I am taking strong ground against the many so-called 'cures' that have been devised, but in so doing I am not basing my opinion on my own study and experience alone, but on the medical opinions of those who for years have been in daily contact with the disease, and have made it a special study, and they 'have come to the conclusion that it is a disease *sui generis*, and incurable."

In the report of the President of the Board of Health, addressed to the Legislative Assembly, Honolulu, 1886, p. 49, in reply to the question, "Is Leprosy Curable?" Mr. F. W. Hutchinson says :—" To this question we are constrained to answer 'No!' At least not under any' known treatment."

Dr. Sidney Bourne Swift, late Resident Physician of the Leper Settlement, Kalawao, Molokai, Hawaii, in his report to the President of the Board of Health, refers to the failure of medical treatment and the numerous alleged cures reported by experimental bacteriologists. "What has become of the cases cured by Fitch, by Arning, by Goto, and by Lutz? Come to the Settlement and you will see them in their graves."—*Biennial Report of the President of the Board of Health to the Legislature of the Hawaiian Kingdom, Honolulu, 1892, p. 87.*

#### THE WEST INDIES AND BRITISH GUIANA.

Dr. Gavin Milroy, in the "Report on Leprosy and Yaws in the West Indies," published in 1873, p. 43, observes:—" We have already seen that in the Barbados Asylum several of the patients had been benefited when no medicinal remedies whatever had been used, the good results being attributed solely to the more regular mode of life, better supply of food, and better housing since their admission, and to their withdrawal from all occasions of intemperance on the one hand, and of destitution on the other. Like effects have been 'observed in the asylums of other Colonies."

On pages 99 and 100, Dr. Milroy says :—" There is a unanimous accord of opinion that the greatest benefit is derived from the adoption of hygienic measures, and that by improving the general conditions, physical and moral, of the leprosy poor, very much may be done to retard or arrest the malady in its early stages, and also to mitigate its severity when more fully developed. Medicinal treatment is universally admitted to be, of no avail, unless combined with the regular use of a nutritive, unstimulating diet, suitable clothing, protection against the vicissitudes of weather, personal cleanliness, and exercise in the open air. There is certainly no medicinal substance, vegetable or mineral, which exerts anything like a direct or specific effect on the malady.....

"The evidence is all but unanimous that leprosy very rarely, if ever, manifests any tendency to a spontaneous cure. When fully developed, a complete recovery is not to be looked for. It is quite apparent, however, that the progress of the disease may often experience a marked retardation of arrest when the patient is maintained in a favourable hygienic condition."

Dr. J. F. Donovan, Superintendent, Leper Home, Jamaica, in his annual report for 1891, says :—" For curative purposes, I think most authorities will acknowledge that we must look for some other method besides the administration of medicinal remedies, as drugs have been tried extensively and persistently, and have so far signally failed of effecting a cure of this formidable pest." — *Supplement to Jamaica Gazette, 18th June, 1891.*

In the same report, Dr. Donovan makes the following' statement as to the condition of patient No. 5, afflicted with tubercular leprosy :—" After medical treatment, the scaly eruption about the flexor aspect of joints has disappeared, the plaques of tubercle on face, forehead, etc., and the enlarged inguinal glands are in *statu quo* after a month's steady use of the inunction and mixture. Symptoms of pulmonary phthisis set in when the gurjun oil was discontinued, as it caused nausea, and subsequently diarrhoea ensued, which the patient attributed to the medicine. A variety of drugs were used to combat the hyper-pyrexia, but without effect."— *Supplement to the Jamaica Gazette, June 18th, 1891, page 81.*

Under the head of "Cure," Dr. J. F. Donovan observes in the same report :—" In some cases the tubercles decrease for a time; in a few years, it may however' be mentioned, that the tubercles have been known to subside spontaneously in some patients for a time, who have been taking no medicines; so too the tubercles may enlarge and increase in numbers during the administration of the drug, as was evidenced in three of our most prominent cases at the 'Home."

"There are few diseases which are less amenable to treatment than leprosy; the entire armoury of known drugs has been tried," says this medical superintendent, and found ineffective."

I may here observe that Dr. Koch's much vaunted tuberculin has been tried in almost every leprosy country on the globe, and found worse than useless. Much suffering has been caused by its use. The *Madras Times*, October 28, 1891, reports the visit of His Excellency Lord Wenlock to the leper hospital in this city, when his lordship had pointed out to him several patients upon whom Dr. Koch's lymph treatment had been tried. One of the patients complained that the experiment had subjected him to excruciating pain.

Dr. W. V. M. Koch, Acting Medical Superintendent, Leper Asylum, Trinidad, says :—" During the past year there has been scarcely any advance made in the treatment of this disease (leprosy) and it continues to baffle 'the most skilful physician. Various new remedies have been tried, but without success."

"No drug has yet been used which exerts a specific action on leprosy."—*Appendix to Report on Leprosy and the Trinidad Leper Asylum, 1891, pp. 72, 73.*

In the appendix to Dr. Beaven Rake's report on Leprosy and the Trinidad Leper Asylum," dated Maraval, February 4th, 1890, it is admitted that the inoculation of animals has proved a failure, and human beings are required as clinical material for experimental purposes. Dr. Rake, p. 36, says :—" If the Home 'Government could see its way to sanction the inoculation with leprosy of two or three condemned criminals in Trinidad, and the commutation of their capital sentences to imprisonment for life, important additions could be made to our present knowledge of the pathology and proper treatment (by segregation or otherwise) of the disease. I can safely predict that many criminals would gladly accede to such an alternative, on having the case clearly stated to them."

Dr. Beaven Rake, himself a great experimenter, says:—" Campana inoculated lepers with erysipelas, with the result that nearly all the

patients in the ward got erysipelas, and the ward had to be closed. No effect was produced on the progress of the leprosy."—*Report on Leprosy in Trinidad for 1890, p. 37.*

Dr. John D. Hillis, of Demerara, observes in his work, *Leprosy in British Guiana*, p. 209 :—" The treatment of leprosy has hitherto been attended with such very poor results that the disease is now regarded as incurable. Drug after drug—so-called specifics—have been tried, only to be laid aside as useless, the disease after a time returning with greater violence than ever." The writer 'then proceeds to describe some of the experiments to which the unfortunate lepers have been subjected. Out of seventy cases treated by Dr. Danielssen at the Lungeguard's Hospital, Bergen, only one was reported cured.

It appeared to me, however," says Dr. Danielssen (page 210), "if I could infect the leprous patients with constitutional syphilis, it might follow that the syphilitic poison might prove superior to that of leprosy, and that thus the system might be brought to that of a person labouring under constitutional syphilis, and might so become subject to the ordinary process of syphilisation." "This ingenious theory, however," remarks Dr. Hillis, "failed in practice, the leprosy remaining unchanged, whilst the syphilitic process went on."

Under the head of " Palliative Treatment," p. 215, Dr. Hillis says:—" Improving the sanitary condition of the leper, it is well known, has great influence in mitigating the disease; and the satisfactory results which have been realised in this direction at the General Leper Asylum may be seen in the following figures, taken from my official report for 1878, when the percentage of deaths to strength for the past four years was stated to be :—

1875.	1876.	1877.	1878.
17.36 per cent.	16.33 per cent.	11.49 per cent.	9.19 per cent.

In the appendix to the report of the Medical Officer of the Leper Asylum, Mahaica, British Guiana, for 880, printed by order of the Court of Policy, Dr. Oscar D. Honiball, Acting Medical Officer to the Leper Asylum, after alluding to the prominent physiological action of gurjun oil, which are purging and vomiting, considers it would be a fatal mistake to administer it in advanced cases. Dr. Honiball records with considerable regret and disappointment his failure to discern its alleged beneficial results. He has also made careful inquiries of the inmates, and the answer as to the beneficial results have been either of a negative nature or strongly adverse. Some say, 'I am not worse than when I came in.' On the other hand, very many bitterly complain of the deleterious qualities, attributing to its administration a rapid and violent increase of the disease. It is so nauseous, and the results following so very often serious, and at all times disagreeable and inconvenient, that the assumption of its curative properties should be based upon a surer basis than hypothesis."

Dr. Castor, Medical Director, Leper Hospital, Demerara (who acknowledges that vaccination is a certain mode of spreading leprosy) says that no therapeutic agent is of any avail as a cure.

Referring to Dr. Castor's report to the Surgeon-General, British Guiana, for 1888, the *Lancet*, March 8, 1890, p. 566, observes :—"Although every remedy reported successful elsewhere has been tried, no beneficial result has been obtained. Dr. Castor holds the opinion that the most that can be done in the way either of cure or prevention is 'by proper diet, dwellings, and sanitary surroundings to ameliorate the symptoms, and often thereby control them.'"

#### AMERICA AND CANADA.

In a chemical lecture on "Anaesthetic Leprosy," by Professor James Nevins Hyde, in the *American Practitioner*, February, 1879, the author says :—" Needless to say that mercury, iodine, quinia, arsenic, and a long list of other remedies, have utterly failed to eradicate the disease. A careful study of the results said to have been obtained by the use of gurjun oil, employed in the Beuperthuy method by Dougal, and of the cashew-nut by De Valence, will lead to the conviction that the benefit was largely due to the improved hygienic condition of the patients submitted to experiment. ' Where we are ignorant it is best to admit the fact; for we thus show that we have at least learned the alphabet of wisdom."

Dr. J. E. Graham, of Toronto, in reply to a communication from the Hawaiian Government regarding leprosy in New Brunswick says, that he has experienced " no good results from medical treatment. Much may be done by attending to the general health of the patients." *Leprosy in Foreign Countries, Honolulu, 1886, p. 158.*

Dr. H. S. Orme, President of the State Board of Health, California, in his valuable papers on "Leprosy, its extent and control," says :—"The general testimony is to the effect that any mode of treatment is disappointing. Arrest of progress is only temporary, being usually followed by suspension of treatment. Indeed it is not certain that long perseverance would be 'attended by permanent relief. At the Tracadie Hospital, patients have been discharged apparently cured, but they generally returned to die. The results are even less encouraging than the treatment of pulmonary consumption. The Health Authorities of the Hawaiian Islands consider leprosy practically incurable, though they acknowledge that life may be prolonged by certain medical treatment, by good food, and by favourable sanitary conditions."

Dr. James H. Dunn, Professor of Dermatology, Mineapolis, in a chemical lecture reported in the *North- Western Lancet*, March 1, 1888, says :—" The treatment of leprosy is accordingly largely palliative. Of course, cures— popular, medical, and secret—have not been wanting; but their unreliability has been repeatedly demonstrated. Of prime importance, if possible, is the removal of the patient to a country or part of the country in which the disease is not endemic, preferably a healthy mountainous district with good air,

nourishing food, and every hygienic appointment, and the use of baths and electricity in proper cases."

In reply to a communication addressed by me to the Superintendent of the Lazaretto, Tracadie, New Brunswick, Mr. J. A. Babineau, November 12, 1889, writes :—"Leprosy is considered incurable here, as elsewhere, for all attempts to cure the disease have failed."

Dr. J. C. Tache, Visiting Physician to the Tracadie Lazaretto, in p. 150, "Leprosy in Foreign Countries," says :—" The various and multiplied attempts made at different times in New Brunswick by medical men, or under medical guidance, to cure the disease have all failed."

Dr. A. C. Smith, writing from New Brunswick to the Hawaiian Government, says :—" I have never observed more than a temporary amelioration from any medical treatment, and only such as might be attributed to the effect of mind over body. My predecessor used coloured water, accompanied by strong assurances of benefit therefrom, and in every instance found a temporary improvement equal in degree to any apparent benefit to be found from the use of medicinal agents." "Leprosy in Foreign Countries," p. 156.

United States Consul James W. Siler, of Cape Town, South Africa, in the report to his Government, after referring to various so-called remedies,, observes :—" After all, these and other remedies only tend to prolong the disease; for, once affected with the leprous taint, the victim is doomed to slowly but surely rot away, until mercifully released by death."— *United States Consular Report for 1887*, p. 565.

Owing to the remarkable spread of leprosy in Venezuela, the United States Consul, Mr. E. H. Plumacher, has paid much attention to the treatment of that disease; and he reports to his Government (No. 119, for 1890, pp. 695-6) as follows :—"Various methods of treatment have been tested at the Maracaibo Lazaretto, especially the administration of the oil of chaulmoogra, which apparently gives encouraging results at first, but produces no lasting benefit. Its use is also attended with grave physical inconvenience, such as a morbid state of the liver; intestinal irritations, accompanied with a slimy and waxy diarrhoea; wandering pains in various parts of the body; eruptions upon the skin, principally attacking the hands, and various other unpleasant attendant symptoms, making the use of chaulmoogra at times intolerable." . . . This treatment has always been entirely voluntary, but no one has been able to persevere in its use. The iodides and mercurial preparations have also been tested, as well as the tincture of cantharides; but all of these remedies produced more or less identical effects—that of a temporary amelioration of the condition of the patient, but without well-founded hopes of anything approaching a genuine cure. . . . As already stated, temporary alleviation has frequently been obtained by various methods, as, in a disease like leprosy, any remedy which tends to improve the state of the blood and the general health will, no doubt, have its temporary ameliorating effect upon the malady itself. So many years of careful study, and of patient and conscientious application of all methods of treatment, have, in my opinion, satisfactorily demonstrated the incurability of the disease; and the most that can be done is to alleviate, as far as possible, the physical suffering and mental distress."

Miguel Valladores, Physician of the Lazaretto, Guatemala, says :—" I have observed that mercurial treatment aggravates the disease of leprosy in a patient."—*Leprosy in Foreign Countries: Honolulu, 1886*, p. 174.

#### INDIA AND OTHER COUNTRIES.

In a report to His Hawaiian Majesty, dated August 12, 1885, by Surgeon-General W. J. Moore, of Bombay, the author says:—" If leprosy is not what I hold it to be, we have still sufficient evidence that the great prophylaxis is sanitation. In sanitation I include the prevention as much as possible of whatever entails a state of human system below par, such as the cheapening of salt (an article of the greatest importance in the human economy), plentiful food, good clothing, suitable and, above all, dry lodging, drainage, conservancy—in short, everything tending to improve the condition of the population of a country. Leper asylums are good and charitable, but will not cure, eradicate, or prevent leprosy. There is no known cure for leprosy when once contracted. Lepers taken into an asylum and well cared for often apparently recover; but the apparent recovery is this: The cachectic debilitated leper becomes temporarily a robust leper, but he remains a leper still, and the disease eventually breaks out again. Apart from charitable motives, therefore, I would not recommend the Government spending large sums on leper asylums—such, for instance, as would be entailed by a 'State Leper Asylum,' as mentioned in Government Resolution No. 2009, dated 11th June, 1883. A more certain, albeit slow, progress will result from sanitation in the broadest sense of the term, which comprises the moral and amelioration of the condition of the people" And in a letter to the *British Medical Journal*, December 14, 1889, p. 1371, Sir William J. Moore observes :—" I feel most confidence in the diminution of leprosy in India, and in the prevention of leprosy in this country, from the influence and progress of sanitation in the most extended sense of the term, in which I include the cleansing generally of villages and towns, drainage, ventilation, good water supply, the cheapening of salt, the prevention of scarcity, opposition to imprudent marriages, and measures for the prevention of specific disease."

Mr. W. Walker, Inspector-General of Civil Hospitals, North-West Province of Oudh, in his report of June 26, 1885, to the Government, observes :—" I may say that medical treatment, in the sense of attempting a cure of the disease, has been abandoned, not only in these provinces, but all over India. Extensive experiments were made in 1875, 1876, and 1887, with regard to the efficacy of certain systems of treatment, and were found to be equally unsatisfactory. If the Government will refer to proceedings in the Medical Department, Nos. 20 and 23, dated March 10, 1887, there will be found the result of a fair trial given to gurjun oil, once a vaunted cure for leprosy. The results of this experiment may be taken as a fair example of the conclusions which have been forced on all trustworthy observers—namely, that good nourishing diet, cleanliness, and friction of the skin with any oil, are the only satisfactory means of retarding the progress of the disease. No other specific treatment is now attempted in any of our asylums. The patients are regarded as

incurable, and are only subjected to medical treatment when attacked by complications which may be hopefully dealt with."

J. Fairweather, Brigade-Surgeon, Inspector-General of Civil Hospitals, Punjab, says :—" All attempts at specific treatment have been abandoned for some years as useless."

Dr. W. R. Kynsey, Chief of the Medical Department, Colombo, Ceylon, in reply to a communication from His Hawaiian Majesty's authorities as to leprosy in India, writes :—" No treatment has yet been found of any permanent benefit. The best results have been obtained from hygienic and dietetic treatment alone." "Lepers," he says, "are chiefly found among the poorer natives, whose dwellings are small thatched huts, crowded, ill-ventilated, filthy, and strewn with mouldy and rotten vegetables and excremental deposits.— *Leprosy in Foreign Countries, Honolulu, 1886, p. 164.*

Mr. H. A. Acworth, Municipal Commissioner, Bombay, says :—" Who ever heard of a case of cure?"

Dr. R. J. Wright, Civil Surgeon, Jessore, India, says:—" Six hundred and nineteen lepers are reported in the Jessore district. The sex is not distinguished; but it appears that only fifty-four inherited leprosy, while six hundred and sixty-five have no idea of its cause. They believe the disease incurable, so it is difficult to persuade them to submit to treatment, and twenty who were treated with gurjun oil derived no benefit."—*Leprosy in Foreign Countries, Honolulu, 1886, p. 34.*

Dr. H. V. Carter, of Bombay, in a communication to the Hawaiian Government, relative to leprosy in India and Norway, dated 1884, says:—" *In limine*, I should state that the cure of leprosy by purely medical treatment has not practically contributed anything towards the obliterating of the disease. To rely, therefore, for a general amendment, upon any of the varied remedial measures often confidently put forward, would be to indulge in fallacies, hurtful as well as deceptive, and to encourage a kind of anticipation hitherto shown by experience to be futile."

Again, the same writer, in part II. of the same paper, observes :—" Nor has purely medical treatment ever proved curative; and, so far from leprosy in Norway showing a natural tendency to subside, there is ample evidence of a present activity, equal to that displayed by the disease twenty - five years ago." — *Leprosy in Foreign Countries, p. 96, Honolulu, 1886.*

In a summary of his work for 1890, in the Leper Asylum at Dehra Dun, India, Dr. M'Laren, the Medical Superintendent, gives the result of the treatment with resorcin ichthyol and gurjun oil, which were used a short time ago, but are now, apparently, abandoned. He says :—" There is not the least appearance of permanent benefit, or of any amelioration of the actual disease."— *Calcutta Englishman, March 7, 1891.*

In his "Remarks on Leprosy," the same authority observes:—"It may not be out of place here to mention that, since 1875, I have given the most careful attention to the treatment of leprosy; tried most conscientiously all the various drugs that have from time to time been recommended, and used unsparingly, and for prolonged periods, all outward applications that have been brought to notice, and must frankly admit that I have not witnessed the least *permanent* benefit from any one of these. . . . Once a leper, always a leper, is the sad outcome of my many years' close observation, let the treatment be what it may."—*My Leper Friends, by Mrs. Hayes, London, 1891. pp. 125-6.*

Under the head of "Treatment," the chief medical officer of Kashmir, Dr. A. Mitra, after alluding to the use of arsenic, chaulmoogra oil, and gurjun oil, observes that they have little or no power in arresting the progress .of the disease. And as regards nerve-stretching, which, in the early stages of the anaesthetic variety, produces very satisfactory results in a large majority of cases, he remarks "the result is not lasting."—*The American Journal of Medical Sciences, July, 1891.*

*The Bombay Gazette*, 17th July, 1891, reports the opening of the New Leper Asylum at Sehore, Bhopal, towards which Her Highness the Begum of Bhopal has contributed munificently, and has promised an annual grant of 4500 Rs. for the expenses of maintenance. The building will accommodate about 160 lepers. In his address, Surgeon-Major Dane frankly said, "We do not expect to cure these unfortunate people, as, notwithstanding the praises which are repeatedly being bestowed on some vaunted 'certain cures' there is no doubt that a cure for leprosy has still to be discovered." This benevolent lady, the Begum of Bhopal, Nawab Shahjeham, has been persuaded to extend vaccinations in her province, upon which she spends 5000 rupees yearly, employing 35 vaccinators, who performed 38,000 vaccinations last year, thus unwittingly spreading the fell disease at the point of the lancet, and helping to fill the wards of the hospital which her benevolence has established.

Babu Prosurmo Coomar Sein, Gurbetta, India, in reply to questions from the Hawaiian Government, reports as follows :—" After taking charge of this dispensary, I have treated twenty lepers. To some of them this disease was hereditary, to some it was owing to the contagion, and to others it was the effect of using mercurial medicines."

Surgeon W. D. Stewart, Civil Surgeon of Cuttack,. says :—" There is a belief that excessive use of mercury tends to develop the disease, by causing a deteriorated state of the blood and tissues."

Babu Jago Mohoun Roy, Orissa, reports :—" In the generality of the cases, especially among the Hindus,. venereal diseases, and perhaps administrations of mercury for their cure, have, I believe, been the cause of leprosy.'—*Leprosy in Foreign Countries, Honolulu, 1886, pp. 33,37,39.*

Surgeon-Major Geoffry C. Hall, Allahabad, in a communication to the *Indian Medical Record*, says :—" Is there any cure for leprosy?"

I reply, No. Can leprosy be mitigated? I say decidedly, Yes. But the fact remains, 'once a leper, always a leper.'

With regard to the vexed question of contagion, I am of opinion that leprosy is inoculable. . . . There is the fact that leprosy sores do heal in a great many cases without any treatment whatever. . . . But these sores healing do not, as so many people imagine, mean that the leprosy is cured, but merely that a local manifestation has been cured; the leper remains a leper, and sores will certainly occur at some future period.

All the remedies seemed to be equally inefficient. Nerve remedies had, I presume, altered nerve tissue to deal with, therefore they could not act in their usual way. The much bepraised resorcin and ichthyol were as useless as all the others, and the conclusions I have come to are :—(1) Lepers should be well fed; (2) kept scrupulously clean; (3) have someunction to keep the skin soft; (4) have their sores treated on rational principles. Then their lives are made less burdensome to them, and they are comparatively happy. The remedies used were strychnine, phosphorus, arsenic, mercury, potassium iodide, chaulmoogra oil, resorcin and ichthyol, gurjun oil, neem oil, and strychnia, and sweet oil with chaulmoogra oil and gurjun oil internally. I made sketches of some of the patients I treated, with remarks made during the course of treatment. I treated in all fifty patients, with in no case any marked benefit as regards the cure of the disease."—*Calcutta Daily News*,. November 3, 1891.

In an article on "Leprosy in Kashmir," by Ernest F. Neve, M.D., F.R.C.S., Ed., I find that, "as treatment, iodoform, iodide of potassium, mercury, arsenic, quinine, phosphate of soda, and mudar root, have been tried internally; while balsam of Peru and gurjun oil have been rubbed on externally. Carbohc, acid and iodine has been used for wounds. Nerve stretching has been adopted for anaesthesia and trophic ulcers. None of these is a specific."—*Lancet*, 16th November, 1889, p. 1000.

The *British Medical Journal*, August 10, 1889, contains an article, entitled, "Clinical Notes on Leprosy," by James J. L. Donnet, M.D., Inspector-General of Hospitals and Fleets, Honorary-Surgeon to the Queen. Under the head of "Treatment" is the following (p. 304):—"In the treatment of this disease the hygienic, the dietetic, and the palliative had more influence than the therapeutic. Where the cleansing of the skin by baths could be effected; where soothing or stimulating applications were made to ulcerated surfaces and to skin, to delay the distressing symptom of prurigo; where good and abundant food was given, fresh air obtained, and exercise without fatigue, taken, with attention to full ventilation of inhabited rooms; where measures were adopted to afford recreation and gentle excitement, and thus divert the mind from the disease itself, a marked difference and a decided improvement, were the consequence. Under these influences the disease made little advance. But it is one that follows a determined course, rapid in some, more dilatory and seemingly stationary in others, but never retrogressing, always advancing."

"Where drugs are administered internally, I remarked that only those possessed of dietetic properties—as, for example, cod-liver oil—were of any value. Mercury, arsenic, iodide of potassium, assacil (obtained by incisions into the bark of the *hura braziliensis*), ammonia, and other preparations, each acted on the system, *modo suo*, but not in the measure or way hoped for."

Dr. Max Sandreczki, in an article entitled "A Study on Leprosy," in the *Lancet*, August 31, 1889, p. 424, says:—"As to the possibility of cure, one may say without fear of contradiction that among adults it is excluded." . . .

"The discovery of the bacillus has not hitherto advanced the curing of leprosy. Neither the transmissibility nor the mode of propagation has been demonstrated. Unfortunately, we are not permitted here to make dissections, and it is almost impossible to procure objects for the microscope. In conclusion, I would remark that if the bacilli cause leprosy, and propagate it from one person to another, how can we explain the long latent period—the repose of the bacillus for years? Is it not probable that the human body, more and more degenerated by years of misery and by every sort of hurtful influence, becomes the soil favourable for the development and culture of the bacillus?"

In a discussion at the Royal Medical and Chirurgical Society on the cure of leprosy, Mr. Macnamara, the author of "Leprosy a 'Communicable Disease,'" observed that "he had never seen a case which he could regard as being even relieved by treatment." — *The Lancet*, May 31, 1890.

Dr. Thin, under the head of "Treatment," p. 203 *etseq.*, observes that iodide of potassium has been experimented with by Danielssen on a large scale. It always produces a more or less violent eruption of nodules with feverish symptoms. Dr. Thin adds: "It affects patients both as a powerful poison and as a means of cure." After devoting several pages to recording experiments in drug medications by Dr. Unna, which must have caused much suffering to the hapless patients, Dr. Thin observes :—"Alas, that strenuous exertions directed with such intelligence and experience, should after all have turned out fruitless! The bacillus, however, remains apparently uninjured; and, although the treatment does not save the patient from his inevitable fate, Dr. Unna has done good service in making such an exhaustive experiment with strong drugs that had not been sufficiently tested previously."—*Leprosy*, by Dr. George Thin, 1891, p214.

Dr. Andres Navarro Torrens, Physician-in-Charge of the Provincial Hospital, Las Palmas, Canary Islands, writes to me, 1889:—" I have not up to this day seen any positive and evident cure by medicinal treatment."

A communication from the Superior Council of Health, Mexico, says :—" In the medicinal treatment there have been employed, successively and without result, mercurials, hydrocotila sciatica, guano, yodadurados, arsenic, sarsaparilla, and tarantula, as diaphoretic measures."

"The therapeutic as well as the dipterocarpic methods of treating the disease have been hitherto ineffectual."— *Leprosy in Foreign Countries, 1886, Honolulu, p. 186.*

Dr. K. Yamamoto, surgeon on board His Imperial Japanese Majesty's ship "Rinjio," in a communication to the *Honolulu Press*, June 19, 1883, describes leprosy as an incurable disease.

A communication to the Hawaiian Government from the Faculty, "Barcelona, Spain, in reply to an inquiry as to the results of medical treatment, says :—" A great number of medicines have been tried to combat this disease, but, in almost all cases, without result."—*Leprosy in Foreign Countries, Honolulu, 1886, p. 194.*

Dr. Kaurin, Medical Superintendent, Leper Asylum, Molde, Norway, says that "hitherto no specific remedy for leprosy has been found. At an early stage the disease may be cured by good 'diet and regimen; by careful nursing of the skin, baths, and symptomatic 'treatment."—*Journal of the Leprosy Investigation Committee, January, 1891.*

After much careful reading, and inquiring into alleged cures in various countries, including those of Dr. Beauperthuy, of Venezuela; the remarkable results, reported by Colonel Chrystie and Father Muller in the Indian journals, \*

\*The latest communication I have seen from Father Aug-Muller, St Joseph's Leper Asylum, Mangalore, S.C., where the Mattel treatment has been tried, appears in the *Calcutta Daily News*, October 30, 1891, and the writer only claims "amelioration in the health of the inmates," but no case of cure. This is no more than the natural result of hygiene without medicine at all.

of Count Mattei's treatment the cures officially reported by certain foreign medical experts in recent Government reports of Hawaii; Dr. Koch's tubercular inoculation; and the nerve stretching and ulcer perforation at the Mucurapo Asylum, Trinidad, I find no evidence to warrant the belief in their ability to cure this disease. In every case the alleged benefit is only transitory, the tubercles and abscesses reappearing, often with increased malignity.

#### TUBERCULIN IN LEPROSY.

Dr. P. Ferrari, in an article on "Koch's Tuberculin in Leprosy," says :—" Dr. Ferrari gives the conclusions of several observers who have experimented with the tuberculin in leprosy. Dr. Danielssen considers (1) that tuberculin in leprosy gives general and local reactions, the former generally coming on four to six hours after the first injection, but sometimes in twelve hours, and rarely in two to three days—the local reaction is more tardy; (2) that unfavourable consequences ensue to the patient, the disease being aggravated, and that the reactions have some similarity to those produced by the preparations of iodine in lepers; (3) that the lymph does not kill the bacilli, but seems instead to give them nutriment and favours their reproduction and circulation in the blood; (4) that when immunity to the remedy is established the disease is in no way arrested, nor the bacilli destroyed. Dr. Ferrari has himself come to the conclusion, from the consideration of the above cases and of those of other observers, that tuberculin exhibits no direct useful action on the leper. As in tuberculosis, it may act on the torpid condition of the tissue, not so much by any specific effect as on account of the small resistance of the diseased tissue. He remarks particularly on the outburst of new tubercles during the paroxysms of fever."—*Journal of the Leprosy Investigation Committee, No. 4, December, 1891, pp. 46-47.*

Dr. J. L. Bidekap, Physician to the Department for Skin Diseases, Rig's Hospital, and Lecturer on Dermatology at the University of Christiania, Norway, says, under the title of "Curative Treatment:"—" There has been searched in vain for remedies which have a direct favourable influence on the disease, or specifics. Mercurial preparations have, of course, been tried to a considerable extent. They have, however, but little or no influence on the disease, and often do harm. The reported few favourable results, or even recoveries, of the employment of these agents have possibly been due to accident, or in some cases to an erroneous diagnosis, the disease having been confounded with syphilis. The same is also the case with iodine preparations, which, according to the experience of Danielssen, are liable to evoke acute outbreaks, and on the whole are hardly advantageous, any more than bromine combinations. Antimonial preparations, and particularly tartar emetic, have, among others, been tried by Danielssen in increasing doses for long periods, but, it seems, without notable effect. Arsenic seems to have little or no influence, and this applies to most remedies of the same class. Of vegetable drugs there are a great many which have been vaunted as specifics at the places where the people understood to gather and to use them. In the European hospitals, however, these remedies have proved more or less inert. I have used salicylic acid for long periods of time; but, contrary to the experience of others, I have seen more harm than benefit from the use of it."

"Of therapeutic remedies it is mainly baths, tepid tub and steam baths, which seem to act favourably, and the general health of the patients often improves greatly by their methodic employment."—*Abstract of Lectures on Leprosy, 1886, pp. 65-67.*

In a Report on Leprosy in New South Wales, Mr. Edmund Sager, the Secretary to the Board of Health, Sydney, says :—" In adopting the system of segregating cases of leprosy, the Board has had before it the fact that the disease is, so far as at present known, incurable, and that its efforts must be directed to prevent its reproduction or spread."

The Report of the Inspector of Asylums, Cape of Good Hope, presented to both Houses of Parliament, 1891, referring to leprosy, p. 30, says :—" There is no reason to believe that specific treatment has in any case effected a cure. Gurjun oil, arsenic, potassium iodide, and ichthyol have been tried without any result beyond what would be expected of healthy surroundings and good diet."

In the Report of the Select Committee on the Spread of Leprosy, Cape of Good Hope, under the head of "Minutes of Evidence," July 1889, I find the following:--

Dr. W. H. Ross, Police Surgeon at Cape Town for twenty-two years, under examination—

Q. 323. "During your stay at Robben Island has it ever been seriously attempted to treat leprosy as a disease in the same way, as any other disease would be treated at a public hospital or asylum?"—"We endeavour to alleviate their sufferings, but very little can be done, except to treat symptoms and complications as they arise in this incurable and hopeless malady."

Dr. H. C. Wright testified—

Q. 21. "Leprosy is a disease for which as yet we have found no cure."

Q. 33. "Have you had any experience of the remedies tried for the cure of leprosy?"—"I do not know of any cure."

Q. 36. "You are, however, of opinion that leprosy is incurable?"—"I do not think that we have found any specific for it. I think all authorities are agreed as to that."

Dr. Beck testified—

Q. 176. "Leprosy cannot be cured, the disease must run its course, and the patient dies."

Dr. J. H. Cox testified—

Q. 227. "I believe that it (leprosy) is not curable."

The Report (page ix.) says :—"In the anaesthetic form of the disease there is not much actual physical pain, but in that as well as in the tubercular form the patient undergoes a gradual physical and often moral decay which renders him an object peculiarly deserving of the compassionate care of the State."—*Cape of Good Hope, Report of the Select Committee on the Spread of Leprosy, July, 1889.*

As to therapeutic means, Dr. Alexander Abercromby observes :—"The animal, the mineral, and the vegetable kingdoms may be said to have been ransacked. By some the chloride of mercury and the bichloride, in combination with sarsaparilla, have been highly extolled; whilst others, relying more upon antimony as a curative means, have given it as their opinion that mercury is positively injurious. In large doses all seem to agree that it aggravates the disease."—*Thesis on Tubercular Leprosy, p. 20.*

The same authority, writing April 20, 1892, from Cape Town, in a letter to myself, says :—"After more than thirty years experience as regards the treatment of the disease 'medicine makes no impression upon it even in the earlier stages.'"

In a Special Report on Leprosy from Robben Island for 1891, Dr. S. P. Impey, Medical Superintendent, says :—"A good deal is said and done when small-pox threatens our country, but how much more dreadful is leprosy than small-pox. Small-pox may kill hundreds in a few days, but all who suffer do not die. Leprosy is fatal in all cases, and all who once catch it, after lingering for a few years a life worse than death, shunned by all, they become outcasts, with no hope of cure before them, and die objects of abhorrence and pity."—*Reports presented to both Houses of Parliament by Command of His Excellency the Governor of the Cape of Good Hope, Cape Town.*

The *Lancet*, of April 16, 1892, has a leading article on the results of this mode of treatment of leprosy Referring to the experiments of Dr. Danielssen (of Norway), it says :—

"The injections were made daily, unless the reactions were severe, when an interval of several days was allowed. In some of the cases the treatment had to be stopped even when only small doses had been reached, because the eruptions in the tuberculated and in the anaesthetic cases became so intense that the disease was evidently aggravated." . . . Drs. Babes and Kalindero, of Bucharest, treated seven patients with inoculations of the same material. Upon these the *Lancet* observes: "Unfortunately the conclusion drawn was that tuberculin aggravated the disease considerably, and, by setting free the bacilli, started fresh *foci* of the disease, and made the whole process more active.

As in lupus and phthisis, the patients became tolerant of the tuberculin after a time; but the disease progressed all the same, and fresh symptoms were frequently excited, lesions became red and sensitive In the anaesthetic form the patches enlarged, became redder and more sensitive, and new patches appeared" Dr Colcott Fox's patient, treated by Mr Cheyne at King's College Hospital, seems to have fared no better. The Injections (of tuberculin) "were followed by severe pains in the ulnar nerves, and in the calves and knees, with a temperature of 103° F. After the fourth injection extreme dangerous collapse followed the reaction, the eruption more prominent and large blebs formed on both feet, and there were other unpleasant symptoms. . . a purely non-tuberculated case of long standing which was almost quiescent, obscure pains at intervals being the only symptoms left; the injections therefore had obviously excited a neuritis and revived the typical macular eruption which had faded away." . . . In one case (treated by Dr. Goldschmidt, of Madeira), "intense and prolonged reaction ensued, followed by blebs and new swellings of skin and mucous membrane, while on the lower limbs absorption of the leprosy infiltration was produced." . . ., "Mr. Cantlie, of Hong Kong, used it (tuberculin) in seven cases, and he also found bacilli in the blood after injection, there having been none there before." . . . "In Dr. Radcliffe Crocker's case a single injection of two milligrammes excited an attack of leprosy fever, which lasted three weeks. Scores of new tubercles came out all over the body, but under gurjun oil inunctions they all disappeared again, and there was a little less infiltration in some parts. The patient, a tuberculated leper, had previously improved considerably with large doses of chaulmoogra oil, and had had no febrile exacerbation for two years

prior to the injection. As an ultimate result he was not really any worse; but three weeks' fever was a long price to pay for a single injection, and he did not care to have it repeated."

"The above cases do not exhaust the list of experiments, but they are sufficient to show that tuberculin is very uncertain in its immediate effects on leprosy; that while in some it produces no reaction or effect at all, in others, even with small doses, considerable and prolonged reaction may ensue; and that therefore not more than one milligramme should be given at first, and cautiously increased according to the patient's toleration of the fluid. Secondly, that it revives the activity of cases which have been quiescent for a long time, producing neuritis, bringing fading rashes into prominence, exciting bullae, and setting free the bacilli; these may get into the circulation and produce fresh cutaneous and other lesions. In the ultimate effect, while some patients have shown improvement that has not been proved to be permanent, and in some was certainly only temporary, on the whole the position may be summed up by stating that, as far as the results hitherto obtained are concerned, the improvement which may result is too uncertain, too limited in character and time, and purchased at too great a risk of aggravation of the disease by the dissemination of new foci, for it to be recommended as a treatment for leprosy; and although some of Dr. Hunter's or similar modifications of tuberculin might lessen the immediate disagreeable effects, the fact of its action being to set free bacilli rather than to destroy them should make us seek in another direction for remedial agents for the relief of victims of this much-dreaded disease."

It is admitted that lepers suffer acutely from neuralgic pains, which Dr. Sidney Bourne Swift says "are common amongst lepers of all types;" and the wretchedness of their condition is intensified by the drastic treatment adopted at many of the hospitals and lazarettos. The application of Koch's tuberculin is often attended with excruciating pains.

Under the head of "Cantharidin Treatment in Leprosy," the *British Medical Journal*, September 5, 1891, says:—"The injections caused severe pain, but no local reaction; they were, however, always followed by a rise of temperature in the leprosy cases."

The writer, when visiting a leper hospital a short time ago, was witness of the fashionable inoculative experimental treatment. The poor creatures were brought into the surgery one after another, some brave and others with a timid, appealing look in their eyes. To enable them to bear the pain of the hypodermic syringe, thrust by the operating physician deep into the flesh, they had a handkerchief between the teeth while held by the hospital nurse or attendant. The puncture of the instrument is usually the least painful part of the experimental process. The treatment, which is often continued for months, produces sickness, acute headaches, and fever.

The rage for experimental research has long since passed the bounds of decent humanity, and many who have investigated the facts are of opinion that legislation ought to be specially invoked in the interest of these, the most hapless members of the human family. It is a common experience for lepers in hospitals to attribute the aggravation of their maladies to therapeutic treatment in the hospitals, and this is confirmed by high medical authority.

In the report on "Leprosy and Yaws in the West Indies," by Dr. Gavin Milroy, London, 1873 (c. 729), the author observes:—"It struck me forcibly, on observing the persistency of the anemic condition of so many patients at Kaow Island (the Leper Settlement of British Guiana), and still more of Dr. Beauperthuy's three private patients at Bartica, that this symptom was in part due to the prolonged use of a medicine, which is found to be notably injurious in like conditions of the system in European practice." From the foregoing testimonials (and others which I have not space to adduce), confirmed by my own observations and inquiries, it appears to be the general experience that leprosy attacks most readily those whose vitality is reduced by malarial fever, syphilis or insanitary conditions—i.e., unwholesome food, and impure water, and is most speedily fatal to those unfortunates at the hospitals who have been selected as subjects for inoculation experiments, mercurial treatment, and other drug medication. Whatever benefit patients have obtained is admitted, by the highest authorities in all the countries I have visited, to have been due solely to improved sanitary conditions and hygienic treatment. One thing is certain, the unfortunate patients dread the experimental treatment to which they are subjected by lepra experts, often escaping from lazarettos and secreting themselves in the gullies and fastnesses of the hilly regions and in the jungle to avoid the terrible ordeal to which they would probably be subjected.\*

\*Dr. George L. Fitch, formerly Medical Superintendent, Leper Settlement, Kalawao, Hawaii, says:—"On November 14, 1883, I inoculated six lepers with the virus of syphilis, by taking ivory vaccine points, and scraping off the surface of a mucous patch on the inner side of the lower lip of a native woman. The points were then allowed to dry, and three hours afterwards I transferred the virus to the arms of six leper girls under twelve years of age. December 14 following I repeated the experiment, taking the virus from a hard chancre on a Portuguese who came to my office. I saw this man in March, 1884, three months later, in the office of a brother physician, and found he was suffering from secondary syphilis. The last time I used fourteen points and inoculated fourteen lepers therefrom, but no result followed in any of the twenty experiments."—*New York Medical Record*, September 10, 1892, p. 297.

It is acknowledged that there is no specific for leprosy, nor is there any drug which has permanently ameliorated the condition of the patient. Where gurjun, chaulmoogra, or other oils have been used externally there is a temporary alleviation, probably due to the massage or friction employed, but the disease, when it once has taken hold of the system, is absolutely unamenable to therapeutic treatment. On the other hand, there appears to be a consensus of opinion that, in the majority of cases, the condition of the lepers may be improved, and life rendered more tolerable, by their removal to a salubrious locality, with wholesome food, cleanly and orderly habits, cheerful recreation and employment for body and mind, and that under these conditions the disease may in rare instances die out. The worst picture of concentrated and hopeless misery I have ever seen was in 1884 in the Lazaretto of Damascus, where all these essentials were wanting. In view of these experiences, which can be multiplied to any extent, and on the ground of humanity, is it not time to put a stop to the torture to which the incurable sick lepers are subjected by drug medication and inoculation, and let these miserable creatures be made as comfortable as tender nursing, varied occupations, and amusements will allow, and permit them to die in peace? Not a few of them are the victims of the Jennerian system, and these are the smallest compensations we can make for the

irreparable injury done to them.

Above all, we can cease to propagate this fell disease. We can discontinue the enforcement of a medical practice which experience has shown to be a potent factor in its dissemination. This is the most terrible count in the long indictment against vaccination; but, as I have shown, it is amply sustained by the testimony, often unwilling testimony, of unimpeachable witnesses of the highest credit and authority. It may perhaps be thought that what I have quoted is only *ex parte* evidence, that possibly an equal array of high authorities may be cited on the other side. This, however, is not the case. There is here no conflict of testimony, so far at least as inoculation is concerned, and vaccination is one and the chief means by which inoculation is effected. If there are authorities of equal weight to be thrown into the opposite scale, in my careful personal inquiries and patient investigation into the subject I have not discovered them.

### SUMMARY.

The results arrived at in this volume may be briefly summarised as follows :— (1) That leprosy has greatly increased during the last half century, and that it is prevalent in many places where it was formerly unknown.

(2.) That whilst the opinion of medical authorities and experts varies considerably on the subject of the contagiousness of leprosy, the preponderance of authority is in favour of the theory that it is not contagious in the ordinary sense of the term, but is communicable by means of a cut, sore, or abraded surface; and this view is confirmed by my own personal investigations.

(3.) That other alleged factors such as malaria, a fish diet, syphilitic cachexia, heredity, and insanitation are admittedly unequal to explain the rapid growth of the disease in certain of our crown colonies and dependencies, as well as in other countries.

(4.) That on one point there is much agreement and hardly any dissent, namely, the inoculability of leprosy; and that the view of leprosy as an inoculable disease, while it is most clear to those who take the malady to be due to a bacillus, is older than the bacteriological evidence, and is not dependent thereon.

(5) That the most frequent opportunities of inoculating the virus of leprosy are afforded in the practice of inoculating vaccine, which is the only inoculation that is habitual and imposed by law; and that the evidence here adduced is calculated to show that vaccination is a true cause of the diffusion of leprosy.

(6.) That the official information, collected by interrogatories and otherwise, has not been hitherto of a kind to show how far vaccination has determined the amount of leprosy in recent times; and that any interrogatories that may be sent out in future should not be limited to ascertaining the effects, as regards leprosy, of hypothetically "pure" lymph. When on very rare occasions interrogatories have been submitted, they have been framed to ascertain the results of a purely hypothetical system of vaccination which is not anywhere discoverable in practice, and alleged to be unattainable (*i.e.*, with pure lymph, and free from hereditary taints, and the replies are therefore futile and misleading.

(7.) That with the exception of two groups of cases— those adduced by Dr. Roger S. Chew, of Calcutta, and Dr. S. P. Impey, of Robben Island—those reported in this volume have not been the result of special investigation, but have cropped up accidentally in the course of medical practice, and in some instances have been published by practitioners with apologies to the profession for presenting such unwelcome disclosures.

(8.) That the increase of leprosy in the Sandwich Islands, the West Indies, the United States of Colombia, British Guiana, South Africa, and New Caledonia, has followed *pari passu* with the introduction and extension of vaccination, which in nearly all these places, without previous inquiry or demand from the inhabitants, has been made compulsory.

(9.) That as leprosy is a disease of slow incubation, often taking years to declare itself, and in its incipient stages can be detected only by practitioners of large experience, it follows that, in countries where leprosy exists, there is great danger of extending the disease by arm-to-arm vaccination.

(10) Leprosy being one of the most loathsome diseases to which the human race is subject, and being practically incurable, it behoves all interested in the public well-being to do their best to *prevent* its diffusion, and, as a means thereto, to discourage the practice of vaccination on that ground, if on no other.

### APPENDIX

THE following items relate only incidentally to the main object of this volume, but may be useful to the reader as illustrating the methods by which vaccination has been fostered and made obligatory in some of our possessions.

These appendices refer briefly to the mischievous consequences of vaccination, and demonstrate its failure from its inception either to mitigate or to prevent smallpox, with facts showing the growing opposition to this form of State medicine, and the necessity of substituting sanitary amelioration.

Some particulars are also furnished of a medical vaccination census carried out in the year 1883 by a committee of vaccine experts, with the object of reinstating in public favour a practice which had been discredited by numerous vaccination fatalities, and notably by the Misterton, Sudbury, and Norwich vaccine disasters. Particulars of the more recent disastrous results of vaccination will be found in the third report of the Royal Commission on Vaccination. London: Eyre & Spottiswoode, 1890 (c. 6192).

**VACCINATION FRAUDS.**

The following is taken from the "Life of Jenner," by Baron, a warm partisan of vaccination, published in 1827, vol. i., pp.

557-559 :— "On the introduction of vaccine inoculation into India, it was found that the practice was much opposed by the natives. In order to overcome their prejudices, the late Mr. Ellis, of Madras, who was well versed in Sanscrit literature, actually composed a short poem in that language on the subject of vaccination. This poem was inscribed on old paper, and said to have been *found*, that the impression of its antiquity might assist the effect intended to be produced on the minds of the Brahmins while tracing the preventive to their sacred cow. The late Dr. Anderson, of Madras, adopted the very same expedient in order to deceive the Hindoos into a belief that vaccination was an ancient practice of their own.

"Shortly after the introduction of vaccination into Bengal, similar attempts were made to prove that the practice was previously known there also. . . A native physician of Bareilly put into the hands of Mr. Gillman, who was surgeon at that station, some leaves purporting to contain an extract of a Sanscrit work on medicine. This work is said to be entitled Sud'ha Sangreha, written by a physician named Mahadeva, under the patronage of Raja Rájusin'ha. It contained a chapter on Masurica or Chicken-pock. Towards the close, the author appears to have introduced other topics; and immediately after directing leeches to be applied to relieve bad sores he proceeds thus: 'Taking the matter of pustules, which are naturally produced on the teats of cows, carefully preserve it, and, before the breaking out of small-pox, make with a fine instrument a small puncture (like that made by a gnat) in a child's limb, and introduce into the blood as much of that matter as is measured by a quarter of a ratti. Thus the wise physician renders the child secure from the eruption of the small-pox.' This communication was shown to Mr. Colebrooke and Mr. Blaquiere, both eminent Sanscrit scholars, and they both suspected that it was an interpolation. . . . . I believe I may further add that Mr. Colebrooke made inquiries whilst in India, which fully satisfied him that no original work of the kind ever had existence. Sir John Malcolm has also been kind enough to ascertain that no such book is to be found in the library of the East India Company. From these statements it must be apparent, that the wellmeant devices of those who attempted to propagate vaccination in India have led to the belief that the practice was known to the Hindoos in earlier times."

It may be added that Dr. Anderson, above referred to, is congratulated by Jenner's biographer on his "unceasing exertions at Fort St. George."

**COMPULSORY VACCINATION IN BOMBAY----THE DANGER OF TUBERCULOSIS.**

Notwithstanding the proofs laid before the Royal Commission on Vaccination regarding the futility of the practice as a prophylactic against small-pox, its injurious consequences in spreading inoculable diseases, and the cruelty and injustice attending its enforcement, there are not wanting those who are continually plotting to extend the system, by means of coercive legislation, amongst populations who are known to entertain a widespread repugnance to vaccination, but who are without representative institutions. At a meeting of the Bombay Legislative Council (reported in the *Times of India*, February 24, 1892) held for the purpose of hearing the second reading of the bill to prohibit the practice of inoculation, and to make vaccination compulsory in certain districts of the Bombay Presidency, the Honourable Mr. Javerilal U. Yajnick moved certain amendments to the law. In the course of his argument, in which he points out the danger of transmitting leprosy and syphilis by means of arm to arm vaccination, he quotes the opinion of "an able and experienced medical gentleman," Dr. Bahadurjee, who in reply to an inquiry writes :—

"In answer to your letter in which you ask me my personal opinion on the arm-to-arm vaccination method which is intended to be enforced by the new Vaccination Bill, I have no hesitation in saying that, besides its being not suited to the peculiar conditions which obtain in this country, on professional grounds the method is objectionable, and for these reasons :— 1. Arm-to-arm vaccination obviously acts as a channel for the transference of some skin diseases, and affords a ready means for propagating such inherited constitutional taints as those of syphilis and leprosy. No doubt, special rules, with full details, will be framed for the guidance of the operators in their selection of proper subjects, with a view to avoid these mishaps; but, having regard to the class of men from whom the supply of district vaccinators is to be obtained, the detailed rules will be of as much use to them as the paper on which they are printed. 2. Syphilitic taint does not necessarily show itself in ill-health at the early age at which vaccination is practised and demanded by law. A child may be in fair health, and yet have inherited syphilis. Moreover, syphilis does not stamp itself on the face and arms, so much as on the back and legs—parts not generally examined by the vaccinator, and thus apt to be overlooked. Only yesterday I was asked to see a case of skin disease in a child. On stripping the child bare, I found him fairly healthy to look at, and could see no skin blemish on his person. But closer examination of the hidden parts revealed the presence of unmistakable condylomata (syphilitic). These condylomata unnoticed, I should have passed the child as a very fair specimen of average health, and a fit subject to take the lymph from. Syphilis, as betrayed in obtrusive signs, is not difficult to recognise, but when concealed, as is more often the case, it is by no means easy to detect it. 3. In the case of leprosy it is still worse. There is no such thing as a leper child or infant. The leper heir does not put on its inherited exterior till youth is reached. And it is by no means possible by any close observation or examination of a child to say that it is free from the leprous taint. Surely arm-to-arm vaccination will not help to stamp out leprosy. On the contrary, it has been asserted, and not without good reasons, that it has favoured the propagation of the hideous disease. 4. It is acknowledged that extreme care is required in taking out lymph from the vesicles to avoid drawing any blood, for blood contains the germs of disease. Extreme care means great delicacy of manipulation, and delicacy of manipulation with children is not an easy task, and requires some experience and training. Is this to be expected from the class of men who are going to act as public vaccinators in the districts? Supposing a district vaccinator to acquire it to some extent after considerable practice, what about the delicacy of manipulation of one

newly put on? 5 Puncturing a vesicle with such delicacy as not to wound its floor and draw blood is one great difficulty. But the selection of a 'proper' vesicle is another as great if not a greater difficulty. Products of inflammation are charged with the germs of disease, the contagion or contamination media, as much as the blood itself is. And the contents of an inflamed vesicle are quite as contaminating as the blood itself of a subject who, though charged with the poison of (inherited) syphilis or leprosy, has none of the obtrusive signs of the taint for identification. And out here inflamed, *i.e.*, angry-looking vesicles are not the exception but the rule, as can be easily told by personal observation and experience, and equally easily surmised if the habits of our poor be duly considered. Thus, even if no blood be drawn, the danger of transferring constitutional taints by the arm-to-arm method is by no means small; remembering that leprosy which claims India, and not England, for one of its homes, does not admit of any detection on the person of a subject from whose arm lymph may be taken, and that syphilis is more often difficult to detect than otherwise, and remembering, also, that both these are often met with largely in some districts."

With regard to tuberculosis, the most deadly of all diseases in Europe, the following extracts from the translation of an article in the *Gazette Hebdomadaire des Sciences Medicales*, by Dr. Perron, *Officier de la Legion d'Honneur*, which appeared in the *Vaccination Inquirer and Health Review* of December, 1890, may arrest the attention of the reflective reader. Dr. Perron says

"The possibility of conveying tuberculosis to man in the act of vaccination was long ago pointed out. Tuberculosis has, in fact, a special predilection for the bovine race which yields us our vaccine. There are few of these animals that escape its attacks; the calf, the heifer sometimes bear traces of it but a few weeks after their birth. It would then appear quite natural to suppose that the vaccine, taken from a bovine animal and inoculated by the skin, might thus convey tuberculosis to the vaccinated subject. It is by no means so, however; for it is demonstrated that the inoculation of tuberculosis by way of the skin is extremely difficult in itself, and that there is not the slightest fear of doing so by way of the vaccinal punctures. The direct conveyance of the tuberculosis contagion in this manner need not, then, be taken into account. If vaccination renders man more prone to contract tuberculosis, it is, in our opinion, by a method altogether different.

"We hold that we must, in this case, arrange our facts in accordance with the new theories of which we have spoken above; that we must, that is to say, consider, with respect to vaccination and the possibility of a tuberculous contagion due to it, the part which can be played in the organism by nocivity, or receptivity, in relation to micro-organisms.

"The cow, as we have said, is the tuberculous animal *par excellence*. She is often the bearer of specific granulations, sometimes even along with the appearance of ordinary health. She is, therefore, a soil eminently favourable, and therefore very receptive, for the bacillus of Koch. But along with tuberculosis there is another acute malady specially attaching to bovines, for it possesses the property of arising spontaneously among them, namely, the vaccinal disease, which, as we all know, shows itself locally by the appearance, on the teats and on the udder, of pustules, whereof we avail ourselves for human vaccination. Thus, then, two acute diseases, tuberculosis and vaccinia, find always in the cow the soil most favourable for their evolution; and that clearly because the medium of cultivation is propitious both to the bacillus of Koch and to the micrococcus of vaccine.

"If, as announced by Professor Bouchard, the medium created by a vaccination can be destructive to one or several microbic species, we may add that, by the law of reciprocity, a medium of cultivation may at the same time be favourable to one or several microbes. That is exactly what happens with the cow in respect of tuberculosis and vaccinia, diseases between which the soil of cultivation establishes, as we see, a striking connection.

"This is the time to examine what happens when we inoculate a human subject with cow-vaccine. By that act we bring the human organism into a state of immunity, which is certainly bactericidal as against the microbe of variola; that is the benefit we seek, and which constitutes the vaccinal immunity. But here is the important point; at the very time when we have created in the man the vaccinal soil, we run the risk of having, *ipso facto*, established that humoral state (*terrain humoral*) which is favourable to the tuberculous genesis, that is, the medium of culture which is receptive for the bacillus of Koch.

"The first and the most grave result which follows from this interpretation is, then, that vaccination, besides the advantages which it offers us in our contest with variola, presents the danger of opening the way for the invasion of tubercle.

"If we now turn back and examine the events of the last century or so, we can show a constant increase of tuberculosis, a fact never hitherto satisfactorily explained. There was a time when this malady existed only as an exceptional thing; now, actually, in spite of the incessant progress in public and private hygiene, in spite of all the material improvements that have been made, it tends more and more to rise to the rank of a pestilence. It should be remarked that it strikes by preference at the young lives, that is, those who are, nevertheless, at the age when the physical resistance to morbid causes is the strongest. Now, a malady which originates in exhaustion, in vital poverty, should display its power in the inverse order, and should fall most heavily on the old. We are, then, compelled to believe that young folk offer, for some quite special reason, an exceptionally favourable soil for the implanting of Koch's bacillus.

"Side by side with this growing extension of tuberculosis, we see developing, *pan passu*, and in the same period of time, that is to say, since the beginning of the century, the practice of vaccination. We may ask ourselves whether in this double simultaneous evolution there is not a hidden oneness? If tuberculosis, in spite of all sanitary precautions, has multiplied its attacks during the last hundred years, it is, we submit, because vaccination has come to create for it a propitious soil. That would explain, not only its advancing growth in all civilised countries, but also its special influence over the young subjects who are always more or less recently vaccinated, and consequently more receptive than the others in the presence of the bacillus.

"In all European armies, vaccination is the order of the day. On their arrival with their corps, the young soldiers are forthwith carefully revaccinated. Now, the military statistics of all countries show an enormous proportion of various forms of tuberculosis among soldiers, especially during the first and second year after their enlistment. Divers causes have been invoked for the explanation of the facts. First, the moral decline produced amongst young soldiers by their separation from their families. That might have been possible formerly, but it is not probable in our day when facility of communications generally permits the young soldier to remain in touch with his native country. Besides, in the army afloat, which is less favoured in this respect, we find no more cases of phthisis than in the army ashore. Nor can a bad hygiene be any longer pleaded, nor an inferior dietary, for the European States take the greatest pains to secure for their soldiers the best of material conditions, and succeed in doing so to a very satisfactory extent. Nor can over-work be alleged, for in time of peace the routine of the service requires, save under very exceptional circumstances, just as much exercise as goes to make up a healthy amount of daily exercise. To sum up, the young soldiers find with their corps material conditions of life, which, for a very large number, are superior to those of their native surroundings. Their life in the great towns, though evidently having an injurious effect, cannot by itself explain the numerous cases of tuberculosis of which we are speaking, for the barracks are in general well situated and looked after in accordance with the rules of health. Whence then can come these attacks of tuberculosis, so sudden, so numerous, upon subjects that, but a few months before, the council of revision rightly declared to be fit for service. Tuberculosis of the lungs, of the organs, of the joints, of the bones, etc., all these fatal evils show themselves in the garrisons of all countries with a frequency before which one might well despair. We believe that we must simply seek the reason for these facts in the revaccination which awaits the recruits upon their arrival at their corps, and which transforms them forthwith into a medium which is receptive towards those germs of tubercle which swarm in centres of population. This revaccination immediately upon enlistment is all the more regrettable and inopportune since just at that moment the young man, separated from his-family, his country, his familiar conditions of life, undergoes, without any period of transition, total and radical changes in his manner of life, and thereby finds himself less well equipped for resistance."

Referring to the efforts made by the Indian health authorities to escape the dangers of inoculated diseases by the introduction of animal lymph, the *Calcutta Daily News* of 9th February, 1892, says :—" In trying to avoid the Scylla of leprosy, syphilis, and kindred evils, they fall into the Charybdis of tuberculosis and other equally fatal maladies. When doctors disagree, patients usually have the reverse of a comfortable time, and in the present situation the public may well look around in alarm, and cry to be saved from the dangers with which the whole subject of vaccination seems to be beset."

#### THE REVOLT AGAINST COMPULSORY VACCINATION IN INDIA.

The first triennial report of the working of the vaccination department in Bengal has been recently published, and the Commissioner says that the Acts in the rural districts are practically a dead letter; vaccination is rejected by all the higher class of Hindus—the Brahmins, Marwaries, Rajputs, and Burmahs—while, among the Mahomedans, the Ferazis display the utmost repugnance to the Jennerian rite. In nearly every village, reports the Commissioner, there are families who persistently refuse vaccination, and secrete their offspring to escape the vaccinators. The *Madras Mail* of July 2nd, 1890, says that vaccination is very unpopular with many classes; and the *Madras Times*, April 16th, 1891, reports that summonses were issued against fifty-two recalcitrants for nonvaccination. At Midnapur, Bengal, where the vaccinations formerly averaged three thousand annually, the number fell to nine hundred last year.

The *Allahabad Pioneer*, September 23rd, 1891, says:—

"The Civil Surgeon of Coconada, in his report on vaccination in that town, says that it is a common occurrence for parents to wash out the vaccine virus immediately after vaccination; and the vaccinators further assured him that the natives are in the habit of rubbing in chalk, chunam, or flour, with a view, if possible, of preventing the vesicles rising on their children's arms."

The *Times of India*, July 14th, 1892, says :—

"The prejudice against vaccination in Burmah seems to be growing to quite a remarkable extent. The report for 1891-92 shows that in Lower Burmah the number of cases was only 129,509, or 10,812 less than in the previous year. In one district alone, Henzada, there has been a fall in two years from 10,134 to 5180, while in the Toungoo district the figures have declined from 8905 to 3069. The Prome, Thongwa, and Thayetmyo districts are also among those which exhibit a considerable decrease, and in most cases no explanation of the decline seems to be forthcoming; while such explanations as are offered the officiating Chief Commissioner 'cannot regard with any satisfaction.' In Upper Burmah there was an increase of some 20,000 cases, but this seems mainly due to the extension of the Act. In Upper Chindwin there was a great and unexplained decrease, and five other districts also show a decline, while in some of these and a number of other districts the people put every possible obstacle in the way of vaccination. *At Katha, Mohayon, and Mobin so strong is the prejudice against arm-to-arm vaccination that the vaccinators appear to have, narrowly escaped violence at the hands of the villagers, who organised an open resistance to the system.*"

The *Civil and Military Gazette*, Lahore, August 8th, 1892, says :—"It appears that the natives of Lahore are opposed to compulsory vaccination. The inhabitants of several *mohallas* in the city have drawn up memorials to the local Government asking that the resolution of the Municipal Committee for the introduction of compulsory vaccination in Lahore be cancelled."

The *Allahabad Pioneer Mail*, 6th October, 1892, under the head of Vaccination in Bengal, says :—"There has been a falling off of nearly two hundred thousand, or about 11 per cent, in the number of vaccination operations performed during the past year in Bengal,

as compared with the record for 1890-91. The number of operators has meanwhile increased by nearly one hundred; and an analysis shows an average decrease of about 107 cases per operator."

And in a leading article the editor observes:---

"If anti-vaccinationists can be numbered in their thousands in England, it is small wonder that they can be numbered in their millions in India."

Those familiar with the social condition of India are aware that every effort has been made to remove this dread of the operation which exists more or less all over the country. New lancets and scarifiers have been introduced, and various viruses have been experimented with, one after another—cow, calf, sheep, goat, lamb, buffalo, and donkey lymph — the last, the discovery of Surgeon O'Hara, having been specially urged upon the attention of District Boards and municipalities by the Government. Surgeon-Major W. G. King writes to the Indian *Medical Record* that he is using *vesicle pulp* or "lanoline vaccine," which is applied by stretching the scarifications and "alternately dabbing and rubbing in the paste." Buffaloes, he observes, appear likely to yield very much more vesicle pulp than calves, but they exhale an "abominable odour," which renders the work of collecting the pulp most repulsive. The Commissioners state that only the lowest and most ignorant classes readily submit. The law enforcing vaccination in British India, which are unparalleled for their severity, were passed without the consent and against the wishes of the people, whose objection to vaccination arises from a knowledge often gained by sad and bitter experience. They know that the fearful spread of leprosy in India and other countries is coincident with and, as they believe, due to the extension of vaccination, and they prefer to face the severities of the law, with its ruinous judicial penalties, or even to risk the dangers of the jungle, where they are sometimes compelled to seek refuge for their little ones, to the risks of this hideous and destructive scourge. That leprosy, confessed to be incurable, is inoculated by vaccination (a fact once vehemently denied) is now reluctantly admitted by the leading dermatologists of all countries, and by the most experienced chiefs of the leper asylums and public health departments in the West Indies, in South America, South Africa, and in the Sandwich Islands

The *Madras Times*, May 18th, 1892, says :—

"Every effort is probably made to obtain pure and healthy lymph, but if the causation of leprosy has not yet been satisfactorily traced, no guarantee can be provided against the presence of the germs of the disease in the lymph used for purposes of vaccination."

### VACCINATION IN THE WEST INDIES.

#### BARBADOS.

There is no compulsory vaccination in this island. The editor of one of the leading journals writes, 2nd May, 1890, that the feeling in the island is so strong against vaccination, that the advocates of vaccination are afraid to move in the matter, and any attempt to enforce it would probably create a riot.

In conversation with all classes and conditions of men (from December to February, 1888-9), from the Chief Justice, Sir Conrad Reeves, to the poorest boatman or sugar plantation labourer, from one end of the island to the other, I failed to discover a single advocate of compulsion. "Let those have it who want it, but don't force it upon me and mine," was the general reply. The police and postmen also get along admirably without re-vaccination. Epidemics are considered less frequent than in other well vaccinated districts, notably Jamaica, Martinique, Guadaloupe, and Hayti.

The natives are, a proud, independent, and more intelligent coloured population than any I met with in the West Indies, and rather look down upon other islanders who are without political representation, and are subject to enforced vaccination. The population in April, 1891, was 182,206, or 1096 to the square mile—-one of the densest in the world.

#### GRENADA.

In marked contrast to the parental freedom enjoyed by the inhabitants of Barbados, with its popular constitution and representative government, is the position of Grenada. I copy the following from the *Grenada People*, June 9th, 1892,—concerning the oppressive legislation in one of the most beautiful islands in our West Indian possessions, administered as a Crown Colony :—"During this week, upwards of thirty or forty of the peasants have been hauled before the police magistrate of the Southern District for alleged violation of the Vaccination Act. In nearly every case fines of half-a-crown' have been imposed, representing almost half of the week's wages which these unfortunates, if they are employed, can hope to earn. In face of the Royal Commission on Vaccination, we do not see why the law making vaccination compulsory should be still enforced. At most, it is of doubtful benefit; and doctors differ as to the positive good or injury which it does. The advocates of Jenner's specific can quote very few cases, if any, in its support; whilst its opponents point with force and truth to the positive injury it has inflicted. Here, in Grenada, pure lymph is seldom employed. As a consequence, many of the children submitted to the process of vaccination contract therefrom fatal diseases. The lymph, in many cases, is collected from children inheriting a taint of the scrofulous disease which prevails amongst the peasantry; and many an otherwise healthy child, after the process of vaccination, presents the appearance of a disgustingly yawsey patient.<sup>1</sup> As eminent medical men differ as to the value and utility of vaccination, we think it ought not to be made an offence punishable by fine or imprisonment if parents refuse to vaccinate their children; but that the law should be amended in the direction suggested by the Royal Commission in their recent report, *i.e.*, it should be optional with the parent whether the child should be vaccinated or not."

**VACCINATION A FAILURE AND A DANGER TO HEALTH FROM ITS INCEPTION.**

Early in the century, when cases of injury were first charged to vaccination by either the suffering victims or their relatives, they were met by emphatic denials on the part of the supporters of Jenner. Proofs of the failures and mischievous results of vaccination, as shown by Dr. Creighton in his remarkable historical work, "Jenner and Vaccination," accumulated from all quarters, but still the vaccinators held on to their creed, Jenner having supplied them with a theory broad enough to meet any contingency. He says there were some varieties of spontaneous eruption, all of which produced sores on the milkers, but only one of these was the *true* cow-pox, all the others being spurious and exerting no specific protective power over the constitution.

On the 18th June, 1890, evidence was adduced by me before the Royal Commission concerning the early failures of vaccinators and the mischievous effects of vaccination (See Third Report of the Royal Commission on Vaccination, pp. 150-151.) In the year 1806 the College of Surgeons instituted an inquiry into the results of vaccination. The results of this inquiry have been overlooked by all the advocates of compulsory vaccination, and notably omitted from Sir John Simon's remarkable "Papers relating to the History and Practice of Vaccination, presented to both Houses of Parliament," London, 1857. (The report of the Royal College of Physicians, which was favourable to vaccination, was included by Sir John Simon in these "Papers." The corresponding report of the College of Surgeons, which appeared in the same publication, but was adverse to vaccination, was ignored — an important historical omission.)

This report states that on the 15th December, 1806, a circular was drafted and referred to the Board of Curators, and, having received their approval, was despatched to 1100 members of the College in the United Kingdom, submitting the following questions

"1st. How many persons have you vaccinated?"

"2nd. Have any of your patients had small-pox after vaccination?"

"3rd. Have any bad effects occurred in your experience in consequence of vaccination? and, if so, what were they?"

"4th. Is the practice of vaccination increasing or decreasing in your neighbourhood? if increasing, to what cause do you impute it?"

To the 1100 circulars only 426 replies were received. Why nearly two-thirds of the members kept silent, when at the outset they were converted in multitude to vaccination, was left unexplained. The replies were thus summarised by the Board on, 17th March, 1807—  
"The number of persons stated in such letters to have been vaccinated is 164,381.

"The number of cases in which small-pox had followed vaccination is 56.

"The Board think it proper to remark under this head that, in the enumeration of cases in which small-pox has succeeded vaccination, they have included none but those in which the subject was vaccinated by the surgeon reporting the facts.

"The bad consequences which have arisen from vaccination are— 66 cases of eruption of the skin,  
24 of inflammation of the arm, whereof  
3 proved fatal."

A copy of the original report containing these remarkable admissions was produced by me before the Royal Commission and examined by the president and each member of the Commission then present.

I have before me a copy of Volume VIII. of the *Medical Observer*, an ably conducted Metropolitan journal published in 1810 (produced also before the Royal Vaccination Commission), and on pp. 183 to 197 I find recorded (with chapter and verse for reference to the authorities) the particulars of 535 cases of persons having small-pox after vaccination; also similar details of 97 fatal cases of small-pox after vaccination and of 150 cases of injury, together with the addresses of ten medical men, including two professors of anatomy, who had suffered in their own families from vaccination.

Concerning these remarkable evidences a leading physician, Dr. Maclean, observes :—

"Although numerous, they are nothing to what might be produced. It will be thought incumbent on the vaccinators to come forward and dispute the numerous facts decisive against vaccination here stated on unimpeachable authorities, or make the *amende honorable* by a manly recantation. But experience forbids us to expect any such fair and magnanimous proceeding, and we may be assured that under no circumstances will they abandon so lucrative a practice until the practice abandons them."

We commend these prophetic words, uttered years ago, to those who look for the impartial treatment of this question at the hands of professional propagandists at the present day.

**VACCINATION FAILURES IN 1817.**

"However painful the duty, we feel ourselves called upon to notice the numerous and accumulating failures of cow-pox in preventing small-pox, whether in the natural way or by inoculation. Our communications on the subject have been numerous, and some of the cases do not appear to have been modified by the previous disease. It is not easy to account for these distressing occurrences, but were we to hazard a conjecture, we would venture to suggest that it is possible the virus may have become so modified by being confined altogether to the human subject that its powers of producing the necessary affection of the constitution, which only can be regarded as the test of security, may be so nearly worn out as to be no longer a certain preventive. Hence the necessity of frequently renewing the efficacy of vaccination by procuring the virus directly from its original source.

"Variola continues and spreads a devastating contagion. However painful, yet it is a duty we owe to the public and the profession to apprise them that the number of all ranks suffering under small-pox, who have previously undergone vaccination by the most skilful practitioners, is at present alarmingly great." -*London Medical Repository*, pp 57 and 95. Edited by George Burrows, M.D., F.L.S., etc., etc., and Anthony Todd Thompson, F.L.S., M.R.C.S., etc. -

### ARM-TO-ARM *versus* CALF-LYMPH VACCINATION.

As the relative merits and demerits of animal and arm-to-arm vaccination are being discussed in the Indian press, I would here call attention to a few facts which appear to have escaped the attention of those who are urging the adoption of new compulsory laws in various districts. It is generally admitted that there is a growing discontent with vaccination in all quarters. In England household censuses have been made in nearly one hundred towns and districts, with the result that eighty-seven per cent. of the signatories are opposed to compulsory vaccination and sixty-eight per cent. certify that they do not believe in vaccination at all. In about ninety towns and poor-law unions the acts are a dead letter; and, owing to the sinister results of the practice, in many of our Colonies the authorities have ceased prosecuting vaccine recusants. In India, Sir John Gorst (*Times*, 17th July, 1891) informed Parliament that compulsory vaccination exists in four districts in Bengal and in 183 municipal cities and towns in different provinces. But the results cannot be considered encouraging even by the most ardent vaccine optimist. The Blue-Books of "Sanitary Measures in India" state the total vaccinations during the years 1886-89 inclusive as follows

1886-87,	5,265,024
1887-88,	5,552,710
1888-89,	6,099,733
1889-90,	6,161,407

The statistical abstract relating to British India gives the smallpox mortality during the same period, viz. :—

1886,	51,112
1887,	65,757
1888,	138,509
1889,	125,453

This increase of small-pox, co-incident with the rapid extension of vaccination, shows that it is a disease governed by causes entirely outside and independent of vaccination. And this opinion is confirmed by the highest authorities. Thus, in a memorandum of the "Army Sanitary Commission," published in the *Bombay Government Gazette*, Dec. 17th, 1885, the Commissioners say

"The first disease in the list—namely, small-pox, which yielded an increase of 1369 deaths, or nearly sixteen-fold that of the previous year's death-rate—had assumed an epidemic state in nearly all the districts of the city; yet Bombay has an effective vaccination service, with the use of calf-lymph." In vol. xviii. of "Sanitary Measures in India," page 203, in reference to the smallpox epidemic of 1884, it is stated :—" We are thus brought face to face with the fact that, notwithstanding the existence of an active vaccination service, small-pox swept over the provinces just as if there had been none." In the same volume, referring to Madras, the Commissioners -say:—" No less than seventy-four per cent. of the small-pox deaths in Madras town occurred among children under three years of age." In Punjab, "the Compulsory Act was in force in the Amritsar municipality, but here the deaths from small-pox were far more numerous than in any other town of the province." In vol. xix., page 113, is the following candid admission :—" Ten years' statistics afford no evidence that vaccination affects the usual epidemic course of the disease, and hence-this fact, in the face of the extensive vaccination work of the present and past years, appears to lead to the conclusion that in its epidemic form small-pox must be met by improving the sanitary condition of the people."

On page 10 of the Report on the Annual Returns of the Civil Hospitals and Dispensaries in Madras for 1888, under the head of Canara, South, I find that while vaccination is making satisfactory progress, the number of vaccinations having increased by 8053 cases, yet "small-pox was more prevalent than usual in the district, and was epidemic in the town of Mangalore." On pp. 9 and 10, under the head of Arcot, North, it is stated that small-pox was prevalent, and that vaccination "was performed in a careless and perfunctory manner." This careless performance of the Jennerian rite is the rule in our Crown Colonies where leprosy is prevalent, as I have found by personal investigation.

According to Sir Edwin Chadwick, Dr. B. W. Richardson, and all other sanitarians of repute, small-pox is a disease due to insanitary conditions, impure water, bad drainage, dirty living, and particularly to overcrowding; and, instead of removing these conditions, the Governments of India during the past thirty years have been spending their energies, and large sums of money, in extending vaccination. Now that the arm-to-arm system has been thoroughly discredited and shown to be futile as a preventive of small-pox and fertile as a disseminator of eczema, syphilis, and leprosy, the cry of the official vaccinator is not the sensible one of "do away with vaccination," but, let us change front and resort to the calf, sheep, buffalo, donkey, or to lanoline lymph—or anything, rather than confess that the Jennerian system is a humiliating failure. It is well known that animal lymph has been a fruitful cause of the spread of disease in Europe. On June 17, 1885, an official re-vaccination with "re-generated" lymph at the Island of Rügen, North Germany, caused an infection of a loathsome eruptive skin disease (*Impetigo Contagiosa*) of 320 children and adults. The details of this sinister affair, from Dr. Koehler, of the Imperial Medical Department, are in my possession, and have been brought before the Royal Commission on Vaccination now sitting. This disaster was due to the use of virus obtained from the Government calf-lymph

establishment, Stettin. In December, 1891, when in Launceston, Tasmania, I learnt that from 200 to 300 children and adults had been afflicted with ulcerative swellings and acute *septicæmia*, caused through animal vaccination in 1887, and that the law in that colony had been suspended. Animal vaccination has no claim to public attention by reason either of its safety or of its novelty. Mr. Farn, the Government Inspector of vaccine lymph, has declared before the Royal Vaccination Commission that he cannot tell by microscopic examination whether lymph is pure or not; and Dr. Robert Cory says that the admixture of lymph with blood, which occurs in the majority of-cases, does not prevent its being used.

Perhaps the most remarkable official pronouncement on this-subject ever made in England is that of the late President of the Local Government Board, during the debate in Parliament on Supply, July 22nd, 1887, at which the writer was present. The object of the declaration was to allay public anxiety as to the safety of the lymph supplied by the Government. Mr. Ritchie, in the course of his speech, said :—" The honourable member for East Donegal (Mr. Arthur O'Connor) said something about lymph. He said, I think, that it was the virus of modified small-pox. I cannot agree with the honourable member in his definition as to that point. I am informed that no lymph which is used for vaccination of any kind has ever, within the memory of man, passed through the human body. Dr. Jenner's first lymph was derived from an animal source; and the lymph which is now sent out is calf-lymph. None of the lymph, I say—at all events in historic times—has passed through the human body; therefore I cannot think that the honourable gentleman is in any way justified in calling the lymph modified small-pox."

Mr. Arthur O'Connor :—" What is it, then?"

Mr. Ritchie :—" I am afraid I am not qualified to give the honourable gentleman a medical opinion of what lymph is. I have told him whence it is derived, and he will see there is no ground for calling it modified small-pox."—*Hansard's Debates, 3rd Series, vol. 317, p. 1803. July 22nd, 1887.*

The chief of the Public Health Department was clearly not aware that until a comparatively recent period arm-to-arm vaccination was practically the *only method in vogue*; and at the time Mr. Ritchie's declaration was made, to the effect that none of the lymph in use had passed through the human body, at least three-fourths of the lymph in use in the United Kingdom was the variety known as arm-to-arm vaccination virus.

#### **DR. R. H. BAKEWELL ON THE RISKS OF VACCINATION.**

In a paper read before the Auckland (New Zealand) Institute, 20th July, 1891, and printed in vol. xxix. of the "Transactions of the New Zealand Institute," Dr. R. Hall Bakewell, formerly Vaccinator-General and Medical Officer of Health for the Colony of Trinidad; author of the "Pathology and Treatment of Smallpox;" Fellow of the Royal Medical and Chirurgical Society of London, etc., says :—" The permanent change in the blood is quite another matter. I commenced, but have never completed, some microscopical investigations into the conditions of the infant's blood before, during, and after vaccination. It is evident that a fertile field for inquiry is open here; and without a series of well-conducted examinations, extending over children of different races, and in different climates, no positive conclusions could be arrived at. But of one thing we are quite certain, as it does not need the aid of a microscope; there is a large destruction of the red corpuscles during the febrile stage of vaccinia, followed by an anaemic condition. How long this anaemic condition lasts we have no trustworthy observations to tell us; and how far it extends—that is, what is the actual loss of red corpuscles—is, as far as I know, in the same state of uncertainty. Of course, we often find parents complaining that children who were perfectly healthy before vaccination have lost colour, strength, and flesh after it, and have never recovered their previous good health. But these complaints, tinged as they evidently are by a strong prejudice against compulsory vaccination, must be received with caution. Still, there is such a mass of evidence of this kind that it ought to be allowed some weight.

So much for the inevitable results of vaccination. The accidents of vaccination may be roughly classified under the following heads:--

1. Inflammatory: including erysipelas and other septicaemic diseases; glandular swellings; phagedaena, sloughing, or mortification at the points vaccinated.
2. Eruptive diseases, mostly of a pustular character, occurring with or immediately after the vaccine eruption; eczema, herpetic eruptions, ecthyma, and impetigo.
3. The inoculation of constitutional diseases—syphilis, leprosy, tubercle.

Now, as regards the inflammatory diseases, there are some vaccinators of large experience who assert that they have never seen any ill-results of this kind arising from vaccination. Well, some people are very lucky, but they have no right to argue from their limited experience that such accidents never occur. I have been very fortunate in my midwifery cases; I have never lost a case in my own practice for thirty-five years; but for all that I do not deny that women die in childbirth. I have seen erysipelas more than once or twice, or a dozen times. In the West Indies it used to be common. The inflammation that followed the vaccination of coloured children was very intense, and the number of insects attacking the unfortunate children no doubt contributed to carry the germs of erysipelas to them. Glandular swellings, particularly in scrofulous children, are not rare. I had myself a case in which each vaccine vesicle was followed by mortification of the skin beneath it, and a phagedaenic ulceration which required very vigorous measures to stop it. This was in a young woman during the epidemic period in Trinidad. I am not sure whether it was a primary vaccination or a re-vaccination. The latter, as is well known, causes very severe inflammation, pain, glandular irritation, and erysipelas in the majority of adults, besides severe and most oppressive febrile disturbance; at least, this is the case at the time of epidemics, when re-vaccination is most

practised.

*Post vaccinal eruptions* are so very common amongst the children of the poorer classes in England that they form one of the stock arguments against vaccination.

*The inoculation of constitutional diseases* used to be laughed to scorn in my younger days. It was said in my hearing by Sir John Simon, K.C.B., then Mr. Simon, the Medical Officer of the Privy Council, that no such inoculation could take place without gross carelessness or unskilfulness on the part of the vaccinator. I used to be of the same opinion ; but a case I saw some sixteen or seventeen years ago convinced me that an infant might look perfectly healthy, and yet be the subject of unmistakable hereditary syphilis. The evidence that syphilis has been communicated by vaccination is simply overwhelming. I may refer to the report of the Committee of the House of Commons on compulsory vaccination; the third report of the Royal Commission on vaccination now sitting in London; the work of Mr. Jonathan Hutchinson, F.R.S., late President of the Royal College of Surgeons of England, on syphilis, in which he devotes a chapter to the description of vaccinal syphilis; and my own experience in this colony and elsewhere. I have seen three cases in this colony alone.

"On my return to Trinidad I had to encounter an epidemic of small-pox which spurred us on to vaccinate right and left, and to revaccinate all who would submit to the operation. But so firmly fixed was the belief of the people that vaccination from a child of a leprous family would be a possible cause of the vaccinated persons becoming leprous, that not even the fear of such a terrible epidemic of small-pox as was then going on would induce them to allow themselves or their children to be vaccinated from any vaccifer in whose family any member was a leper. And then, to my astonishment and dismay, I found that there was hardly a Creole family in the island—white, coloured, or black—free from the taint of leprosy."

#### SIR JAMES PAGET ON SURGICAL PATHOLOGY.

"After the vaccine and other infectious or inoculable diseases, it is, most probably, not the tissues alone, but the blood as much as or more than they, in which the altered state is maintained; and in many cases it would seem that, whatever materials are added to the blood, the stamp once impressed by one of these specific diseases is retained; the blood, by its own formative power, exactly assimilating to itself, its altered self, the materials derived from the food.

"And this, surely, must be the explanation of many of the most inveterate diseases; that they persist because of the assimilative formation of the blood. Syphilis, lepra, eczema, gout, and many more, seem thus to be perpetuated: in some form or other and in varying quantity, whether it manifests itself externally or not, the material they depend on is still in the blood; because the blood constantly makes it afresh out of the materials that are added to it, let those materials be almost what they may. The tissues affected may (and often do) in these cases recover; they may have gained their right or perfect composition; but the blood, by assimilation, still retains its taint, though it may have in it not one of the particles on which the taint first passed; and hence, after many years of seeming health, the disease may break out again from the blood, and affect a part which was never before diseased."—*Lectures on Surgical Pathology, 4th ed., pg. 39. 1876.*

#### DR. M. D. MAKUNA'S MEDICAL VACCINATION CENSUS.

Prior to the appointment of the Royal Commission on Vaccination in 1889, the latest professional examination of the vaccination question was in the form of a medical inquiry, initiated by Dr. Montague Makuna, late superintendent of the Fulham Small-pox Hospital. Its object was to remove, if possible, the widespread feeling of mistrust prevalent, in various parts of the United Kingdom, as to the benefits and safety of vaccination, which had been discredited in public estimation by reason of the failures and mischiefs of the operation, with details of which the press was flooded. The inquiry was made by a committee of thirty medical gentlemen, most of whom were vaccine specialists. The meetings were held in the Council Chamber of Exeter Hall, London, under the presidency of Dr. C. R. Drysdale, senior physician of the Metropolitan Free Hospital, a gentleman who has devoted much time to this important question. Dr. Drysdale promised the Committee to read a paper on the results of the inquiry. The proceedings were reported in the *Midland Medical Miscellany* and in the *Medical Press and Circular*. A circular letter, with copy of the report of the first meeting of the Committee, was sent to members of both Houses of Parliament.

At the first meeting of the Committee, held on 15th February, 1883, Dr. Makuna, in explaining the objects of the proposed inquiry, referred to the opposition to vaccination; an opposition which has become intensified since vaccination has been made compulsory. A medical inquiry was, therefore, considered indispensable, and it was anticipated that the evidence disclosed in favour of vaccination would be so unanimous and conclusive, as to effectually restore public confidence in the practice, and to put an end to all opposition. The chairman, Dr. Drysdale, said he considered the proposed inquiry would be of great value to the profession and to the public, and expressed a desire that the Local Government Board and other authorities should be requested to co-operate.

The attention of the Local Government Board, the British Medical Association, the Epidemiological Society, the Medical Officers of Health, the Royal College of Physicians, as well as ambassadors, consuls, etc., was specially called to the inquiry, and they were requested to contribute facts and information from all parts of the world.

A circular was drawn up and approved by the Council, and sent to 4000 medical practitioners, a considerable portion of whom were public vaccinators, medical officers of health, and vaccine specialists. The circular elicited 384 answers, and the results were published in a pamphlet entitled "Transactions of the Vaccination Inquiry."

An analysis of the answers (made by Mr. Thomas Baker, Barrister-at-Law) shows that the seven questions submitted have been answered by 384 medical men, of whom 102 are public vaccinators, vaccine specialists, medical officers of health, or officials.

The following is the third, and one of the most important, submitted to this medical inquisition, viz. :— *What diseases have you in your experience known to be conveyed or occasioned or intensified by vaccination* . To this question 13 give no answer, and 139 answer "None,"\*

\* No. 17 says: "Two deaths from erysipelas occurred after vaccination in my practice, both commencing on the ninth day." Therefore, that so many answer, "None," may be accounted for by the fact that public vaccinators commonly do not see the vaccinated child after the eighth day.

but many qualify this reply by the words, "in my own practice," "direct," "not serious," "personal," etc. On the other hand, the list of mischiefs (many fatal) includes the following, as recorded by 232 medical witnesses. (This enumeration has been checked by the Rev. Isaac Doxsey, F.S.S., and Mr. J. H. Lynn :—)

	Witnesses		Witnesses.
Abdominal phthisis	1	Boils	8
Abscesses	11	Bronchitis	1
Angeioleucitis	2	Bullae	1
Arm disease needing amputation	1	Cancer	1
Axillary Bubo	1	Cellulitis	5
Axillary gland, enlargement of	1	Convulsions	4
Blindness	1	Diarrhoea	4
Blood poisoning (fatal)	1	"Died"	1
Diseased Bones	1	Phagedsenic action	1
Diseased Joints	1	Phlegmon	2
Dyscrasia	1	Pityriasis	1
Ecthyma	1	Pneumonia	1
Eczema	60	Prurigo	3
Eruptions	5	Psoriasis	1
Erysipelas	120	Pynmia	7
Erythema	22	Pyrexia	1
Gangrenosa	3	Rickets	1
General Debility	1	Scald head	1
Herpes	3	Scarlatina	3
Impetigo	7	Scrofula	9
Inflammation	10	Septicimea	1
Latent diseases developed	2	Skin disease	21
Lichen	2	Struma intensified	4
Marasmus	1	Syphilis	43
Meningitis	2	Tuberculosis	1

Mesenteric disease	1	Ulceration	6
OEdema	2	Varioloid	1
Paralysis	1		

The following *qualified* admissions are also made, viz.

Eczema	4	Nettle rash	1
Esypelas	6	Syphilis	10

On the 19th of April, 1886, the results of this medical census were laid before the Right Hon. James Stansfeld, then President of the Local Government Board, and in May a copy of the analysis was sent to him at his request. And on the 25th June, and on the 2nd July, 1890, I called the attention of the Royal Commission on Vaccination to this important inquiry, and presented an analysis of the results for its consideration. The facts ought, in the interest of the public safety, to be widely disseminated through the press, and made known to magistrates, boards of guardians, and others concerned with the enforcement of the Vaccination Acts.

It has, I think, been clearly proved on the evidence of medical specialists, that to the long catalogue of diseases conveyed at the point of the lancet in vaccination must now be added that of leprosy. This terrible indictment has been denied again and again by those who have not taken the trouble to investigate the facts for themselves, and have shut their eyes to the facts revealed by others. Is it reasonable to suppose that negative statements, however confidently made, can destroy the positive testimony of careful investigators such as Dr. John D. Hillis, Professor W. T. Gairdner, Dr. Edward Arning, and Dr. S. P. Impey? The fact that syphilis is communicable by vaccination was emphatically repudiated by a President of the Local Government Board not long ago, and the terrible Algiers vaccine disaster in 1880 was officially proclaimed an impossible occurrence. The fact that leprosy may be communicated by vaccination is now reluctantly admitted even by those who are most anxious to clear the rite from this reproach. In concluding a defence of vaccination from the charge referred to in No. 4 of the *Journal of The Leprosy investigation Committee*, Dr. Beaven Rake says: "It is evident that the risk of transmission of leprosy by vaccination is so small that, for all practical purposes, it may be disregarded." Dr. P. Abraham says: "The possibility of an occasional accidental inoculation of the disease by vaccination might be admitted;" and Dr. C. F. Castor, in a paper defending vaccination from this stigma, observes: "The opinion expressed that vaccination from a tainted source will produce the disease (leprosy) is, I believe, a true one."

### MEDICAL DENIALS AND ADMISSIONS.

The four numbers of the *Journal* issued by the Leprosy Investigation Committee contain a large amount of testimony from authorities in every part of the globe. A conspicuous feature, and one which has been commented upon in the press, is the confusion and contradiction of medical opinion, and this confusion is not restricted to theorists who have never visited countries where leprosy prevails, but is exhibited amongst superintendents of leper hospitals, well-known dermatologists, and eminent general practitioners. Most of the theorists are able to cite facts in support of their several beliefs, and maintain their conflicting opinions with equal confidence. Some of the most prominent of these views have been dealt with, but it would be beside the scope of this work to refer to them all. Beyond the general admission of the alarming increase of the disease, there is but one point upon which there is any approach to a consensus of opinion, and that is, that leprosy is a disease communicable by inoculation. Conversing with directors of leper institutions, experienced practitioners, and careful observers in countries where leprosy prevails, whatever their particular theories about it, I have found no one who denies that it is inoculable. In some instances, when pressing the logical issue of these answers I have said, "Then the disease is also communicable by vaccination," this has often been admitted, though sometimes with hesitation and reserve, and generally accompanied with the proviso that leprosy cannot be invaccinated if pure lymph only is employed and the operation be skilfully performed. Even if this were true, how pure lymph can be selected in tropical countries where the disease is generally of slow incubation, and does not manifest itself for years, and where the vaccinifer is never properly examined, is a mystery not explained. Moreover, while the State can enforce vaccination, it cannot compel the use of healthy vaccinifers, nor enforce careful operation. In nearly all leprosy countries arm-to-arm vaccination still furnishes the chief sources of supply. The perennial cry of public vaccinators is that the lymph is "unsatisfactory." Animal lymph is often attended with excessive inflammation, and the practitioner is obliged to dilute it with glycerine, lanoline, and other substances, and its use is much more expensive. Moreover, a good deal of the so-called animal lymph in vogue is really only arm-to-arm vaccine, inoculated into calves, buffaloes, sheep, and donkeys, and partakes of the diseases both of man and of animals. Of the many cases of ulcerative and of fatal vaccination which have come under my notice during the past twenty years not a few have been due to the use of carefully-selected animal vaccine.

Dr. Robert Cory, Medical Director of the Government Calf Lymph Establishment, London, testified before the Royal Commission, November 17, 1889 (Q. 4390), that out of 32,000 cases there were 260 returned with sore arms, and 38 with eruptions. Then there were 16 cases of erysipelas, and nine of axillary abscesses, and (Q. 4392) eight deaths were reported to the Station of children who had

been vaccinated with animal lymph. The same witness testified (Q. 4369) that lymph taken from the cow leads to greater inflammation, and has a greater tendency to produce ulceration, than lymph which has been humanised.

### HOW LEICESTER DEALS WITH VARIOLOUS OUTBREAKS.

The success of what is known as the "Leicester Experiment" has created considerable public interest both at home and abroad, and, in response to repeated inquiries, I am able to furnish the following particulars from the pen of Mr. Councillor Biggs, of Leicester. Mr. Biggs was for several years a member of the Board of Guardians, and is now a member of both the Sanitary and SmallPox Hospital Committees. He has had much to do with the substitution of sanitary amelioration and isolation for the now discarded system (so far as Leicester is concerned) of vaccination.

Our procedure in the notification of a case of small-pox may (he says) be described in the words of our Chief Sanitary Inspector, Mr. F. Braley :—"When a case is reported, I at once go to the infected house, and try to ascertain where the disease was contracted, where the patient has been working, where he has been visiting, and his movements generally for the last ten or twelve days. I also make a point of seeing all persons who have visited the infected house during the time stated; in addition, I visit all factories and workshops where other members of the family have been employed; and by this-means have been able to get cases removed when the first symptoms of the disease appeared.

"Immediately on the removal of the patient, I superintend the fumigation of the house with sulphur; liquid disinfectants are used freely in the drains and about the yard, and the ashpit is emptied and disinfected; the next day the bedding is taken to the disinfecting chamber and subjected to the hot-air process.

"Up to the present time I have succeeded in getting almost every person connected with the infected houses into quarantine. In a very few cases I have experienced opposition.

"The above represents practically all we do of a special character beyond the ordinary treatment in cases of supposed infection. Those who are prevailed upon to go into quarantine usually remain for fourteen days, the period within which small-pox is supposed to incubate after infection. So far from the authorities having to resort to harsh measures to enforce quarantine, this period of rest is made to be of so pleasant and agreeable a character that, at its expiration, many have been reluctant to leave the hospital.

### VACCINATION OPTIONAL.

"This fact disposes of an accusation which is constantly being hurled at Leicester, namely, that we not only forcibly seize those who have been in contact with small-pox cases, and compulsorily detain them in quarantine, but that, whilst they are there, we compel them to submit to vaccination or re-vaccination.

"Let us examine as to how far this favourite theory of our opponents has any foundation in fact.

"Of fifty-five persons who voluntarily went into quarantine during the three years a 1886-88, only twelve were vaccinated or re-vaccinated whilst in quarantine. If to these twelve we add three others who underwent the operation immediately before entering the hospital, there remain forty persons, or, 72.7 per cent, of the above fifty-five, who were neither vaccinated nor re-vaccinated during the quarantine period.

"Applying the same percentage to the 128 persons quarantined before a 1886, we find a further number of thirty-five persons who voluntarily submitted to the operation, who, when added to the other fifteen, make only fifty for the extended period. Thus, out of a total number of 183 persons who have passed through the quarantine wards since the introduction of this system in 1877, no fewer than 133 were neither vaccinated nor re-vaccinated whilst in the hospital.

"During this period from fifteen to twenty persons absolutely refused to go into quarantine at all, and we had no power to compel them.

"Nearly all those who were quarantined belonged to the poorest classes, and to these a fortnight's holiday with free board and good, if not comparatively luxurious, living, would prove to be no mean attraction. Those who had good homes remained there in preference to going to the hospital. Thus no infringement whatever of personal liberty has taken place against those who have put themselves for a time under the 'Leicester Method' of treatment; unless indeed, the gastronomic allurements above referred to might have proved an inducement to some to voluntarily yield up their personal liberty for a time.

### SUCCESS OF THE LEICESTER METHOD

"After the subsidence of the great small-pox epidemic of 1871-73, which caused 360 small-pox deaths, when the town was thoroughly well vaccinated, up to the year 1889, which was the last year for which I could prepare statistics for the Royal Commission on Vaccination—that is, during the sixteen years from 1874 to 1889, inclusive—no fewer than thirty-three importations—mostly from well-vaccinated districts—and a large number of successive outbreaks of small-pox, were successfully stamped out. The town was thus saved from the further spread of the disease, with its possible ravages, by the 'Leicester Method' of treatment, *without recourse to vaccination*, and also without the slightest approach to arbitrariness on the part of the authorities, or any infringement of personal liberty.

### ECONOMY OF THE "LEICESTER METHOD."

"It is sometimes assumed that this 'Leicester Method' of isolation, quarantine, disinfection, and sanitation is so expensive as to be practically prohibitive.

"On the contrary, our 'Leicester Method' is extremely economical as well as effective. Besides, it is now well-known that, however thoroughly a community is vaccinated, so little reliance is placed upon this supposed safeguard, that on the outbreak of small-pox recourse is at once had to the very measures which have been so persistently decried when used to the salvation of unvaccinated Leicester.

"From 1874 to 1889 the cost of public and private vaccination at Leicester was not far short of £10,000 (being about £9,818 2s. 11d.). During the same period the cost of quarantine, including compensation for destruction of infected clothes, bedding, disinfectants, etc., was under the modest sum of £500 (or about £488 11s. 2d.). This represents a saving in favour of our Leicester method, as against vaccination, of over £9000 in the course of sixteen years. This £9000 was completely thrown away, to say nothing of the impaired vitality and spread of disease which vaccination necessarily implies. The £500 cost of quarantine, etc., did all the effectual work of saving the town from the ravages of small-pox threatened by the thirty-three importations, and absolutely averted the real danger implied by the occurrence of 116 small-pox cases in the midst of our crowded population.

#### JUSTIFIED BY RESULTS.

"Perhaps it will not now be out of place to briefly enumerate the substantial reasons which justify the Leicester people in the course they have pursued in respect to vaccination, and in adopting sanitation as their defence in the conflict with zymotic disease.

"Taking the groups of years dealt with by me before the Royal Commission on Vaccination, our average annual small-pox death-rate during 1853-57, with a moderate amount of vaccination, was only 91 per million population. But when vaccination had been continually and largely practised for a quarter of a century, and had reached over 90 per cent. to the annual births, and when, of course, its assumed protective power should have been greatest, our small-pox death-rate had progressively risen to an annual average of 773 per million population in 1868-72. Since that time vaccination has rapidly declined in the Borough, now being only about 2 per cent. Of the births, and small-pox mortality has disappeared from our midst.

#### SAVING OF LIFE IN LEICESTER.

"Our death-rate from the seven principal zymotic diseases, namely, small-pox, measles, scarlet fever, diphtheria, whooping-cough, common fevers (typhus, typhoid, and continued fever), and diarrhea, averaged annually for the five years 1868-72 no fewer than 6852 per million living, with over 90 per cent, of primary vaccinations to births. This is the highest vaccination rate and zymotic death-rate we have ever had recorded for Leicester. In 1888-89, when primary vaccinations were only about 5 per cent, of the births, the zymotic death-rate had fallen to only 2304 per million. On our Leicester population alone this would mean a saving of nearly 680 lives each year.

"Without going into unnecessary details, I may observe that the improvement in our general death-rate amongst children shows equally remarkable results. With over 90 per cent, of primary vaccinations to births in 1868-72, our death-rate from all causes, of children under five years of age, was 107; under ten years, was 61 ; and under fifteen years was 45 per 1000 living under each of those ages respectively. While in 1888-89, with only about 5 per cent. of primary vaccinations to births, each of these death-rates had fallen enormously. The death-rate under five years had declined to 63, that under ten years to 35, and that under fifteen years to 25 per 1000 living at each of the given ages respectively.

"This would represent a saving of about 880 lives under five years, of about 988 lives under ten years, and of about 1080 lives under fifteen years of age, inclusive and respectively for each year in Leicester.

"When it is remembered that the claim put forward for vaccination is its preservation of the younger lives, especially those under five years of age, the life-saving result of the 'Leicester method,' as shown above, is particularly striking. And it proves, unmistakably, that our watchword, 'Sanitation,' carries with it far more potency to deal with zymotic disease and with small-pox than the now discredited cry of 'Vaccination.'

#### THE GENERAL HEALTH OF LEICESTER.

"Once more our general death-rate, that is, our death-rate from *all causes* and at *all ages*, gives results no less important. In 1868-72, when vaccination had reached its climax in Leicester, our death-rate was about 27 per 1000 of the living population, being nearly 5 per 1000 above the general death-rate for all England and Wales. In 1888-89, when vaccination had virtually ceased to be practised in the town, notwithstanding our disadvantageous geological and geographical position, in a valley, with one of the most sluggish rivers in England and a clayey and impervious water-logged subsoil, our incomplete, and therefore inadequate, drainage, our death-rate had fallen so rapidly, with declining vaccination, that it had actually fallen below the general death-rate of England and Wales. The death-rate for England and Wales was 17.9 for 1888-89, and that for Leicester 17.5, or 5.1 gain in favour of Leicester in less than twenty years.

These figures as compared with times of high vaccination mean an additional saving of about 1400 lives each year in Leicester alone, above the normal rate of saving in England and Wales. If this extra gain could be similarly achieved by the cessation of vaccination in

the population of the whole country, other things being equal, it would mean an enormous saving of life beyond that which has actually been effected. The population of the United Kingdom for 1888-89 was estimated by the Registrar-General to be over 37,000,000. On this population an annual saving of about 189,000 lives would be effected. Even allowing an ample margin for possible errors in the calculations of the Registrar-General, these figures are sufficiently momentous to claim serious consideration.

"When it is borne in mind that England and Wales include all the rural districts, where the death-rate is very low, and that here our people are chiefly an artizan and manufacturing population whose circumstances are ever inimical to the health of the younger lives, Leicester's progress from being one of the unhealthiest of towns to its present proud position must be acknowledged to be marvellous.

"With such remarkable results before us, the Leicester people can calmly await the verdict of thoughtful minds, assured that their course of action in rejecting vaccination, and their reliance upon sanitation, will in the long run break down existing prejudice, and that it will ultimately receive general approval and adoption."

It need only be added that a full report of the Leicester system has been presented by Mr. Biggs before the Royal Commission on Vaccination, which will be found in the fourth report of the evidence.

### COW-POX AND VACCINAL SYPHILIS.

The following extracts from Dr. Creighton's "Natural History of Cowpox and Vaccinal Syphilis" (London, 1887) express the conclusions of his historical inquiry—namely, that cow-pox is a disease resembling small-pox only in name, but resembling the great pox both in name and in reality, and that so-called vaccinal syphilis is only cow-pox in its original form, as the milkers used to experience it:---

"The real affinity of cow-pox is not to the small-pox but to the great pox. The vaccinal roseola is not only very like the syphilitic roseola, but it means the same sort of thing. The vaccinal ulcer of every-day practice is, to all intents and purposes, a chancre. It is apt to be an indurated sore when excavated under the scab; when the scab does not adhere, it often shows an unmistakable tendency to phagedaena. There are doubtless many cases of it where constitutional symptoms are either in abeyance or too slight to attract notice. But in other instances, to judge from the groups of cases to which inquiry has been mostly directed, the degeneration of the vesicle to an indurated or phagedaenic sore (all in its day's work) has been followed by roseola, or by scaly and even pemphigoid eruptions, by iritis, by raised patches or sores on the tonsils and other parts of the mouth or throat, and by condylomata (mucous tubercles) elsewhere." (Page 155)

"The first duty of everyone is once for all to disabuse his mind of Jenner's invention of the name *variolae vaccinae* for cow - pox. The affection of the cow's udder was long recognised by common folk as a pox in the original and classical English sense of the word the name of it in Norfolk was pap pox No one had dreamt of discovering any resemblance in it to the pustules of the foreign contagious skin disease which came to be called the small pox until Jenner by a masterstroke of boldness and cunning, placed the Latin name *variolae vaccinae* first on his title page as if he were merely expressing in scientific form the universally accepted meaning of the colloquial name There was no candid or overt attempt in the body of his essay to justify that daring innovation; most of his readers from that time to this have hardly realised that it was an innovation at all, for the reason that Jenner adroitly left his title page to justify itself. His trumped-up name somehow passed without challenge, except for a grammatical objection on the part of Pearson, and a general criticism by Moseley; and although the want of likeness, still more in circumstances than in form, between the pustules of small-pox and even the modified kind of inoculated cow-pox vesicle, has been pointed out in elaborate detail by several writers, and ought, indeed, to be so obvious to any one as not to need pointing out at all, yet the Jennerian fable of *variolae vaccinae* continues to be the creed of the medical profession." (Page 157.)

"The rational theory of the Morbihan disaster (of vaccinal syphilis in 1866) is that ulceration, followed by induration and (or) phagedaena, is part of the natural history of cow pox infection that it is nearly always latent or kept in check; that in some circumstances it may be brought reverted to; that these circumstances, in the particular epidemic, date and number of the vesicles raised on the vaccinifer, and the draining of their lymph to the last drop, so as to vaccinate an enormous number; and lastly, that a continuous reproduction of lymph from that stock tended to confirm and even to intensify the reawakened powers of the cow-pox matter, as evidenced by the more decided 'syphilitic' character of the secondaries (mucous patches on the tonsils) in two cases of the last group." (Page 140.)

"The origin of vaccinal syphilis remains, as Bohn says, 'shrouded in mystery.' Readers who have followed my argument hitherto will not be surprised if now I claim the phenomena of so-called vaccinal 'syphilis' as in no respect of venereal origin, but as due to the inherent, although mostly dormant *natural history characters of cow-pox itself.*" (Page 124)

### THE AUTHOR'S PERSONAL STATEMENT OF THE RESULTS OF VACCINATION

During the past twenty-two years it has been my experience to travel in all parts of the United Kingdom, from Land's End to the Shetland Islands, and in almost every state in Europe, from the Mediterranean to the North Cape, in countries intervening between the Tagus in the west, and the Volga, Danube, and Bosphorus, in the east; also in Morocco, Algeria, Upper and Lower Egypt, Asia Minor, Upper and Lower Canada, Nova Scotia, and most of the states and territories of North America; also in Venezuela and British Guiana, South America, in the Windward and Leeward Islands, the French and Danish West Indies, in the archipelagoes of Greece and Hawaii, the Island of Ceylon, in Tasmania, New Zealand, the colonies of Australia, and in South Africa.

In nearly all these countries I have made it my business to inquire into the methods and results of vaccination, procuring information from public officials and from intelligent private individuals, and I have hardly ever inquired without hearing of injuries, fatalities, and sometimes wholesale disasters, to people in every position in life, and these have occurred from the use of every variety of vaccine virus in use. My informants have included governors, chief magistrates, consuls, professors of medicine and surgery in Continental universities, members of legislative assemblies, superintendents of leper asylums, editors of medical and hygienic journals, chiefs of military and general hospitals, presidents and medical officers of state and colonial health departments, superintendents of small-pox hospitals, clergymen of all denominations, missionaries, heads of educational establishments, and the best informed amongst old residents in the places visited.

In one country it was my privilege to be furnished with a general letter of introduction from a minister of State (since Prime Minister), which gave me access to all the official and medical authorities. Often the fatality described to me has befallen the infant of a poor mother, who with dread forebodings in her mind has tried to shield her offspring from the vaccinator's lancet as long as she could, and, like a fugitive slave, only surrendered to the minister of the law when overtaken in pursuit or her place of refuge discovered, or, like that of a distinguished Moslem (Suffey Bey Adem), my travelling companion in 1884 from Damascus to Beyrout, who had lost a daughter, a nephew, and a niece (vaccinated together about a year before our interview), all of whom died of the operation, after the most acute suffering. At other times I have seen stalwart soldiers and post office officials seriously injured, and in more than one instance crippled and ruined for life, by compulsory revaccination. I have personally investigated vaccine disasters at two military hospitals, one in Europe and the other in Africa, where, in one case, three, and in another case thirty soldiers ultimately died of the operation, and more than twice this number were seriously, and, in most cases, permanently injured. In Australasia I have personally inquired into a case of wholesale disaster— of acute septicemia, exhibited by terrible ulcerations following vaccination with calf lymph—to several hundred persons, and have seen the sad consequences in permanently ruined health I have received several thousand written statements from parents, who allege that their children have been seriously or fatally injured by vaccination I have proved beyond doubt, by personal inquiries in various countries where leprosy is increasing, that the increase is due to vaccination, and have furnished the testimonies of numerous medical authorities, and of official reports (all mention of which has been omitted from our leading medical journals), in support of these incriminating allegations. These facts have been detailed by me in the *Times*, *Nonconformist*, *Echo*, *Leeds Mercury*, *Manchester Guardian* and *Examiner* and *Times*, *Leicester Post*, *Newcastle Leader*, *Scottish Leader*, *Cardiff Daily News*, *Gloucester Citizen*, *Hospital Gazette*, *The Tocsin*, *Journal d' Hygiene* (Paris), *Birmingham Gazette*, *The Vaccination Inquirer*, and other influential and well-known English, American, and Colonial journals; and some of them were quoted by me, with chapter and verse, before the Royal Commission on Vaccination, now taking evidence in London, and will be found in the third official report of the proceedings.

I may also mention that numerous facts of a sinister character were contributed by many of the delegates representing the leading European States at the International Anti-Vaccination Congresses held in Paris, Cologne, Berne, and Charleroi, the reports of which have been published and presented to the chiefs of Governments, and of Public Health Departments in all countries. Not only have the facts been submitted to Continental Ministers of State, and to successive Presidents of the Local Government Board in England, but in December, 1890, I laid them before Mr. Langridge, Chief Secretary to the Government of Victoria, Australia, and before leading officials in other Colonies. It seems to me, therefore, that, in view of these experiences, and in the presence of such unimpeachable facts, the opposition which has arisen, and is growing daily in nearly all countries, is a commendable and patriotic struggle, which should be encouraged in every possible way. The laws (often cruelly enforced), which compel the parents of this and other countries to put the health and lives of their offspring into the hands of irresponsible State officials, with the alternative of severe and not seldom ignominious punishments, are a grave national blunder, and constitute a species of tyranny wholly indefensible; and it behoves every good citizen to endeavour, by every constitutional means, in the interests alike of justice, of individual and parental rights, and in defence of the public health, and of our helpless children, to get these laws completely and permanently extinguished.

## EXTRACTS

In an article entitled the "Dreadful Revival of Leprosy," in the *San Fernando Gazette*, Isle of Trinidad, 22nd February, 1890, the writer says :—" It may not be generally known that as far back as 1805 there were only three lepers in Trinidad; eight years later there were 73 out of a population of 32,000. Twelve years later, when an attempt was made to segregate them upon a small adjacent island, it was found that these afflicted persons had increased so rapidly that the scheme had to be abandoned. In 1878 there were 860 out of a population of 120,000, and later statistics show that the number of lepers was increasing four times as rapidly as the population." .....Dr. White, surgeon to the United States Navy, who visited the islands in 1882, in a report to his Government estimates the concealed cases at 3 per cent. of the population. p41.....According to the same writer on the subject, leprosy was discovered in the island in 1840, but Mr. D. Meyer, Agent for the Honolulu Board of Health, in the appendix to the report presented to the Legislative Assembly of Honolulu in 1886, says it was in 1859 or 1860 that he saw the first case of the disease. 1840 was the date of its introduction is the opinion p42....To account for the appalling spread of this terrible scourge of humanity within such a short period of time, the evidence points conclusively to one prominent cause--vaccination. There is no evidence to show that leprosy increased in Hawaii until after the introduction and dissemination of the vaccine virus.

In a communication to the Government of Hawaii, Dr. Kynsey remarks that leprosy is not confined to any community, but is more frequently observed among the Singhalese and Tamilins; seldom among the Eurasians, and more rarely among Europeans, and is chiefly found among the poor, ill-fed, ill-housed classes of the community. The Eurasians, I may observe, as well as the better-class Europeans, absolutely decline to be vaccinated from native lymph sources, to which the native population are obliged, reluctantly, to submit.p78

The day after my visit, 31 of the inmates were taken from the Suspect Hospital to Honolulu, and thence from the King's Wharf were forcibly deported to the living grave at Molokai, from whence no traveller returns. The scene was of the most painful description. These afflicted creatures were torn from their friends and relatives, husbands from wives, children from their parents, frantic with uncontrollable grief. Lovers were separated, their lips trembling with emotion, amidst unutterable wailings, wringing of hands in the agony of despair, and heart-breaking experiences which I shall never forget, and which the pen of a Balzac, or Victor Hugo, could only adequately describe. p44.....This goes on year after year, and will probably continue until medical men themselves turn their attention from experimental treatment to preventive measures, and themselves petition Governments to suppress the mistaken system of vaccination, which, it is admitted by the highest authorities, has been a prolific source of this terrible evil.

The *New Orleans Medical and Surgical Journal* 1880, published a communication from Dr. T. H. Bemiss, Lahaina, Hawaii, on the introduction and spread of leprosy in these islands. "Alarmed," says the writer, "by an invasion of small-pox in 1853, a general vaccination of the whole population was ordered, p118

A well-known medical practitioner at Honolulu gave me a photograph of Keanu, which distinctly shows the appearances peculiar to inoculated tubercular leprosy at the point of insertion in the arm, as well as in other parts of the body. And he considered the experiment an absolute demonstration of the inoculability of the disease. He also unhesitatingly expressed the opinion that the dissemination of leprosy in Hawaii was largely due to inoculation by the lancet of the public vaccinator, a most serious matter not only for Hawaii, but for all other countries where the repulsive

and destructive disease is endemic. Dr. Arthur Mouritz, Medical Superintendent of the Leper Settlement, Molokai, says it is doubtful whether one per cent, of the Hawaiians would resist intentional inoculation.p128.....Nor can they be considered remarkable, knowing how the disease had been propagated by the vaccination lancet. In one instance reported to Queen Liliuokokalani, an entire school in Hawaii was swept away, with the exception of a single survivor, by this means.

In all countries where leprosy is endemic, Europeans resolutely object to be vaccinated with lymph from native sources; and, notwithstanding the law, when imported lymph cannot be obtained they and their children remain unvaccinated. As a consequence, the population of Europeans attacked with leprosy is comparatively small and, indeed, of rare occurrence, except in the case of soldiers who are subject to the military regulation of revaccination. p129

## JAPAN

Leprosy has existed from time Immemorial in this country, and there is an old established leper settlement at the hot springs at Kusatsu, to the north of Tokio. Leprosy is reported to be increasing considerably, and according to a communication in the *Liverpool Mercury*, September 22nd, 1891, three leper hospital asylums have been established in Tokio during the past ten years. One of these hospitals, treated in 6 years 4249 cases, of which 3852 were those of Japanese patients. The *Pioneer* (Allahabad) of September 9th, 1891, reports that leprosy has spread in the Japanese villages to an alarming extent during the past few years. In one village near Toimachi, in the Gifu Ken province, every inhabitant is a leper. The Japanese Government is taking steps to look after their afflicted people.

*The Lancet* for May 25th, 1889, states that vaccination was made compulsory in the seventh year of Meiji (1874). It will be noted therefore that the rapid diffusion of leprosy took place shortly after the introduction of the compulsory law, and has kept pace with the progress of vaccination in this community. Dr. Tamanoto, of the Imperial Japanese Navy, says that when leprosy occurs in a family it is the custom to conceal it.

## COLOMBIA

"He remarks that in Antioquia (Colombia) not a single case of leprosy was known thirty years ago. Since then, the disease has spread in all directions, and the number in this town is now said to be over 800. I may add that, during the interval, vaccination has been introduced in all the Republics of South America with the usual sinister results."--[William Tebb](#) (1893 Book: LEPROSY AND VACCINATIONp48)

*In all the French colonies vaccination has been prosecuted with rigour, and has been followed by the increase of leprosy, just as in England the increase of infantile syphilis is due to arm-to-arm vaccination, as shown in the third report of the Royal Commission on Vaccination. The barbarous therapeutics, the tattooing and burning, have existed among the natives from time immemorial. Vaccination has been but recently introduced.*

"I should be sorry to see a leper cook, and I go further than that. In vaccinating, I think hardly a medical man would take vaccine lymph from the arm of a leper infant. I know it has been our practice for the last twenty years not to do so." p64

## SOUTH AFRICA

The Colonial legislature would have served the cause of the public health more effectually by directing their attention to municipal sanitation, and discouraging the practice of vaccination, which, according to the opinion of district surgeons, and the best informed authorities in South Africa, has been instrumental in largely spreading both syphilis and leprosy. It is hardly possible for a disinterested observer and inquirer to come to any other conclusion. p72.....Dr. Alexander Abercromby, author of "Thesis on Tubercular Leprosy," writing to me from Cape Town, April 20th, 1892, says the disease is now "spreading rapidly amongst the white population and better class of people."

He records the curious fact that, of about 120,000 souls in Mitylene, 15,000 are Mussulmans, and amongst these there is not a single leper to his knowledge. Dr. Zambaco omits to note the fact that Mussulmans in most countries have a rooted aversion to, and distrust in, vaccination, and escape the ordeal whenever they can.' p100

"A sad case occurred here a short time ago, which shows the danger that arises from the practice of vaccination in an island where leprosy is treated as of no account. A few months ago a little girl, the daughter of the Rev. Mr. —, a Wesleyan missionary, who came to the West Indies from England two or three years before, fell ill. On examination by the doctors it was found that the poor child had contracted leprosy. The only probable means of communication was by inoculation; and thus the parents, endeavouring to save their daughter from the very remote danger of small-pox, inoculated her with the horrible poison that will make her life a living death and herself a loathsome and repulsive, spectacle. p145

:—" Dr. Gavin Milroy, in his 'Report on Leprosy and Yaws in the West Indies' (House of Commons Command Papers, c. 729) states on pages 32, 33, 'In the frequent conversations which I subsequently had with many of these gentlemen (the medical officers in the West Indies) I learned the fact that the European and most of the higher creole families were always extremely anxious about the source of the lymph to be used in the vaccination of their children, from the dread of a leprous taint being thus acquired. None of my informants appeared to partake of this belief themselves, but all recognised the propriety of avoiding the use of lymph from children of families known or believed to be afflicted, especially as infants themselves rarely, if ever, exhibit any outward manifestations of the malady.' "Dr. Milroy says that the Vaccinator-General, Dr. Bakewell seemed to give countenance to the *popular belief* as to the transmissibility of leprosy by vaccination." p155

In Barbados we find a strong prejudice against vaccination, for Dr Browne writes:—"It has been a general rule not to vaccinate from the *apparently unhealthy*, or those of leprous taint, not so much from any opinion founded on fact of the possibility of conveying the disease, as *from respect to the general prejudice prevailing* p154

Dr. Freeland, Government Medical Officer of Antigua :—" In some of these islands, leprosy had no doubt spread from the want of precautions to separate the diseased from the healthy, from poverty, from overcrowding, or from decomposed food, *and from, I fear the system of arm-to-arm vaccination, which now so universally prevails.*" p154

"I could trace the first authenticated cases of leprosy back to about 1830, but the terrible spread all over the islands did not take place until very nearly thirty years later, at a time when an epidemic of small-pox had given rise to very general and very careless vaccinations throughout the group .....attach far more importance to an instance of an increase of leprosy soon after vaccination on a much smaller scale, and during a much more recent period than the above. I have it on good authority that a very remarkable new crop of leprosy cases sprang up at Lahaina, on the island of Maui, about a year after most careless vaccination had been practised there." p157

Amongst other incidents, the Princess refers to an interview with one, Kehikapau, in the presence of several persons. - Kehikapau called the Princess's attention to the circumstance of his having contracted the disease from vaccination. He also mentioned that, through the same agency, all his schoolmates had died of the disease, induced in this way. According to the Report of Surgeon J. R. Tryon, of the United States Navy, leprosy has spread "from year to year in Hawaii, and has increased to a marked degree since the indiscriminate and careless vaccination practised during the severe epidemic of small-pox in 1853." — *Medical and Surgical Memoirs, 1887, vol. 2, ft. 1252, by Dr. Joseph Jones, President of the State Board of Health, Louisiana.* "After referring to the relation of leprosy with syphilis in the Hawaiian Islands, the author says :—"Vaccination was also inquired into. Alarmed by an invasion of small-pox in 1853, a general vaccination of the whole population was ordered, and physicians being at that time very few on the islands, non-professionals aided in the work. p160

In the report of Dr. H. W. Blanc, Professor of Dermatology and the Chief Sanitary Inspector for the city of New Orleans, November 27, 1889, addressed to the President of the Board of Health for the State of Louisiana, where leprosy has been provokingly prevalent, it is stated that leprosy, syphilis, and tuberculosis are transmitted by vaccination. p179

And in a leading article, November 22, 1891, this same influential Indian journal, referring to leprosy vaccination, observes :—"There seems to be no possible room for doubting the reality of the very grave danger to which attention is drawn..... It is notorious that inoculation, that is, the direct introduction of the virus into the blood, is the chief, if - not the sole, means by which leprosy is communicated. p183

7.—" A Hindu male, Bhaleshur, aged ten years. Six months after vaccination, three and a half years ago, a white patch appeared over his left clavicle and on vaccine site. Half of the patch on clavicle ulcerated, and the ulcer, finch broad and 3/4 inch long, refused to yield to either arsenic or mercury, both of which he had taken for two years. The clavicle is denuded of flesh, and plainly visible to the naked eye, while the ulcer itself is of a leprosy type. p195

It is certainly amazing to find that probably the chief factor in the dissemination of leprosy in the present day—Jennerian vaccination— should have been practically set aside by the Indian Commissioners. Considering the amount of conclusive evidence now before us, many, like myself, must have felt appalled to find that this was so. p206

Dr. Roger S. Chew, of Calcutta, who was for six years in the Medical Department of Her Majesty's Army in British India, and has devoted fourteen years to the study of leprosy in India and other countries, furnishes, in his pamphlet on leprosy, a table giving the results of his investigations into

the causation of the 1034 cases which have come under his treatment. Of these, he says, insanitation is responsible for 105 cases, vaccination for 148, and 72 cases are due to other forms of inoculation. p190

Dr. Sutherland, of Patra, says :—" When serving with the native army, I found repeatedly that men who had in early life the character which I regard as a proof of the existence of a leprous taint, which I have already described, frequently had to be invalided in after years for leprosy, and subsequent observation and inquiry have led me to the conclusion that the opinion I have formed regarding what I have named a leprous taint was correct, and that this condition precedes the appearance of the disease in its aggravated form; and I think I am warranted in concluding, from the data given above, that this leprous taint exists in one out of every ten of the adult rural population of this district. In stating this, I am aware that my views will probably astonish persons who have not given the subject the attention I have."—*Royal College of Physicians Report, p. 188.* p218

Some (soldiers) have had their arms amputated and been discharged from the service, and others have sustained lifelong injuries. It must be noted that soldiers, when quartered in tropical countries where leprosy and syphilis prevail, are often obliged to submit to several re-vaccinations. In Capetown, a soldier belonging to the North Stafford Regiment, on duty near Government House, informed me (February 9th, 1892) that since he joined the army he had been vaccinated thirteen times. He was badly pitted with small-pox. 221

"Amongst 62 persons affected with this disease now in treatment in the Hospital dos Lazaros, in this city, 26 were vaccinated p232

It is clear by Dr. Abraham's mode of argument that leprous vaccination, as an important factor in the increase of the disease, is the last thing he will admit. All other possible sources of dissemination must be excluded before a theory so fatal to medical prestige can be tolerated. Any other of the numerous theories promulgated to account for new centres of leprous contamination the doctor is ready to consider, but vaccination (to use a classic phrase) "must be preserved from reproach," and the reputations of its distinguished advocates maintained. p239

The testimonies elicited by this inquiry as to the communicability of leprosy and syphilis seem to have had no practical effect on the College of Physicians. In a letter from that body on "Vaccination and Leprosy," dated London, August 17, 1871, and addressed to the Earl of Kimberley, it is stated that, while it is admitted that in a few instances syphilis has been transmitted by vaccination, "yet with reference to leprosy it must be observed that there is no evidence adduced beyond the merest presumption that this disease has ever been transmitted by vaccination." p245

The alarming increase of leprosy in Hawaii, which took place after the introduction of vaccination by the missionaries p245 end

Owing to the increase of leprosy in South Africa, inquiries by Select Committees of the Legislative Assembly were instituted in 1883 and 1889, but the interrogatories relate chiefly to the spread of the disease, and to its contagious or non - contagious character. The questions were submitted *viva voce*, and vaccination as a possible factor in the dissemination of leprosy is carefully ignored. p248

This correspondence, implicating vaccination, and pointing out a much-neglected source of danger, is absolutely ignored in the *Journal of the Leprosy Investigation Committee*; while communications from all parts of the world, in which the most diverse and conflicting theories are advanced by

persons whose opportunities for observation and inquiry have necessarily been of a very meagre description, have found insertion in its pages. p254

Moreover, leprosy is an insidious disease, and in its early stages cannot be diagnosed and detected save by experienced medical practitioners accustomed to treat this particular malady. Of the enumerators, not one in a hundred could detect a case of leprosy if he saw it, except when presented in its most aggravated and repulsive form. p259

Dr. John D. Hillis, F.R.C.S., formerly the Superintendent General of the Leper Asylum, Mahaica, in his work, entitled "Leprosy in British Guiana" (1881), says, p. 148:—"With regard to this country one important fact is the immunity from leprosy enjoyed by the aboriginal tribes of British Guiana." This immunity from the disease is attributed to the circumstance that no Indian will allow himself or his children to be vaccinated p265 .....In a communication to me, dated Rio de Janeiro, May 20th, 1892, Dr. Lima says :—" Now, about the Indian races, those who live away altogether, without any interference or intercourse with civilisation, their freedom from leprosy can be explained not only by the absence of the Jennerian vaccination, but also by the non-intercourse with people capable of being the conductors of the germs of the disease." p266

*Aliwal North* (Report, 1885 ).—"Vaccination has been extensively performed amongst both Europeans and natives." In the following year (Report, 1886), the same officer remarks that "small-pox has raged," of which he has treated about 450 cases, and adds that "syphilis has made vast strides." Two years later (Report, 1888), we read :—" Syphilis is still very prevalent. I have frequently drawn the earnest attention of the Government to the sad havoc this disease is dealing amongst the inhabitants."

While showing the utter failure of the extensive vaccination practised in 1884 to prevent the serious epidemic of small-pox which occurred the following year, these three official reports show how the most loathsome of diseases are disseminated by the vaccinator's lancet. The District Surgeon urges the Government to appoint a Commission of Inquiry. p271

Vaccination, he says, is carried out in the Colonies in a most careless and perfunctory manner. He has seen the operator pass his lancet from one arm to another without the smallest attempt to disinfect the instrument or discriminate between the diseased and the healthy, in districts where both leprosy and syphilis are endemic. From other reliable sources I am satisfied that this is the rule rather than the exception. Canon Baker believes that leprosy is chiefly communicated by means of inoculation, and that arm-to-arm vaccination is a prolific cause of the spread of this fearful plague in South Africa. ....While the vaccination laws for several years have not been enforced against the white population in Natal, all the natives are vaccinated either under persuasion or threats, the operation being carried out in the usual careless manner, with arm-to-arm virus taken from native children without previous examination, and not the slightest attempt is made to clean or disinfect the lancets after each operation. Hundreds of natives, as I am informed on unimpeachable authority, have died of blood-poisoning and of inoculated diseases. ....A member of the Legislative Council, Sir John Bisset, reported in Parliament that many were "blood poisoned, presenting a horrible sight, and dying masses of corruption." In January, 1891, leprosy disseminated in this way

was discovered in fifty kraals in one electoral division alone. The natives in their simplicity submit to vaccination, being told that it was the "Incosi" (King) that ordered it, and this was the way the white man secured himself against the plague of small-pox.p274.

"Was vaccinated in 1879; leprosy appeared in 1883." "Vaccinated three times, last vaccination during small-pox epidemic in 1878; leprosy attacked me in 1887." "Vaccinated twice, first when twenty years of age. Leprosy appeared between first and second vaccination." p280

The Leprosy Commissioners (all ardent supporters of the Jennerian practice) have searched far and wide for a rational theory that will account for the recent spread of leprosy in certain countries, but have utterly failed to discover one, and are almost driven to the conclusion that touches closely upon the facts collected in this volume. p309

It may also be added that, at the time when leprosy disappeared from this country, the practice of inoculation and vaccination was unknown, otherwise there is little doubt that leprosy would have been perpetuated in England by the empoisoned lancet, as it is now in the West Indies, British Guiana, India, New Caledonia, the United States of Colombia, Venezuela, and Hawaii.....Sir Erasmus Wilson, in his article on "Leprosy" in Quain's "Dictionary of Medicine," refers to the various drugs which are recommended and used by one physician or another—quinine, strychnine, phosphates, nitric acid, acetic and carbolic acid, iodine, arsenic, perchloride of mercury, asclepias gigantea, hydrocotyle asiatica, veronica quinquefolia, plumbago rosea, acid nitrate of mercury, potassa fusa, acrid irritating oil of the shell of the cashew nut, chloride of zinc, etc. p312 Ch 17

I may here observe that Dr. Koch's much vaunted tuberculin has been tried in almost every leprosy country on the globe, and found worse than useless. Much suffering has been caused by its use. The *Madras Times*, October 28, 1891, reports the visit of His Excellency Lord Wenlock to the leper hospital in this city, when his lordship had pointed out to him several patients upon whom Dr. Koch's lymph treatment had been tried. One of the patients complained that the experiment had subjected him to excruciating pain. .... It appeared to me, however," says Dr. Danielssen (page 210), "if I could infect the leprosy patients with constitutional syphilis, it might follow that the syphilitic poison might prove superior to that of leprosy, and that thus the system might be brought to that of a person labouring under constitutional syphilis, and might so become subject to the ordinary process of syphilisation." "This ingenious theory, however," remarks Dr. Hillis, "failed in practice, the leprosy remaining unchanged, whilst the syphilitic process went on."

.....Needless to say that mercury, iodine, quinia, arsenic, and a long list of other remedies, have utterly failed to eradicate the disease. p322--325 ch 17

*The Bombay Gazette*, 17th July, 1891, reports the opening of the New Leper Asylum at Sehore, Bhopal, towards which Her Highness the Begum of Bhopal has contributed munificently, and has promised an annual grant of 4500 Rs. for the expenses of maintenance. ....This benevolent lady, the Begum of Bhopal, Nawab Shahjeham, has been persuaded to extend vaccinations in her province, upon which she spends 5000 rupees yearly, employing 35 vaccinators, who performed 38,000 vaccinations last year, thus unwittingly spreading the fell disease at the point of the lancet, and helping to fill the wards of the hospital which her benevolence has established. p333 Ch 17

The remedies used were strychnine, phosphorus, arsenic, mercury, potassium iodide, chaulmoogra oil, resorcin and ichthyolin, gurjun oil, neem oil, and strychnia, and sweet oil with chaulmoogra oil and gurjun oil internally p335 ch 17

"The first and the most grave result which follows from this interpretation is, then, that vaccination, besides the advantages which it offers us in our contest with variola, presents the danger of opening the way for the invasion of tubercle.

"If we now turn back and examine the events of the last century or so, we can show a constant increase of tuberculosis, a fact never hitherto satisfactorily explained. There was a time when this malady existed only as an exceptional thing; now, actually, in spite of the incessant progress in public and private hygiene, in spite of all the material improvements that have been made, it tends more and more to rise to the rank of a pestilence....."Side by side with this growing extension of tuberculosis, we see developing, *pan passu*, and in the same period of time, that is to say, since the beginning of the century, the practice of vaccination. We may ask ourselves whether in this double simultaneous evolution there is not a hidden oneness? If tuberculosis, in spite of all sanitary precautions, has multiplied its attacks during the last hundred years, it is, we submit, because vaccination has come to create for it a propitious soil. ....In all European armies, vaccination is the order of the day. On their arrival with their corps, the young soldiers are forthwith carefully revaccinated. Now, the military statistics of all countries show an enormous proportion of various forms of tuberculosis among soldiers, especially during the first and second year after their enlistment. ....Whence then can come these attacks of tuberculosis, so sudden, so numerous, upon subjects that, but a few months before, the council of revision rightly declared to be fit for service. Tuberculosis of the lungs, of the organs, of the joints, of the bones, etc., all these fatal evils show themselves in the garrisons of all countries with a frequency before which one might well despair. We believe that we must simply seek the reason for these facts in the revaccination which awaits the recruits upon their arrival at their corps, p358 appendix

Those familiar with the social condition of India are aware that every effort has been made to remove this dread of the operation which exists more or less all over the country. New lancets and scarifiers have been introduced, and various viruses have been experimented with, one after another—cow, calf, sheep, goat, lamb, buffalo, and donkey lymph — the last, the discovery of Surgeon O'Hara, having been specially urged upon the attention of District Boards and municipalities by the Government. Surgeon-Major W. G. King writes to the Indian *Medical Record* that he is using *vesicle pulp* or "lanoline vaccine," which is applied by stretching the scarifications and "alternately dabbing and rubbing in the paste." Buffaloes, he observes, appear likely to yield very much more vesicle pulp than calves, but they exhale an "abominable odour," which renders the work of collecting the pulp most repulsive. The Commissioners state that only the lowest and most ignorant classes readily submit. The law enforcing vaccination in British India, which are unparalleled for their severity, were passed without the consent and against the wishes of the people, whose objection to vaccination arises from a knowledge often gained by sad and bitter experience p363 app

"The number of cases in which small-pox had followed vaccination is 56."The Board think it proper to remark under this head that, in the enumeration of cases in which small-pox has succeeded vaccination, they have included none but those in which the subject was vaccinated by the surgeon reporting the facts.

"The bad consequences which have arisen from vaccination are— 66 cases of eruption of the skin,

24 of inflammation of the arm, whereof

3 proved fatal

"Although numerous, they are nothing to what might be produced. It will be thought incumbent on the vaccinators to come forward and dispute the numerous facts decisive against vaccination here stated on unimpeachable authorities, or make the *amende honorable* by a manly recantation. But experience forbids us to expect any such fair and magnanimous proceeding, and we may be assured that under no circumstances will they abandon so lucrative a practice until the practice abandons them." 366 app

This increase of small-pox, co-incident with the rapid extension of vaccination, shows that it is a disease governed by causes entirely outside and independent of vaccination. And this opinion is confirmed by the highest authorities. Thus, in a memorandum of the "Army Sanitary Commission," published in the *Bombay Government Gazette*, Dec. 17th, 1885, the Commissioners say:

"The first disease in the list—namely, small-pox, which yielded an increase of 1369 deaths, or nearly sixteen-fold that of the previous year's death-rate—had assumed an epidemic state in nearly all the districts of the city; yet Bombay has an effective vaccination service, with the use of calf-lymph." . In vol. xviii. of "Sanitary Measures in India," page 203, in reference to the smallpox epidemic of 1884, it is stated :—" We are thus brought face to face with the fact that, notwithstanding the existence of an active vaccination service, small-pox swept over the provinces just as if there had been none." In the same volume, referring to Madras, the Commissioners -say:—" No less than seventy-four per cent. of the small-pox deaths in Madras town occurred among children under three years of age." In Punjab, "the Compulsory Act was in force in the Amritsar municipality, but here the deaths from small-pox were far more numerous than in any other town of the province.arm to arm

According to Sir Edwin Chadwick, Dr. B. W. Richardson, and all other sanitarians of repute, small-pox is a disease due to insanitary conditions, impure water, bad drainage, dirty living,. and particularly to overcrowding; and, instead of removing these conditions, the Governments of India during the past thirty years have been spending their, energies, and large sums of money, in extending vaccination. Now that the arm-to-arm system has been thoroughly discredited and shown to be futile as a preventive of small-pox and fertile as a disseminator of eczema, syphilis, and leprosy, the cry of the official vaccinator is not the sensible one of "do away with vaccination," but, let us change front and resort to the calf, sheep, buffalo, donkey, or to lanoline lymph—or anything,. rather than confess that the Jennerian system is a humiliating failure. It is well known that animal lymph has been a fruitful cause of the spread of disease in Europe. It is well known that animal lymph has been a fruitful cause of the spread of disease in Europe. On June 17, 1885, an official re-vaccination with "re-generated" lymph at the Island of Rügen, North Germany, caused an infection of a loathsome eruptive skin disease (*Impetigo Contagiosa*) of 320 children and adults

The perennial cry of public vaccinators is that the lymph is "unsatisfactory." Animal lymph is often attended with excessive inflammation, and the practitioner is obliged to dilute it with glycerine, lanoline, and other substances, and its use is much more expensive. Moreover, a good deal of the so-called animal lymph in vogue is really only arm-to-arm vaccine, inoculated into calves, buffaloes, sheep, and donkeys, and partakes of the diseases both of man and of animals. Of the many cases of ulcerative and of fatal vaccination which have come under my notice during the past

twenty years not a few have been due to the use of carefully-selected animal vaccine. Dr. Robert Cory, Medical Director of the Government Calf Lymph Establishment, London, testified before the Royal Commission, November 17, 1889 (Q. 4390), that out of 32,000 cases there were 260 returned with sore arms, and 38 with eruptions. Then there were 16 cases of erysipelas, and nine of axillary abscesses, and (Q. 4392) eight deaths were reported to the Station of children who had been vaccinated with animal lymph. The same witness testified (Q. 4369) that lymph taken from the cow leads to greater inflammation, and has a greater tendency to produce ulceration, than lymph which has been humanised.appendix

#### LEICESTER:

"Taking the groups of years dealt with by me before the Royal Commission on Vaccination, our average annual small-pox death-rate during 1853-57, with a moderate amount of vaccination, was only 91 per million population. But when vaccination had been continually and largely practised for a quarter of a century, and had reached over 90 per cent. to the annual births, and when, of course, its assumed protective power should have been greatest,. our small-pox death-rate had progressively risen to an annual average of 773 per million population in 1868-72. Since that time vaccination has rapidly declined in the Borough, now being only about 2 per cent. Of the births, and small-pox mortality has disappeared from our midst. ....

With over 90 per cent, of primary vaccinations to births in 1868-72, our death-rate from all causes, of children under five years of age, was 107; under ten years, was 61 ; and under fifteen years was 45 per 1000 living under each of those ages respectively. While in 1888-89, with only about 5 per cent. of primary vaccinations to births, each of these death-rates had fallen enormously. The death-rate under five years had declined to 63, that under ten years to 35, and that under fifteen years to 25 per 1000 living at each of the given ages respectively.

"This would represent a saving of about 880 lives under five years, of about 988 lives under ten years, and of about 1080 lives under fifteen years of age, inclusive and respectively for each year in Leicester.appendix

These figures as compared with times of high vaccination mean an additional saving of about 1400 lives each year in Leicester alone, above the normal rate of saving in England and Wales. If this extra gain could be similarly achieved by the cessation of vaccination in the population of the whole country, other things being equal, it would mean an enormous saving of life .....of about 189,000 lives would be effected. Even allowing an ample margin for possible errors in the calculations of the Registrar-General, these figures are sufficiently momentous to claim serious consideration.

## PREFACE

THE remarkable spread of leprosy during the past thirty years has excited much public attention. Having for many years been interested in the public health, I have been prompted to investigate the causation of this increase. My attention was first called to the growing ravages of leprosy during a visit to Asia Minor in the year 1884, and to one source of infection the extent of which is as yet imperfectly realised (I mean vaccination), by the perusal of the evidence brought before the Select Parliamentary Committee on Vaccination of 1871 by Dr. R. Hall Bakewell. In 1888-89, during a visit to the Virgin, Leeward, and Windward Islands, British Guiana, and Venezuela, I took the opportunity of investigating this serious allegation. In the course of my inquiries I obtained particulars of a number of cases of leprosy due to vaccination. These were furnished by highly respectable colonists, but were often coupled with the request that no names were to be published, either of the suffering families or of those who communicated the details. This reluctance, which is entitled to every consideration was due to the fear of exposing relatives, and damaging their social standing in the community where they reside. Although the danger of communicating leprosy by vaccination has been admitted in official and other reports, I have on many occasions found it extremely difficult to get at the facts, copies of important documents having been repeatedly refused by officials both at home and abroad, and notably in the French Colonial possessions.

It is perhaps too much to expect that those who regard Jenner as one of the greatest of human benefactors will display much energy in bringing to light such cases as I have referred to.

Some of the obstacles in the way of independent investigation of this subject are alluded to in a communication, read before the Royal Vaccination Commission, from Dr. Charles E. Taylor, Secretary to the Legislative Council, Island of St. Thomas, Danish West Indies. Dr. Taylor states that during his 20 years residence at St. Thomas, D.W.I., he has known many cases of the communication of leprosy by means of the vaccinator's lancet, but he adds that the sufferers or their families invariably decline to have the fact disclosed. One resident physician in Honolulu, who told me how the disease had been disseminated by means of vaccination in Hawaii, strongly deprecated making the details known, as he would not answer for the consequences. Despite these difficulties, however, a good many cases are recorded by medical men of high standing and wide experience, and some of them are here presented to the reader. Cases have come under my cognizance in which the reports of district surgeons, showing the spread of terrible diseases by means of vaccination, have been officially suppressed.

In June, 1890, I appeared as a witness before the Royal Commission on Vaccination, and gave evidence as to the results of my inquiries up to that date. This evidence will be found in the third report of the proceedings, pages 154-161.

At that time my investigations had been mainly limited to the West Indies, British Guiana, and Venezuela. Since then I have extended my - personal investigations to Norway, California, the Sandwich Islands, Ceylon, Egypt, New Zealand, Cape Colony and Natal in South Africa, and most of the Colonies in Australia, and have put myself in communication with superintendents of leper asylums and leading dermatologists in all other countries where leprosy is endemic. The results of these inquiries, with other collateral evidence bearing on the subject, are briefly set forth in this volume. While the *pros* and *cons* of the theories of heredity, fish-eating, malaria, and contagion, have been frequently dealt with by wellknown writers, this is, I believe, the first attempt made to

bring together a body of evidence regarding the inoculability of leprosy and the evidence of its communicability by means of vaccination.

To physicians, superintendents of leper hospitals librarians of public institutions in Norway, Hawaii, the West Indies, the United States, and other countries, I am indebted for valuable official and other documents bearing on the subject, which I have freely quoted.

The *British Medical Journal* of July 3, 1886, p. 24, in a leading article on the investigations into the causation of leprosy, undertaken by Dr. Edward Arning in Hawaii at the instance of the Hawaiian Government, observes that this inquiry "is likely to have results of great importance both to science and to practical medicine." This prophecy is indeed likely to be fulfilled, but hardly in the manner anticipated by the writer. Amongst the most important of Dr. Arning's discoveries is that vaccination has been instrumental in widely disseminating leprosy amongst the helpless and confiding population of that beautiful Archipelago.

Leprosy is one of the most loathsome as it is one of the most tissue-destructive diseases known, and when going through the wards of leper hospitals I have frequently noticed with pain the poor afflicted creatures bending their heads and covering their hands to conceal from strangers the sight of their distorted features and mutilated limbs. It is hardly possible to conceive, much less describe, the depth of human misery caused by the spread of this hideous and destructive disease; but some idea of its nature may be gathered from the following description of leprosy, which may well excite the sympathy of the philanthropist. It will be found in a recent work on leprosy by Dr. Thin, pp. 99-100. It is translated from Leloir, an eminent French authority on leprosy, and refers to the tubercular variety of the disease. "If the patient," he remarks, "does not die of some internal disorder or special complication, the unhappy leper becomes a terrible object to look on. The deformed leonine face is covered with tubercles, ulcers, cicatrices, and crusts. His sunken, disfigured nose is reduced to a stump. His respiration is wheezing and difficult; a sanious, stinking fluid, which thickens into crusts, pours from his nostrils. The nasal mucous membrane is completely covered with ulcerations. A part of the cartilaginous and bony framework is carious. The mouth, throat, and larynx are mutilated, deformed, and covered, with ulcerated tubercles. The patient breathes with the greatest difficulty. He is threatened with frequent fits of suffocation, which interrupt his sleep. He has lost his voice, his eyes are destroyed, and not only his sight but his sense of smell and taste have completely gone. Of the five senses hearing alone is usually preserved. In consequence of the great alterations in the skin of the limbs, which are covered with ulcerated tubercles, crusts, and cicatrices, the pachydermic state of skin which gives the limbs the appearance of elephantiasis, and of the lesions of the peripheral nerves which are present at this time, and by which occasionally the symptoms of nerve leprosy are combined with those of tubercular leprosy, the sense of touch is abolished. The patient suffers excruciating pains in the limbs, and even in the face, whilst the ravages of the disease in his legs render walking difficult and even impossible. From the hypertrophied inguinal and cervical glands pus flows abundantly from fistulous openings. In certain cases the abdomen is increased in size on account of the liver, spleen, and mesenteric glands being involved. With these visceral lesions the appetite is irregular or lost. There are pains in the stomach, diarrhoea, bronchial pulmonary lesions, intermittent febrile attacks, and a hectic state. The peculiar smell, recalling that of the dissecting room, mixed with the odour of goose's feathers, or of a fresh corpse, is indicated, but badly described, by the authors of the Middle Ages, who compared it to that of a male goat."

Dr. John D. Hillis, formerly of British Guiana, says of the anaesthetic variety, that it is "known also as *leuke* of the Greeks, *baras* of the Arabians, joint-evil of the West Indies, *sunbahirii* of the East Indies, and dry leprosy, in contradistinction to the other form also known as humid leprosy; is characterised by a diseased condition of the nerves, and a peculiar eruption, the primary characteristic of which is loss of sensation, or anaesthesia; hence its name. After a time ulcerations form, a sort of dry gangrene of the limbs sets in, and joints drop off, and finally there is more or less paralysis. It would take a large volume to describe the signs or symptoms of leprosy, but the preceding account is -sufficient to show what an alarming affection we have to deal with."

In Mrs. Hayes' little book, "My Leper Friends," is a chapter on leprosy, by Surgeon-Major G. G. Maclaren, M.D., in which the writer observes, pp. 123-4: Acting on the strength of my own convictions as to the transmissibility and communicability of leprosy, I established the Dehra Dun Asylum on the principle already noted (the presence of a *bacillus* in the blood), and it has answered so far admirably; all its inmates living as happily as they can under their unfortunate conditions, and ending their existence contentedly! I have had, of course, ample opportunity of studying the nature of the disease, and its effects on the different organs of the body, and in many examinations I have made, *post-mortem*, I can testify that not a single organ in the whole body is exempt from the attacks and inroads of this dire and, loathsome malady. It invades the brain, spinal nerves, the eyes, tongue, and throat, the lungs, the liver, and other digestive organs. In addition, as is generally known, it maims and deforms the external parts of the body in a manner too revolting to describe. It is painful to witness the amount of deplorable suffering some of these creatures endure. True it is that many feel but little pain—one of the forms of the disease producing *anaesthesia*, or insensibility of the parts affected; but this is the case in a few only. The majority suffer in variously painful degrees, according to the organ or part implicated, and it is a mistake to think that their sufferings are little. Many, in the earlier forms of the ailment, lose their sense of sight, smell, and taste, and when their lungs or throat is attacked (a common form), their agonies are dreadfully distressing and painful to behold. The inroads of the disease are slow and gradual, which makes it all the more trying, and the painful and lingering death to which most are doomed is a condition that one dreads to dwell on." It was the terrible nature of the disease that fostered the growth of the *sumajh* in India, the leper being accompanied to the grave with tom toms, where, in a sitting posture, he was buried alive.

In the West Indies, in British Guiana, in the Sandwich Islands, and in South Africa, when cases of invaccinated diseases were related to me, I was urged by the sufferers and by their friends to make known their grievances to English people and to the Imperial Parliament, and, if possible, to bring public opinion to bear upon a mistaken and mischievous system which, without doing the least good, has been the cause of such terrible and far-reaching consequences. Acting upon these entreaties, and upon others contained in communications from various leprosy countries, I have presented to the public through the press, and to members of Parliament, such facts on this subject as came before my notice up to July, 1890. I now offer to the public further evidence and testimonies, on behalf especially of the afflicted population of our Crown Colonies and Dependencies, whose grievances have been so long and so flagrantly disregarded. Every attempt to introduce compulsory vaccination in the populous Island of Barbados, British West Indies, has been thwarted, owing to the widespread belief that leprosy and syphilis are communicated by the vaccine virus. In St. Thomas, Danish West Indies, and in Georgetown and other parts of British Guiana, it has, for similar reasons, been found practically impossible to enforce the vaccination law, and, in

spite of severe compulsory enactments, entire districts remain unvaccinated by reason of this special danger; while, in the Sandwich Islands, a bill for the repeal of the vaccination law was introduced in the Legislative Assembly, July, 1890, by J. Kalua Kahookano, representative from North Kohala, Island of Hawaii.

Under the head of "The Legislature," the *Daily Commercial Advertiser*, Honolulu, November 9, 1892, publishes the recent report of the Sanitary Committee, as follows :—

"Hon. J. S. WALKER, President of the Legislature.

"SIR,—The Sanitary Committee report consideration of Bills Nos. 9,13 and 25, and Petitions Nos. 33, 152, and 206, relative to Vaccination.

"The object of all these bills and petitions is to repeal the law compelling parents and guardians to cause the children in their charge to be vaccinated.

"The complaints against the present system were very pronounced, and the repeal of the law making vaccination compulsory was strongly urged."

The committee met the Board of Health and conferred with them upon the subject, and under date of June 25th, addressed a communication to the Board, in which is the following :—

"Hawaiian Legislature, June 25, 1892.

"DAVID DAYTON, Esq., President, Board of Health. "SIR,—An effort is being made in the Legislature to repeal or amend the law relating to vaccination; the object being to leave vaccination optional with parents and individuals.

" The chief objection raised against the present compulsory system appears to be the belief of some that leprosy, and other diseases, have been propagated by means of vaccination.

"It is said that some of the vaccinating officers are careless in the use of vaccinating instruments, operating first upon one person and then another without cleansing the instrument; and that there is distrust of the quality of virus used, in some cases serious inflammation and illness following the inoculation.

"The petitions and proposed measures relating to the subject have been referred to the Sanitary Committee, and the committee desire the views of the Board upon the subject.....

"Any suggestions the Board may be pleased to make will be appreciated.

Respectfully submitted,

WILLIAM O. SMITH, *Chairman Sanitary Committee*

The official report of the Honolulu Board of Health for 1892 shows that resistance to vaccination is spreading in many districts in these islands, and at the same time there is observed a sensible diminution in the number of lepers. In New Zealand, prosecutions for non-vaccination have for some time been abandoned. In the South African Colonies of Natal and Cape Colony the vaccination laws are enforced only during outbreaks of small-pox, and vaccination is everywhere regarded with mistrust. In the Transvaal and Orange Free State vaccination is entirely optional. In England there are about one hundred towns and poor law unions where the vaccination laws are a dead letter. In several of the Swiss cantons compulsory vaccination has been tried and abolished, and in no canton is there any penalty for non-vaccination. An attempt was made to pass a federal vaccination law in 1881, and was defeated in a Referendum by 253,968 votes against 67,820. In the Australasian Colony of Tasmania the compulsory law has been suspended by reason of its

deleterious effects on the health of the people. In the Colonies of New South Wales, and Queensland, Australia, the people have successfully resisted every attempt to impose the hotly-disputed Jennerian dogma upon them. Dr. Manning, the medical adviser to the Government of New South Wales, reports that in 1891 vaccination was only partially carried out in thirteen Country districts. In ninety-two districts, no vaccinations were reported. The extent of the mischief already experienced will never be known, but sufficient is already admitted to arrest the attention of all who are seriously concerned for the public health and for the well-being of the community. Is it not, therefore, the duty of every medical practitioner to personally inquire into the matter for himself; and no longer to shelter himself behind the orthodox belief in the benign character of vaccination? For nearly a century Jenner's prescription has been tried and found wanting. Each of the reports of the Royal Commission on Vaccination already published establishes the failure, mischievous effects, and injustice of the compulsory infliction of an artificial disease upon healthy people, while some of the most distinguished names in the profession have testified to its being the certain vehicle for the dissemination of leprosy. These names include Sir Erasmus Wilson (sometimes called the father of dermatologists), Dr. John D. Hillis, Dr. Liveing, Sir Ranald Martin, Professor W. T. Gairdner, Dr. Tilbury Fox, Dr. Gavin Milroy; Dr. R. Hall Bakewell, formerly Physician to the Leper Asylum, Trinidad; Dr. A. S. Black, of Trinidad; Dr. Edward Arning; Dr. Walter M. Gibson, late President of the Honolulu Board of Health; Professor H. G. Piffard, New York; Dr. A. M. Brown, London; Dr. Frances Hoggan, Dr. Blanc, Professor of Dermatology, University of New Orleans; Dr. Bechtinger, of Rio; Professor Montgomery, of California; Dr. Sidney Bourne Swift, late Medical Director, Leper Settlement, Molokai, Hawaii; Dr. P. Hellat, St. Petersburg; Professeur Henri Leloir, Lille; Dr. Mouritz; Surgeon Brunt; Dr. John Freeland, Government Medical Officer, Antigua; Dr. S. P. Impey, Superintendent, Leper Asylum, Robben Island, Cape Colony; and many others.

On the subject of leprosy there are no higher authorities; therefore, considering that the evidence adduced in the following pages is founded upon an accumulation of facts and the testimony of eminent dermatologists, it is hardly open to doubt the intimate relation between the spread of leprosy and the increase of vaccination. May I not, then, urge that a concerted effort—by petitioning Parliaments, Legislative Councils, and other governing bodies, and by the powerful aid of the press—should be made to abolish the compulsory infliction of a disease fraught with such disastrous and far-reaching consequences to the human family? Until vaccination is disestablished and discontinued, and sanitary amelioration substituted for the inoculative experiments, drastic drug medication, and nerve stretching, practised in various leper asylums, I am convinced that this dreaded disease will march onward with accelerated destructive force, and its ultimate extirpation will be rendered well nigh impossible.

No one can be more conscious of the shortcomings of this treatise than the author; but if the painful facts herein disclosed should induce some able and independent pathologist to continue these researches in the interest of the public and regardless of consequences, the author will feel that his efforts have not been altogether fruitless.

REDE HALL, BURSTOW, BY HORLEY, SURREY, *January 2<sup>nd</sup>, 1893*

## CHAPTER 1: THE INCREASE IN LEPROSY

[RUSSIA](#) [BOKHARA](#) [NORWAY](#) [ICELAND](#) [THE WEST INDIES](#) [JAPAN](#) [THE GRECIAN ARCHIPELAGO, TURKEY, AND SYRIA](#) [EGYPT](#) [THE UNITED STATES](#) [THE SANDWICH ISLANDS](#) [VISIT TO KALIHI](#) [THE MAURITIUS](#) [MADAGASCAR](#) [CANADA](#) [UNITED STATES OF COLOMBIA](#) [BRITISH GUIANA](#) [DUTCH GUIANA](#) [VENEZUELA](#) [AUSTRALASIA](#) [OCEANA](#) [NEW CALEDONIA](#) [FRANCE](#) [SPAIN](#) [THE UNITED KINGDOM](#) [SOUTH AFRICA](#) [INDIA](#) [BURMA](#) [CEYLON, TONQUIN](#)

THE awakening of public interest in the leprosy question is due to the accumulation of evidence from nearly all parts of the world, showing that this fearful scourge, for reasons which are now being investigated, has greatly increased, and is still increasing.

At a dinner given at the Hotel Metropole, January, 1890, in aid of the National Leprosy Fund, at which the Prince of Wales presided, Sir Andrew Clark said that, "after making due allowances for the scare and disturbance which had been occasioned, there remained the obvious and indisputable fact that leprosy was a real question. He could produce overwhelming testimony of this fact, and the evidence was conclusive not only that leprosy did exist in larger measure in recent years, but that new germ centres were springing up in various quarters, and the old centres were widening. Before England and the civilised world there was looming a condition of affairs which might by growth threaten civilisation"

Sir Morell Mackenzie, in an article entitled "The Dreadful Revival of Leprosy," which appeared in the *Nineteenth Century* for December, 1889, after referring to, its diffusion in Europe and America, says :—" In almost every other quarter of the globe leprosy is rife at present, and wherever it exists it seems to be slowly but surely extending its ravages. It is impossible to estimate even approximately the total number of lepers now dying by inches throughout the world, but it is certain they must be counted by millions. It cannot be comforting to the pride of England — 'the august Mother of Nations' —to reflect that a very large portion of these wretched sufferers is to be found amongst her own subjects."

Dr. A. M. Brown, in his comments on "Leprosy in its Contagio-Syphilitic and Vaccinal Aspects," says, page 6 :—"From all that we can learn, leprosy is now alarmingly on the increase, particularly in some of our Colonial dependencies, and the fact has been causing much anxiety in later years."

The actual number of lepers throughout the world is far more than is stated in official statistics; for all authorities agree that there are cases, in some countries very numerous, which have never been reported, "the patient and his friends" (in the words of Dr. Charles W. Allen) "knowing with what horror the public regards the disease, naturally shunning publicity, and the physician humanely guarding his secret." From personal inquiries in many countries, particularly in Ceylon, Hawaii, South Africa, British Guiana, Venezuela, and the West Indies, I can fully confirm Dr. Allen's conclusion. In Hawaii leper-hunting is a dangerous business, as many of these unfortunate beings consider death preferable to the best managed lazaretto, where, besides loss of freedom and the companionship of fond relatives, they are obliged to dwell amidst the most repulsive and saddening surroundings. While on a visit to the General Hospital, Honolulu, my attention was called to a police officer, Kealioha Mani, who was lying severely, and probably fatally, wounded by a leper whom he was endeavouring to arrest. A short time ago a party of lepers armed themselves with five new Winchester rifles, and fired upon the police sent in pursuit. The love of freedom burns as brightly in these afflicted people as in their more fortunate countrymen.

In an article on leprosy in Hawaii, in the *Occidental Medical Times*, April, 1889, Dr. F. B. Sutliff, Sacramento, California, who spent four years as Government Physician at Wailuku, on the island of Maui, observes:—"The work of segregation has at no time been faithfully carried out. A large number of milder cases are not disturbed at all, and a good many others have been permitted to go free because of some influence, political or otherwise, that they may have possessed. . . . It is seldom that a leper desires to go away from his home to an hospital, and the study of his life after he knows himself to be a leper is how to live with his friends and keep out of the way of those whose business it is to know all about him. I never before saw a place where the people can hide so easily. . . . They are quick to take alarm, and a look from the Government Physician, an inquiry concerning their name, is enough to cause them to change their residence at once." Dr. Sutliff says he has every reason to believe that there are at least four lepers not reported for every one that is.\*

\*Dr. L. Roussel, Government Medical Officer, in his report dated 30th October, 1888, Port Mathurin, Mauritius, says, "It is seldom lepers come to the Dispensary for treatment. Most of them hide themselves in the mountains, and do not like to move about in public."

Dr. H. S. Orme, President of the State Board of Health, California, in his instructive treatise on Leprosy, says, "I have no doubt that the practice of *secreting lepers is general throughout the world*, wherever the disease prevails; and it is not difficult, in an early stage, for lepers to evade the authorities and go about their usual business."

The largest number of lepers segregated in any one year was in 1873, when the numbers received at the leper settlement, Molokai, according to the official reports, was 487, for several years previous to which arm-to-arm vaccination has been prosecuted with great and unparalleled energy. The destructive results of this misguided policy are everywhere manifest for those who are not too prejudiced to see what is plainly before them.

#### RUSSIA.

Leprosy is reported to be increasing in Russia with startling rapidity. A St. Petersburg correspondent of the *London Standard*, January 18, 1891, says:—"The Town Council of Riga, aroused by the rapid spread of leprosy in the neighbourhood, has voted a sum of nearly six thousand roubles for the establishment of an asylum and hospital, which it is hoped will be ready to be opened in August. In 1887, Dr. Bergmann discovered thirty-seven cases in the town, and twenty-one in the environs. There are now over one hundred. In and around Dorpat, where the disease has attained alarming proportions, the late Professor Von Wahl strongly urged the necessity of leper colonies, such a system of compulsory isolation being in conformity with the provisions of the existing, but unenforced, law of Livonia."

As to the prevalence of "prokaza," or leprosy, in Russia, Dr. O. Petersen and Professor Munch have collected eight hundred and seventeen cases, which, however, must be considered far below the actual number. The former observer has noted forty-three cases from the records of the St. Petersburg hospitals in the last sixteen years.

Archdeacon Wright in his instructive work, "Leprosy an Imperial Danger," says that leprosy has increased so much of late in the Russian provinces of the Baltic that last year a "Society for Combating Leprosy" was founded at Dorpat, under the presidency of Professor Wahl, but otherwise composed entirely of lay members. Dr. Hellat, of Dorpat, travelled through the district, and showed that the reports made to the Government were very imperfect. In Livonia, where official statistics reported 108 cases, he found 276. In Courland he discovered 76 cases, and in Esthonia, 26. From other sources I hear that in the neighbourhood of Dorpat the lepers number as many as 17 per 100, and another report says that in certain districts 10 per cent of the population are affected. From more recent reports (May, 1892) I learn that the Town Council of Riga, alarmed by the ever-increasing proportions attained by the fearful malady, have just erected a leper hospital, at a cost of 60,000 roubles, which already contains 98 authenticated cases. The British Consul at Riga, in his report for 1891, says:—"It is difficult to discover the victims of this dire malady, as their relations and friends hide them from the sanitary inspectors."

In a communication from Dr. P. Hellat to Dr. P. S. Abraham on "Leprosy in the Baltic Provinces," dated 10th October, 1891, St. Petersburg, Mochovaia, 44, the writer says :—"My observations, continued for three consecutive years, gave the astonishing result that leprosy was very widely spread in the Baltic provinces; certainly considerably more than we formerly thought ourselves justified in believing. The number of lepers in certain districts is as much as 2 per cent, of the population. Furthermore, the investigation showed that the disease was steadily on the increase."—*Journal of the Leprosy Investigation Committee, No. 4, December, 1891, pg. 7.*

#### BOKHARA.

The *London Daily Chronicle* of October 29th, 1891, contains the following (per Reuter's telegram):--

"St. Petersburg, October 27th.—The Emir of Bokhara has had several consultations of late with Russian medical men concerning the prevalence of leprosy in his dominions, and especially in the north-eastern quarter of the town of Bokhara, called Gonzari Pissiane, which spot may indeed be considered as the hotbed of leprosy in Central Asia. The lepers are allowed to lead an independent life in this quarter; they are allowed to contract marriages, and no supervision, whether medical or otherwise, is exercised over them. It has resulted from the advice tendered him at these consultations that the Emir has decided upon the foundation of a special hospital for the lepers, at which they will be treated by specialists in their disease."

#### NORWAY.

The present writer has been under the impression that leprosy had diminished in Norway, the diminution being generally admitted to be due to the segregation of lepers in the hospitals at Troudhjem, Molde, and Bergen; but Dr. Vandyke Carter, who has closely investigated the subject, considers that :—"So far from leprosy in Norway showing a natural tendency to subside, there is ample evidence of a present activity equal to that displayed by the disease twenty-five years ago."—*British Medical Journal, Nov. 28th, 1885, p. 1048.*

#### ICELAND.

The Rev. W. T. M'Corrick, in a lecture delivered at Brighton, says:—" Before leaving, I was enabled to gain some details respecting leprosy, which is of a bad kind, and indigenous to the country, from Mr. Patterson, the British Consul, to whom Archdeacon Wright had written for information when publishing his book on this disease, and also Dr. Scheving. I learned here that in the year 1800 there were 150 cases out of a population of 50,000, but that now, out of a population of 72,000, the numbers had decreased to 25. I must state, however, that on further inquiries from an older and more experienced doctor near Laugardalir (Gudmunson, I think, was the name) I was told that the disease was increasing, and that one in every thousand was a sufferer from this hideous complaint. There are no hospitals for leprosy in Iceland, though Dr. Henderson, who travelled through the island in 1814, states that there were four then in existence.—*Journal of the Leprosy Investigation Committee, No. 4, December, 1891, pp. 69, 70.*

#### THE WEST INDIES.

During my visits to the Virgin Islands, the Leeward and Windward Islands, and British Guiana, 1888-89, I had opportunity of conversing with intelligent residents, including governors, medical practitioners, superintendents of leper hospitals, magistrates, prison chaplains, editors of newspapers; and the general opinion was that leprosy was largely on the increase. In some islands, such as Jamaica, St. Kitts, and Trinidad, there are leper communities, which are gradually increasing; and appeals are frequently made in the Colonial Press for their segregation in hospitals.

In a dispatch to the Colonial Secretary, Dr. R. Hall Bakewell, Vaccinator-General, Trinidad, said : —" The very great increase of leprosy in this island, particularly among persons in easy circumstances, is the subject of general remark, and although we have no statistical evidence of the fact, yet it seems admitted on all hands."—*Page 7, Compendium of "Extracts from Report and Returns" in the "Royal Gazette," Trinidad, March 1st, 1871.*

On the 22nd January, 1889, I visited the lazaretto at Barbados, a crowded institution. A new ward was then in course of construction, to accommodate 32 more patients; but the applications from the single parish of St. Michael were greater than the extra beds to be provided. I may mention that the island of Barbados comprises thirteen parishes, with a total population of about 180,000 of which St. Michael's contains about a sixth; and it is estimated that 150 to 200 more beds ought to be provided under the present system of voluntary segregation. If the segregation, which includes only the leprous poor and pauper class, were compulsory, as some now demand, the alarming spread of the disease, which is endemic in all the islands, would be yet more fully exhibited.

The *Official Gazette*, Barbados, May 5th, 1890, p. 524, says :—"With a daily average of 104 there have been 16 admissions, 3 discharges, and 4 deaths. The Poor Law Inspector, Mr. C. Hutson, says: — "Considering the overcrowding of the wards, it is, I think, wonderful that we keep so clean."

The census returns from Barbados show that while the population during the ten years, 1871 - 81, had only augmented 6 per cent., the lepers had multiplied 25 per cent.

According to the Surgeon - General's report of hospitals in Trinidad for 1880, No. 41, p. 38, the number of patients in the Leper Asylum on June 30, 1880, was 124.

The report for 1888, *Trinidad Royal Gazette*, p. 1116, says :—" The admissions have been limited to the amount of accommodation, and there were fourteen lepers at the end of the year in the Colonial hospitals, awaiting vacancies for admission to the Asylum."

The Asylum (at Mucurapo, Port of Spain, Trinidad), which I visited in February, 1889, contained at that time 180 patients (under the medical superintendence of Dr. Bevan Rake), who are admirably cared for by the French Dominican Sisters. Every bed is occupied. In his report to the Surgeon-General for 1887, Dr. Rake says:—" The new infirmary at the Asylum was opened in August last, and was quickly filled, 19 patients being admitted on the 19th, and nine more on the 25th. Since then it has been constantly full."

I was informed by the lady superintendent that a new ward was, to be built at once, to contain 30 additional beds. There were then, she said, fourteen lepers in the Colonial (Port of Spain) Hospital awaiting vacancies for admission to the asylum.

In the last report on leprosy in Trinidad, dated March 1st, 1891, by Dr. W. V. M. Koch, acting Medical Superintendent, it is stated (p. 65) that the new infirmary ward, which was finished at the end of 1889, and occupied early in 1890, has been full all the year round. There was a rush of patients to fill it.

The *Trinidad Leprosy Report* for 1890 (p. 31) says that during the year a new ward containing 30 beds has been opened. The asylum contains 210 inmates, "every bed being occupied."

Dr. Bevan Rake says :—" There is, I fear, little doubt that the disease is increasing in Trinidad as in other tropical countries."—*Papers on Leprosy, Trinidad, p. 34.*

In an article entitled the "Dreadful Revival of Leprosy," in the *San Fernando Gazette*, Isle of Trinidad, 22nd February, 1890, the writer says :—" It may not be generally known that as far back as 1805 there were only three lepers in Trinidad; eight years later there were 73 out of a population of 32,000. Twelve years later, when an attempt was made to segregate them upon a small adjacent island, it was found that these afflicted persons had increased so rapidly that the scheme had to be abandoned. In 1878 there were 860 out of a population of 120,000, and later statistics show that the number of lepers was increasing four times as rapidly as the population." The writer arraigns the authorities for their supineness, and urgently calls upon them to take the necessary steps to arrest the progress of this fearful disease.

In a leading article in the *St. Christopher Gazette* (of St. Kitts), the 17th May, 1889, entitled, "The most pressing question in the Colony," the writer quotes Dr. Boon's last quarterly report, which (he says) "clearly and forcibly showed the Government the enormous increase in our leper population during the last six years." Dr. Boon, who held the position of Acting Government Analyser of Vital Statistics, says :—" There is one subject to which I would specially call the attention of the Government, and that is the necessity of legislation with regard to lepers. I am satisfied that the disease is increasing rapidly in this island (St. Kitts)."

In the *Lazaretto*, No. 11, a paper published in the West Indies, the editor asserts that a careful census carried out by medical officers would demonstrate that St. Kitts and Nevis contain more lepers per thousand of the population than any other British possession. He also considers that the disease has increased in Antigua, and there are no fewer than 300 lepers in the Leeward Islands. The *Lazaretto*, No. 21, for April 20th, 1891, estimates the number of lepers in the two islands of St. Kitts and Nevis at 200. In 1871 Dr. Munro discovered, by a personal census, that there were 72 lepers at St. Kitts, a number which has now increased to 135, or at the rate of 90 per cent. in twenty years. To accommodate the growing community of lepers, a large lazaretto has recently been built at Sandy Point, ten miles from Basse Terre, St. Kitts, which already contains eighty inmates. The *British Medical Journal* for June 20th, 1891, says that a petition was lately sent to the Governor, Sir W. F. Haynes-Smith, with the request that it might be sent to the Queen. Amongst other things it states that leprosy is most prevalent in these islands, and that the number of persons afflicted with it is rapidly increasing.

The London *Daily Graphic* for August 15th, 1891, publishes the following:—" Sir Morell Mackenzie writes—' I beg to enclose a copy of a letter recently received by Dr. Munro, formerly medical officer of St. Kitts, West Indies, which shows conclusively that leprosy is extending in that colony.'

"The letter from Dr. Boon, referred to by Sir Morell, runs as follows :—" 'In your time I believe there were about fifty lepers in St. Kitts; at present there are 120 known lepers, and I think there are a good many more that are kept hidden from the medical men. I am at present getting as complete a list as possible of the lepers here. One thing is very noticeable in Nevis, namely, the way in which the leprosy spreads in each neighbourhood from single cases. It is not easily traced in St. Kitts, as the people there do not own land like the Nevis people, and are consequently more nomadic. One thing has struck me very much, and that is the number of shop-keepers that have contracted the disease.'

"We have also received a letter from Dr. Boon, who says :—" 'The enclosed photograph of mendicant lepers, subscribed for by a few gentlemen of this island for the purpose of forwarding to you for publication in the *Daily Graphic*, will give a slight idea of the risks by contagion to which the population of this colony is daily subjected. Leprosy has attacked people of all conditions in the West Indies. A few years ago a newly-appointed inspector of police enforced the local 'Vagrant Act,' and prevented the squads of mendicant lepers from perambulating the town, begging from house to house, and importuning people in the streets. Through the action of the then President of the Island, the inspector was forbidden by the Governor to interfere in any way with these lepers. The fact that a member of the former gentleman's family was afflicted with this disease may have had something to do with his action in the matter. We count among our lepers (other than mendicants) bakers, butchers, salesmen in groceries and provision shops, fishermen, printers, editors, circulating - library keepers, shopkeepers, planters, agricultural labourers, and carpenters. In a lodging-house kept by a leper, members of the Bar lodged when on circuit, and slept on the same bed used by the leper when he had no lodgers. Another leper kept a creche, and tended about twenty infants at a tithe in his room for over ten years.'"

In the report of the Blue Book of St. Vincent, British West Indies, 1890, the Acting Administrator observes:—"It is

greatly feared that leprosy, which has already proved so great a scourge to some of our colonial possessions, will become a serious trouble in St. Vincent.

Our administrator of the islands, Mr. Irwin C. Maling, reports to the Colonial Office that the disease, though perhaps slowly, is surely on the increase; and though the average of patients treated at the Leper Asylum is only 15, there are many more at large. No law exists to compel those afflicted with the disease to go to the asylum and receive proper medical attention, but the subject is one which will receive the early attention of the Local Government."

On June 2nd, 1890, Mr. Gourley, M.P., called the attention of the Under-Secretary of State for the Colonies to the considerable population of lepers in the West Indies, which, he said, was daily increasing. Sir W. F. Haynes Smith, of the Leeward Islands, who informed me in 1889 that leprosy was seriously on the increase in the West Indies, issued an address to the Federal Council in April, 1891, in which he quotes the opinion of the medical profession that the disease has greatly increased, and that the only satisfactory explanation of the spread of the disease is that under certain conditions it is communicable and contagious. Sir William Robinson, Governor of Trinidad, writing to the Secretary of State from Government House, 9th May, 1889, says :—" After fifteen years' residence in the West Indies, I can fully corroborate Dr. Rake's statement that leprosy is on the increase, and I am not surprised at it."—*Papers on Leprosy, Trinidad, p. 35.*

In the report of the superintending medical officer of Jamaica, dated July, 1891, it is stated that 420 cases of leprosy in the island are known to the district medical officers, but it is conjectured that a good many living in unfrequented districts are not reported, and that some cases in families of the better classes are not to be found in these returns. The actual number is estimated at 450, or one in 1378 of the present population of the island, reckoned at 620,000. This is a decidedly low estimate. A new ward, capable of accommodating forty beds, has just been made ready for the reception of these unfortunate patients.

A communication from Dr. N. Lacary, physician to the lepers in the French Antilles, dated Basse-Terre, Guadeloupe, January 16th, 1892, and sent by request of the chief of the Sanitary Department at Guadeloupe, in reply to an inquiry for the statistics in respect to leprosy, states that it is impossible to report with accuracy the number of persons known to be more or less subject to leprosy throughout the various districts. The island of La Disirade, in which the Lazar-house is situated, may afford some exact figures, and contains one hundred diseased (leprosy) persons from Guadeloupe and its dependencies, and from Martinique. The lepers frequently secrete themselves, and it is impossible to give the exact figures of those who are at large. It is recognised throughout the islands that leprosy is on the increase.

#### JAPAN.

As my communications to the Authorities in Japan requesting information remain unanswered, I have but few details to report. Leprosy has existed from time Immemorial in this country, and there is an old established leper settlement at the hot springs at Kusatsu, to the north of Tokio. Leprosy is reported to be increasing considerably, and according to a communication in the *Liverpool Mercury*, September 22nd, 1891, three leper hospital asylums have been established in Tokio during the past ten years. One of these hospitals, treated in 6 years 4249 cases, of which 3852 were those of Japanese patients. The *Pioneer* (Allahabad) of September 9th, 1891, reports that leprosy has spread in the Japanese villages to an alarming extent during the past few years. In one village near Toimachi, in the Gifu Ken province, every inhabitant is a leper. The Japanese Government is taking steps to look after their afflicted people.

Mr Hamilton Cartwright, in *The Lancet* for May 25th, 1889, states that vaccination was made compulsory in the seventh year of Meiji (1874). It will be noted therefore that the rapid diffusion of leprosy took place shortly after the introduction of the compulsory law, and has kept pace with the progress of vaccination in this community. Dr. Tamanoto, of the Imperial Japanese Navy, says that when leprosy occurs in a family it is the custom to conceal it.

The Rev. Father Vigroux, Missionary Apostolic, in an article in the *Catholic Review*, which also appears in the *Tablet*, May 14th, 1892, says that 44 patients have already been admitted to the Leper Hospital at Gotemba, Japan, founded by the late Father Testevuide. There is accommodation for as many as eighty.

#### THE GRECIAN ARCHIPELAGO, TURKEY, AND SYRIA.

In the Island of Samos, with a population of 42,000, there are 43 registered lepers, and many others unregistered; to segregate whom the Prince of Samos has built an asylum. In Constantinople Dr. Dujardin Beaumetz estimates that there are three thousand, some of them at large, and others in the hospitals.

In Syria lepers abound, and the most repulsive examples I ever saw were in the lazaretto at Damascus, where the supervision and accommodation was of the most wretched description. For their comforts they depended on the alms given by casual visitors. In Palestine I noticed many lepers, in the most hideous state of deformity, begging. This was in 1884. The Constantinople correspondent of the *Times* writes (July 31st, 1889):—" Dr. Zambaco has made a special study of leprosy, and purposes to present to the congress 'the result of his assiduous labours on the subject. Like some others, Dr. Zambaco has come to the conviction that leprosy is non-contagious. He offers practical arguments and proofs in support of his opinion. There are in Constantinople alone upwards of 250 lepers, all of whom Dr. Zambaco has personally attended. Of these, 25 individuals only are isolated in a special locality at Scutari—the remainder are to be seen in the streets, and in contact, without any restraint, with the rest of the population. In the Islands of the Archipelago there are at Crete 8000 lepers; and at Rhodes, Cyprus, Mytilene, Tenedos, and other smaller islands, they are also numerous, and excepting in the larger ones, free in their movements. Dr. Zambaco has prepared to lay before the congress, and for publication, a most interesting work upon the subject of leprosy in the Levant, containing numerous illustrations, portraits, and biographies of patients living and dead, with accounts of curious cases of cure, non-contagion, and remarkable facts observed by him, which cannot fail to attract attention of scientific men with respect to the disease which has come so prominently before the public."— *Times*, August 6, 1889, p. 10.

### EGYPT

During my visit to Egypt in February, 1891, endeavoured to ascertain the facts as regards leprosy in that country. I called at several hospitals, and conferred with a number of officials connected with Government, but without obtaining much information. Dr. Selim Zeidan, the medical director of the General Hospital at Luxor, informed me that during the past few months five lepers had presented themselves for admission, but he was obliged to refuse them. This was due not to want of space, but to lack of funds. In a communication to Dr Abraham, dated 4th Nov-1890, and published in the *Journal of the Leprosy Investigation Committee*, Dr Greene, of Cairo, director of the Sanitary Department, Egypt, states that the total number of cases reported is 2058, "but this does not by any means represent the whole of the lepers in Egypt, for many districts, where I have reason to suppose some exist, sent in blank returns."

### THE UNITED STATES

Dr. Blanc, of New Orleans, Clinical Lecturer Dermatology at the Medical College, and Dermatologist to the New Hospitals, has had opportunities for observation. In a report to Louisiana Board of Health, May, 1889, he refers to 42 known cases of leprosy at New Orleans, twelve cases at La Fourcho, and six cases (these doubtful), at St. Martinsville; and in only a very small number could he discover the causation in heredity.

In the *New York Medical Journal*, July 13th, 1889, Dr. R. W. Taylor states that during the past fifteen years he has almost constantly seen from one to three lepers in the crowded wards of the hospitals on Blackwell's Island, New York. Other authorities give similar reports of the New York hospitals.

Dr. Charles W. Allen, Dermatologist, in his article on "Leprosy" in the *New York Medical Journal*, March 24th, 1888, calculates the number of lepers in the United States at 150. "Unquestionably," says Dr. Prince A. Morrow, "is leprosy gaining ground in this country, and the disease prevails over more than a fourth of the habitable globe."

### THE SANDWICH ISLANDS

In the Sandwich Islands leprosy is allowed to be the chief of the destructive forces which are gradually depopulating the native race of this beautiful archipelago. Its rapid increase is by far the most urgent and anxious question of the hour, and successive Medical Officers of Health seem powerless to cope with it.

In a leading article on "The Nature of Leprosy" *The Lancet*, July 30th, 1881, p. 186, says :—" The great Importance of the subject of the nature and mode of extension of leprosy is evident from the steady increase in certain countries into which it has been introduced. In the Sandwich Islands, for instance, the disease was unknown forty years ago, and now a tenth part of the inhabitants are lepers. In Honolulu, at one time quite free, there are not less than two hundred and fifty cases; and in the United States the number is steadily increasing."

According to the latest returns handed to me (October, 1890) by Mr. Potter, the Secretary to the Board of Health, Honolulu, 1154 lepers were segregated in Molokai, to which must be added thirty, sent from the Hospital of Suspects at Kalihi to Molokai on the 30th of the same month, while there are probably several hundred secreted by relatives in the various islands. On 31st March, 1888, the number officially reported to be at large in the various islands amounted to 644, but, efforts have been made during the past three years to capture these afflicted creatures and segregate them at Molokai.

The experiment of segregation, coupled as it is with enforced separation of relatives and friends amongst a race who are very gregarious and affectionate, is attended with great difficulties, and found impossible to carry out successfully.

A medical practitioner informed me that well-to-do lepers were not interfered with, and he gave me the names of several at large who occupied prominent positions in the island; and he observed that it was not intended to disturb them, notwithstanding the law which imposes segregation upon all lepers regardless of distinction.

Dr. J. H. Kimiball, of Honolulu, ex-President of the Board of Health, in his official report for 1890, observes:—"Some very bad and unmistakable cases are in hiding in the fastnesses of the mountains or high up in the valleys, fed and secreted by their friends, while some mild cases change their place of residence so often as to baffle the efforts of the officers of the law for their arrest."

Dr. Edward Arning reported that he had visited the remotest gulches and corners of the islands, where few white men penetrate, and had found lepers at large, including some bad cases. He suggests that it may be just-as well to leave these poor wretched creatures where they are, as they are more out of the way there than at Kakuako or Kaluapapa. Dr. John S. M'Grew, in a communication to General James de Comby, the United States Resident Minister, says :—" From political and other influences with officials of the Government, many lepers are permitted (in Hawaii) to go at large without being questioned—really dangerous cases of leprosy."

Dr. White, surgeon to the United States Navy, who visited the islands in 1882, in a report to his Government estimates the concealed cases at 3 per cent. of the population.

Mr. Dayton, the President of the Board of Health, Honolulu (an old resident in the island, who has had a wide experience in the service of the public health), was kind enough to furnish me with facts relating to the introduction, establishment, and increase of leprosy throughout Hawaii, and the steps taken to deal with it by isolation, medical treatment, and hygiene, and also with copies of official reports published by the Board of Health.

According to the same writer on the subject, leprosy was discovered in the island in 1840, but Mr. D. Meyer, Agent for the Honolulu Board of Health, in the appendix to the report presented to the Legislative Assembly of Honolulu in 1886, says it was in 1859 or 1860 that he saw the first case of the disease. That 1840 was the date of its introduction is the opinion of Dr. W. B. Emerson, ex-President of the Board Health, Honolulu, who, in his report published in *Practitioner* of April, 1890, attributes the introduction of the disease to a case reported by the Rev. D.D Baldwin, M.D., to the Minister of the Interior, May 26th, 1864. In 1863 Dr. Baldwin received reports from the deacons of his church at Lahaina with the names of 60 people who were believed to be affected with this disease. In a very few years leprosy increased to an enormous extent, and in 1868 Dr. Hutchinson reported 274 cases.

Dr. Emerson says :—" Leprosy has made fearful strides. It is not necessary to trace with precision the curve that represents the increase of leprosy in these islands from that date to the present time. It is a fearful story, and should teach us that leprosy is undoubtedly communicable."

In his report dated Molokai, March 3 1st, 1888, Mr. Meyer says :—" That the spread of this scourge in these islands has been truly fearful is known to every one here, and that it could not have spread as it has done unless it were communicable, appears to me to admit of no doubt."

To account for the appalling spread of this terrible scourge of humanity within such a short period of time, the evidence points conclusively to one prominent cause--vaccination. There is no evidence to show that leprosy increased in Hawaii until after the introduction and dissemination of the vaccine virus.

Small-pox was introduced from San Francisco in the year 1868. In that year a general vaccination took place, spring lancets being used, which the President of the Board of Health (Mr. David Dayton) informed me were difficult, if not impossible, to disinfect—the operation causing irreparable mischief. The synchronicity of the spread of leprosy with general vaccination is a matter beyond discussion, and this terrible disease soon afterwards obtained such a foothold amongst the Hawaiians that the Government made a first attempt to control it by means of segregation. Another outbreak of small-pox occurred in 1873, and yet another in 1881, both followed by general arm-to-arm vaccination and a rapid and alarming development of leprosy, as may be seen in successive reports of the Board of Health. In 1886 the then President of the Board of Health recorded his conviction, in an official report, to the effect that "to judge by the number of cases in proportion to the population, the disease (leprosy) appears to be more virulent and malignant in the Hawaiian Archipelago than elsewhere on the globe." Leprosy became then, and is now, the most pressing question in these islands.

## VISIT TO KALIHI

In October, 1890, I started from Honolulu in company with Mr. C. B. Reynolds, the Chief Executive Officer of the Board of Health, to visit Kalihi, a place three miles away, where persons supposed to be tainted with leprosy were incarcerated. It consists of cottages, dispensary and recreation ground, the whole surrounded by a double wall to prevent escape, and is a dreary place of abode. There were 74 patients in the establishment, most of whom exhibited distinct traces of this loathsome malady, including some unusually bad cases. Within this enclosure was a comfortably furnished cottage which Sister Rose Gertrude had recently occupied, but had now vacated. Both the cottage and the dispensary of which this lady had the charge were in a bad state of disorder, and presented a painful contrast to rooms in the care of the Dominican Sisters at Trinidad, and in other Asylums I have visited.

The day after my visit, 31 of the inmates were taken from the Suspect Hospital to Honolulu, and thence from the King's Wharf were forcibly deported to the living grave at Molokai, from whence no traveller returns. The scene was of the most painful description. These afflicted creatures were torn from their friends and relatives, husbands from wives, children from their parents, frantic with uncontrollable grief. Lovers were separated, their lips trembling with emotion, amidst unutterable wailings, wringing of hands in the agony of despair, and heart-breaking experiences which I shall never forget, and which the pen of a Balzac, or Victor Hugo, could only adequately describe. Mr. Reynolds said that at times it seemed more than he could stand and he did all that was possible to mitigate their sufferings. He told me that in ten days time there would be another contingent to undergo the same sorrowful experience. This goes on year after year, and will probably continue until medical men themselves turn their attention from experimental treatment to preventive measures, and themselves petition Governments to suppress the mistaken system of vaccination, which, it is admitted by the highest authorities, has been a prolific source of this terrible evil.

## THE MAURITIUS.

In the Mauritius, according to Dr. Seizor, in the *Progres Medical*, 1886, translated by Dr. P. Abraham, and quoted in his work on leprosy, lepers of all races, including Europeans, can be counted by hundreds without difficulty.

## MADAGASCAR.

The Paris correspondent of the *Daily News* telegraphs, August 12th, 1890, that the French Catholic missions in Madagascar have taken up the lepers there, and have built a lazaretto at Ilafy, near Antananarivo. A second hospital for 200 lepers, who are not so invalided, is at Abohivaraka, where they work in the rice marshes.

## CANADA

In May, 1885, the lazaretto at Tracadie, New Brunswick, contained 21 lepers, and others were known to be at large.

The *British Medical Journal*, July 18th, 1891, says:—"Owing to the increase of leprosy in British Columbia, the inhabitants recently memorialised the Canadian Government, asking that some steps should be taken to check the progress of the evil. It has accordingly been resolved to found a leper colony in D'Arcy's Island, which lies off the coast. As soon as the arrangements are complete all the lepers in the colony (most of whom are Chinamen) will be transferred to this island. Dr. F. H. Smith, the superintendent of the well-known lazaretto at Tracadie, New Brunswick, has been requested to investigate the alleged increase of leprosy in the towns of the Pacific slope of the Dominion"

## UNITED STATES OF COLOMBIA.

In the consular report to the Foreign Office, sent by Mr T H Wheeler, the British Consul at Bogota, dated September 26th, 1890, I find various facts confirming previous reports as to the rapid development of this disease Referring to the number of lepers Mr Wheeler says —" A well-known physician of Bogota, the editor of the *Medical Review* of the city, has stated, in an article lately published in that review, that one tenth part of the inhabitants of Santander and Boyaca are lepers. As the population of these two departments is about 1,000,000 this estimate would give 100,000 lepers in that portion of Colombia alone. The medical officer of the principal lazaretto of the country, who has travelled extensively in the departments of Santander and Boyacá, with a special view of studying the question of leprosy, estimates that they contain some 30,000 lepers I believe that both these estimates are very much exaggerated, but the number of lepers must be very great in those two departments, as I am aware from my own observations in travelling through them in 1883. Some months ago the Government of Santander endeavoured to obtain from the various municipal authorities official returns of the number of lepers in the department. Reports were sent in from about half the municipalities, giving notice of 1804 lepers, of whom 388 were living in the lazaretto of the department. But no returns were sent in from the districts

known to be most infected with leprosy, and in any case, no satisfactory census upon such a subject can possibly be taken in Colombia. On the merest suspicion that anything of the sort was intended, every leper, who could possibly do so, would at once disappear, and remain hidden until it was all over, for fear of being dragged to a lazaretto and separated from his family and friends, and amongst the population, in general, there is no such dread of the disease as would lead them to give information against any lepers who might be concealed in their neighbourhood.

"Santander and Boyaca are the departments most infected with leprosy; next to these are Cundinamarca, Tolima, and Antioquia, in the order named, but a certain number of cases are to be found in all the other departments. In Cundinamarca, where the number is more easily estimated than in any other part of the country, there are said to be over 4000 cases of leprosy, and in Antioquia from 800 to 1000. In the whole Republic, there cannot, I believe, be less than 20,000 cases, and there are probably many more.

"Leprosy is most common in Colombia amongst the lowest classes, whose homes and mode of life render them liable to exposure to cold and damp, but it is by no means confined to the poorer class, as many people of wealth and position have been attacked by it."

There are two lazarettos in Colombia, one in Agua de Dios, where one consul found 520 lepers in July, 1890, the other at Contratacion, department of Santander, with 390 of these afflicted people. A Bill has recently been laid before Congress asking for an appropriation of £10,000 for the construction of a new lazaretto, but the disease has reached such proportions as to render such a sum quite inadequate to cope with the ravages of the disease. Mr. Wheeler says that it seems inevitable that leprosy should continue to spread more and more throughout the country, unless some great effort is made to arrest its progress. He remarks that in Antioquia not a single case of leprosy was known thirty years ago. Since then, the disease has spread in all directions, and the number in this town is now said to be over 800. I may add that, during the interval, vaccination has been introduced in all the Republics of South America with the usual sinister results.

Mr. Edward H. Hicks, M.R.C.S., practitioner in Bogota, says :—" The local authorities have called attention to the alarming spread of leprosy in the Republic of Colombia, South America. In districts in which the disease was formerly unknown it has appeared to spread with great rapidity. As to articles of diet, the greater number of cases occur where fish cannot be obtained in these places."—*British Medical Journal*, Nov. 8th, 1890.

The *New York Herald*, of April 10th, 1892, says:—" Reports about the spread of leprosy in the Republic of Colombia are of the most alarming character, and should receive the very serious consideration of the United States health authorities. Every district in Colombia is said to be more or less infected."

In the last annual report of the Consul-General of the United States of Colombia (1890-1) it is observed that the question of the great increase of leprosy has become a very grave one for the country. Prior to the year 1860, the numbers of the afflicted were comparatively stationary; but since that time the increase has been much more rapid, and the disease has spread to districts in which it was previously unknown, almost the whole of Colombia being now infected. Children are frequently seen in the lazarettos in a leprous state, and the mortality is exceedingly high.

Dr. Alzevedo Lima, chief medical officer, Hospital, Rio de Janeiro, says :—" Has leprosy increased in Brazil within the last years? It seems that it has, but we have no exact data to guarantee a positive affirmation. However that may be, it is no exaggeration to say that in Rio de Janeiro there are more than 300 lepers disseminated throughout the city "—*Journal of the Leprosy Investigation Committee*, December, 1891, p 25

The last census of Brazil returned the number of lepers at 5000, but Dr. Lutz, a lepra specialist, estimates it at 10,000 and upwards.

#### BRITISH GUIANA.

In January, 1889, I visited Demerara and Essequibo, British Guiana, but owing to the state of my health I was unable to visit the leper asylums at Mahaica and Gorchum. During my sojourn, the newspaper at Berbice (where the leper asylum is located) published a statement to the effect that, for want of accommodation in the asylum, lepers in the worst stages of the malady had been seen in the streets and bye-ways. In the report of the Surgeon-General of British Guiana for 1887, Dr. C. F. Castor says:—" I hear on all hands that leprosy is spreading — not only here, but all over the world—very considerably." And in a communication to the secretary of the Leprosy Committee, dated 21 November, 1891 (*Journal No. 4, p. 36*), Dr. observes:—" No one for a moment doubts that leprosy is spreading' I was able to obtain only one report of a date earlier than 1887, that of the Surgeon-General for 1879, in which Dr Manguet says —" Many children are brought to me in the incipient stages the disease (leprosy)," and added that the disease was spreading.

When going over the Colonial Hospital, Georgetown, British Guiana, Dr Ferguson spoke to me of the serious increase of leprosy in the colony, and said that they were obliged at the general hospital to receive lepers for whom there was no room at the asylum. He pointed out to me five lepers in one ward with other patients. Dr J L Veendam, a Government medical officer, who had at that time resided sixteen years in the colony, and has medical charge of four sugar estates, assured me that leprosy was much more widely disseminated in the colony than was generally supposed, and that this was the case amongst all classes of society. Referring to a ball which was to be given that evening to Governor Haynes Smith, he added, 'I know lepers who will mix with the gay through this evening.' Some time ago Dr Veendam medically examined all the labourers on the four estates under his charge, 250 in number, and found about 50 who were more or less tainted with leprosy.

One of the highest authorities, Dr. John D. Hillis, F.R.C.S., for ten years Medical Superintendent of the principal lazaretto in British Guiana, and who has devoted twenty years to the consideration of this important subject, says :—"To the most casual observer (in British Guiana) the increase must be apparent, irrespective of the fact that the asylums cannot be enlarged fast enough to contain the cases that are compelled, by want or the rapid advance of the fell disease, to seek admission and relief within their walls, whilst hundreds of others, it is well known, do not enter but remain outside to mingle with others or contaminate their surroundings. Not only is leprosy on the increase in the colony, but the increase has been greatest in the last decade. . . . Wherever the writer goes, he meets with lepers walking about among, and, mixing with, the people, may be in the church, or in shops. As the signs and symptoms of the disease become better known, they will perhaps be more easily recognised by the uninitiated."

In 1858, the lepers were located at the present Institution at the mouth of the Mahaica Creek, which not very long ago was enlarged to meet the ever increasing demand on its accommodation.

On 31st. December, 1859, there were only 105 inmates at the Asylum. In 1869, they had increased to 300, and the place could hold no more. Increased space was provided, and in 1889 we find, from the official reports, over 500 of these unfortunate inmates. Around this leper asylum, outside its boundaries, there are large numbers of lepers not included in these returns. Dr. Hillis states that, while the increase of the population in twenty years, between 1858 and 1878, was only 45 per cent., the increase of lepers was 160 per cent.

Dr. George Thin, in his work on "Leprosy, p. (1891), says :—" It is estimated that in 1890 the number of lepers in British Guiana was 1000, or one in 250 of the population." My own inquiries led to suppose the number was larger, as from all that could gather there were about 500 lepers in the asylums at Mahaica and Gorchum, and I saw several at the General Hospital, Georgetown, for whom there was no room in the asylum. These were by old medical residents to be far less than the total leper population.

#### DUTCH GUIANA

Leprosy is making rapid progress in Dutch Guiana, and a devoted priest, who has been attending to the temporal and spiritual wants of the people, was reported in October, 1890, to be dying of the disease. Bishop Walfingh, of Surinam, has recently visited Holland, with the object of raising funds to build a suitable hospital, and has met with a successful response to his benevolent appeal.

#### VENEZUELA.

In the early part of 1889 I visited Venezuela, pursuing my inquiries as to leprosy in Carracas, Bolivar, and other places. From all the information I could obtain I learned that its spread, though less conspicuous than in the adjoining territory of British Guiana, is making constant advance. From a report made by the United States Consul at Maracaibo, Mr. F. H. Plumacher, the American Government in 1890, I find that leprosy began to be felt as early as 1828, and in 1841 the National Government, under the direction of President Bolivar, purchased an island four miles east of Maracaibo, and erected an hospital and dwelling-houses for the accommodation of these afflicted people. In 1876 the cases had assumed alarming numbers, so as to seriously to endanger the sanitary future of the State. In the year 1890 there were 125 patients in the lazaretto, and many more at large in the city and environs, and all attempt to segregate them is thwarted by the efforts made by friends for their concealment. This increase here, as in other countries, is coincident with the extension of the practice of vaccination.

#### AUSTRALASIA.

Leprosy is not unknown in the Australasian colonies, and is especially noticed in a report dated 7th May, 1890, and

ordered to be printed by the Legislative Assembly of New South Wales. This report was handed to me by the President of the Board of Health. From it I find that, at the close of 1889, there were 30 cases of leprosy under official cognizance.

The *Lancet*, of August 1st, 1891, says that the number of lepers has more than doubled during the past ten years.

Referring to the report for 1891 (which has not yet reached me) the *Sydney Mail* of February 20th, 1892, under the head of "Leprosy," observes :—" Those of the public who are the least disposed to alarmist views will probably regard as highly serious the statements now made public regarding leprosy in New South Wales. The statements give a great shock to the feeling of confidence based on the supposed comparative immunity of persons of European races from the attacks of this terrible disease. Of course, it has always been known that where the conditions are specially favourable to contagion, the supposed racial protection ceases to be a safeguard. But it is, nevertheless, startling to learn that of ten persons found by the Board of Health during the year to be suffering from leprosy five were natives of this colony of European descent, while four were Chinese, and one a Kanaka. At the beginning of the year there were 13 lepers under detention at the lazaretto, while those so detained at the end of the year numbered 21, of whom eight were natives of New South Wales of European descent, 11 Chinese, one Javanese, and one Kanaka. During the time the lazaret has been available there have been 31 patients, of whom one could not be detained, and nine have died."

Our colonists are becoming alarmed at the invasion of leprosy in New Zealand. The *New Zealand Herald*, Auckland, June 14th, 1890, in an article headed "Leprosy Among the Natives," says :—" A gentleman at Hokianga writes to a friend here—'My brother was north a few days ago on a vaccination tour at Herekino, and he reports an outbreak of leprosy at Herekino amongst the natives, several of whom died from it. Others are in a fearful state. Their fingers and toes rot off, their nose, teeth, and jaws are corroding, and their bodies are rotten. He has reported the matter to the Government. Strange to say, it got this length before we heard of it. The natives are scared, and avoid each other. Timoti Puhipi recommends the lepers being deported to the Three Kings' Island.'"

A petition by Dr. Bakewell of Auckland, New Zealand, formerly superintendent of the Leper Asylum, Trinidad, for an inquiry into leprosy in New Zealand, has been presented to the Public Petitions Committee, and referred to the Government for consideration.

Dr. George Thin states that a school in New South Wales has been closed by order of the Minister of Public Instruction, in consequence of reports that some children in it are developing symptoms of leprosy.—*Leprosy*, p. 247.

#### OCEANA.

The *Sydney Morning Herald*, of March 27th, 1891, says :—" The spread of leprosy among the Pacific islanders seems to be going on steadily, judging from the following report, which we take from the *Samoa Times* of January 31st—' We hear (says that journal) that leprosy has established itself at Penrhyn Island, and that there are no less than ten fully-developed cases there. The doctor of H.M.S. Cordelia, which has lately been cruising in that quarter of the Pacific, confirms the statement, and is of opinion that the disease has been brought to Penrhyn from the Hawaiian Islands by a number of refugees from the latter place. The same authority also states there is a case of undoubted leprosy at Manaheke Island. These facts strengthen the argument we have used in our columns, as to the urgent desirability of steps being taken to prevent leprosy becoming an established institution in our midst.'"

#### NEW CALEDONIA

In the French penal colony of New Caledonia, leprosy has made its way with fearful rapidity. Previous to 1853 leprosy was unknown in the colony, but recently two leper asylums have been established. In a report on leprosy, presented to the Parliament of Victoria by the Secretary to the Board of Health, Sydney, it is stated that the Board of Health has received a communication from His Excellency the Governor of New Caledonia, M. Pardon, to the effect that the disease is extremely prevalent in that Colony, where about 500 of the native population are affected, and seven persons of European parentage, six convicts, and one child, all French, have been officially reported as suffering from the malady.

The *Journal of the American Medical Association*, March 22nd, 1890, says :—" Leprosy is reported to have found its way to New Caledonia, the French penal colony, and already there are hundreds of cases among the natives and convicts."

The *British Medical Journal* of April 25th, 1891, has the following :—" Dr. M. A. Legrand has recently published an account of the introduction of into the French convict settlement of New Caledonia which is at once interesting and instructive. In 1846, when missionaries first landed in the island, the was entirely unknown there, nor did it exist in 1853, when the French formally annexed it. In October, 1880, M. Vauvray, chief of the Health Department, sent back five

negroes from the New Hebrides on the ground that they had lost their fingers and toes from leprosy. He at the same time requested the authorities to prevent the introduction of lepers into the colony. In September, 1883, M. Brassac reported that there were several cases of leprosy in the north part of the island, and suggested the establishment of a lazaretto for their reception. The authorities, however, took no steps, and in 1888, Dr. Forne, chief physician and president of the Committee of Hygiene, presented an elaborate report, in which he stated that the cases of leprosy could then be numbered by hundreds, especially in the north. But the committee adopted the ostrich-like policy familiar to such bodies, and it was not till the following year that, yielding to the force of public opinion, the executive decided to establish two leper houses, one at Pic des Morts, near the Bay of Canala, and the other in the Isle of Goats in the Noumea roads. Forty lepers were confined in the former, and twenty in the latter. In May, 1890, the total number segregated was seventy, and there had already been fifteen deaths. A third lazaretto is about to be established not far from Houailou. Though it was not until 1883 that the first cases of true leprosy among the aborigines of New Caledonia were observed, more or less legendary accounts of earlier appearances of the disease are current among them. Thus a Chinaman, covered with hideous sores, is said to have arrived in 1866 or 1867, and to have lived for several years with a native tribe, several of whom afterwards developed disease of the same nature. Whatever may be the true history of the importation of leprosy, there can be little doubt that it was imported, and at the present time, according to M. Legrand, it exists everywhere in New Caledonia, and has acquired a foothold in the great majority of the native tribes. Europeans have also suffered. The course of the disease appears to be more rapid than elsewhere, a fact which M. Legrand attributes to the habit which the natives have of scarifying the maculae and the tubercles, often to a considerable depth, with pieces of glass, and to their ruthless use of caustics. M. Legrand considers that these barbarous therapeutics, together with tattooing and burning with moxas, which seems to be their fashion of expressing affliction at the loss of relatives, have much to do with the spread of the disease. He explains the ravages made by the disease in virgin soil like New Caledonia by the fact that the people, not being aware of the danger, take no precautions against it."—*Archives de Médecine Navale, February, 1891*

*In all the French colonies vaccination has been prosecuted with rigour, and has been followed by the increase of leprosy, just as in England' the increase of infantile syphilis is due to arm-to-arm vaccination, as shown by the Minutes of Evidence with the third report of the Royal Commission on Vaccination. The barbarous therapeutics, the tattooing and burning, have existed among the natives from time immemorial. Vaccination has been but recently introduced.*

#### FRANCE.

M. Besnier, a member of the French Academy of Medicine, has reported that leprosy, far from disappearing by degrees, is spreading rapidly. Since the extension of the French colonial possessions, soldiers, sailors, traders, and missionaries, have fallen victims to it in large numbers.—*British Medical Journal, October 22nd, 1887, p 919.*

According to the London *Evening Standard*, October 26th, 1891, Dr. Besnier reports the number of lepers in Paris at 100, there being at the St. Louis Hospital eight persons afflicted with this disease.

#### SPAIN.

"Leprosy has been on the increase in different parts of Spain for some years past, and the extension of the disease has at last aroused the attention of the Government. On February 16th the Director - General of Beneficence and Sanitation sent a circular letter to all governors of provinces calling on them to take such steps as may seem necessary under the circumstances."—*British Medical Journal, March 5th, 1892.*

In a communication to the *Lancet*, January 16th, 1892, "On the Origin and Spread of Leprosy in Parcent, Spain," founded upon investigations by Drs. Codina and Zuriaga, Dr. George Thin introduces the following table and comments :—

*"Table Showing the Cases of Leprosy in the Towns referred to in this Report.*

Towns	No of inhabitants	Date of invasion	Cases up to 1887	Males	Females	Total	Remarks
Parcent	150	1850	65	21	7	28	I gathered the data stated in the present table during my visit to the towns in the district of Parcent. Although I have endeavoured to obtain my information as accurately as possible, I am unable to guarantee its correctness. the towns sometimes hide the truth as to the number of lepers existing; but if there are any, they will
Languart	400	1868	31	20	5	25	
Pego	1200	17--	---	14	6	20	

Orba	160	1873	25	12	6	18
Pedreguer	720	1809	79	9	3	12
Murla	120	1870	14	8	2	10
Sagra	100	1848	13	5	3	8
Benidoleig	80	1869	7	4	1	5
Gata	440	1860	6	3	1	4
Jalon	560	1867	8	2	1	3
Denia	650	17--	---	3	1	4
Oudara	325	1862	7	2	1	3
Tounos	80	1860	10	2	1	3
Beniarbeig	130	1871	6	3	--	3
Sanet	90	1884	3	1	1	2
Alcahali	98	1870	6	2	--	2
Jaica	320	--	--	2	1	3
Benichembra	120	1872	3	1	--	1
			285	114	40	154

consist in showing too small, rather than too great, a number of lepers.

"There is nothing in the soil, occupation, food, or race to account for any difference in the number of lepers which are to be found in these towns respectively. It also shows that the proportion of lepers to the population of the towns is not connected with the length of time that the disease has lasted, and therefore is not in relation to the opportunities given by heredity, even if it were assumed that heredity was a cause. Parcent, which is the most striking example, shows in twenty-seven years, in a population of 150 inhabitants, 65 cases of leprosy, of whom 28 were living at the end of that period; whilst Pego, with 1200 inhabitants, and where the disease has lasted since last century, had only 20 living lepers. Pedreguer, in which we know there was leprosy in 1809, with a population of 720, had in about forty years 79 lepers, of whom 12 were living at the date of the report whilst Murla, with only 120 inhabitants, had had 14 cases in seventeen years, of whom 10 were living at the date of the report.

"Excluding heredity as an insufficient cause of these cases, and as otherwise being discredited, the difference of the rate of increase of leprosy in these similarly situated villages is best explained by the assumption that the opportunities for contagion have been greater in some cases than in others, even if we did not have the statements which I have collected from two independent sources—namely, from the Mayor of Parcent, referred to by Dr. Zuriaga, and from Dr. Codina's report to the Director-General at Madrid. Another sad fact comes out from a study of this table—namely, that in many of the towns the appearance of the disease is comparatively recent and that in this part of Spain leprosy is spreading. The necessity for a hospital in Parcent seems to have been realised at last, for we find that a commission visited the neighbourhood in June, 1887, for the purpose of finding a site, and were uttered one by the municipal corporation free of cost."

No inquiry appears to have been made, either by Dr. Codina, Dr. Zuriaga, or Dr. Thin, as to vaccination being a possible cause, which, according to a communication to me from Senor U. Montez, the Spanish Consul in London, has been obligatory for many years. This gentleman writes (London, May 26, 1892):—"Apart from previous ordinances on the subject, the law making vaccination obligatory on the whole of Spain is dated the 28th of November, 1855." This mode of propagation, where the contaminating virus enters directly into the blood, is surely more credible than the one suggested by Dr. Thin, of contagion (simple contact), unless Dr Thin, like other pathologists, interprets the word to include inoculation and vaccination.\*

\* Baron, in his "Life of Jenner," vol i., p. 604, says that Mr. Allen, Secretary to Lord Holland, writing to Jenner from Madrid in 1803, observes:—"There is no country likely to receive more benefits from your labours than Spain; for, on the one hand, the mortality among children from small-pox has always been very great; and, on the other hand, the inoculation for the cow-pox has been received with the same enthusiasm here as in the rest of Europe." . . . The result, however, was the reverse of satisfactory; the writer adding, that "the inoculation of

the spurious sort has proved fatal to many children at Seville, who have fallen victims to the small-pox after they had been pronounced secure from that disease."

### THE UNITED KINGDOM.

The following appears in the *British Medical Journal*:—" Dr. T. Colcott Fox, one of the Honorary Secretaries of the Dermatological Society, has been good enough, in reply to an inquiry, to forward for publication the following list of cases of leprosy shown to that Society since its foundation:--

DATE.	EXHIBITOR.	WHERE FROM
July 12th, 1882	Mr. Hutchinson	India
"	Dr. E. B. Baxter	Dutch and Chinese parentage
Oct. 11th	Dr. Crocker	Singapore (shown at International Medical Congress)
Dec. 13th	Dr. Liveing	India
Mar. 14th, 1883	Mr. Hutchinson	?
"	"	?
Oct. 10th	Mr. M. Baker	Antigua
	Dr Sangster	? If English case. Sections of nerves.
Jan. 9th, 1884	Mr. Baker	?
Feb. 13th	Dr. Crocker	?
"	Dr. Stowers	India
Mar. 13th	Dr. Allchin	?
July 11th	Dr. Crocker	?
Jan 9th 1885	"	India
May 1885	Mr Hutchinson	?
July 1885	"	Cape Colony
" "	Dr Crocker	?
Oct 10th 1888	Dr Cavafy	?
Feb 13th 1889	Dr Crocker	?

"Dr Fox adds that he has also seen the following private cases since 1879:---

1. Boy from Demerara. . . . .
2. Girl from Demerara. . . . .
3. Man from Cape Colony.
4. Man from India. . . . .
5. Lady from Orange Free State.
6. Lady from Honolulu.
7. Lady from Cape Colony.
8. Officer from Bengal.
9. Man from India.

"Dr. Fox adds that he has seen three cases in hospital practice, but all these have also been under the care of other physicians at other hospitals.

"Dr. Larder has now two cases in the Whitechapel Infirmary."—*British Medical Journal, March 30th, 1889.*

### SOUTH AFRICA.

In consequence of the serious increase of leprosy following the imposition of vaccination in Cape Colony, a Select Committee was appointed by the Legislature in 1883 to take evidence as to the cause of such increase, but, strange to say, no inquiry was made, nor were any interrogatories submitted to the witnesses, as to vaccination being a possible factor in the case. Mr. T. Louw, M.P., was appointed Chairman of the Committee.

Dr. Henry Anderson Ebdon, President of the Medical Board, testified that he had resided many years in India—the Punjaub, the Himalayas, Rajputana, Western India, where leprosy is prevalent, and in other parts. He has been in the Cape, consecutively, close upon 22 years, and during that time had seen a great deal of leprosy. He was sure it was on the increase.

Q.—" As you are inclined to think that the disease is contagious, do you think it

dangerous to the health of other people to use food prepared by leper hands?"

"I should be sorry to see a leper cook, and I go further than that. In vaccinating, I think hardly a medical man would take vaccine lymph from the arm of a leper infant. I know it has been our practice for the last twenty years not to do so."

The Rev. Canon James Baker testified that "the increased spreading of the disease in many parts of the colony is now generally admitted. It is spreading among both the white and the coloured races, especially in places near the sea coast."

In the appendix E to this report, is a letter from Dr. Wm. R. Turner, dated Vrendenburgh, 1st Sept., 1883, in which I find the following :—" Leprosy in parts of Saldanha Bay is spreading so rapidly that, if some measures are not at once taken by the Government, all the surrounding districts will probably become infected. I know of more than twenty cases in one place alone, in every stage of the disease, and am sorry to say it is not confined to the coloured portion of the inhabitants."

The conclusion stated in the official report is "that leprosy prevails extensively in this Colony, and is steadily spreading among both white and coloured classes."

In June 11th, 1884, an Act was passed by the Legislative Assembly, Cape of Good Hope, entitled, "The Leprosy Repression Act, 1884," with the following preamble :—" Whereas the disease of leprosy is prevalent in this Colony, and has lately been spreading, and continues to spread, and it is desirable to check the extension of such disease, and, if possible, to exterminate it."

At a public meeting in Cape Town in December, 1890, Sir Gordon Sprigg said that there were between 600 and 700 lepers in Cape Colony.

In a paper read before the Epidemiological Society of London by Dr Phineas S. Abraham, p. 3, I find the following :—" In the South African Reports for 1886, a decided increase of leprosy is stated to have taken place in the districts of Alexandria, Bedford, Clanwilliam, Herschel, Malmesbury, Paarl and Stockenstran; and for 1887 the spread of the disease is reported not only from most of these districts, but also from Wynberg, Stutterheim, and Kokstadt. The majority of the medical officers speak very strongly on the subject. For example, one of them (from Alexandria) writes that 'leprosy is certainly spreading rapidly, and unless some active and efficient measures are soon taken, it will become a matter for the most serious consideration.' - Another (from Bedford)—' I believe it to be considerably on the increase, and should be stringently dealt with.' Another (from Malmesbury)—' With reference to leprosy I cannot but repeat my statements of the last years to the effect that the disease is slowly but surely increasing, each fresh case acting as the nucleus to a more or less extended infection.' Another (from Paarl)—'It is deplorable to see what strides it is making.' And in 1887, 'As for leprosy, although it is making rapid strides, there is no notice taken of it' (*i.e.*, by the authorities). More than one of these district surgeons, indeed, assert or imply that the Boards of Management, and others who have the power to put the Act in force, shirk the duty on the score of expense, and that the Public Health Act is to some extent a dead letter."

In consequence of the continued increase of this disease, another select Committee of Inquiry was appointed in 1889, under the presidency of Chief Justice Sir J. H. de Villiers. In the appendix J to the Report, printed by order of the Legislative Council, pp. xiv. and xv., the Rev. Canon J. Baker, F.L.S., F.S.Sc., says :—" I entertain no doubt that leprosy is spreading in this colony at the present time. Observant and intelligent persons have assured me that they have recently met, in various parts of the colony with more cases than in previous years.

"There are many and great difficulties in getting correct information on the subject. I have known patients to be carefully concealed, and the relations of the affected do not like to be spoken to as to the mode of contraction of the disease. I have given great offence by calling attention to particular cases. I believe the number to be much greater than is known by medical practitioners, or by the Government authorities."

From the minutes of evidence it appears that Dr. H. C. Wright, district surgeon at Wynberg, being under examination, testifies as follows :—

Q. 5 "Will you state roughly the number of cases in your district? "—"About twenty; but it is impossible to state exactly. A great number of cases are concealed. I have not the slightest doubt that there are more cases than have come under my notice. There are, for instance, some cases I suspect to exist, because I am aware that leprosy is in the family, and lately some of these people have disappeared ; they are never seen, and, I believe, are hidden away."

Dr. Simons, District Surgeon of Malmesbury, was asked :—

Q. 75. "Since your appointment as District Surgeon, have you known any increase in the number of persons affected ?"—"Yes; certainly."

Q. 76. "Is the disease principally confined to coloured persons?"—"No; it is not confined to coloured persons. I know of several cases where families of white farmers are affected."

Dr. W. H. Ross, Police Surgeon in Cape Town, was asked :—

Q. 230. "During the time you were Police Surgeon in Cape Town, did you meet with many cases of leprosy?"—"Yes; in going about, I used to see about a dozen a day among the poorer classes."

The Hon. Dr. Atherstone, M.S.C., who has practised in the colony 50 years, chiefly in Graham's Town, where he was District Surgeon for 26 years, and who has always taken a great interest in the subject, said :—

Q. 341. "I am decidedly of opinion that it (leprosy) is spreading."---July 18, 1889.

The following are *Extracts from the Report of the Select Committee on the Spread of Leprosy, President, Sir J. H. de Villiers, July, 1889, p. 8*:—"The result of the inquiry has been, in the first place, to establish the fact that leprosy is on the increase in the colony. Many of the District Surgeons say that, in their particular districts, there is no such increase, and others again are unable to express any opinion upon the question, but in the more populous districts of the colony, such as the Cape and the Paarl, and even in some of the outlying and less populous districts, such as Alexandria and Stockenstrom, the District Surgeons report a marked increase in the number of cases. It should be borne in mind that the victims of this loathsome disease naturally endeavour to conceal it from others, as much and as long as possible, and that many more cases are sure to exist than have come under the notice of the medical men, whose answers have been received, or whose evidence has been taken. Your committee estimate the number of lepers in the colony to be upwards of 600."

On page 12 is an extract as follows :—"The committee conclude—(1) 'That leprosy is on the increase in this colony.' (2.) 'That the disease will continue to increase unless effectual measures are adopted to check it, and if possible to stamp it out.'"

On the 8th April, 1890, the Governor of Cape Colony and High Commissioner Sir Henry Loch laid the foundation-stone of a new leper hospital at Robben Island, which will provide 200 beds for the unfortunates stricken with a fatal and repulsive disease. A writer in the *Cape Argus*, May 20th, 1891, who signs himself "Epaminondas," and seems, by the character of his frequent communications, to be much concerned regarding the inadequacy of the measures undertaken to check the ravages of the scourge, concludes his letter thus—"In the cause of humanity; for the suppression of the deadly disease; for the safety of the general bulk of the inhabitants, and, last but not least, the alleviation of the afflicted, it seems to me that it is the bounden duty of the Government to meet the question face to face, and devise some means to cope with this terrible and, if unchecked, disastrous evil now pervading the Colonies, and Transkei particularly."

In the valuable Consular Reports issued by the Government of the United States I find one for June, 1887, from Consul Siler, of Cape Town, which is not without interest and instruction. Mr. Siler says, "Not until 1845 was any attempt made by government to check or -to stamp out the disease. In that year a leper asylum was established at Robben Island, seven miles from Cape Town, and, up to 1884, 744 lepers had been admitted to the institution, and comprised but a very small proportion of the leper population, as the segregation of lepers was not made compulsory. In fact, lepers mingle freely with the other citizens, and their appearance is so common that they attract little attention in the streets. At the Cape Town Fish Market I have seen lepers at work cleaning and curing fish, and the disgusting sight did not seem to deter buyers."

The rapid increase of the disease, particularly among the European population, as described in the recent reports of district surgeons, has aroused the Colonial Government to action, and a second and larger asylum is in process of construction, the present accommodation being -wholly inadequate to provide for all the afflicted applying for admission.

A correspondent writes to the *Cape Argus*, May 21, 1891, and, referring to the alarming increase of leprosy in South Africa, says :—"it is now two - years since the out-cry commenced, and yet, what has the Colony done for the benefit of the wretched people cursed with this insidious disease, and for the protection of their neighbours? Here, in the Transkei, nothing! It is notorious that in every magistracy in the Transkei leprosy is rife and spreading rapidly, and, sad to say, over

the lepers themselves there is absolutely no restraint. They frequent the public offices and trading stations unchecked.

By their horrible hospitality, they provide lavish feasts of Kafir beer, invitations to attend the same being scattered broadcast. Fancy drinking Kafir beer, prepared and filtered by leprous hands? And this is done every month in the year!"

Under the head of "The Public Health," the South African Directory for 1891, p. 446, observes that "with a view of checking the spreading of venereal disease and leprosy, which have for some years past been reported to be phenomenally prevalent in various districts of the Colony, Acts were passed in 1884 and 1885 giving the Government powers whereby it was hoped that these disorders would eventually be stamped out." One of these is entitled, "The Leprosy Repression Act," which gives the Colonial Secretary power to forcibly remove and incarcerate any known leper in a leper asylum or hospital. This drastic measure had not then been promulgated or put in force. There are many lepers in good positions in the Colony, of both white and mixed races, whose friends would make any sacrifice rather than have them segregated with their fellow-sufferers, either in Robben Island or elsewhere. Those who advocate the forcible deportation of lepers from their friends (most of whom would willingly keep them from public observation in thinly-settled districts) can know little of the heart-breaking scenes constantly witnessed at the separation of these afflicted persons at Honolulu when about to undergo perpetual banishment to Molokai, Hawaii. Although a terribly repulsive and loathsome disease, leprosy is not communicable by simple contact. The Colonial legislature would have served the cause of the public health more effectually by directing their attention to municipal sanitation, and discouraging the practice of vaccination, which, according to the opinion of district surgeons, and the best informed authorities in South Africa, has been instrumental in largely spreading both syphilis and leprosy. It is hardly possible for a disinterested observer and inquirer to come to any other conclusion.

The Cape Town *Times* of March 5th, 1892, says:

"A correspondent writes to the Orange Free State *Express*, under date February 25: The first batch of these unfortunates (the Theba 'Nchu contingent), twenty in number, were despatched from here on Saturday last, and probably twelve or fifteen more will leave here within a few days. The lepers are all natives, mostly Baralongs. It was hard work for the Landdrost, with the aid of the mounted police, to hunt them up. It would take too much time to relate all the cunning (in this case excusable) devices resorted to by the families of the lepers to evade the law. It was a heartrending sight to see how mothers and children parted. It must be done, for the sake of the general safety, but it was an awful spectacle to see and hear the cries of distress, especially of the sound relations who remained behind."

Referring later to the same deportation of lepers, the Port Elizabeth *Telegraph*, March 12th, says—"Although the large number of fifty-four lepers have been despatched to Robben Island, it is believed that others have managed to conceal their condition from the authorities." . . . "It is a very remarkable fact that, whilst in the last census the number of lepers were returned (from this district) as four, already fifty-four have been discovered suffering from the loathsome disease of leprosy."

Dr. Alexander Abercromby, author of "Thesis on Tubercular Leprosy," writing to me from Cape Town, April 20th, 1892, says the disease is now "spreading rapidly amongst the white population and better class of people."

#### INDIA.

In the speech delivered at Marlborough House, London, June 17th, 1889, the Prince of Wales stated that one of the chief centres of Leprosy is India, where there are 250,000 lepers, and that our colonies contained unnumbered victims to this loathsome disease. The *British Medical Journal*, September 13th, 1890 (p. 639), reports that "a comparison of statistics regarding lepers during the thirty years 1851-81, shows that their number has been increasing in India at the rate of about 30,000 every ten years. During the last ten years the rate of increase is supposed to have been higher." I have before me communications from staff surgeons, medical officers of health, superintendents of leper hospitals, and medical practitioners, showing the spread of leprosy in various provinces of India, and in other countries. The Rev. G. M'Callum Bullock, of the London Mission, Almora, writing 21st August, 1889, says :—"It is the general opinion of residents, both European and native, that leprosy has increased in Kumaon during the past thirty years, and there are upwards of 1600 lepers in Kumaon alone out of a population of 1 1/8 millions."

Dr. C. T. Peters, in his report on cases of leprosy treated at Belgaum, Presidency of Bombay, dated Bombay, June, 1879, says:—"Judging from Mr. M'Corkhill's figures, there were not less than 22.8 per cent. of the population, in the Belgaum districts alone, afflicted with some form or other of leprosy."

In a paper read before the Calcutta Microscopical Society, December, 1890, Dr. W. J. Simpson said it was certain that

leprosy was on the increase, an opinion confirmed in a letter to me, dated August, 2 1st, 1889, by Dr. Chunder Ghose, Medical Superintendent of the Leper Asylum, Calcutta.

The City Coroner of Bombay says that leprosy is vastly increasing in that city. The *Times of India*, February 21st, 1891, estimates the number of lepers at large in Bombay, at 1000. At a meeting of the Municipal Council of Bombay, reported in the *Times of India*, April 12th, 1889, various speakers describe the terrible state of things existing in the city. Mr. Kirkham saw lepers near the public tank dressing their terrible sores, scratching their ulcers against the iron railing of the Elphinstone High School, where the boys sat on coming out of school. Dr. Blaney said, "all over Bombay, in dark corners, in gullies where rats and bandicoots had taken their abode, these lepers were hiding themselves, thrown out by their families, to pine away neglected and forlorn."

At a meeting of the General Committee of the "Homeless Leper Relief Fund," Bombay, held at the Municipal Rooms, the President, Sir Dinshaw M. Petit, said that the hospital (which contains over 200 patients) was overcrowded, and further admissions had to be refused. Having no homes or places of refuge, lepers hang about the bazaars of the large cities in India, forced by their necessities to sell fruit or vegetables, and to expose their maimed bodies to the gaze of the public, in order to obtain a wretched living.

Referring to the newly opened Matoonga Asylum, Bombay, Mr. Commissioner Acworth writes, May 26th, 1891 :—"With accommodation for 190, I had yesterday 226 inmates, but fortunately a new ward has just been completed, and this overcrowding will temporarily cease, though only temporarily. If I had room for 500 I could fill the asylum in a week."

The *Times of India*, May 21st, 1892, says :—"While the Matoonga Asylum is seriously overcrowded with lepers, and there are, besides, between forty and fifty bad cases in the Byculla Leper Dhuramsala, Sir Dinshaw's lakh of rupees and the land for the extension of the asylum lie still idle because of the deadlock between the Government and the Municipality over the police charges question. As the Government decline to budge in this matter, the Corporation, not altogether unjustifiably perhaps, refuses to undertake the responsibility of the Leper Asylum. Unless something is done to remedy this state of things, our streets will again be overrun with homeless lepers, and Mr. Acworth's labours in the cause of these afflicted people will practically be brought to naught."

The *Lahore Civil and Military Gazette*, May 30th, 1891, in a graphic narrative of the suffering caused by leprosy, bearing the signature "A. H.," in the leading article column, observes :—"A great deal has been said and written on the subject of the lepers and leprosy by people who have seen and pitied the miserable condition of native lepers, who parade their affliction before the public in our streets and thoroughfares, soliciting alms from the passer-by. The majority of English ladies and gentlemen who are told such persons are lepers understand and know so little about the horrible disease that they are inclined to regard them as ordinary crippled beggars, afflicted with a disease peculiar to natives, and from which Europeans are happily exempt. This is far from being the case: leprosy seems to have obtained a terrible hold over our white brethren and sisters in India, many of whom are hiding away, alone and forgotten, in the thickly populated slums and by-lanes of our large cities. I could conduct my readers to godowns and huts where English men and women are to be found in Calcutta in a horrible condition; some in the last stage of the disease."

In a Presidential address on the "Geographical Distribution of Diseases in Southern India," delivered at the annual meeting of the South Indian and Madras branches of the British Medical Association, Surgeon-General George Bidie, M.B., C.I.E., speaking on the subject of leprosy, said :—"According to census returns the proportion of lepers amongst the population of Madras is 4.4 per 10,000, against 5.2 in Bengal, and 8.5 in Bombay; but there is reason to believe that these figures fall short of the actual extent of the disease. In Madras it is on the whole slightly more prevalent in coast districts than in inland, the ratios being 4.9 in the former, and 4.4 in the latter, per 10,000 of population. The proportion of lepers in the several districts ranges from 2.0 in Coimbatore to 10.5 in Madras city. The districts showing the highest ratios next to Madras are Nilgiris 8.0, Tanjore 7.0, and Chingleput, Malabar, and North Arcot, each 6.0 per 10,000. The disease attacks Europeans and Eurasians as well as natives, but is most common in natives. The propagation of leprosy is no doubt largely influenced by heredity, but recent observations appear to show that it is also contagious. In localities in which lepers are at large with the disease in an active state, and having open sores, there seems to be an increased tendency to fresh cases amongst the general population."—The *British Medical Journal*, p. 115, July 20, 1889.

#### BURMA.

In a communication from Mr. C. G. Bayne, the Officiating Secretary of the Chief Commissioner of Burma, to the Secretary of the Government of India, dated Rangoon, 6th December, 1889, and published in the *Journal of the Leprosy Investigation Committee* for February, 1891, it is said that the majority of officers questioned state distinctly that, in their

opinion, leprosy is increasing in Burma. Mr. Smeaton, Commissioner of the Central Division, says :—"In the opinion of the majority of the gentlemen consulted, there are more lepers now than there were ten years ago." Mr. Norton, Deputy Commissioner of Rangoon, remarks :—" Those best qualified to form a judgment on the subject are of opinion that lepers are more numerous now than formerly." Surgeon-Major Baker and Dr. Frenchman have come to the same conclusion. Mr. Bayne observes :—" The opinion of these officers is of special value, because both of them, particularly Dr. Baker, have paid much attention to leprosy, and have much experience of it. Dr. Baker gives reasons which are based on observations of actual facts, and are not merely impressions."

#### CEYLON, TONQUIN

In Ceylon, as I learned by personal inquiries made in the island in January, 1891, leprosy is extending rapidly amongst the native population. The Leper Asylum at Hendala, near Colombo, one of the oldest in India, which in 1880 contained only 100 lepers, has now 208; and Dr. Meier, the resident Superintendent, does not hesitate to say that, in his opinion, the disease is steadily increasing.

There are about 200 lepers at large in the city of Colombo, and about 1800 in the island. Dr. Kynsey, the Surgeon-General for Ceylon, reported in 1885 that leprosy had decidedly increased since 1862, as the number of patients then in the asylum was 63, but had increased in 1885 to 151. Dr. Kynsey says :—"I have no doubt that a certain reproduction of the disease is going on, whatever the factors are at work, and that the proportionate growth of leprosy in the colony is by no means diminishing."

In a communication to the Government of Hawaii, Dr. Kynsey remarks that leprosy is not confined to any community, but is more frequently observed among the Singhalese and Tamilins; seldom among the Eurasians, and more rarely among Europeans, and is chiefly found among the poor, ill-fed, ill-housed classes of the community. The Eurasians, I may observe, as well as the better-class Europeans, absolutely decline to be vaccinated from native lymph sources, to which the native population are obliged, reluctantly, to submit.

An Anti-Leprosy Association has recently been organised in Bengal by certain benevolent members of Hindu communities in the Presidency. Their efforts are being directed especially to ameliorate the condition of the lepers in the Santhal Parganas, forming the southern portion of Bhagalpur, a very poor district, where the people can do little to help either themselves or their afflicted neighbours.

The *British Medical Journal* gives an account of a leper village near Hanoi, Tonquin, where, out of a population of 400, nearly one-half are affected with leprosy. The lepers of Hanoi doubt the contagiousness of leprosy, and the chiefs of the village affirm that there has not been a single case of contagion.

[index](#)

## CHAPTER 2: IS LEPROSY CONTAGIOUS?

ONE of the most debatable points in connection with the spread of leprosy is that of contagion, and amongst dermatologists there are rival schools—contagionists and anti-contagionists. In the report of the Committee of the Royal College of Physicians, issued in 1867, thirteen were in favour of contagion, and thirty-four physicians and experts in various parts of the world were convinced that the disease was non-contagious. The chief authorities in Norway, including Boek and Danielsen, who had forty years experience, were opposed to contagion; and this is the prevailing view in Norway at the present time.

Dr. G. A. Hansen says :—"If people wash themselves, and take the least care of themselves, when they come in contact with lepers, I do not think there is any danger whatever. It is a remarkable fact that not one of the nurses or servants in our Asylums (Norway) has caught the disease, although they daily wash and dress the patients."

In the pursuit of my investigation, I have been confronted on every hand by the most conflicting theories with regard to the causation of leprosy, and particularly with regard to this question of contagion. The contagionists, when pressed, I found invariably included inoculation, and interpreted the word in that sense. They admitted that the leprous discharge might be touched with impunity, when the integument is intact, but not otherwise. Every nurse, doctor, attendant or laundress, in the hospital, is bound to come in repeated contact with pus from ulcerated tubercles. It is only by the insertion of the leprous virus into the blood, through a sore, prick or abraded surface, that the disease is communicable. This view is now held by the highest authorities in all parts of the world. At the same time, there are others who hold that the disease is transferable in a lesser degree by inhalation, heredity and cohabitation.

From personal inquiries made at asylums and lazarettos in various countries where leprosy is endemic, I am convinced that, apart from the risk of inoculation, there is little or no danger of contagion, using the word to mean simple contact between unbroken surfaces of the body. So far as my investigations have extended, the only country where the belief in communication by simple contact prevails to a certain extent is Hawaii; but here also I found much diversity of opinion, not a few using the word contagion to include inoculation, both accidental, as in a cut or a sore, and by design, as in vaccination.

I believe that the instances of communication apart from inoculation of this disease (if they exist at all) are extremely rare, but the theory is opposed to the results of most inquiries.

A medical resident of sixteen years' standing in British Guiana told me that the disease was being extensively disseminated in some unexplained and mysterious way, as the infected population had greatly augmented of late years; you encountered them in churches, at balls and public meetings, in the streets, and the market-place. Several leprous patients were pointed out to me at the Colonial Hospital, in close proximity to the other inmates, and I may observe that only the worst cases (and these belonging to poor families) are segregated at the Leper Hospitals. The lazarettos at Gorchum and Mahaica, British Guiana, at Trinidad and Barbadoes, were full to overflowing; new wings were in progress, or had recently been added, and the demand considerably exceeded the present accommodation in each establishment. No one appeared to be afraid of contagion, and I could not learn of a single case so communicated. After going through the various buildings of the Leper Asylum at Mucurapo, Trinidad, and seeing the unfortunate patients in every form of this hideous

and mutilative disease, I said to the lady superintendent (of Dominican Sisters), who had been in charge of the institution for seventeen years, "Have you no fear of contagion?" "Not the slightest," she promptly replied. "And you and your assistants do all that conscientious nursing requires?" (This includes washing the sores and bandaging the limbs of the unfortunate inmates.) "Certainly, and feel it a joy and privilege to be of service to these afflicted people." "Has any case of infection by contact to doctor, nurse, attendant, or laundress ever been reported during your superintendence?" "Not one."

This experience was confirmed at the lazarettos in Barbados and elsewhere; and some of the nurses and attendants have been employed from ten to thirty-two years. At the leper asylum in Ceylon, I learned that the laundry work had been managed by one family for three generations, and no case of infection had ever been recorded of laundress, nurse, or doctor. Similar experiences were related to me in South America, South Africa, and at the leper asylums in Norway.

The officials connected with the leper settlements at Molokai, and the Hospital of Suspects, Kalihi, near Honolulu, where I saw some of the worst cases, have not the slightest fear of contagion. They told me that they had never known a medical attendant or nurse contract the disease by simple contact. Of inoculation through sores, or wounds in the skin, or the entrance into the blood through the minutest prick or abrasion, a wholesome fear is entertained, not only amongst the native population, but by the officials; and not without sufficient reason, as will be seen by the facts detailed in another chapter.

The British Consul in Crete, in a memorandum to Baron Ferdinand de Rothschild, M.P., on the subject of leprosy in that island, concludes that the disease is not contagious, from the fact that there are "several cases of healthy women married to, and living with, lepers for years without being in the least affected. In fact, if the disease were decidedly contagious and hereditary, it would inevitably spread much more than it does, considering that the lepers are perfectly at liberty to marry among themselves or with healthy persons, and that their children remain with them like those of other people, without any precaution being taken on their behalf."

Dr. Arthur Mouritz, in his official report to the Honolulu Board of Health, dated Molokai, February, 1886, says :—" The washerwoman for the hospital Kalowao (Molokai) has washed the soiled clothes of the worst cases, certainly many of them so, in the settlement for the past seventeen years."

In a communication by Dr. Van Deventer Director of the Suburban Hospital, Amsterdam, to the Hawaiian Government, the writer says :—" Not one case of contagion has ever been recorded."

Dr. Trousseau, of Honolulu, who told me he devoted much attention to the causation of leprosy in Hawaii, says :—" Is leprosy infectious or ever contagious in the proper sense of the word, that is, by contact mere and simple? I emphatically say 'No.'" I am supported in that opinion by the whole medical world, and by my personal experience."

Dr. Manget, formerly superintendent of the Leper Asylum, British Guiana, observes :—" My own opinion is in favour of the contagiousness of leprosy, and that it may be propagated by the matter of ulcerated tubercles being applied to any raw surface; but I admit that I have met with cases which would seem to preclude the idea that the disease can be considered contagious in the ordinary sense of the term."

In the Leprosy Committee Report of 1887, signed by Dr. C. Handfield-Jones, chairman, it is stated "The committee believe that leprosy is not contagious in the conventional sense of the term, but, if at all, is only so in low degree and under exceptional circumstances."

Dr. Max Sandreczi, director of the Hospital for Children, Jerusalem, says :—" I am obliged to declar that the result of my researches gives me the conviction that leprosy is by no means contagious, and that consequently the exclusion and isolation of the patients is both a useless and a cruel measure."—*Lancet Aug. 31, 1889, pg 423.*

The *Lancet*, June 22, 1889, p. 1252, says :—"There hardly an hospital in London that has not had within its walls cases of leprosy within the past decade—in-patients, it is true, who have contracted the disease in countries where it is indigenous. Nor, so far as we know, has there ever been an instance of the communication of the disease from one of those subjects others in this country."

Mr. Jonathan Hutchinson, F.R.S., LL.D., in answer to the questions published in No. 1 *Journal of the Leprosy Investigation Committee*, "Is leprosy contagious?" suggests to inquirers into this subject the following important considerations :—"A certain number of lepers arrive every year in England from abroad. They usually remain in England and are allowed to mix freely with their friends. Children are permitted to go to schools, married couples continue co-habitation, inmates of hospitals and workhouses are, unless specially loathsome, placed in the general wards; in brief, not a single precaution against contagion is ever taken, and yet the disease never spreads. Precisely the same statements are true of French practice. It is believed that there are six lepers in Paris at the present time, and I am told that two leading Paris surgeons have each a leper employed as a household servant. Yet the disease never spreads in Paris any more than in London.

"The officers of leper hospitals, surgeons, nurses, and students, hardly ever become the subjects of the disease. . . In Norway I believe that no instance of an official becoming a leper has ever been known, although the exposure has been most free."

And in a footnote to his article, page 74, Mr. Hutchinson adds:—"Surgeon-Major Porteous, in 1855, published a list of servants who had been employed in the Leper Hospital, Madras. It included eleven servants who had been employed in the wards in periods varying from ten to fourteen years. None of them had become the subjects of leprosy."

Dr. Van Someron, who had charge of the hospital six years later, says :—" There is no record of any of the medical officers connected with the lazarettos having become affected with the disorder, nor have I heard of its ever having attacked the attendants of those who in private families were its victims."

Dr. W. Munro, the author of a work on leprosy, explains his views of contagion as follows :—" I do not pretend to express any distinct belief as to the probability of the disease being conveyed by simple contact, being more inclined to believe that it is carried by inoculation in most cases."

The *Lancet* of June 28, 1890, referring to the theory of contagion in connection with the spread of leprosy, says :—" But there are conditions and limits to the contagion: probably it occurs only through inoculation." This opinion is supported, according to the *British Medical Journal*, October 11, 1890, in the despatch from the Government of India relating to the isolation of lepers. It particularly notes that many of the medical authorities in India consider that the evidence at present

available goes to show that leprosy is contagious only in the sense that it is inoculable. The "Report of the Royal college of Physicians on Leprosy," issued in 1867, states "that the all but unanimous conviction of the most experienced observers in different parts of the world is quite opposed to the belief that leprosy is communicable by proximity or contact."

Sir Erasmus Wilson says leprosy is endemic, but not contagious.

Dr. William B. Atkinson, secretary of the State Board of Health, Philadelphia, in diagnosing the case of John Anderson, a Swedish leper, observes that there is no danger of contagion except by inoculation.

Dr. Shoemaker, of Philadelphia, says leprosy is only contagious through inoculation.

In a study on leprosy, based on personal observation, Dr. L. Duncan Bulkley has arrived at the conclusion that the disease is not in any proper sense of the word contagious, but there is reason to believe that under certain conditions it can be inoculated.—*Family Doctor*, June 11, 1892.

Dr. H. M'Hatton, Macon, Georgia, concludes a paper "On the Propagation of Leprosy," published in the "Transactions of the Medical Association of Georgia," by stating that it is non-contagious, and quotes the report of the committee of the English College of Physicians to the effect that, out of sixty-six answers to their inquiries, only nine speak of it as contagious, forty-five as non-contagious, and twelve are silent.

Dr. John L. Mears, Medical Superintendent of San Francisco Board of Health, says—" Although this disease (leprosy) may not be contagious in the ordinary acceptation of that term, we are satisfied that it is communicated by inoculation."

Drs. Fox and Graham report in the transactions of the American Dermatological Association for 1883, page 197, as a result of their combined investigations, that leprosy is contagious by inoculation, and *there is no reason for believing that it is transmitted in any other way.*

Dr. P. W. Farrar, Nevada, Iowa, W.S., in a communication to Mr. L. F. Andrews, Secretary, State Board of Health, February 21st, 1885, p. 205, says:—"Leprosy is not contagious in the usual acceptance of the term. It requires actual inoculation of pus or blood into the circulation through open vessels or abraded surfaces, and there must be favourable cachectic condition to the action of the virus."

Dr. Bevan Rake in a communication to the Acting Surgeon - General, dated Maraval, 11th July, 1889, says :—"In a paper received from St. Louis, Missouri, only the other day, I saw that Dr. Bockmann estimates that there must be in Minnesota about 100,000 persons of Norwegian descent whose ancestors were lepers; and yet leprosy never appears amongst them; all the leprous Norwegians in the State are imported, so that leprosy does not appear to have spread there either by heredity or contagion."

In an article entitled "Notes on Leprosy as observed in Antigua, West Indies," Mr. John Freeland, Government Medical Officer, observes :—" On the subject of contagion I certainly agree with Mr. Hutchinson when he says that the profession divides itself into two camps, one asserting contagion and the other denying it; but I think that the contagionists, or those who believe that contagion takes an important share in the spread of the disease, are, in this part of the world at least, in a decided

minority. No one, I imagine, would absolutely deny that contagion might be artificially effected by inoculation; but the chances of such an event happening accidentally are so remote that it can hardly be taken into account."—*British Medical Journal, October 5th, 1889.*

Dr. James H. Dunn, Professor of Dermatology in the Minnesota Hospital College, in a clinical lecture on leprosy, reported in the *North - Western Lancet*, March 1st, 1888, said : — " The question, Is leprosy contagious? has been a source of much discussion and contention. At times and in some countries it has been looked upon as markedly contagious. Some writers still regard it so; but at the present day the great majority of dermatologists teach that it is not, at least not in the ordinary sense of the term. There is no evidence to show that the malady. has in any instance spread by contagion in a country where leprosy is not endemic."

Mr. T. H. Wheeler, the British Consul of Bogota, South America, in his Report for 1890 to the Foreign Office, No. 804, observes that although public opinion favours the belief prevalent in Colombia that leprosy is contagious, in the climates of Tocaima and Agua de Dios it is not so :—" For . more than one hundred years that these places have been the chosen resort of lepers in all stages of the disease, who have mixed freely with the other inhabitants of the district, there is no case on record of the disease having been contracted by contagion."

Dr. Alfred Ginders, in a communication to the Inspector-General of Hospitals, etc., Wellington, New Zealand, on Leprosy among the Maoris, dated Rotorua, 4th July, 1890, states his opinion that the disease is not infectious or contagious in the ordinary sense, but "that, in all probability, the worst cases have arisen from direct infection of the blood by inoculation, either accidental or premeditated." The only premeditated form of inoculation in vogue is that induced by the lancet of the vaccinator.

The Medical Superintendent, Leper Asylum, Calcutta, Dr. Madhub Chunder Ghose, in his Report to the Honourable H. Beverly, President of the District Charitable Society of Calcutta, 27th August, 1889, says :—" It seems to me, after an experience of fifteen years in the asylum, that leprosy is not contagious or infectious in the proper acceptance of the term. Recently I have taken the full history of all the lepers in this asylum, and, with one or two exceptions, the origin of the disease could not be traced to contagion; some acquired the disease from an hereditary taint, some from the effects of syphilis, and the indiscriminate use of mercury; but in most of the cases the origin of the disease could not be satisfactorily traced, but I have no doubt that the disease can be communicated by an abraded surface absorbing leprosy matter."

Dr. Ghose adds :—" To prove my assertion as to the non-contagiousness of leprosy, I beg to bring forward the following facts, that is to say, my own personal experience of the disease for over fifteen years. There is an inmate of the asylum, by the name of Doris, who is a non-leper, and who has been at the asylum for over twenty years, sleeping in the same ward, constantly mixing with the lepers, eating with them, etc., and he has not contracted the disease.

"There is also an idiot boy at the asylum, a non-leper, who has been an inmate for over ten years; he also sleeps, eats, and mixes freely with the lepers; this boy, also, has not the slightest trace of the disease.

"The dhoby attached to the asylum, with his father and grandfather before him, have washed the clothes of the lepers for more than thirty-five years; none of those showed any signs of the disease.

"The native doctor, Runchanun Dass, who lived with his family for over ten years in the premises of the asylum, neither contracted the disease, nor did any of his family.

"The dressers, Buddye and Narain, acted, the former for twelve years, and the latter for ten years: they did not suffer from the disease.

"The dressers, Rajjian and Jaddao, have been attached, off and on, the former for eight years, and the latter for ten years (this man is yet at the asylum as a dresser), and I have recent news regarding Rajjian, who has gone to his country: these men are unaffected. The dressers have, daily, to handle sores, wash unhealthy ulcers, apply ointment, etc., besides having to shave the lepers periodically. The present Christian cook and his father have been working at the asylum for over twenty years. The father died a non-leper, and the son is free of the disease.

"Other cooks, who work for a few years and then go to their country, have never been attacked. The sweepers, Roohon and Bustee, have worked more than seven years without contracting the disease. Both the men have been discharged, and are yet living. Other sweepers, who have been working a short time each, also have not suffered.

"The Durwana have not contracted the disease. The present Durwan has been now over five years in service.

"I have myself been attached to the asylum now for over fifteen years, visiting the lepers daily, cutting and handling them, without having suffered.

"My predecessor, Dr. K. Stewart, was in medical charge of the asylum for over twelve years, and remained free of the disease till his death. My assistant, Dr. H. W. Mitnish, M.R.C.S., England, has been at the asylum for over eight years, and is healthy."—*Report presented to the Hon. H. Beverley, M.A., dated Calcutta, 27th August, 1889.*

Dr. Vandyke Carter, of Bombay, says:—" I have not met with any evidences of the contagious nature of leprosy that bear sifting."

Dr. Day, of Calcutta, who, according to Dr. Balehandra Krishna, L.M. and S. of Bombay, has made leprosy his special study, says, in the *Indian Mirror*, that he does not believe in the contagious nature, of leprosy.

Dr. J. Jackson, Bengal, in reply to a communication from the Royal College of Physicians, writes :—" It is not contagious in the ordinary sense of the term. . .—*Leprosy Report, p. 202.*

When Mr Commissioner Acworth, of the Bombay Municipal Corporation, paid an official visit to the Madras Leper Hospital, he was informed that the sweepers employed to wash the ulcers of the lepers did not contract the disease, although some of them had been doing the work for fourteen years.

Mr. A. Mitra, L. R. C. P., L. R. C. S. (Edinburgh), Chief Medical Officer, Kishmir, in an article in the *American Journal of Medical Sciences*, Philadelphia, 1891, observes :—" Of course, contagion by inoculation is possible, and often takes place in various ways. In India, people usually have their feet and skin bare, and, therefore, there is every likelihood of inoculation."

Mr. A. Mackenzie, Secretary to the Government of India, writing from Simla to the Minister of

Foreign Affairs, Honolulu (October, 1885) says:—"On the whole, it is believed that the medical evidence tends to show that the disease is not contagious. In support of this view, it may be mentioned that not a single servant of the asylum at Almora, in the Kumaun District of the North-Eastern Provinces, appears to have contracted the disease during the thirty-one years for which there is information."

Dr. W. A. Kynsey, the Surgeon-General, Ceylon, says:—"It (leprosy) is not considered contagious in Ceylon, and lepers are not generally shunned by their relatives or friends for fear of infection, but are often maintained by them in their own houses. It is, in my opinion, not contagious as syphilis, Parangi, the exanthematous diseases. There is no conclusive evidence in the hospital records of, communicability by direct contact with, in close proximity to, diseased persons. The attendants of the hospital have for years been in close association with lepers in all stages of the disease, the head-servant for more than twenty years; and the washing of the establishment has been performed by a family in the neighbourhood for four generations; but not a trace of the disease, as I have reason to know, has been observed among *them*."—*Leprosy in Foreign Countries*, p. 9.

Dr. Dixon, Medical Superintendent of Robben Island, Cape of Good Hope, in a report published in the *Journal of the Leprosy Investigation Committee*, No. 3, July, 1891, says :—"The evidence gathered from officials and patients long resident on Robben Island shows that there is no authentic instance, with possibly one exception, of any non-leprous person on the island having contracted the disease, either direct or indirect, with the leper residents."

Dealing first with the possible exception, the circumstances were as follows :—A lad, son of the shoemaker, constantly associated with the lepers; he ate of food given to him by them, and was in the habit of fishing with their tackle; it is stated that on one occasion, when using the lepers' tackle, *he had a wound on his finger*. For about ten years he exhibited symptoms, said to be those of leprosy. He died in 1888, having suffered for about ten years. It cannot be held that there is conclusive proof that this solitary case originated by contagion.

The evidence of the older officers goes to show that, until about the year 1884, all the lepers' soiled and filthy linen was washed by the female lunatics in cold water only, and was often mixed with the underclothing of the lunatic patients in the process of washing. This practice was probably in vogue for upwards of thirty years, yet there is no alleged or recorded instance of any lunatic patient contracting leprosy on Robben Island.

Dr. W. H. Ross, Police Surgeon in Cape Town, was asked—

Q. 252. "You are aware that the bacilli have been in the saliva 'of lepers, would not that render the disease liable to be spread by the act of kissing?"—"Not unless there was some cracked surface on the lips or mouth. I have never known of a case of leprosy having been contracted on the island, although they mix there freely." — *Report of Select Committee on the Spread of Leprosy, Cape of Good Hope, July, 1889. Minutes of Evidence.*

Mr. Davidson of Madagascar says :—"Leprosy is contagious by inoculation only."

Dr. W. V. M. Koch, the Acting Superintendent of the Leper Asylum, Trinidad, writing on the

subject of contagion, explains that "the entrance of the (leper) germ into the system will take place if it is brought into contact with an absorbing surface—any abrasion of skin or mucous membrane being sufficient for this purpose."— *Surgeon General's Report for 1891*, pg. 71.

Dr. Alexander Abercromby writes to me from Cape Town, April 20th, 1892, that after thirty years experience he holds that leprosy is partly contagious, and explains that he does not use the word contagion in the strict sense, "but when there is a discharge from a leprosy sore, and this coming .in contact with the tissues of a healthy person will develop the disease; or the saliva of a person coming into contact with a slight abrasion of cuticle, or healthy mucous surface."

Under the head of "Leprosy in Havana," the *British Medical Journal*, June 18th, 1892, says that the number of cases in the Real Casa Hospital de San Lazaro at the present time averages 80 to 90, but seldom reaches 100. In 32 cases (40 per cent.) no family history of the disease could be obtained. 'In no single case could leprosy be traced to contagion, and of the 25 persons employed in the hospital, only one (a chaplain) contracted the disease during the last 12 years. Dr. Arango, the present medical superintendent, has never known any case in which the disease could be distinctly traced to contagion, and he knows persons who have lived twenty-eight or thirty years in the hospital without contracting it."

[Index](#)

### CHAPTER 3: LEPROSY COMMUNICABLE BY INOCULATION

WHILE the preponderance of medical and scientific opinion is against the theory that leprosy is, in the ordinary sense of the word, a contagious disease, the evidence in favour of its being communicable by inoculation is overwhelming. Even those who strongly uphold the theory, of contagion invariably include inoculation as one of the principal means of communication. However widely authorities differ as to the other causes to which leprosy is attributed, such as climatic influences, unwholesome and putrid food, want of salt, a fish diet, malaria, heredity, contagion, syphilis. and insanitation, we may safely affirm that there is a practical consensus of opinion as to its inoculability.

To the question, Is leprosy inoculable? Sir William Moore, K.C.I.E., late Surgeon-General, Bombay Staff, Hon. Physician to the Queen, says :—"Professors Damisch and Kobner proved by an experiment that leprosy may be communicated to animals by inoculation. There is also the well-authenticated case of a boy, Miller, who pricked himself with a needle used by a leper, from which injury leprosy developed. Then there was a case of a medical student pricking himself when performing a *post-mortem* examination on a leper."

Sir William Moore has himself cited (*Journal of the Leprosy Investigation Committee*, No. .1, p. 28) a case of inoculation in a person with an injured hand who was employed to rub sulphur ointment on leprosy patients, his family being quite free from the disease, and no history of previous association with lepers being obtainable. He considers that the sulphur ointment had no protective influence. "All that is required is the transmission of leprosy discharge, which contains the microbe or germ of leprosy, to the healthy body. But in order that the poison may act it is necessary that it should come in contact with an abrasion or sore on a healthy skin. An infinitesimal portion of leprosy discharge is quite sufficient."—*Leprosy and Leper Houses*, pp. 2 and 3.

In a communication to the secretary of the Leprosy Fund, dated June 2, 1890, Sir William says:—"Leprosy has been attributed to the following causes:--(1) Climatic heat; (2) unsanitary conditions ; (3) want of salt; (4) vegetable diet; (5) fish diet; (6) lime in water; (7) malaria. But facts show that none of these are the causes." After giving the reasons for this conclusion, the writer adds :—"My views that leprosy is a phase of inherited syphilis, communicable, however, by inoculation, and the reasons for such views, have been expressed in my 'Manual of. the Diseases, of India,' 1887."

This view accords with the most eminent medical authorities in all countries where leprosy prevails. In a report on Leprosy in Cyprus, by Dr. Heidenstam, chief medical officer for the island, transmitted by the High Commissioner, Sir Henry Bulwer, to Lord Knutsford, and presented to both Houses of Parliament, March, 1890, the author, after dismissing various theories put forward to explain the spread of leprosy, such as heredity, the use of putrid food, salt pork, mal-hygiene, malaria, and miasma, says :—"My researches have led me to the conclusion that leprosy is what should be termed an inoculable disease, inasmuch as the virus is transmitted into the system in like manner as many other maladies, notably syphilis, anthrax, glanders, etc.; but it has not the same action in all constitutions, nor in all circumstances of life, and is of a long and slow incubation. My further researches and studies have not in any way altered the opinion I then expressed, and I am more than ever convinced that the direct cause of leprosy is simply and solely due to the inoculation of the virus of a person affected into another up to that time free.

"It has been advocated that instances of the communicability of leprosy have been rare, and so

doubtful that it is impossible to rely on their authenticity. In this island, at least, I have met many cases where the slightest doubt could not be entertained."

Dr. Olavide, of Madrid, at the Paris Dermatological Congress of 1889, maintained that leprosy was evidently a parasitic disease, contagious, and inoculable. This authority refers to a curious fact, that it is observed by preference amongst the soldiers and monks who have resided previously in America and in the Philippine Islands. In Spain, while vaccination is not always carried out amongst the civil population, it is rigorously enforced in the army, as I was informed some years ago by the then British Consul; Mr. M'Pherson, of Madrid.

At the same Congress, Dr. Zambaco-Pacha, communicating the results of his inquiries concerning leprosy in the Isle of Mitylene, mentions that while he is an anti-contagionist, the discovery of the leprous bacillus has somewhat shaken his ideas. He records the curious fact that, of about 120,000 souls in Mitylene, 15,000 are Mussulmans, and amongst these there is not a single leper to his knowledge. Dr. Zambaco omits to note the fact that Mussulmans in most countries have a rooted aversion to, and distrust in, vaccination, and escape the ordeal whenever they can.\*

\*This repugnance was made known to me by means of personal investigations in Ceylon in 1890-91. "The First Triennial Report of the Working of the Vaccination Department in Bengal" mentions, amongst other races, the Mahomedan Ferazis, who display the utmost repugnance (as do also the higher classes in India) to vaccination.

Dr. Sutherland, of Patna, observes that :—"Another test of the prevalence of leprosy in this district was to ascertain the proportion of leprous persons in Patna gaol. Among Mussulmans, two were affected, or one in twenty-eight; while among the Hindoos there were seventeen persons affected, or one in every sixteen."

"This is certainly a startling assertion, one person in every sixteen affected with the taint of leprosy, and yet it comes from the pen of a careful *observer*."—*Leprosy a Communicable Disease, by Surgeon C N. Macnamara, p. 15 and 16.*\*

\*The *Madras Times*, Nov. 28, 1891, referring to the opposition to vaccination, which, the editor observes, is by no means confined to the ignorant populations,' says :—"Official 'reports show notably that the Lubbays and Mahomedans, as a class, resist vaccination, and do much to prevent the authorities from tracing the age of children over six months, with a view to enforcing the Act. Male vaccinators, it is remarked, are prohibited from entering their houses on the ground that these are *gosha*, and Hindu female vaccinators are unable to cope with the difficulty satisfactorily. It has been proposed to employ a Mahomedan female vaccinator, but a suitable woman who can read, write, and serve notices has not yet been found."

In the *Archives de Médecine Navale et Coloniale*, September, 1890, is an article by Dr. F. Forne on the "Contagiousness of Leprosy," of which theory the writer is a firm adherent. Dr. Forne says:—"One of the arguments invoked for the purpose of denying the contagious character of leprosy consists in saying that the persons attending on the lepers—religious persons, infirmiry attendants, medical men—do not contract leprosy. It is important to refute that assertion by showing that it is contradicted by facts." The writer then proceeds to give details of the case of Father Damien, who, after sixteen years' residence at the leper settlement at Molokai, succumbed to this disease, as Dr. Forne supposes, through contagion. Of this there is not the slightest proof, unless contagion is understood to include inoculation, and that this is intended would appear by the following reference to another case to illustrate the author's theory:—"Dr. Hulin de Goden, medical officer of the leper settlement of Desirade (French Antilles), says that Sister A. became leprous after having pricked herself in the fingers of her hand with a sewing-needle while mending articles that had been used by

lepers. Whether it was after having pricked her fingers matters little, since it is by the skin of the hands that the leprous contamination would have taken place in both cases. He observes that, in general, the washing of linen is habitually practised under the supervision of the Sisters, while sewing, on the contrary, is more often carried out by themselves.

"The accidental inoculation would have taken place before 1878, the date of the first leprous manifestations; in 1881 the affection had taken so considerable a development that Dr. Hulin de Goden decided to isolate the patient.

"An analogous fact has been observed in Tahiti, where leprosy has been transferred by passing from the native race to the white race, absolutely in the same manner as we have the fact produced in the Sandwich Islands, in New Caledonia, and in Guiana.

"A religious woman from Europe, free from hereditary taint, who was working at the linen-drapery of the hospital at Tahiti, inoculated into herself the terrible malady with a sewing-needle under the same conditions as the religious woman of Guiana, She was sent back to France in 1881 as being affected with leprosy."

Dr. Woods, cited by Dr. Hahn, expresses himself, thus:—"In the hospitals of Calcutta, and other districts of the East Indies, hospital attendants, positively free from all hereditary taint, have contracted leprosy by means of accidental inoculations undergone in the exercise of their functions; Dr. Robertson, Director of the Leper Settlement of Seychelles, became leprous during his period of service in that house."

Dr. Forné says: "Dr. Hillebrand cites the following case :—At Borneo a young European boy was in the habit of playing with a child of colour affected with leprosy. One day this latter plunged the point of his knife into an anaesthetised part of his body, an operation which was immediately repeated by his comrade with the same knife. Some time afterwards the European started for Holland, there attained his maturity, and, at the end of nineteen years, returned to Borneo fully affected with leprosy."

In a memoir read by Besnier before the Academy of Medicine, Paris, October 11th, 1887, Leloir, a high authority, is stated 'to have pointed out that lepra would appear to be contracted by inoculation and not by contact, from the fact that the epidermis does not, as a rule, contain bacilli, and that the epidermo-dermic basal membrane apparently constitutes a barrier to the passage of the micro-organism in either direction.

One of the latest contributions to 'this important subject is an able work entitled "Leprosy," by Dr. George Thin (London, 1891), in which the question of contagion is fully discussed. The author has succeeded in bringing together (pp. 139-166) the largest number of examples of alleged contagion of any writer I have met with. Some of these are distinctly traceable to inoculation by means of sores, pricks, gunshot wounds, abraded surfaces. The following are amongst the examples:—

No. 14.—Dr. Duncan, Civil Surgeon, Julpaiguri district, states that a healthy woman sustained a gunshot wound in the thigh. She had no leprous relations, but her husband was a leper with ulcerations on his hands. The woman became a leper.

No. 53.—A young coloured boy, while suffering from an eruption, played with a boy who was a leper; the previously healthy boy became a leper about a year afterwards, whilst his family remained

untainted.

No. 67.—Dr. W. H. Ross cites a case which occurred in a European family without any leprosy taint. J. K., while playing with leper boys, pricked himself with one of their fishing hooks, and became an undoubted leper.

On page 162 Dr. Thin remarks: "No one doubts that syphilis is a contagious disease, because surgeons, nurses, and attendants may fulfil their duties for many years in Lock hospitals without becoming infected; and it is a matter of every-day experience that a member of a large family may pass through all the infectious stages of syphilis, living in constant association with brothers and sisters, without the disease being transmitted; yet it is quite certain that in all those cases the disease could be communicated by an inoculation of the simplest kind." From this illustration we infer that Dr. Thin considers leprosy transmissible by inoculation, and sometimes uses the word contagion in that sense, as I have noticed with many other writers on leprosy.

On page 66 Dr. Thin quotes Dr. Donelan as authority for a case of leprosy due to inoculation.

Professor Cayley, F. R. C. S., says (*Journal of the Leprosy investigation Committee*, p. 36) that leprosy is directly inoculable.

Dr. John Murray, Inspector- General of Hospitals London, in a communication to Dr. P. 5. Abraham, Secretary of the National Leprosy Fund, June 9th, 1890, says: "I consider that it (leprosy) is communicable from the sick to those that are well, probably through a broken surface, as an ulcer or wound, and that it may be communicated by inoculation."

Dr. Liveing, physician to the Middlesex Hospital, in his Gulstonian Lectures for 1873, says:—"Facts, too, are slowly accumulating which tend to prove that the casual inoculation of leprosy matter is one actual means of spreading this fell complaint." Dr. Hoegh, in his "Report on Leprosy" for 1855, quoted by Liveing, "suggests that the disease is communicable through the *Itch Acarus* (presumably the *acarus scabici*) which in Norway commonly infests the skin of lepers."

In his handbook on the "Diagnoses of Skin Diseases," 1880, p. 284-5, Dr. Liveing writes:—"Leprosy has within the last thirty years been imported and spread rapidly amongst natives of certain islands where it was before quite unknown. It is probable that in a certain stage of the disease it is inoculable. This appears to me the most reasonable explanation of its progress amongst a new population."

In reply to a communication which I addressed to the superintendent of the Leper Asylum, Bergen (which institution I visited in 1889), Dr. G. Armauer Hansen, the Physician General of Leprosy in Norway, the discoverer of the *bacillus leprae*, says :—"I think leprosy to be inoculable; I, moreover, think that leprosy in most cases is transferred by inoculation."

Sir Erasmus Wilson, F.R.S., in his work on "Cutaneous Disease," 1864, says :—"Lepra is a blood disease. The origin of the disease is doubtless an animal poison, but the source and nature of the poison are unknown. One remarkable case lately under our observation has led to the belief that it may be communicated by inoculation."

## INDIA

Dr. Balchandra Krishna, L.M. and S., in his pamphlet entitled "Leprosy in Bombay in its Medical

and State Aspects," suggests a mode of reconciling the conflicting opinions as to the contagious nature of leprosy. He quotes the *Lancet* of June 29, 1889, "The discovery of the *bacillus leprae* by Hansen has greatly strengthened the belief in contagion. This bacillus has never been found in any disease or condition other than leprosy, while it has invariably been found by competent observers in the skin of tuberculated lepers from all parts of the world. In the non-tuberculated cases, on the other hand, it is invariably absent in all the sores in the diseased nerves. But, it has been found in the nerves themselves when the disease is not of too old a standing, and in those skin lesions of mixed nerve and skin leprosy not dependent upon disease of the nerve trunks. This goes far to explain the non-transmissibility of nerve leprosy. The evidence, on the whole, then, is strongly in favour of the disease being communicable; but all are agreed that it is only so in the *ulcerating stage* of the *tubercular* or the *mixed form* by inoculation of the pus on an abraded surface, either directly from the patient, or from the stained clothing or other objects contaminated by the secretions from the leprosy sores. It is certainly not communicable by aerial infection in the same way as small-pox or other exanthemata."

"This seems to me," says Dr. Krishna, "to explain satisfactorily the reasons why some observers found cases which convinced them of the contagious nature of the disease, while others met with some which did not show any contagious nature. It also explains the three cases which I have mentioned above, as on no other hypothesis can they be explained."

In a paper on leprosy in the *Times of India* (Bombay), August 13, 1889, Dr. Balchandra Krishna says that the evidence in proof of the communicability of the disease from man to man is overwhelming.

Brigade-Surgeon H. V. Carter, of Bombay, referring to the spread of leprosy, says: "The direct communicability of leprosy is at least a good working hypothesis."

Surgeon-Major Pinkerton, in his evidence before the Royal Commission on Vaccination, testified that leprosy was increasing in the cities of India, and believed that it was inoculable.—*Second R.C. Report, p. 6.*

In a letter to the *Times*, June 12, 1889, Surgeon-Major Pringle, late of the Sanitary Department, Her Majesty's Army, Bengal, refers to the danger of spreading leprosy by both inoculation and vaccination. "The fact is, the amount of the virus of leprosy with which Father Damien was unknowingly fatally inoculated might have been, and probably was, very minute. I am amply justified, from a careful study of smallpox inoculation and vaccination during the whole of my thirty years' Indian service, in stating that, unless prompt and stringent measures are taken in Bombay, leprosy inoculation will become far more possible, and hence probable, than it may appear at present."

Dr. Joq. Frank Periera, Medical Superintendent of the Leper Asylum, Bombay, India, in a communication to the *Times of India*, November 18, 1890, gives his opinion that the contracting of leprosy is mainly due to its inoculation by means of open sores from one person to another, and adds: "In most, if not in nearly all the cases treated by me, their previous histories have, almost without exception, disclosed the fact of the disease being due chiefly to heredity and inoculation."

Dr. Cunningham, the special adviser to the Government of India, admits the principle of the inoculability of the disease.

As to the supposed cause of leprosy, "my experience," says Dr. S. M. Shircore, of Moorshedabad, India, "does not tend to the belief that this disease is contagious in its nature, unless by direct inoculation."

Dr. H. A. Ackworth, Municipal Commissioner, Bombay, who has devoted much attention to the leprosy question, writes to me from Bombay, 24th May, 1891:—"All the medical men that I have met have agreed 'that in whatever of any other methods leprosy may be transmissible, it is certainly so by inoculation.'"

Dr. W. K. Hatch, M.B., Surgeon, Bombay Army, reports in the *British Medical Journal*, June 2 6th, 1886, p 1713, that on June 27th, 1885, a student, while making a *post-mortem* examination on the body of a confirmed leper, cut his left forefinger at the top, and received a small abrasion, which resulted in certain characteristics of leprosy. This writer has been promised further particulars.

Dr. Neve, of Kashmir, says that in leprosy the *bacillus lepra* is always present; that the period of incubation is so long, "that a few positive instances of inoculation or contagion outweigh an immense amount of negative evidence."—*Leprosy, by Dr. George Thin, p. 62.*

Dr. G. D. M'Reddie, Civil Surgeon, in his letter to Dr. Ghose, dated Hurdor, the 18th February, 1888, states:—"From observations I know leprosy is hereditary. It is also contagious in the sense that it is necessary for the discharge from a leprosy ulcer to come into direct contact with the broken skin of the recipient, or the blood of a leper to be inoculated into the system, as in vaccination."—*Report on Leprosy to the Hon. H. Beverley, MA., by Madhub Chunder Ghose, Leper Asylum, Calcutta, August 27th, 1889.*

Surgeon C. N. Macnamara sums up the question of the communicability of leprosy as follows:—"The arguments, therefore, against the communicability of leprosy do not refute those in favour of it; consequently, I can arrive at no other conclusion than that leprosy is communicable; but it is necessary for the propagation of the disease by this means that the discharge from a leprosy sore should enter the tissues of a healthy person, and, further, the disease may even then (unless under peculiar circumstances) remain undeveloped in the system for years."—*Leprosy a Communicable Disease, p. 43.*

### SOUTH AFRICA.

In Appendix A to the "Cape of Good Hope Report of the Select Committee on the Spread of Leprosy," 1883, is an interesting communication from the Rev. Canon James Baker, dated Kalk Bay Rectory, August 10, 1883, as follows:—"My own opportunities for investigation have been rather exceptional, and my advantages considerable. In early life I was a student of Medicine, and subsequently of Chemistry and Natural Philosophy, at University College, London. My appointment as chaplain to the Lunatic Asylum and General Infirmary on Robben Island, where I remained nine years, put me in the way of getting experience among lepers, and I commenced at once and continued to make the nature of this terrible disease a special subject of inquiry. In my present sphere of duty I see, unhappily, many cases for investigation. The increased spreading of the disease in many parts of the colony is now generally admitted; it is spreading among both the white and the , coloured races, especially in places near the sea coast.

"Leprosy is not to be compared with small-pox or scarlet fever, as to contagion, any more than

typhoid fever, but this can be conveyed in excreta, finding its *nidus*, or seat of incubation, in one part of the body only; and so, while many will escape leprosy who handle patients as they may handle decomposing corpses, with the skin of their hands unbroken, others may have their blood-vessels or absorbents come in fatal contact with the active poison of the disease."

In the body of the same report I find the evidence of a number of witnesses of wide experience, who have given the subject much attention. Hon. Dr. Atherstone, Member of the Legislative Council, and F.R.C.S., Eng., who has practised in the Colony fifty years, chiefly in Graham's Town, where he was District Surgeon for twenty-six years; also Consulting Physician of the Albany General Hospital, and President of the Leprosy Inquiry Committee of 1889, testified as follows :—" I have formed a very decided opinion as to the nature of the disease, and the manner in which it is transmitted from one to another, and spread all over the country. Recent microscopic investigation has established the fact that the diseased tissues and secretions are invaded by numerous parasitical, rod-like organisms called bacilli, always of the same form and size, no matter from what part of the world the leper comes, or what part of the body is examined, whether the tubercles, lymphatic glands, cartilages, or suppurating sores. This specific bacillus of leprosy is no doubt the true cause, and it is spread by inoculation, either by direct contact with the secretion, or suppurating sores of the leper, or transmitted by the clothes, utensils, pipes, etc., containing' these parasitical germs of the disease."

Q. 345. "You are then of opinion that it is contagious?"—"Yes; in the mode I have described; not in the ordinary sense of the word."

On page 8 I find the following :—"Another result of our inquiry has been to remove any doubt that might previously have existed as to the contagiousness of the disease. Your committee are satisfied that where the disease has not been derived by heredity from one of the parents or grandparents, it has in every instance been contracted by means of contagion. It is quite possible that the disease may not be communicable except to a person having some wound or abrasion in the skin; but when it is borne in mind that the victims often suffer from a discharge of matter from the hands. or other limbs, it is not difficult to conceive how readily the disease may be communicated to persons coming in contact directly or indirectly with the sufferer."

Dr. Abercrombie, member of the Cape Town Medical Board, says (Answer 6a) :—" It would be communicated to a person who came in contact with a leprosy person if he had a sore or an abrasion. For instance, if he were to touch a leprosy person with a sore finger, use the same knife and fork, or drink out of the same glass."

Sir Samuel Needham, superintendent of the Old Somerset Hospital, says:—" I do not think it is contagious, except in cases of cohabitation, when persons are reduced to a low state of health, through being badly fed, or when they get a cut or wound inoculated by contact with a leprosy patient."

Dr. W. H. Ross, twenty-two years Police Surgeon at Cape Town, in reply to Question 311, "Do you know the case of a little boy who contracted leprosy on the island?" said:—" I know the case. The boy had no leprosy relations. He associated with leprosy, and one day, being out fishing with them, he ran a fish hook into his finger. Leprosy shortly afterwards made its appearance."

In the "Report of the Select Committee of the Legislative Assembly on Leprosy," July, 1889, are the

following answers from the same witness :—

Q. 346. "I know of several cases in which the disease was communicated by inoculation."

Q. 351. (1) "It has been conclusively shown that it is always accompanied, if not caused, by a specific bacillus or bacilli, distinctly recognisable under high powers of the microscope in all the stages, in the skin, tissues, glands, secretions, nerves, and bones of the parts affected, undergoing ulceration and destructive degeneration by the pressure of interstitial tubercular deposits. (2) These specific rod-like bacilli, like other fungoid growths of the lowest type of generative life, such as dry rot in old wood, etc., it appears, can only gain access to the system in persons in a low state of vitality, either from poverty and filth, defective nutrition, or depressed nervous energy or constitutional debility, from heredity, or other causes of enfeebled condition of health, admitting of the growth and reproduction of the germs of these low organisms.

(3) In such weakened state of the constitution, hereditary or acquired, these bacilli may be introduced into the system by direct contact with any abraded absorbent surface of the skin or mucous membranes, as in wounds, sores, pricks, etc., or with the mucous surfaces of the lips, mouth, nose, eyes, etc., but chiefly in parts distant from the centre of circulation, as in the toes, fingers, etc., where they may find a lodgment from the diminished vitality of the part being insufficient to destroy them, although sufficient to prevent its rapid growth."

Dr. J. C. Tache, Titular Professor, Laval University, Visiting Physician of the Tracadie Lazaretto, New Brunswick, Canada, reports to the Hawaiian Government ("Leprosy in Foreign Countries," 1886, p. 142-3):— "There is a case, the facts of which are established beyond the possibility of cavil, in which the disease appears to me, as well as it did to those who witnessed it, to have been produced by the absorption of liquid matter discharged from the body of a woman who had been in a cachectic state from leprosy. At the funeral of that woman, the body was carried on the shoulders of four strong young men. The day was hot, and, on a sudden, liquid matter began to ooze out through a joint of the coffin, wetting the shoulder of one of the carriers. The wet, combined with the heat and the pressure of the sharp edge of the coffin, produced an abrasion of the skin of the young man. The contact of the liquid with the abraded surface lasted a part of the time of the procession, and the whole length of the service, as it was only on his way home that the young man washed his sore shoulder, and changed his clothes. Some months after, that man, whose health had always been robust, began to feel unwell. In a short time the symptoms of leprosy made their appearance, and he died of the disease eleven years after the occurrence. There had never been any case of leprosy in his family, whose ancestral genealogy is traced for several generations back. In fact, the disease was not yet known as leprosy, being of recent appearance in the locality, and among these people. He was the fourth case in that place, the other three being the woman spoken of, the husband and sister of the woman, in the ancestry of whom there had never been any trace of the disease. The fifth case in that locality was the sister of the young man." It is noticeable that the incubation of this disease was of comparatively short duration.

Dr. Manget, Surgeon-General, British Guiana, in the Report of the Royal College of Physicians on Leprosy," p. 45, observes:—" My own opinion is in favour of the contagiousness of leprosy, and that it may be propagated by the matter of ulcerated tubercles being applied to any raw surface; but I admit that I have met with cases which would seem to preclude the idea that the disease can be considered contagious in the ordinary sense of the term."

Dr. Charles W. Allen, attending physician to the North Western Dispensary for Skin Diseases, Surgeon to the Charity Hospital, in an article in the *New York Medical Journal*, March 3 1st, 1888, on leprosy, concludes that the disease is transmissible by inoculation from one individual to another.

In a remarkable article on "Leprosy, its Extent and Control," by Dr. H. S. Orme, published in the 20th volume of "Transactions of the Medical Society of the State of California" (1890), page 180, Dr. Saxe is quoted as giving the case of a physician's son who acquired the disease after inserting a pin into his leg which a little Hawaiian leper had just previously thrust into an anaesthetic patch on his own leg.

Dr. S. Kneeland, of Boston, U.S., who visited Honolulu in 1872, says :—" There can be no doubt that it (leprosy) is spread by cohabitation, and inoculation of its diseased fluids, in the same way as syphilis."—*Dr. Hillis on "Leprosy in British Guiana,"* p. 192.

Dr. J. C. Graham concludes an article in the *Canada Medical and Surgical Journal*, October 1883, as follows :—" In all probability the disease is communicated solely by means of inoculation; and opportunities for such inoculation are very few indeed, unless there has been a long and intimate contact with a diseased person."

Dr. Graham here omits from his purview the universal practice of vaccine inoculation, which sometimes carries with it the sources of leprosy and of other diseases.

In a leading article in the Philadelphia, U.S.A., *Medical News* on "Leprosy in its Relation to the State," the writer says:—" From time to time we hear of lepers reaching this country, either from Norway, the West Indies, or from China, and it becomes a very important question how to deal with such cases. Up to a few years ago, opinion was very strongly against the contagious nature of the disease, but since Hansen's discovery of the *bacillus lepra* facts have been accumulating to show that the virus is a fixed contagion, communicable by inoculation, like syphilis and glanders."

Dr. William B. Atkinson, Secretary to the State Board of Health, Philadelphia, in his official report for 1890 of a case of leprosy (John Anderson, a Swede), observes: "There is no danger of contagion except by inoculation. The transmission of leprosy by inoculation or contact has been a debatable point with the profession for many years; but since the disease has been better studied, and the discovery of the *bacillus leprae*, a minute organism found in every case of true leprosy, opinion is gradually but surely coming round to the recognition that leprosy may be communicated by the unhealthy to the healthy to a much greater extent than has hitherto been considered probable."

The *American Journal of the Medical Sciences*, October, 1882, has a communication on "The Question of Contagion in Leprosy," by Dr. White, who remarks that heredity as the only, or as an important factor is out of the question. "It would have required several generations to have accomplished such results; we must look, then, to the customs of the race as exceptionally

favourable to inoculation, and as the only possible explanation. It is probable that leprosy, like syphilis, may be communicated under all circumstances by which some of the fluids and other products of the infected *foci* of a diseased person come in contact with abraded or excoriated, possibly with the uninjured surface of a healthy person. It would be necessary that the diseased products should be at the surface of the skin, or mucous membrane, and this would generally be accompanied during the process of softening by which the impermeable layers were removed. Thus the nodular form in its ulcerative stage would necessarily be the most dangerous phase of disease, whereas the anaesthetic form might exist for years with little danger of communicating itself to its surroundings. In this sense we may conclude that leprosy is contagious, and in these ways, probably, the disease mostly spreads in a family, a community, a nation."

Mr. Plumacher, United States Consul at Maracaibo, Venezuela, observes in his official report for 1890 (p. 695) with reference to leprosy :—" I confess freely that I am not a believer in the theory of contagion properly so called. It will be easily understood that should matter from a leprous ulcer come into absolute contact with the blood of a healthy person inevitable infection would result, and leprosy be engendered, in the same manner that the surgeon at times meets his death through blood poisoning contracted in the dissection of a cadaver."

The United States Consul to Cape Colony, Mr. James W. Siler, in the official report on leprosy to his Government, dated March 24th, 1887, observes :—"This specific bacillus of leprosy is no doubt the true cause, and it is spread by inoculation by direct contact with the secretion or suppurating sores of the leper."

In a paper read before the State Medical Society by Dr. R. J. Farquharson, Secretary of the Iowa State Board of Health, Des Moines, and published in the *New York Sanitarian*, July, 1884, the author says:---

"Leprosy is not contagious in the ordinary acceptation of that term. It requires an absolute inoculation of pus or blood into the circulation through open vessels or abraded surfaces, and at the same time it is assumed that we must have the cachectic conditions favourable to the action of the virus."

Dr. Wood, of the United States Navy, in the Fourth Report, Navy Department, says that the dressers in the hospitals of Calcutta and other portions of the East, positively free from hereditary disease, have in many instances developed it, under circumstances connecting the inoculation with their duties.

The *New Orleans Medical and Surgical Journal* 1880, published a communication from Dr. T. H. Bemiss, Lahaina, Hawaii, on the introduction and spread of leprosy in these islands. "Alarmed," says the writer, "by an invasion of small-pox in 1853, a general vaccination of the whole population was ordered, and physicians being at that time very few on the islands, non-professionals aided in the work. It is charged by some that, as a natural result of the labours of the heterogeneous force so appointed, not only syphilis but also leprosy was greatly increased. In my last circuit trip in my district, I found very few adults who had never been vaccinated. This involves the question of inoculability, in my opinion the main, if not the only means of propagation, other than inheritance."

The same journal, 1888, says that "leprosy may be communicated from a leprous to a non-leprous person by means of a specific virus, which acts somewhat like the specific poison of syphilis,

depending upon thin or denuded surfaces for its absorption, and which remains potent, very probably for an indefinite period of time."

Dr. R. Hall Bakewell, formerly Superintendent of the Leper Asylum, Trinidad, testified before the Select Committee of the House of Commons in 1871, that the inoculation of leprosy was proved as much as any fact in medical science.

In a paper read before the Auckland (New Zealand) Institute, July 20, 1891, and printed in vol. xxiv. of the "Transactions of the New Zealand Institute," Dr. Bakewell says :—" That bacilli exist in both leprosy and tubercle is beyond all dispute; that the bacilli of these diseases may be grown and cultivated in suitable media is ascertained as a fact respecting one of them—tubercle— and, although not experimentally proved as regards the bacillus of leprosy, yet is almost beyond doubt. Artificial nutrient materials have hitherto failed, and it is not allowable to try the only natural medium—the blood and tissues of a person living under conditions likely to develop leprosy. I have no doubt, from seeing the origin of leprosy cases, and studying several hundred cases of the disease, that it is not only inoculable, but that it spreads by inoculation or absolute contiguity, and I have no hesitation, after twenty years' consideration of the subject, in affirming again the opinion given before the Committee of the House of Commons."

Dr. N. B. Emerson, President of the Honolulu Board of Health, says :—" The great problem that confronts the Board of Health is the leprosy question, and the medical profession in the Hawaiian Islands are, I believe, unanimous in the belief that leprosy is a communicable disease, and a transplantable disease, communicable by inoculation."

In a communication to the Secretary of the National Leprosy Fund, dated Dublin, 6th October, 1890, Dr. John D. Hillis, F.R.C.S.I., late Medical Superintendent, Leper Asylum, Demerara, says :—" My views on leprosy are explained in my work, 'Leprosy in British Guiana,' published by Churchill & Son. A further experience of ten years has convinced me more firmly than ever that leprosy is a communicable disease, most probably by inoculation. In tropical climates, many suffer from ulcers, excoriations, etc., which may render them more susceptible when brought so much into contact with lepers."

Dr. Arthur Mouritz, who occupied the position of physician to the Leper Settlement, Kalawao, Molokai, in 1886, says :—" The *contagium* of leprosy enters the system by inoculation at broken surfaces of the skin, fissures, or chaps, on external mucous surfaces, and possibly by punctures of insects, or the presence of parasites, scabies, etc." In his report to the President of the Board of Health, Honolulu, dated February, 1886, the doctor says:—" Some weight must be attached to the views of the foreigners themselves. They, one and all, such as are now alive, emphatically declare their belief that the disease is contagious. Some give evidence of contact (immediately followed by local symptoms—direct inoculation), infection of the whole system speedily following, this again succeeded by external manifestations of leprosy within a comparatively short period."

In his "Biennial Report to the Legislature of the Hawaiian Kingdom," session 1890, Dr. T. H. Kimball considers the fact of the inoculation or transplantation of leprosy to have been proved in those islands, and that the *bacillus lepra* carries the infection.

Dr. Ginder, who investigated cases of Maori leprosy at Taupo and Rotorua, New Zealand, in his "Report to the Inspector-General of Hospitals, etc., Wellington," dated 4th July, 1890, concludes

"that in all probability the worst cases have arisen from direct infection of the blood by inoculation, either accidental or premeditated."

From inquiries made from those who were intimately acquainted with the late Father Damien, I have no doubt that in his case the disease was induced by means of inoculation of leprosy virus from other patients, when he resided in Molokai, through sores on the skin. While possessed of many noble traits, this worthy and self-sacrificing missionary was conspicuous for neglect of ordinary hygienic precautions.

Dr. W. Munro, in his work on leprosy, quotes a series of cases to show that leprosy is spread by contagion, but explains in page 80 the wide interpretation he gives to this much misunderstood word. He observes "that by using the word 'contagion' I do not pretend to express any distinct belief as to the probability of the disease being conveyed by simple contact, being more inclined to believe that it is carried by inoculation in most cases, though long-continued contact even of unbroken healthy with diseased skin may be sufficient."

The doctor gives particulars (p. 84) of several cases of inoculation, all of which, he says, tend to show that inoculation is the chief, if not the only, manner by which the disease is propagated, such propagation taking place quickly only when some special circumstance, as the person being wounded, makes inoculation easy and certain. This writer does not believe there is any evidence of its being communicated in food or drinks, and the only danger from association with lepers is "*when the healthy person has any cut or sore about his hands by which he might be inoculated.*"

Dr. John Freeland, Government Medical Officer, Antigua, in a communication dated Antigua, Sept. 15, 1890, says :—"When I wrote to the *British Medical Journal* in October last that no one would deny that contagion might be artificially produced by inoculation, I meant, of course, inoculation by means of the actual introduction of secretion from the leper's sore into the skin of the healthy, effected either directly by the lancet, or accidentally conveyed through the broken surfaces of the leper and the healthy coming in contact." Dr. Freeland relates how that "T. S., a healthy and robust lad, who was denied board and lodging by his relatives on account of his irregular and late hours, sought accommodation and residence in an out-room situated in a leper's yard. After a time, he received rather a severe wound on one of his feet, and I was called upon to attend him, when I naturally protested against his surroundings, and wished him to go into hospital, not only that he might have every comfort and care, but that he might also be at once removed from his diseased neighbours. He would not, however, consent to leave his house, and I continued attendance long enough to discover that my patient had, since his accident, been systematically using the same basin, the lotion, and even the very rags and bandages that were, perhaps, but a few hours removed from the ulcerated surfaces of his leprosy companion. I need not tell you that the healthy wound soon developed into an intractable and sloughing sore, and was, after some time, followed by those general, but unmistakable, symptoms of leprosy, which went on progressing until the disease was fully formed, and the lad died, an ulcerated and necrosed leper." — *The Lazaretto, St. Kitts, West Indies, October 6, 1890.*

### THE INOCULATION OF THE CONVICT KEANU.

Whatever doubts have heretofore existed as to the inoculability of leprosy, there can hardly be any after a dispassionate consideration of the facts connected with the experiment on the condemned convict at Honolulu. The prisoner Keanu was inoculated with leprosy by Dr. Edward Arning on the

30th September, 1884, and again in November, 1885, *after previously making a most searching inquiry as to any leprosy taint in his family, and a dose examination of his own body.* This examination satisfied Dr. Arning that no trace of the disease could be found in him. Every precaution was taken to secure his isolation from contaminating surroundings, and means were adopted to ensure that he was not employed outside the prison walls. On the 2nd September, 1888, Dr. N. B. Emerson, then President of the Board of Health, and Dr. T. H. Kimball, Government Physician, examined the prisoner and signed the following certificate :— "This is to certify that we have this day carefully examined Keanu, who was inoculated in November, 1885, and we find his condition as follows:— "Ears tubercular and considerably hypertrophied; forehead the same; face, nose, and chin show flattened tubercular infiltration; mouth clean, no tubercles; face generally presents a leonine aspect.

"Hands puffed, fingers swollen at proximal phalanges, tapering to distal phalanges; tips of forefinger and thumb of left hand are ulcerated from handling hot tin cups of tea or coffee, indicating anaesthesia.

"Body—Back thickly mottled with flattened tubercles and the surface uneven to feel, colour of the same—a yellowish brown; front of the body, chest and abdomen, presents plaques of tubercular infiltration of larger size than back, separated from each other by wider intervals and of a brighter colour, in some cases a ruddy pink, especially over upper part of sternum.

"Legs—The infiltration thins out as far down as the knees, there being one large bright patch on the inside of the left thigh ; legs below knees quite clean and skin smooth and even to touch.

"Feet — (Edematous; have poor circulation; bluish colour; soles of feet clean.

"Seat of inoculation, outer aspect of left forearm, upper third, shows a dark purplish scar, about one-and-a-half inches long by five-eighths of an inch wide, irregular in shape, keloid in aspect, dense and inelastic.

"The tests for anaesthesia were not made. Eyes with sclerotitis, muddy and infected.

"No signs of palsy about muscles of face, orbiculares palpebrarum, hands, or forearms.

"It is our decided opinion that this man is a tubercular leper.

"N. B. EMERSON, M.D.,  
*President of the Board of Health.*  
"J. H. KIMBALL, Government  
*Physician, Honolulu."*

In the spring of 1890 Dr. D. W. Montgomery, Professor of Pathology, California University, microscopically examined a piece of Keanu's skin, and discovered the *bacillus leprae* both singly and in groups. This bacillus has been found, according to the *Lancel*, by competent observers in the tuberculated form of leprosy in all parts of the world, and has never been found in any other disease or condition. Keanu has since been sent to the lazaretto, Molokai, a confirmed and incurable leper—a punishment ten times more severe than the death penalty, and, in my judgment, utterly unjustifiable. In a letter on "Leprosy" in the *British Medical Journal*, September 24, 1887, Dr. William Jelly observes :— " I daresay the poor Kanaka convict (Keanu), had he known what leprosy

is, would, without hesitation, have preferred the guillotine, the garotte, or the hangman's rope."

Regarding this official declaration, Dr. C. N. Macnamara says:— "This report establishes unequivocally the fact that the inoculated man has become leprous; and, as he had been inoculated three years previously, there is every reason to believe that the disease is the result of the inoculation. This is very much borne out by the fact that at the seat of inoculation there is what is described as a dark, purplish scar of about one inch wide, keloid in aspect, dense and inelastic.

"The importance of a positive result like this cannot be outweighed by a considerable number of negative experiments; although, so far as we know, this is as yet the only direct experiment that has been made from a leper to a sound individual, and we do not believe that its importance is lessened by the fact that inoculations made from a diseased part of the body to an apparently unaffected part of the body of the same person have, in some cases, not led to development of the disease in the inoculated part within a comparatively short lapse of time.

"The communication of leprosy in this case confirms the views generally entertained by those who hold that the disease is contagious, the idea being that it can only be conveyed from one person to another by a direct communication of leprous tissue into the moist, living tissue of the person infected; in short, that when it is contagious, it is contagious in the same way that syphilis is understood to be contagious."—*Leprosy a Communicable Disease*, p. 45.

In an article in the April (1890) number of the *Occidental Medical Times*, Dr. Sidney Bourne Swift, Resident Physician, Leper Settlement, Molokai, reports the present condition of Keanu as follows :—"Age 70 years; weight 178 pounds; leprous infiltration beneath integument of face and forehead; tubercular enlargement of lobes of both ears, the right more than the left; ulceration of palate, and extensive ulceration of pharynx; tubercular enlargement of uvula; tubercular enlargement of alae of nose; partial occlusion of nasal fossae, due to leprous infiltration beneath pituitary membrane; chronic conjunctivitis and phrygium-like growth on both eyes; almost deaf; voice hoarse, and with a nasal inflection. Anaesthesia of both hands and feet, although no pronounced enlargement of ulnar or tibial nerves; numerous tubercles distributed over the entire body, but most marked on the upper and lower extremities; three small but angry-looking ulcers on outer aspect of left leg; softened tubercle on dorsum old age."

In an article on "Personal Observations of Leprosy in the *New York Medical Journal* for July 27th, 1889, Dr. Prince A. Morrow, after describing the results of the inoculation by Dr. Arning and the development of tubercular leprosy in the convict, observes that, during his visit to Molokai, he excised a small sub-cutaneous tubercle and a portion of the underlying skin. Numerous sections of this specimen were made by Dr. Fordyce, and in all of them the presence of bacilli was exhibited under a microscope. Dr. Morrow estimates that in the Sandwich Islands "about one half the cases are tubercubus, about one-third are anaesthetic, and the remaining sixth represent the mixed form; the tubercular type is the most rapidly fatal."

Dr. F. B. Sutliff, who spent four years studying cases of leprosy in Maui, Hawaii, says, referring to Keanu's inoculation :—" This case will always stand alone; I suppose no other man will ever be purposely inoculated with leprosy. The facts in the case that point towards the inoculation as having been the direct and only cause of the disease are many and strong. Still they will be attacked by those who would rather maintain their own ideas than discover the truth.\*

\*In an article on Keanu's inoculation, the *Occidental Medical Times*, April, 1892, Dr Sidney Bourne Swift intimates that the case made out by Dr Arning is inconclusive, inasmuch as other members of Keanu's family have been found to be affected with leprosy. Keanu's own son, Eokepa, aged about 23 years, and his first cousin, Maleka, on his mother's side, are lepers, living in the leper settlement. Eokepa left school in 1873 on account of this affliction. These cases are by no means inconsistent with the facts contained in the reports above quoted, and it must not be forgotten that the lepra disease was first discernible at the points of inoculation. Nor can they be considered remarkable, knowing how the disease had been propagated by the vaccination lancet. In one instance reported to Queen Liliuokokalani, an entire school in Hawaii was swept away, with the exception of a single survivor, by this means. However, the case for inoculation does not rest upon Dr. Arning's experiment, but on the unimpeachable evidence of numerous reputable witnesses in all parts of the world, and on the fact admitted by pathologists that, given suitable conditions, all bacterial diseases are inoculable.

A well-known medical practitioner at Honolulu gave me a photograph of Keanu, which distinctly shows the appearances peculiar to inoculated tubercular leprosy at the point of insertion in the arm, as well as in other parts of the body. And he considered the experiment an absolute demonstration of the inoculability of the disease. He also unhesitatingly expressed the opinion that the dissemination of leprosy in Hawaii was largely due to inoculation by the lancet of the public vaccinator, a most serious matter not only for Hawaii, but for all other countries where the repulsive and destructive disease is endemic. Dr. Arthur Mouritz, Medical Superintendent of the Leper Settlement, Molokai, says it is doubtful whether one per cent, of the Hawaiians would resist intentional inoculation.

### LEPROSY COMMUNICATED BY INSECTS.

Both in the West Indies, and in British Guiana, I found the belief prevailing amongst the people, as well as, to a certain extent, amongst medical practitioners, that leprosy was inoculated into the blood by mosquitos.

Nor is there anything improbable in the idea. Sir William Moore, late Surgeon-General, Bombay Staff, "is of opinion that one of the chief sources of danger is due to flies and mosquitos. These pests of Indian life may carry enough leprosy discharge to communicate the disease to a healthy person. None of us can make sure that the fly or mosquito, which irritates by its persistent attention, has not come from a leper. A fly investigates a leprous sore or discharge, carries a particle of poison in its proboscis, or feet, and next settles on some abrasion of the skin of a healthy person !" Dr. Manson, in China, says that elephantiasis has been conveyed by a mosquito. (The "elephantiasis" conveyed by mosquitoes appears to have been another kind of disease than leprosy).

In Dr. Wilson's communication on leprosy in *The Lancet*, Nov. 13, 1880, p. 779, the writer says:—"Dr. Manson received some reward from the Chinese Government a few years ago, for the discovery that leprosy was caused through the introduction of a poison into the blood by the bite of the mosquito, and although little has been heard of this discovery since, the idea seems to receive support from many facts, and explains the curious occurrence of that dreadful malady in the arctic regions, where the mosquito abounds."

Dr. Albert S. Ashmead has an article on "Leprosy in Japan" in the *Journal of Cutaneous and GenitoUrinary Diseases*, vol. viii. page 220, copied into the *Journal of the Leprosy Investigation Committee* for July, 1891, in which the danger of minute inoculation by insects is referred to as follows :—"The Japanese guard carefully against mosquitos and other insects, and wherever insects most abound the most endemic leprosy is found. In addition, those parts exposed to insect foraging are the seat of primary skin lesions of leprosy, as also mucous membranes most exposed to germs in

food and water."

And it may be remarked that, if leprosy may be communicated by means of mosquitos and other insects, where the inoculated virus is infinitesimal in quantity, how much greater in proportion is the danger of such contamination in vaccination? In' the latter case the vaccine lymph may, and often is, taken from children where the disease lies dormant, in the incubating stage, without declaring itself by the smallest signal to the eye of the most experienced physician. In all countries where leprosy is endemic, Europeans resolutely object to be vaccinated with lymph from native sources; and, notwithstanding the law, when imported lymph cannot be obtained they and their children remain unvaccinated. As a consequence, the population of Europeans attacked with leprosy is comparatively small and, indeed, of rare occurrence, except in the case of soldiers who are subject to the military regulation of revaccination. This repugnance to native lymph on the part of Europeans in the West Indies was pointed out by Dr. R. Hall Bakewell, Vaccinator - General, Trinidad, in his remarkable evidence before the Select Parliamentary Committee of 1871, and has been referred to by Dr. Castor, of British Guiana, and other authorities.

[Index](#)

**CHAPTER 4: VACCINATION WITH REFERENCE TO LEPROSY**

HAVING shown, on the authority of some of the most eminent dermatologists and superintendents of leper asylums, and from the testimony of those who have devoted special attention to the study of leprosy, that the disease is inoculable and spread by inoculation, we proceed to inquire whether there is evidence that this inoculation may be due in whole or in part to vaccination. When dealing with this question, I am aware that I am treading on delicate ground, inasmuch as vaccination has been lauded as an operation benign in its nature, free from peril, "the greatest discovery in the history of medicine," \*

\*Sir John Simon, late Chief Medical Officer to the Local Government Board, speaking of Jenner and vaccination in his "English Sanitary Institutions," London, 1890, p.123, *note* says :—"I venture to predict that the new evidence [before the Royal Commission on Vaccination], so far as it may regard the merit of his discovery, will establish more firmly than ever that Jenner's services to mankind, in respect of the saving of life, have been such that no other man in the history of the world has ever been within measurable distance of him."

and, out of half-a-million prescriptions or so, the only one possessing such transcendent merits as to justify its universal compulsory enforcement. It is, moreover, considered by many ardent advocates to be impolitic to do or say anything calculated to discredit vaccination. It is hardly necessary to remind our readers that there has never been a scarcity of medical inventions which have held out similar promises. Smallpox inoculation, which, according to Dr. Moore, cost the nation millions of lives, was universally accepted by the profession for the best part of a century as a discovery "highly beneficial to mankind;" and it would not have been difficult, had it been originally an English discovery, to have obtained a munificent grant from Parliament, and possibly to have persuaded the Government to make it obligatory and universal. The practice of bleeding and cupping was in vogue for at least three centuries, and the use of huge doses of mixed and noxious drugs for nearly as long a period. Jenner received a reward of £30,000 from Government on his explicit assurance that vaccination would make an end of small-pox. The evidence brought before the Royal Vaccination Commission in London, by statisticians and able pathologists, abundantly shows that, while it has had no effect in diminishing either sporadic or epidemic small-pox, it has been a prolific source of the spread of inoculable maladies, such as skin disease, pyaemia, eczema, phlegmon, and, notably, leprosy and syphilis.

**THE WEST INDIES.**

One of the earliest medical practitioners to call public attention to the spread of leprosy by vaccination was Dr. R. Hall Bakewell, president of the Board of Health, Trinidad, who, as Vaccinator-General of that island and Visiting Physician of the Leper Hospital, possessed unusual opportunities for observing the effects of vaccination upon the health of the people. In a communication dated 31st December, 1870, Trinidad, to the Colonial Secretary, London, Dr. Bakewell says :—" The question is not as simple as it appears. It is not a question of half-a-dozen minute punctures in an infant's arm *versus* an attack of small-pox. It is a question of performing on every child that is born into the world, and that lives to be three months old, an operation sometimes, though very rarely; fatal; sometimes, but not frequently, attended with severe illness, always accompanied by considerable constitutional disturbance in the form of fever; sometimes, in an unknown proportion of cases, introducing into the system of a healthy child constitutional syphilis, but suspected in the West Indies of introducing a poison even more dreaded than that of syphilis—leprosy. And the parent is required by law to subject his child to these evils, most of

which are only possible, but one of which is certain (the fever), for the purpose of avoiding the chance of an epidemic of small-pox, which, when it does occur, may or may not attack the child.

"It may be taken as proved that the syphilitic poison may be, and has been, introduced into the system of a previously healthy child by means of vaccination. But we know that leprosy is a constitutional disease, in many respects singularly resembling constitutional syphilis; like it, attended by stainings and diseases of the skin; like it, attacking the mucous membrane of the nose, throat, and mouth; like it, producing falling off of the hair, diseases of the nails and bones; and, like it, hereditary. Why should not the blood of a leprosy child, whether the leprosy be developed or not, contaminate a healthy one?"

"It seems to me not merely a popular opinion, but a medical one also. In returning to Europe in the spring of this year, I met several medical men from Demerara and other tropical countries, and they all considered that leprosy might be, and is, propagated by vaccination.

"Such cases as the following are difficult to account for, unless one adopts the hypothesis that leprosy is contagious (and, if contagious, *a fortiori* inoculable). The daughter of a colonel in the army, who held a staff appointment in one of our tropical colonies, contracted leprosy while in the colony. There could be no hereditary tendency, for both the parents are English, and it could not have arisen from bad diet. The young lady herself was a creole, but I was not able to discover whether she had been vaccinated from a creole or not. When I called in to see her in England, the disease was so far advanced that nothing could be done for her.

"Four cases at this moment in this colony are whites, both of whose parents are Europeans."—*Royal Gazette, Trinidad, March 1, 1871.*\*

\*Since the above was written I have been informed by the father of one of the patients that Sir Ranald Martin, on being consulted after seeing the case, pronounced that the leprosy had been caused by vaccination.—*Footnote to Dr. Bakewell's Report.*

Dr. Bakewell was summoned on behalf of the Government to give evidence before the Select Vaccination Parliamentary Committee in 1871, and testified as follows (Answer 3563, p. 207 Official Report) :— "There is a very strong opinion prevalent in Trinidad, and in the West Indies generally, that leprosy has been introduced into the system by vaccination; and I may say that, as Vaccinator-General of Trinidad, I found that all the medical men, when they had occasion to vaccinate either their own children or those of patients in whom they were specially interested, applied to me for English lymph; and that was so marked that in one instance a man, who had never spoken to me before, wrote me quite a friendly letter, in order to get lymph from England when he had to vaccinate his own child. It is quite evident that the only reason for wanting lymph from England must be that they consider it free from contaminating the system by leprosy; because, of course, there is an equal chance, and probably a greater chance in England, of the lymph being contaminated by syphilis."

Question 3564 and Dr. Bakewell's answer (pp. 207-8) are as follows :— Q.—" Have you had experience of any case in which Leprosy has been introduced by vaccination?"

A.—" I have seen several cases in which it seemed to be the only explanation. I have a case, now under treatment, of the son of a gentleman from India who has contracted leprosy, both the parents being of English origin. I saw the case of a child last year, who, though a creole of the Island of

Trinidad, is born of English parents, and is a leper, and there is no other cause to which it is attributable. Sir Ranald Martin, who is a great authority on these points, agreed with me that the leprosy arose from vaccination." \*

\*Since the above evidence was communicated, twenty years ago, Dr. Bakewell has availed himself of opportunities for extending his researches into the causation of leprosy in New Zealand, which have served only to confirm and strengthen his previous conclusions. In a paper read before the Auckland (New Zealand) Institute, 20th July, 1891, and printed in vol. xxiv. of the "Transactions of the New Zealand Institute," Dr. Bakewell observes that the inoculation of leprosy by means of vaccination is now exciting much attention, and he gives the results of his more recent Inquiries into the subject of vaccination, citations from which will be found in the appendix to this volume.

In a State paper addressed to Earl Granville, consisting of correspondence on the subject of leprosy, presented to both Houses of Parliament by command of Her Majesty, May, 1871, Dr. Bakewell refers to a boy, aged 15, brought from Guadaloupe by Dr. Brassac at the expense of the French Government, in which the disease was attributed to vaccination from a leprosy source.

No notice seems to have been taken of this startling testimony by the Select Vaccination Committee in their Report; and it was not until the publication of Professor Gairdner's remarkable cases in the *British Medical Journal*, June 11, 1887, that further inquiry was attempted. In the same year Governor Robinson, of Trinidad, issued a circular to medical men in the Colony, referring to these cases. This letter contained the query, "whether the disease (leprosy) is communicable by vaccination, lymph from healthy vesicles alone being used." It is obvious that the form in which the question was submitted was, but little calculated to elicit the true facts. If "healthy vesicles" alone were used, it is clear that no disease, other than *vaccinia*, could result, and vaccination would be acquitted from a serious indictment, which was the evident intention of the experts who formulated the question. To discuss whether, and how far, impure lymph; or the arm-to-arm lymph in general use in countries like Trinidad, where leprosy is endemic, could convey leprosy, would have been to travel beyond the scope of the inquiry. To this circular twenty-seven replies were received, which may be summarised as follows :—

(a) Upon the matters of experience, two of the witnesses, Dr. Alston and Dr. Chittenden, do not clearly indicate how far their experience warrants them in expressing an opinion upon the question. Of the remainder, four, Dr. de Verteuil, Dr. R. F. Black, Dr. R. H. Knaggs, and Dr. Bevan Rake, appeal confidently to their own practice. The others do not appear to have had sufficiently extensive experience to warrant a conclusion.

(b) As to the communicability of leprosy by vaccination, two of the writers, Dr. de Verteuil, and Dr. Bevan Rake, consider that leprosy cannot be inoculated by vaccination, if pure lymph be used. Dr. Black is of opinion that leprosy can be inoculated, though lymph from healthy vesicles alone be used. All the others express themselves with uncertainty and hesitation, or else disclaim having an opinion worth expressing upon the subject. Dr. de Montbrun, senr., says that leprosy would not be inoculable if every medical practitioner selected very healthy infants, born from healthy parents. and used only the lymph which exudes spontaneously after the puncture of the vesicles. Hardly any of the witnesses refer to the notorious difficulty, not to say impossibility, of ascertaining what families are leprosy; concealment, for prudential reasons, being the rule, as admitted by intelligent inhabitants in all the leprosy districts I have visited. Dr. Robert Francis Black, who has resided sixteen years at Port of Spain, Trinidad, informed me that his attention had been directed to the subject, and he had not the smallest doubt as to the invaccination of leprosy. He replied to the

circular as follows:--

76 Queen Street, Trinidad,

July 16, 1887.

SIR,—I have the honour to acknowledge the receipt of your confidential circular, No. 1818, dated 12th instant, and beg to state, for the information of His Excellency the Governor, that my experience of leprosy agrees with the statements of Professor W. T. Gairdner, of Glasgow, contained in your circular, and that I am of opinion that the disease in question is communicable by vaccination, lymph from healthy vesicles alone being used.

I myself have seen two or three cases of leprosy following vaccination, and have questioned the parents closely, but failed to ascertain or detect any family taint in either. Both the parents were respectively from Africa and China, the other was of creole parentage, but all the children were born here. With reference to these facts, I may mention here that, as far as I can recollect, the periods of incubation after vaccination were from two to three years; in fact, immediately after vaccination all were seized with obstinate cutaneous eruptions. As these were casual cases, I kept no memoranda, and as they did not return I lost sight of them, they probably concluding that it was hopeless to do so. I am also of opinion, for the reasons here stated, that arm-to-arm vaccination, at least in Trinidad, where leprosy is decidedly on the increase, is bad, as many very respectable families here are tainted with the disease, and nearly all the Portuguese have some member of their families actually diseased.

In conclusion, I may mention that I am also of the opinion that leprosy, like syphilis, tubercular phthisis, and cancer, is hereditary and contagious.

I have the honour to be, Sir,

Your obedient servant, R. F. BLACK,

Dr. C. B. Pasley, Acting Surgeon-General, etc.

Dr. Gairdner's cases are reported in the *British Medical Journal*, June 11th, 1887, with the following title: "A Remarkable Experience concerning Leprosy; involving certain Facts and Statements bearing on the, Question—Is Leprosy Communicable through Vaccination?" By W. T. Gairdner, M.D., LL.D., Professor of Medicine in the University of Glasgow :—

"The time seems to have arrived when, without injury or offence to anyone concerned, it is possible to bring under the notice of my medical brethren some facts, and some inferences arising more or less directly out of the facts, in a case which occurred to me some years ago, but which I have found it necessary hitherto to deal with as involving matters of professional confidence not suitable for publication. Even now I shall deem it expedient to frame this mere narrative in such terms as shall not point to any definite locality, or to any recognisable person, among those chiefly concerned; although, by a formal certificate granted only the other day, I feel, as it were, absolved from the last tie that bound me, even under the most fastidious sense of professional duty, to reticence.

"Six or seven years ago, the parents of a young boy, fairly healthy in appearance, but with a peculiar eruption on the skin, brought him to me, and along with him a letter from a medical gentleman whom I had entirely, or almost entirely, forgotten, but who stated himself to have been a pupil of mine in Edinburgh considerably over twenty years before. It is unnecessary to enlarge on the particulars of this case, further than to state that, after more than one most careful examination, in which I had the assistance of my colleague, Professor M'Call Anderson, we came to the conclusion which we announced to the parents, that the boy was suffering from incipient, but still quite well-marked, leprosy in its exanthematous form; a diagnosis afterwards amply confirmed. What struck me at the time as most peculiar was, that this case, coming from a well-known endemic seat

of leprosy (an island within the tropics) and with a letter involving medical details by a medical practitioner of many years' local experience—sent to me, moreover, for medical opinion and guidance—should not have been more frankly dealt with by a diagnosis announced even to the parents, before they left the island. The father of the child was a sea-captain constantly engaged in long voyages—for the most part between this country and the island alluded to. Both father and mother were Scotch, and there were several other children, all reported as quite healthy, as also were both the parents. Under these circumstances I wrote to the medical man—who in the sequel may be called, for brevity, Doctor X.—simply stating the diagnosis arrived at, and indicating the line of treatment proposed. The parents were informed that it would be best for the child to live in this country, and his mother agreed to remain with him accordingly. And, as they appeared anxious to have every available suggestion and advice, I mentioned the name of Dr. Robert Liveing as having given much attention to the subject, and offered to write to him if they would take the boy to London, as they appeared desirous of doing. Although I wrote to Dr. Liveing, circumstances unknown to me led to a change in their plans, and, instead of going to London, they went to Manchester, where I believe some physician was consulted, but I do not remember who he was. Ultimately, the mother determined for a while to settle in Greenock, and I placed her accordingly in communication with Dr. Wilson of that town, who for some time thereafter remained in medical charge of the case.

"Meanwhile, the course of post brought me in a few months a reply from Dr. X., not only entirely assenting to our diagnosis as communicated to him, but stating that he had been perfectly well aware from the first of the case being one of leprosy, but had deliberately chosen not to affirm the fact or even to allude to it in any way, either in his communications with the parents or in his letter to me. No reason was assigned for this (as it appeared to me) very remarkable reticence; but, as I did not wish to have the credit of having discovered for the first time what a gentleman so much more familiar with the disease might have been supposed to have overlooked, I took means to inform the parents of Dr. X.'s reply, and of his having been all along of the same opinion with regard to the disease as we were.

"After this the matter passed out of my mind, and for several years I neither saw nor heard of this child except accidentally and in a way entirely to confirm first impressions. About three years ago, however, while engaged in lecturing on specific diseases, and among others, briefly, on leprosy, I made an effort to find out something more about this patient. The mother had removed to Greenock, and had brought over the whole family to Helensburgh, where, as I learned, they were visited by Drs. Reid and Sewell, and from the latter I now learned that the poor boy had gone steadily to the worse, and was extremely feeble, covered with sores, and in a most deplorable condition physically, but still receiving every attention and care that constant medical treatment, with the most faithful and loving maternal nursing, could afford to lighten his sufferings. I accordingly proposed, within the next few days, a visit to my old patient, as a matter of satisfaction to myself. Unhappily there was no other apparent object, either as regards diagnosis or treatment, for a visit which was, nevertheless, very gratefully accepted.

"The case was now in the most advanced stage of leprosy, proceeding to mutilation of the extremities, and accompanied not only by external sores, but presumably by internal lesions, which had reduced the patient to the last stage of emaciation. It was on this visit that the curious particulars now to be related were first brought to my knowledge by Dr. Sewell, and afterwards confirmed by the statement of the mother, showing very clearly, though, of course, upon second-hand information

to a certain extent, that Dr. X. had a very special reason for his extraordinary reticence in the first instance. Her husband, who in his frequent voyages had opportunities of coming into communication with Dr. X., had remarked to him how very strange it was that, even in writing to a medical man about the case, he had given no hint of his opinion about it. The Doctor's reply to this was, in the end, to the effect that he had kept silence because he did not wish to compromise a boy of his own, whom he (Dr. X.) believed to be a leper, and from whom he believed at the time that the boy he had sent to this country had become infected with the disease. He further explained that he had vaccinated his own boy with virus derived from a native child in a leprous family, and, as I understood (though perhaps not definitely so stated) that leprosy had declared itself in the native child after the vaccination; and, further, that (using his own child as a *vaccinifer*) he had vaccinated our patient directly from him. Before sending the last-named patient away with his parents, he had satisfied his own mind not only that his own boy was leprous, but that he had in this way become the source of the disease to another; but, the disease in his own child being in a very mild form, he was anxious not to disclose its existence. Meanwhile Dr. X. had died; his estate had passed into the hands of trustees; and I was informed that this reputed leper-boy had been, under the instructions of his father and his guardian, placed and retained at a public-school well known to me in this country, and that the boy was pursuing the usual course of a public-school education, in entire unconsciousness or the disease with which he was supposed to be affected.

"This information, so communicated, placed me in rather a difficult dilemma, namely—was I justified in taking steps to ascertain the truth of the story as regards Dr. X.'s boy, either by personal investigation or, at least, by inquiries conducted so as to result in a well-grounded and scientifically exact opinion as to the facts? And, further, supposing that such opinion should turn out to be that Dr. X.'s boy was a leper, was it a matter of duty on account of others to formally disclose the fact, be the consequences to the boy what they might? It was hardly probable that a boy generally known to be a leper would be retained permanently in any public school in this country, even had it been unquestionably a matter of medical doctrine that such a proceeding was quite safe. On the other hand, the boy was receiving the benefits of an English education at the express wish and on the responsibility of his father and guardian, and without (so far as appeared) any misgivings on the part of anyone. He was an orphan, and in what was to him a foreign land; his remaining under instruction might be, and probably was, a matter of the greatest possible importance to him. To bring him, therefore, even by an indiscreet inquiry, under the ban which in many or most countries still attaches to leprosy was certainly no part of the business of an outsider, and could only be justified at all by an overwhelming sense of duty to others.

"Under these circumstances I thought it well to consult, privately, one or two of those friends in London whom I believed to know most about leprosy, and among others Dr. Liveing, whom I was able to remind, at this stage, of my previous letter. These friends concurred in assuring me that, in the rather improbable event of their being personally consulted as to the retention of a leper in a public school (it being presumed, of course, that he was physically fit otherwise), they would have no hesitation at all in affirming that the other boys would not be endangered by such proceeding. As I happened to be very well acquainted with one of the medical officers (though not the ordinary medical officer) of the school in question, I communicated these opinions to him, and stated to him at the same time the extraordinary circumstances which had begotten, for me, such a lively interest in the son of Dr. X. In the course of a few days I was informed that an inquiry had been held by the medical staff; that the boy had been sent for and privately examined (though not ostensibly ill in any

sense); and that it was, beyond all doubt, considered to be a case of leprosy. The medical authorities decided, however, that under the circumstances it was not their duty to sound the alarm, or in any way to disturb the boy's education.

"From this time onwards (except the death of the first patient soon afterwards) I heard nothing more of these matters till a *few* weeks ago, when I was asked to see Dr. X.'s son professionally on behalf of the school authorities; and, if so advised, to request Dr. Anderson also to give an opinion as to the present state of health of this young man, who happened at the time to be visiting some friends in Glasgow. It was represented to me that he had maintained, on the whole, fairly good health since I last heard of him through my medical friend, and had not been incapacitated from school work except on account of a contagious eczema which had been prevailing, and with which he had been affected in common with other boys. Apparently, however, the opinion had arisen that his general health was not quite so good, and that, in view of a cutaneous affection of this kind, apparently communicable, existing, it was no longer expedient that he should remain at the school. Indeed, I could not but come to the conclusion that his removal, on public grounds, had been practically settled; and with every desire to soften the blow as much as possible to the poor boy, it was felt to be necessary that his guardian, at least, should receive unequivocal and unbiased testimony as to the actual state of the facts and circumstances under which the decision was arrived at. Under these circumstances I saw and examined this boy, and made a report, along with Dr. Anderson, to the effect that the disease was evidently leprosy, though of a remarkably mild type, as shown by discolorations and cicatrices, and also by large, anaesthetic areas on the back of one limb. All breaches of surface, however, and all discharge had ceased at the time of our report, and Dr. Anderson felt still in a position to affirm that no danger to others could occur from the boy's remaining at school. On this last point I did not feel able to give an unqualified assent to my colleague's opinion; but as regards the matters of fact and observation there was no doubt whatever, and our report accordingly on these was substantially as above."

In further explanation Professor Gairdner, in a letter to the *British Medical Journal* August 8, 1887, says :— "In submitting to you some curious facts and statements which had been brought under my notice as bearing on the above subject ("Leprosy and Vaccination": *British Medical Journal* June 11, 1887)I was exceedingly careful not to obtrude any opinion of my own. It was clear from the first that the mere statement of such detail would waken up some old controversies, and would perhaps involve very serious practical issues; but these considerations did not appear to me to justify withholding the facts, but rather the public statement of them in as unbiased a form as was possible."

Referring to these cases, Dr. C. Burgoyne Pasley, Acting Surgeon General, Trinidad, observes :—"The fact remains, that an unlucky boy, of undoubted European parentage, acquired a most loathsome disease, and died a miserable death as the result of vaccination, carefully or carelessly performed as the case may have been."—*Papers on Leprosy, Government Printing Office, Trinidad. 1890.*

The same medical authority says :—" If by accident I draw blood in puncturing the vesicle on the arm of any child, I invariably reject the child as a vaccinifer, no matter how healthy it may appear, or how abundant the supply of lymph may be, fearing to inoculate any constitutional disease, leprosy, syphilis, *etc.*"—*British Medical Journal* 1p. 270, July 30th, 1887.

A correspondent of the London *Daily Graphic*, writing from St. Kitts, 5th June, 1890, reports the

following under the title of

"A SAD CASE."

"A sad case occurred here a short time ago, which shows the danger that arises from the practice of vaccination in an island where leprosy is treated as of no account. A few months ago a little girl, the daughter of the Rev. Mr. —, a Wesleyan missionary, who came to the West Indies from England two or three years before, fell ill. On examination by the doctors it was found that the poor child had contracted leprosy. The only probable means of communication was by inoculation; and thus the parents, endeavouring to save their daughter from the very remote danger of small-pox, inoculated her with the horrible poison that will make her life a living death and herself a loathsome and repulsive, spectacle. Hoping that by returning to England he might get something done for his daughter, the missionary resigned his charge and made preparations for his departure. But a new trouble awaited him. The Royal Mail Company's steamers could not take a leper as a passenger; but one of Messrs. Scrutton's vessels agreed to take the sorely distressed family to England. They got on board, and started on their voyage. But ill luck again attended them, for, while leaving the island, and when nearly opposite their old home, the, ship struck on a reef; and, although all on board were saved, the missionary and his family remain here, where they have been so sorely tried."

While in Trinidad, I made inquiries of a highly intelligent merchant, who has resided forty-three years in the West Indies, and has always been much interested in the public health. He says the belief is general in the islands that leprosy is being extensively disseminated by vaccination, and he furnished me with particulars of a number of healthy families where leprosy and other diseases have broken out after vaccination, of others who, in spite of, a law enforcing vaccination, have preferred to undergo the worry and penalties of prosecution to the terrible risks of this hideous and incurable malady. In some instances the children infected with leprosy have been sent by their parents to France and England, where, after treatment by some of the most distinguished physicians, they have either succumbed to the disease or returned to die at home; and in one case the mother died of a broken heart on seeing her eldest son come back a complete wreck, loathsome to the sight. All the victims described by my informant were in good circumstances,, and none were even sent to the Leper Asylum, where only the poor are interned. He says that had he kept a record he would have been in a position to have given details of very many cases, with all the attending circumstances, and adds, "I have come to the conclusion that we are indebted to vaccination for not only this (leprosy), but many other diseases, especially those of a scrofulous nature, as well as syphilis."

In a communication to the *Lazaretto*, St. Kitts, August 25, 1890, Dr. John Freeland, Government Medical Officer, Antigua, West Indies, says:--"In some of these islands leprosy has no doubt spread for the want of precautions to separate the diseased from the healthy, from poverty, overcrowding, or decomposed food, and from, I fear, the system of arm-to-arm vaccination which now so universally prevails."

The following letters, read before the Royal Vaccination Commission, from Dr. Charles E. Taylor, of St. Thomas, Danish West Indies, secretary and member of the Colonial Council of St. Thomas and St. John, member of the Board of Health, etc., illustrate the difficulties which obstruct the investigation into this momentous subject, owing to the dread which is generally felt by inhabitants of its becoming known that members of their family are tainted with this fearful malady, and probably also to an unwillingness to cast reproach on a prescription so extensively recommended by

the profession as vaccination:--

St. Thomas, Danish West Indies

Virgin Islands, Jan. 2 1890.

DEAR Sir to your inquiry with reference to the spread of leprosy in the West Indies, I beg to say that it is difficult to obtain testimony with regard to this disease having been conveyed into families either by vaccination or otherwise.

There is such a dread of the hideous fact becoming known, and though parents will talk about such and such a case, when it is pushed home to themselves, and their evidence requested for public purposes, even so important as a Royal Commission, they beg to be excused.

My own experience has compelled the conviction that leprosy has on numerous occasions been propagated by the vaccinator's lancet in these islands. Children have been brought to me a year or two after vaccination who have shown unmistakable signs of leprosy, and whose parents assured me that such had never been b their family before. On the other hand, inquiry into the antecedents of the child from whom the lymph had been selected revealed the existence of leprous taint either on the paternal or maternal side.

My own experiences have been confirmed by Dr. Bechtinger, formerly a resident and practising physician here, whose extensive researches entitle his opinion to great weight amongst pathologists.

The belief also, in the British West Indies as to the conveyance of leprosy in this way is widespread, and forms one of the strongest grounds against compulsory vaccination that I know of.

In view of such a fact, and in face of such a terrible danger it is my conscientious opinion that every physician should hesitate before subscribing to such a doctrine.

I have the honour to be,  
Yours very respectfully,  
CHARLES E. TAYLOR, M.D., F.R.G.S., etc.

A later communication from Dr. Charles Taylor is published in the *Public Opinion* of Nov. 27th, 1891.

It is dated :—

St. Thomas, Danish West Indies, October 20.

I have read the report of the evidence given before the Royal Commission on Vaccination in London with much interest, and with regard to the connection between vaccination and leprosy, an experience in these islands of over twenty years enables me to confirm the truth of this terrible indictment. On more than one occasion cases have come before my notice of leprosy in families which could only have been inoculated with the vaccine virus, none of the family having previous to vaccination been afflicted with this malady. Leading dermatologists in all parts of the world, and the most experienced physicians in the West Indies, are of the opinion that leprosy is spread most readily by means of inoculation, either through a wound or an abraded surface, and still more readily by puncturing contaminated vaccine virus into the arms of healthy persons. The reports of the medical officers of health and physicians to the leper asylums in the West Indies show that leprosy, which thirty years ago was stationary or subsiding, has increased. This, I have every reason to believe, and it is also the opinion of other competent medical men, is coincident with the introduction and spread of vaccination, for there are a number of islands where the disease was

almost unknown previous to its inoculation in this way. Were it not for the reluctance which all physicians, have to expose families tainted with leprosy, they could give evidence as startling as the cases mentioned by John D. Hillis, of British Guiana; Dr. Bechtinger, formerly of St. Thomas; Dr. R. Hall Bakewell; and Dr. Black, of Trinidad. The possibility of spreading such a dire disease by means of the lancet is one too grave to be longer disregarded, and, it is needless to say, a serious matter for these islands, the most lovely in the world, where children, whose parents may be the most healthy, are liable to leprosy through arm-to-arm compulsory vaccination. May I venture to hope that the English Press will have the humanity and courage to speak out and compel colonial authorities to withdraw the vaccination enactments, which on these grounds alone are so dangerous to ourselves and our families. CHARLES E. TAYLOR, M.D.

So great is the dread of the invaccination of leprosy and syphilis, that when I visited the island of Granada in January, 1889, a gentleman connected with one of the public institutions of the island told me that he had two unvaccinated children, and, that rather than incur the risk of invaccinated leprosy or syphilis, he had sent them with his wife to a place of refuge in the mountains. He was not sure, he said, whether this *ruse* would succeed, as the authorities were very sharp.

When I visited Barbados in January, 1889, Mr. E. Racker, the proprietor of the *Agricultural Reporter*, Bridgetown, informed me of a case of leprosy communicated by vaccination, which he had personally investigated. Mr. Racker was intimately acquainted with the father, a member of the Legislative Council, and on one occasion, when visiting his house, noticed that his friend's youngest child was afflicted with leprosy. The father said it was due to vaccination with lymph taken from a child subsequently discovered to be leprosy. Though he believed in the benefits of Jenner's discovery, he declared that there should be no more vaccination in his family. I may observe that so widespread is the belief in Barbados that leprosy and syphilis are communicated by vaccination, that every attempt to make it compulsory has been defeated. Nevertheless the advantage of vaccination is believed in by several men with whom I conversed, and there is a considerable amount of vaccination practised, to which I attribute no small share in the admitted augmentation of this disease before referred to. The hideous risk, attending the practice of vaccination is illustrated by the following letter of Mr. Racker, who writes .2nd May, 1890:—" I know all about the case reported in the *British Medical Journal* by Dr. W. T. Gairdner. I am one of the executors to the will of Dr. J. C., but I had no idea that the boy was suffering from leprosy until I got a letter from the head master of Dollar, enclosing a letter from Dr. Gairdner.

"I think I told you how I once consented to have my children vaccinated, and how at the last moment I changed my mind, and would not allow them to be operated on, Well, that boy, Dr. J. C.'s son, was the one from whom they were to be vaccinated. What a narrow escape I had!"

Mr. Alexander Henry, Vice-Chairman of the Council of the British and West Indian Alliance, and formerly editor of the *St. Kitts Gazette*, who has resided some years in the West Indies, and has devoted much attention to the spread and causation of leprosy, writing 12th June, 1890, says :—" A medical officer of health cautiously admitted to me that leprosy was contracted by means of careless vaccination. Now, careless vaccination means vaccination from arm to arm, which is almost universal in these islands. I do not believe there is a doctor of any standing in the West. Indies who would deny that leprosy can be inoculated. It is admitted that owing to the slow incubation of the disease it is difficult to distinguish a leper; and when you take into account that medical officers are constantly complaining to the Government 'that they cannot get a supply of calf-lymph,' and add to

this the indiscriminate and careless yet vigorous manner in which they carry out the vaccination laws upon an ignorant and simple people, who have no means of asserting themselves, I think we may safely conclude there is a high probability that leprosy is spread by vaccination."

When or how leprosy entered this island is perhaps unknown. Certain it is, however, that the dread disease has recently been advancing by leaps and bounds. In proof of its increase here I quote the following passage from a recent quarterly report of Dr. Alfred Boon, one of the Government medical officers and acting analysts of Government statistics. Dr. Boon says :—"The opinion that it is, as many hold, increasing in the island, is supported by the fact that in the four years 1885 to 1888 thirty-four such deaths were registered."

In a later communication received by me from Mr. Henry, dated October 8, 1891, he declares his conviction that vaccination is one of the chief factors in the spread of this fearful disease in the West Indies. After referring to the small-pox epidemic in Martinique, in 1887, and the consequent extensive re-vaccination propagated in St. Kitts, the writer proceeds :—" But, you may ask, how did that affect the labouring class, who are known to have a strong prejudice against vaccination, and among whom the disease of leprosy is most common? This is the incident to which I wish to draw your attention. There is in force in St. Kitts (and in most of the other islands) a law to compel all boatmen and porters to take out a yearly license. Now, it so happened that, at the time when the boatmen and porters required to renew their yearly badge, the small-pox was raging in Martinique, with, of course, the usual panic in St. Kitts. The boatmen and porters were informed by the Inspector of Police, or by his authority, that no one could have his license renewed unless he had been re-vaccinated that year. I need not point out the unspeakable dangers which such a system of indiscriminate—almost reckless—arm-to-arm vaccination exposed adults of the class among whom leprosy is rampant. In considering the medical aspect of the practice, you must bear in mind that the defence of the arm-to-arm vaccination by the medical officers is their admission that it is almost impossible to obtain pure calf lymph in the islands. Can you wonder, then, that there should exist a strong prejudice and an unspeakable dread of vaccination among the lower classes in the West Indies?" In support of this contention, that the majority of the West Indian islanders fear the practice of vaccination, Mr. Henry adduces the evidence of the medical officers themselves :—" Dr. Gavin Milroy, in his 'Report on Leprosy and Yaws in the West Indies' (House of Commons Command Papers, c. 729) states on pages 32, 33, 'In the frequent conversations which I subsequently had with many of these gentlemen (the medical officers in the West Indies) I learned the fact that the European and most of the higher creole families were always extremely anxious about the source of the lymph to be used in the vaccination of their children, from the dread of a leprous taint being thus acquired. None of my informants appeared to partake of this belief themselves, but all recognised the propriety of avoiding the use of lymph from children of families known or believed to be afflicted, especially as infants themselves rarely, if ever, exhibit any outward manifestations of the malady.' "Dr. Milroy says that the Vaccinator-General, Dr. Bakewell seemed to give countenance to the *popular belief* as to the transmissibility of leprosy by vaccination."

Dr. de Verteuil, of Trinidad, in replying to the views of Dr. Bakewell, says (p. 34) that "it is necessary to take certain precautions. The vaccinifer should be healthy, and born of parents free from any syphilitic or leprous taint, and, as hereditary syphilis generally manifests itself after the age of four or five months, it would be as well to choose as vaccinifers children of five or six months and above." The only comment I need make on the "defence" of Dr. de Verteuil's is to point out that it is well nigh impossible to take the necessary and certain precautions to know if the

vaccinifers are *leprosy*.

Dr. Bowerbank, of Jamaica, in pp. 34, 35, says:—"I have frequently heard of a case of leprosy occurring in a family, alleged to have been the result of vaccination. I know of two instances in one family (a Jewish one), in which the parents and friends are thoroughly convinced in their own minds that such was the case. In Barbados we find a strong prejudice against vaccination, for Dr Browne writes:—"It has been a general rule not to vaccinate from the *apparently unhealthy*, or those of leprosy taint, not so much from any opinion founded on fact of the possibility of conveying the disease, as *from respect to the general prejudice prevailing*. For the Leeward Islands, I refer you to a letter to the editor of the *St. Kitts Lazaretto*, 23rd August, 1890, by Dr. Freeland, Government Medical Officer of Antigua :—" In some of these islands, leprosy had no doubt spread from the want of precautions to separate the diseased from the healthy, from poverty, from overcrowding, or from decomposed food, and from, *I fear the system of arm-to-arm vaccination, which now so universally prevails.*"

Mr. Henry says that the only point on which medical men seem to be unanimous regarding leprosy is that, whether it is contagious or not, it is inoculable; and, after citing various medical testimonies, showing the connection between leprosy and vaccination, he observes :—" If ever a case was proved it is this one that there is a universal belief in the West Indies that leprosy is spread by means of vaccination. And I, for one, place far more reliance upon a popular belief of this kind, and especially upon this subject, than I place upon medical testimony, because the neighbours of a leper are far more likely to know when and how he contracted the disease: they know his pedigree, family history, and the whole condition of his life and its surroundings, whereas the medical officer simply pays a casual visit, and often does not hear or know of the leper till the disease manifests itself to such an extent that the leper becomes a burden and a danger to his relations and his neighbours.

"But what was the answer of the College of Physicians to the inquiry of the Chief Secretary of State for the Colonies, as to 'whether there was any ground for the belief that leprosy was spread by vaccination (in the West Indies)?' On page 86, same Report, in their answers and advice to Lord Kimberley:—" The College of Physicians feel they cannot press too strongly on your Lordship the importance of enforcing the practice of vaccination for the protection of those who are too ignorant to protect themselves.' As the people become a little wiser, they will be able to protect themselves from the prejudice of the College of Physicians."

#### SANDWICH ISLANDS.

Leprosy is a disease of relatively slow incubation. Children pronounced perfectly healthy, and represented as approved subjects both for vaccination and for vaccinifers, may, in a few months, exhibit the unmistakable signs of leprosy. In a report by Dr. Edward Arning, dated Honolulu, H.I., November 14, 1885, presented to the president and members of the Board of Health, p. 52, this distinguished observer says:—" The next point touches the vaccination question, with which I have dealt at length under the heading of experimental work. I would further urge that the medical examinations of school children, which have led to the elimination of quite a number of cases, should be kept up regularly and carefully. As an instance of their necessity, I may quote a case which has quite recently come under my observation. A little girl (native) belonging to one of our large schools passed my close examination a year and a half ago as healthy, but now presents initial symptoms of leprosy. We must not rely on general healthy appearance in these examinations, and

on a furtive glance at hands and arms. I have found unmistakable marks of leprosy on the back of a child that held a recent health certificate. Moreover, we shall have to extend our examinations even to the very young children, in spite of Dr. Fitch's assertion that leprosy does not make its appearance before the period of second dentition. I have seen a child with clear signs of leprosy at three and a half years of age, and -know of another boy who was a marked case at four years old."

This eminent bacteriologist, in a letter before me, dated September 6, 1889, says:—" During my stay on the Hawaiian Islands for the bacteriological study of leprosy, I was naturally drawn to a scrutiny of the question whether leprosy is transmissible, and had been there transmitted by vaccination; all the more so as there is a general opinion prevailing on these islands that the unusually rapid spread of the disease about thirty years ago may possibly be attributed to the great amount of indiscriminate vaccination carried on about that period. And there is no mistake about the actual synchronicity of the spread of vaccination and of leprosy in the Hawaiian Islands; but many a mistake is possible as to the real causal relation between the two.

"I could trace the first authenticated cases of leprosy back to about 1830, but the terrible spread all over the islands did not take place until very nearly thirty years later, at a time when an epidemic of small-pox had given rise to very general and very careless vaccinations throughout the group .....attach far more importance to an instance of an increase of leprosy soon after vaccination on a much smaller scale, and during a much more recent period than the above. I have it on good authority that a very remarkable new crop of leprosy cases sprang up at Lahaina, on the island of Maui, about a year after most careless vaccination had been practised there."

The impossibility of detecting leprosy in its early stages is a matter of common notoriety amongst physicians, so that many who believe in the prophylaxis of vaccination refuse to incur the terrible risks involved by its practice in leprosy countries.

Dr. E. Kaurin, in "Notes on the Etiology of Leprosy," in the *Lancet*, January 25th, 1890, observes :—" We must bear in mind that the duration of the disease is much longer than is generally supposed. The patients, as a rule, take no account of the long prodromal stage, marked by indefinite subjective phenomena and temporary affections of the skin. The physicians themselves often overlook the early symptoms of the disease; indeed, it is sometimes impossible to form a diagnosis in the early stages. The whole period of the disease, from the onset to the time when distinct signs are noticeable, amounts to at least from three to four years."

Mr. H. A. Acworth, writing to me from the Municipal Commissioner's Office, Bombay, July 29th, 1891, says:--"I have plenty of lepers in my hospital here who could not be identified as such, unless they were completely stripped and examined by a trained eye."

Dr. Mitra, in his Report on Leprosy in Kashmir, refers to the recorded statistics of lepers, and says that the enumerators "might have overlooked many cases in the incipient stages," whereupon the Lahore *Civil and Military Gazette* calls attention to the consequent dangers of communicating organic or other diseases by means of vaccination.

Dr. E. Arning says :-" When in Hawaii I attended a German boy, aged 12, who suffered from leprosy, from whom, when he was seven years old, several white families had been vaccinated."—*Journal of the Leprosy Investigation Committee, February, 1891, p. 131.*

In the report of Dr. Webb, medical inspector, on the condition of the schools, April 1st, 1886, are

recorded five-cases of incipient leprosy in the Royal School, and two in the Fort School, Honolulu.

Dr. F. B. Sutliff, of Sacramento, California, who has studied the disease as Government physician on the Island of Maui, says:—" I very seldom visited a school without excluding some (children), while the spots just beginning to show in others made it only too probable that they would not long be doubtful cases. It did not seem to me a difficult task to read the fate of Hawaii in the little dark faces that looked up from their books."— *Occidental Medical Times, April, 1889.*

In Dr. Arning's report, dated Honolulu, Nov. 14, 1885, p. 14, we read :—" Closely allied to inoculation is the subject of vaccination. You are doubtless aware of the very prevalent opinion among medical men that the unusually rapid spread of the disease may possibly be attributed to the great amount of indiscriminate vaccination which has been carried on in these islands. If my information is correct, unquestionably new centres of leprosy have developed after vaccination was practised and several old inhabitants have told me how they themselves used no precautions whatever in vaccinating during a small-pox scare.

"To bring some light on this moot point I vaccinated a number of lepers. The vaccination only took in three cases, one tubercular and two anaesthetic. Both the lymph and crust of the tubercular case contained the *bacillus leprae*; in the anaesthetic cases I could not detect it."

Dr. Arthur Mouritz, then Resident Physician and Medical Superintendent of the Leper Settlement, Mobkai, in his Report for 1886 to the Board of Health, after alluding to contagious and hereditary predisposition, says:—" The third cause to which I attach some importance, and which has undoubtedly spread the disease, is vaccination. I can bring forward no case personally, but I have reliable hearsay evidence that after the operation of vaccination had been performed on several white children, they manifested signs of leprosy, and finally developed the disease. Evidence on this same point is put forward by Sir Ranald Martin in India, and by Professor H. G. Piffard, of New York, both reliable authorities."

An Appendix to the "Report on Leprosy" addressed to the Legislative Assembly of Hawaii, in 1886, is an interesting account of Queen Kapiolani's visit to the Leper Settlement at Molokai, by the Princess (now Queen) Liliuokalani, in July, 1884. Amongst other incidents, the Princess refers to an interview with one, Kehikapau, in the presence of several persons. - Kehikapau called the Princess's attention to the circumstance of his having contracted the disease from vaccination. He also mentioned that, through the same agency, all his schoolmates had died of the disease, induced in this way.

According to the Report of Surgeon J. R. Tryon, of the United States Navy, leprosy has spread "from year to year in Hawaii, and has increased to a marked degree since the indiscriminate and careless vaccination practised during the severe epidemic of small-pox in 1853." — *Medical and Surgical Memoirs, 1887, vol. 2, ft. 1252, by Dr. Joseph Jones, President of the State Board of Health, Louisiana.*"

In a summary of reports furnished by foreign Governments to His Hawaiian Majesty's authorities as to the prevalence of leprosy in India and in other countries, and as to the measures adopted for the social and medical treatment of persons afflicted with the disease (Honolulu, 1886), I find the following extracts, p. 238 and 239, from the *New Orleans Medical and Surgical Journal, April, 1880.*

After referring to the relation of leprosy with syphilis in the Hawaiian Islands, the author says :—"Vaccination was also inquired into. Alarmed by an invasion of small-pox in 1853, a general vaccination of the whole population was ordered, and physicians being at that time very few on the islands, non-professionals aided in the work.

"It is charged by some that, as a natural result of the labours of the heterogeneous force so appointed, not only syphilis, but also leprosy, was greatly increased. In my last circuit trip in my district, I found very few adults who had never been vaccinated. This involves the question of inoculability—in my opinion the main, if not the only, means of propagation other than inheritance—that is, like syphilis, it depends for its propagation upon the direct introduction of virus into the blood."

The fact that an increase in the practice of vaccination in leprosy countries is often accompanied by an increase in the dissemination of leprosy is shown by the following evidence :— Mr. George C. Potter the Secretary to the Honolulu Board of Health, writing to me on behalf of the President of the Board of Health, Dr. J. H. Kimball, in a letter dated Honolulu, H.I., June 1st, 1890, says :—" It is an opinion among the laity and some of the profession that the extensive arm-to-arm vaccination that was practised in the years 1852 and 1868 during small-pox epidemics was a prolific cause of the spread of leprosy" In a report of the Board of Health to the Legislative Assembly of 1886, by the then president, Mr Walter M Gibson, I read, p 35, "There are two more causes which, in my judgment, have had a great effect in the propagation of leprosy, or diseases closely allied to it, although, medically, it be a disease *sui generis*. The first was the ignorance of some of the early and unqualified medical practitioners who were permitted to spread disease broadcast, and to do irretrievable injury before retribution overtook them; but the second and chief cause was the indiscriminate and, to my mind, careless vaccination that began about 1868

Dr H S Orme, President of the State Board of Health, California, in an able memoir on "Leprosy: its Extent and Control," says:—" There can be no doubt that the lowering of the vital stamina of the race by the great prevalence of syphilis (at Hawaii) prepared them for the inroads of any disease that might threaten. During this period small pox also scourged the people, and in 1868 there began a general vaccination, in which virus was taken indiscriminately from human subjects. This reckless practice doubtless contributed greatly to the spread of both syphilis and leprosy."

In an article on "Personal Observations of Leprosy in Mexico and the Sandwich Islands," in the *New York Medical Journal* for July 17, 1889, the author, Dr Prince A Morrow, M A, says —"Vaccination is believed by the natives, as well as by many intelligent physicians, to be a potent agent in the rapid diffusion of leprosy through the islands It must be remembered that until recently vaccination was performed by unskilful persons, human virus was used, and no distinction was made between a healthy person and a leper as a vaccinifer. The fact is incontestable that, after the general vaccination of the natives, numerous leprosy centres developed in various parts of the islands where the disease had previously been unknown. Arning demonstrated the plentiful presence of *bacilli* in the lymph and crusts of vaccine pustules in lepers."

In the *Archiv fur Dermatologie und Syphilidologie* for January, 1891, we read that at the Berlin Medical Congress of 1890 Dr. Arning read a paper on "The Transmission of Leprosy," wherein he scouts the idea of hereditary transmission. He proceeds to ask the question raised by the late Dr. Hillebrand, "Has leprosy been spread in the Hawaiian Islands by means of universal vaccination?"

And he declares:— "There can be no doubt as regards the synchronousness of the diffusion of leprosy and the introduction of vaccination into the Hawaiian Islands.

"I am able to state—having excellent authority for so doing, though, unfortunately, no statistics—that a very remarkable accumulation of fresh leprosy cases took place in 1871-72, in a place called Lahaina, on the Island of Maui. This happened about one year after a universal arm-to-arm -vaccination, which had been most carelessly performed. About fifty to sixty cases occurred suddenly in this locality, which up to that time had been comparatively free from the disease."

Dr. Arning concludes :—"Arm -to-arm vaccination should be prohibited in countries in which leprosy abounds."

When, during my visit to -Honolulu in October, 1890, it became known that I was seeking information concerning the spread of leprosy, in the interest of the public health, and not to support any medical theory or foregone conclusion, several gentlemen who had devoted much attention to these subjects called upon the, and others gave me introductions to those who were conversant with them. The President of the Board of Health, the Hon. David Dayton, and the Secretary, Mr. Potter, afforded me valuable assistance, and supplied me with copies of their various official reports relating to the introduction and dissemination of leprosy and the methods adopted for dealing with the scourge, which, with other European diseases, bids fair, unless arrested, to destroy the entire native race. They incidentally showed me copies, cut from the Press, of my own communications on the subject of leprosy and vaccination in the West Indies, thus illustrating their desire to inform themselves upon the subject by evidence from all quarters of the globe.

I have, in this monograph, made free use of the facts and testimonies contained in these important official documents, and I take this opportunity of expressing my thanks for the courtesy' and information furnished by the gentlemen connected with the Board of Health, resident physicians, the Executive Officers at Molokai and Kalihi, and members of both Houses of the Legislature.

According to all the evidence which I have been able to obtain, leprosy was unknown in the Sandwich Islands until many years after the advent of Europeans and Americans, who introduced vaccination ; and there is no aboriginal word in the Hawaiian language for this disease. Mr. Dayton, President of the Board of Health, says that the natives, having no words of their own, used the Chinese words *maipake* ?—" what is this disease?"

In Captain Cook's time (1770-79 ED) these islands were supposed to contain a population of 400;000 at the present time they do not number more than 40,000, and are rapidly diminishing. In all quarters, both native and European, lay and medical, among members of both Houses of the Legislature, I found the belief all but universal that leprosy was considered to be communicable, and that the propagation of the disease during the last twenty-three years was largely due to vaccination.

One medical authority told me that he had no doubt that the disease was inoculable and spread by vaccination, but he did not think it would be prudent to disclose the fact amongst the' natives, as he would not be responsible for what they would do. He expressed his own convictions freely on the subject, which are confirmed by Dr. Edward Arning's inoculation experiment on the condemned convict Keanu, of whom he gave me a photograph, showing the development of the tubercular form

of this disease. No other intelligent resident shared the fear of such an exposure, the incriminating facts having already been acknowledged both in the official reports and in various communications by medical practitioners to American medical journals. On the contrary, when it became known that I was there not to institute experiments but to collect facts in the interest of those afflicted people, I was urged by influential citizens, and particularly by members of the Legislature, to do what was possible to make known the evils under which they suffered, and to bring an enlightened public opinion to aid them in putting an end to a mistaken medical procedure, which had led to such disastrous results. One of the gentlemen who besought my intervention was Mr. J. Kalua Kahookano, a barrister-at-law, and representative of North Kahala, Island of-Hawaii (the largest in the Archipelago), who introduced a bill (July, 1890) in the Hawaiian Legislative Assembly to repeal the vaccination laws. This bill was supported by a petition from Mr. Kahookano's constituents, showing how leprosy, syphilis, and other diseases had been scattered broadcast in these islands by means of the vaccinator's lancet, and new centres of the diseases thus established. The truth of this fearful indictment is now admitted by several medical practitioners of high standing, who have visited the islands to study the cause of the rapid spread of this destructive malady.

Amongst other old residents who kindly volunteered information was Mr. H. G. Crabbe, a member of the Upper House of Legislature, who had resided in the islands for forty-three years, and had always taken an active interest in the public health. He said it was time that the true facts concerning the propagation of this disease in Hawaii were made known, as the people were being decimated by leprosy conveyed to the blood by vaccinators. Mr. Crabbe detailed various facts in proof of this serious charge, and expressed the utmost anxiety that the truth should be made manifest in countries where public opinion was a potent factor for the wellbeing of the community. He had met with many cases of leprosy clearly traceable to vaccination in the islands, and the facts were admitted by those who, like himself, had taken the trouble to investigate them; but the evil was being perpetuated by those who ought to know better, partly through apathy on the part of the authorities, and partly through the ignorance of the natives, who accepted whatever kind of vaccine virus was most handy when wanted for use. Mr. Crabbe was a believer in vaccination as a prophylactic against small-pox, but considered that, as at present administered, it was a most cruel and mischievous infliction upon a confiding population.

In a statement handed to me by Mr. Crabbe, dated Honolulu, Hawaii, Oct. 22, 1890, the writer says:—" In the year 1866 there was an indiscriminate vaccination of young and old amongst the natives; this vaccination was compulsory, but, thank heaven, I did not allow my children to be vaccinated with the common herd. From that time the leprosy cases became more frequent; many natives who had previously been healthy were afflicted with leprosy. The spread of the loathsome disease was more pronounced in the years following this indiscriminate vaccination. I can recall one case in particular of a native girl by the name of Kapeka, as healthy and as nice looking as 'tis possible for a native to be, who was forced to be vaccinated in the year 1866. In the year 1871 or 1872 Kapeka was sent up to the Molokai Leper Asylum by order of Dr. Robert M'Kibbin. In this particular case I have always contended that this girl was inoculated with the germs, not only of leprosy, but also of syphilis, from this fact. Long before she exhibited any signs of leprosy (some three years), if she hurt herself, so as to make an abrasion of the skin, the place would inflame and suppurate, and would take a long time in healing, presenting an appearance like a syphilitic sore. She died at the Leper Settlement."

The appropriation by the Government for the Molokai Lazaretto is £10,000 a year—a large sum for

a poor and comparatively thinly populated country. During the past twenty-five years, about a million and a quarter dollars have been expended by the Hawaiian Government in making provision to benefit these afflicted people. It is, however, melancholy to reflect that one source of the dissemination of the disease, viz.—vaccination, is still permitted, and, there is reason to believe, is encouraged both by the misguided Government and, notably, by certain official members of the medical profession. The latter have inherited such a deeply-rooted prejudice in favour of the merits of the Jennerian practice as to blind them to its destructive potency in countries where leprosy is endemic. The great majority of medical practitioners take their views from the medical journals, which most unfairly refuse to give their readers the adverse side of the Jennerian practice.

Notwithstanding the evidence of the disastrous results of vaccination in spreading and establishing new centres of leprosy, we are told in the "Biennial Report of the President of the Board of Health to the Hawaiian Legislature for 1888" (in which the depopulation of the islands, and the spread of leprosy, is frequently referred to) that "the work of vaccination has been pushed with vigour;" and, "The Board would recommend the passage of a more stringent law, imposing heavier penalties and giving the vaccination authorities all necessary authority."

In his remarkable work, "Traite Pratique et Theoretique de la Lèpre," p. 306, Professor Henri Leloir refers to the introduction and progressive increase of leprosy in the Sandwich Islands, and states that vaccination, compulsory and *en masse*, contributed to the spread of the disease.

Coincident with the activity with which vaccination has been extended in Hawaii, there have been several very severe outbreaks of small-pox. In the year 1881, according to official reports, 500 persons died of smallpox, a large majority of whom had been vaccinated. Each of these epidemics has been accompanied by a more stringent enforcement of vaccination, and has been followed by the development of new centres of leprosy and the more rapid spread of this destructive scourge.

#### BRITISH GUIANA.

In the pursuit of my inquiries in British Guiana in 1888-89, the public librarian, Mr. Rodway, expressed himself much interested in the subject of leprosy, which, considering the remarkable increase of the disease in that colony, has been neglected of late years. He called my attention to a work entitled "Leprosy in British Guiana," by a careful scientific observer, Dr. John D. Hillis, formerly Superintendent of the Leper Asylum in that country. Mr. Rodway said this was regarded as the standard work on the subject. From it I extract the following particulars of invaccinated cases

Case IV., p. 30.—*Confirmed Tubercular Lepra, supposed to have been contracted by Vaccination.*—Joseph Francis C—, a fair Portuguese, born in Demerara, now aged twenty years. His parents are alive and healthy. He has been suffering for the last ten years from tuberculated lepra. He has a sister, aged eighteen years, at present (1879) an inmate of the asylum, suffering from the same form of leprosy. They were both admitted on July 30th, 1877, from Murray Street, Georgetown. They have three sisters and one brother, who are alive and well. Our patient, J. F. C—, and his sister were vaccinated with lymph obtained from a member of a Portuguese family, ("It is within the knowledge of Dr. Manget, surgeon-general, and the author, that this family are at present afflicted with tuberculated lepra.") in whom leprosy was afterwards found to exist. They were the only members of the C— family vaccinated with this lymph.' Within 18 months of the performance of the operation by Dr. —, a reddish brown spot appeared on the inner side of the right thigh, preceded, it is stated, by some constitutional disturbance. This spot was raised and tender,

accompanied by profuse sweating all over the body, and remained for some time. Subsequently other spots made their appearance on the right buttock (which disappeared shortly after), between the shoulders, and on each cheek. They were all ushered in by more or less well-marked febrile symptoms. A red patch next appeared on the forehead, and epistaxis set in, periodically occurring to this day. Tubercles then made their appearance on the face, the other patches continuing to increase in thickness and roughness, and forming tubercular infiltration."

"The latter was removed by gurjun oil, under which treatment many of the symptoms were ameliorated." State and condition on November 30th, 1879 :— "He has a light brown irregular patch on the front of his chest; this had been larger, thicker, and mahogany-coloured, and has evidently undergone partial absorption. There is a patch of tubercular infiltration on the back of the arms, and at the back of the elbows. The fingers are swollen, shining, and dark-looking, a solitary tubercle forming on the back of the hand. The swollen condition of the fingers and hands is very characteristic. There are two tubercles on each cheek the size of marbles; the lobes of the ears are thickened, and a tubercle is forming on the upper lip.

"There is no appearance of hair growing on the face. There are reddish-brown discolourations on the front and back of the legs. There are a few small scattered tubercles on the dorsum of the feet, and the lower parts of the legs are swollen and hard to the touch. There are tubercles on the scrotum, an ulcer on the leg where a tubercle has ulcerated, and the larger tubercles are slightly anaesthetic. This young man is one of the carpenters of the Institution; he is in hopes the treatment now being adopted may arrest the disease, which is, however, making slow but sure progress."

On page 191 of Dr. Hillis's book, a passage is cited from the work of Dr. Vandyke Carter (p. 178), one of the greatest authorities on the disease, in which vaccination is instanced as one mode of communicating leprosy. On page 192, we read :—" The subject of leprosy was brought forward at the stated meeting of the New York Academy of Medicine, January 20, 1881, in a communication by Dr. H. G. Piffard, in which the author, who is not himself a believer in the contagiousness of leprosy, states :—' A review of the evidence bearing on the contagiousness of leprosy led the speaker to the conclusion that this disease, like syphilis, is not contagious by ordinary contact, *but it may be transmitted by tile blood and secretions. Vaccination may transmit it.*"

A case in the speaker's own experience was cited in proof of this."— *The Medical Record, February 19, 1881 p 212.*

Sir Ranald Martin states :—" The dangers to Europeans arise chiefly from vaccination and from wet-nursing. I felt that very early in my career in India and I took the precautions which are here recorded. I saw an English lady last year in a horrible condition (she said) from having been vaccinated from a leprous child." — *Leprosy in British Guiana, by Dr. Hillis, p 182.*

On page 208 we read :—" I have already given some cases in which there could be no reasonable doubt but that the disease was produced by vaccination with tainted lymph. Those of the brother and sister mentioned are conclusive on the point, and we have the testimony in favour of this mode of propagation from such men as Tilbury Fox and Erasmus Wilson. I will therefore conclude this chapter with a case from the work of a recent writer, Dr. Piffard, of New York " :—" Case III.—William T—, aged 25 years, was admitted into Bell Hospital in May, 1864. He was of English parentage, but was born and passed his early life in British Guiana. After vaccination, performed when young, his arm became greatly swollen and inflamed, and large sloughs separated.

Investigation revealed the fact that the vaccine virus had been taken from a negro whose mother was a leper. At the age of seven years some brownish spots appeared upon his back and arms; and at the age of eleven a blister formed on the palm of the right hand, followed by permanent contraction of the flexor tendons. A few months later he felt a tingling sensation around the nail of the right index finger, followed by a line of suppuration and loss of the nail. The finger soon healed, but the same morbid process separated itself in the other fingers of the same hand. After a few months, according to his statement, the skin of the distal phalanges split, and the flesh shrank away from the bones, leaving them exposed. The bones separated at the joints, and the stumps healed. These various processes occupied eighteen months or two years.

"The disease then affected the distal phalanges of the left hand in the same manner. After this it attacked the right foot, and a slough formed over the lower part of the instep. The great toe then became swollen, the skin split, and its distal bone separated; then, without much regularity, the remaining phalangeal bones of fingers and toes necrosed and came away."—*Diseases of the Skin*, p. 209.

"On examination," adds Dr. Hillis, "the patient was found to have *maculae* or other spots, and anaesthesia of the parts affected."

On the 31st March, 1890, I wrote Dr. Hillis, referring to the cases of invaccinated leprosy mentioned in his book, and asked if he could furnish me with any other facts, and whether he would be willing to give evidence before the Royal Commission. To this I received the following reply:--

134 Leinster Road, Dublin, 2nd April, 1890.

DEAR Sir,—Yours to hand. I have no further reliable evidence as to the transmission of leprosy by vaccination than that contained in my book. These cases, however, may be relied on. I got the particulars from the medical man who performed the vaccination in question, and the parents of the children. I enclose a reprint from *Timehiri*.—I am, Yours faithfully, -JOHN D. HILLIS.

Wm. Tebb, Esq

*The British Medical Journal* of November 5, 1887, contains a letter from Dr. Hillis, repeating his conviction as to the communicability of leprosy by means of vaccination. Dr. Hillis says he has had more than twenty years' experience of the disease (leprosy), and half of this time he was superintendent of the largest leper asylum in the West Indies. In this remarkable work, Dr. Hillis quotes Dr. George Hoggan, whose testimony I have adduced, as an authority on the subject of leprosy, and few persons have had greater opportunities of studying the pathology of this disease.

In a recently published work by the late Archdeacon Wright, entitled "Leprosy an Imperial Danger" (Churchill, 1889) the writer, p. 85, reluctantly admits the danger of leprosy vaccination. "Much, very much," he says, "seems to imply that leprosy can be communicated by inoculation, and is communicated by vaccination."

Dr. C. F. Castor, the Medical Superintendent of the Leper Asylum, Mahaica, British Guiana, in his report for the year 1887, p. 43, says :—"Another manner in which the disease (leprosy) may be produced in the healthy with no taint is vaccination. This seems a most probable means of

communicating the disease, nor can there be any doubt, I fancy, after reading the admirably recorded case by. Professor Gairdner, of Glasgow, in the *British Medical Journal* of the 11th June, 1887. Dr. Rake, of Trinidad, disputes the obvious conclusion of the professor, and marshals a number of facts that do not in any way, to my mind, overthrow the fact that in that case vaccination was the cause of introducing the disease in the child."

Again, in paragraph 86 of the same report, Dr. Castor says :—" I have noted these points because I consider they are important, and as needlessly obscuring a palpable fact which should be made known far and wide in countries where leprosy is endemic and widespread, as with us, that there is every certainty of inoculation through vaccination."\*

\*Since the above was written Dr. Castor has given evidence before the Royal Commission on Vaccination (December 2nd. 1895), and in some particulars modified this opinion as to the danger of communicating leprosy by means of vaccination. In an article in No. 4 of the "Journal," December, 1891, in reply to my evidence on this subject before the Royal Commission, p. 4, Dr. Castor observes:---The opinion expressed that vaccination from a tainted source will produce the disease is, I believe, a true one." Surgeon Brunt, R.N., testified, March 2nd, 1892, before the Royal Commission, to actual cases of invaccinated leprosy within his own experience. Positive evidence and a body of unimpeachable facts cannot be set aside by wavering and contradictory statements like those of Dr. Castor.

The dread of communicating leprosy at Georgetown by means of vaccination is very general, and, as a consequence, the vaccination laws are, to a large extent, inoperative. Dr. Robert Grieve, Surgeon-General for British Guiana, in his report for 1887, referring to vaccination, p. 7, says :—" In the beginning of the year vaccination, which had been carried on energetically in the latter part of 1886 in Georgetown, came practically to an end, owing to the unwillingness of the people to bring their children for the purpose."

On inquiry from both medical practitioners and intelligent residents, I found that this objection was mainly due to a wholesome dread of infection of leprosy, when the vaccination was performed with arm-to-arm virus, and of syphilis with various cutaneous eruptions, when imported lymph was used.

In the "Report on Leprosy and Yaws in the West Indies," by Dr. Gavin Milroy (House of Commons papers, C 729), the Surgeon-General of British Guiana says (p. 33) :—" As far as my own opinion goes, I am inclined to believe in the possibility of such communicability—i.e., of leprosy by means of vaccination. There is no objection in Guiana to vaccination, if the parties know the children from whom the lymph is to be taken." But against this there is the testimony of Drs. Hackett, Watkins, Stevenson, and Allison, who state that vaccination has hitherto been practised to a very limited extent among the lower classes in Guiana. Dr. Allison says that "this is principally, if not entirely, due to the difficulty of obtaining vaccine lymph ;" while Dr. Stevenson admits (p. 35) that "the prejudice of the lower classes against vaccination, on account of the supposed communicability of leprosy by it, was, until the recent epidemic of small-pox in Trinidad, insurmountable."

#### UNITED STATES.

The origin of various recent outbreaks of leprosy in the United States is veiled in obscurity, only because medical men do not know where to look for it; though they have admitted that, since the discovery of the *beth//us leprce*, vaccination appears to be the most probable cause. Reluctant to impugn the Jennerian practice, and with opportunities at command, they have preferred to extend their researches in other directions.

Dr. H. S. Orme, President, State Board of Health, California, considers the ordinary explanations given to account for the dissemination of this disease inadequate, and observes:—" Not heredity, nor syphilis, nor endemic conditions, could have given rise to the group of sixty cases in the village of Spain; to the outbreaks in New Brunswick and Cape Breton Island; to the sixteen cases at Charlestown between 1846 and 1876; to the forty-two now at New Orleans, or to the two at Galveston. It is often impossible to trace the source and mode of contagion, but the same is true with all the disorders whose contagiousness is disputed."---*Leprosy: its Extent and Control, p. 29.*

In the "Transactions of the Medical Society of the State of California" for 1890, vol. XX., Dr. Orme, referring to the general vaccination of the people of the Sandwich Islands in 1868 with human lymph, consequent upon an outbreak of small-pox, says:—" This reckless practice doubtless contributed greatly to the spread of both syphilis and leprosy."

"At a meeting of the New York Academy of Medicine, June 6, 1889, Dr. Prince A. Morrow gave an account of his personal observations on Leprosy. Referring to his visit to the Leper Asylum at Molokai, he said he considered it probable that a number of the cases which had arisen in the Sandwich Islands had been caused by impure vaccine."—*British Medical Journal, Aug. 31, 1889.*

Dr. T. B. Sutliff of Sacramento, California, has sent me the following narrative of a case of invaccinated leprosy, contracted in California :—" Boy, native of California; never been out of this State; no family history of any constitutional disease; was well until about eight years ago; was then vaccinated. The arm became very sore, and was swollen in its entire length. An abscess formed in the axilla, and subsequently broke, discharging pus freely. Recovery ensued, the arm becoming well again. Soon after it was noticed that there were numerous patches of 'ringworm' on the body. This condition continued for several months. Several persons, himself included, were vaccinated by the father directly from the boy. The father, and one other of the persons vaccinated, subsequently had 'ringworm.' The father has since had 'tetter' from time to time. One year after vaccination the boy's ears became slightly enlarged. The nose was noticed to have become broadened, and tubercles formed on it and on other parts of the face.

"The ears are markedly enlarged, the nose broadened, and the *alce* are thickened. The hands show the disease quite plainly, the fingers being clubbed. There are a few small ulcers. There is a sore on the shoulder. The feet are beginning to be affected."

In the report of Dr. H. W. Blanc, Professor of Dermatology and the Chief Sanitary Inspector for the city of New Orleans, November 27, 1889, addressed to the President of the Board of Health for the State of Louisiana, where leprosy has been provokingly prevalent, it is stated that leprosy, syphilis, and tuberculosis are transmitted by vaccination. Dr. Blanc says that, "in his two-fold capacity of Dermatologist to the Charity Hospital of the city and Chief Sanitary Inspector of the city, he has had unusual opportunities for the study of leprosy and vaccination. During the past eight years he had observed over sixty cases of *bona-fide* leprosy (anaesthetic and tubercular). The disease is slowly increasing, it is inoculable and communicable by vaccination, and humanised virus should be avoided. Most of the vaccinations are performed by me and my assistants, and I will not on any account allow humanised virus to be used."

*The Occidental Medical Times*, Sacramento, California, of September, 1890, publishes "An Interesting Case of Anaesthetic Leprosy apparently following Vaccination," by Sidney Bourne Swift, Resident Physician, Leper Settlement, Molokai, H.I., and D. W. Montgomery, Professor of

Pathology and Clinician for Diseases of the Skin in the Medical Department of the University of California. The writers say that "one of the most interesting points in this case is that Peke (the leper) had been vaccinated one year before developing symptoms of leprosy, and that the vaccination scar became anaesthetic. Might it not be that with the vaccine virus the virus of leprosy has also been inoculated?"

This question is answered by Dr. Chr. Uronwald, Chairman of the Sanitary Committee on Leprosy, Minnesota, Wisconsin, U.S., who says in the official report of the State Board of Health, "Vaccination has undoubtedly originated leprosy."

In a paper read before the California State Medical Society, in 1881, Dr. A. W. Saxe gives an instance of three children in Honolulu, born of American parents, who became lepers.

In consequence of the serious development of leprosy in Hawaii, there has arisen, during the past two or three years, a determined opposition to vaccination, to which the increase of leprosy is naturally attributed. The President of the Board of Health, the Hon. David Dayton, in the Report to the Board of Health, Honolulu, for 1892 (p. 27), says "that notices were inserted in the newspapers offering vaccination, but there were no applicants." In the same report (p. 67) Dr. R. B. Williams, Government Physician for Hilo and Puna, Hawaii, says:—" There is among natives great prejudice and opposition to vaccination. . . . Hence voluntary vaccination is almost impossible." The existing law renders vaccination obligatory upon all the inhabitants of these islands, and has heretofore been enforced with great rigour, particularly during outbreaks of small-pox. During the past two years it appears to have been relaxed, and objectors have been humanely suffered to escape the dreaded ordeal. It is interesting and instructive to note the result. On page 41, the President of the Board of Health, observes : —" On December 31st, 1890, there were 1213 lepers in the custody of the Board, that being the highest number ever reached; and on March 3 1st, 1892, there were only 1115, a decrease of 98 during the period." A recommendation is thrown out in the report, that the vaccination law should be amended, as the present laws are entirely unsuited to the times. In view of the evidence brought before the Royal Commission on Vaccination in London, showing the futility of vaccination as a preventive of small-pox, and its fertility in disseminating every inoculable disease, the only reasonable alteration in the vaccination laws that will be acceptable to an enlightened public opinion is their entire- and permanent abrogation.

Personally I have heard of many cases, which I have no doubt have been due to leprosy vaccination. There is, however, it is to be regretted, manifest reluctance on the part of the profession to look for causation in this direction; it is generally pooh-poohed as soon as mentioned; and when it appears to be the only way of accounting for a particular case, the attending physician prefers to hold his peace rather than discredit a practice which he has been educated to believe is the greatest discovery in the history of medicine. Professor Gairdner, of Glasgow, introduces his cases of invaccinated leprosy in the *British Medical Journal* with an apology and evident reluctance.

It is generally admitted that, given the right conditions as to environment, temperament, or idiosyncrasy, all bacterial diseases are transmissible from one human being to another; and as no single authority that I have met with, since the discovery of Hansen, pretends that leprosy does not belong to this category, the danger of vaccination is obvious. I am aware that this objection is attempted to be met by the introduction of animal lymph; but animal lymph is admitted to be too active, especially in tropical countries, to be used direct; and in general, therefore, it is available

only after one or two removes, when it carries with it diseases both animal and human, as has been shown in evidence before the Royal Commission on Vaccination.

### BRITISH INDIA.

An uneasy feeling is beginning to be exhibited in India on this momentous subject, owing to the accumulation of -evidence tending to show the sinister connection between the extension of the State-provided remedy against small-pox and leprosy. The synchronicity between the spread of leprosy and the extension of vaccination has given rise, in some districts, to such a dread of vaccination, that every device is resorted to by thoughtful parents to prevent their children being vaccinated. Attempts have been made to remove the dread of leprosy inoculation by the substitution of cow, calf, sheep, lamb, and donkey lymph; various compounds (one described by the medical purveyor as the Madras paste, and another as Lanoline) have been introduced; and some of the leading journals now energetically demand a safer and better system of vaccination. Dr.N. Boral, Chief of the Vaccine Department in the Jubbulpore district, has come to the rescue of the Jennerian *cultus* in the columns of the Allahabad *Morning Post*, but he sees clearly the weight of the incriminating testimony, and admits that to deny- the possibility of vaccinal syphilis or vaccinal leprosy would be tantamount to denying the value of human testimony altogether.

The authorities in India are well aware of the widespread repugnance to vaccination in that country, and of the cause of this repugnance, in the mischievous results known to every vaccinator; but all mention of these evils is carefully omitted in their official reports. Now, however, that the dangers attending the most carefully conducted vaccination have been so fully disclosed in the voluminous evidence taken before the Royal Commission on Vaccination, the culpability of such reticence is inexcusable. *The Statesman*, of Calcutta, August 22, 1891, commenting upon the "Resolution on the Statistical Returns of Vaccination in Bengal for 1890-1," in the *Calcutta Gazette*, August 21, 1891, observes:—"It has been stated that one of the greatest objections to vaccination among the natives of India, and other Oriental peoples, is that diseases such as leprosy, and other terrible blood diseases, have been inoculated with the vaccine virus. We think that some opinion should have been expressed under this head, and the omission of it is to be regretted in what is supposed to be a report given for the general edification of the Government as well as the public." And in a leading article, November 22, 1891, this same influential Indian journal, referring to leprosy vaccination, observes :—"There seems to be no possible room for doubting the reality of the very grave danger to which attention is drawn. . . . . It is notorious that inoculation, that is, the direct introduction of the virus into the blood, is the chief, if - not the sole, means by which leprosy is communicated. Throughout the greater part of Europe, at least, and in all the principal British Colonies and Dependencies, including India, vaccination is not merely the most common means of inoculation, but in most of the countries in question it is a means which, practically, is universally adopted, and enforced by legal penalties. It seems, then, to follow, almost of necessity, that, unless special precautions are taken to prevent so terrible a calamity, leprosy, wherever it prevails in these countries, must inevitably, in a certain proportion of cases, be communicated through the medium of vaccination. . . . . When vaccination from the human subject is practised, it is quite possible that, in a few generations, it might lead to an enormous multiplication of cases, and that without implying any want of ordinary care on the part of operators. For it should be remembered—and herein, it seems to us, lies the real gravity of the danger—the disease is not one that commonly shows itself in infancy. The child from whom the lymph was taken might, to all appearance, be perfectly healthy, and yet its blood might be infected with this fatal and loathsome poison, and the operation thus make it a focus

of contagion."

*The Calcutta Daily News*, August 7th, 1891, referring to the allegations that vaccination is responsible for the transmission of insanity, leprosy, and other diseases, observes :—" The question is an important one; and while it is a great gain to humanity to even modify such a scourge as small-pox, it is largely discounted by the consideration that immunity from it may be purchased at the price of other diseases as bad or worse than that affliction itself."

*The Bombay Guardian* of April 6th, 1889, commenting upon the spread of leprosy by vaccination, observes :—"If we have to choose - between the danger of leprosy and small-pox, let us by all means have the latter. The ghastly sights to be seen in every Indian public thoroughfare, of the scabious, handless arms, and footless legs of begging lepers, forbid any other alternative. Small-pox is bad, 'but leprosy is a hundred times worse.'"

\* *The Indian Spectator*, Bombay, December 27, 1891, in a leading article, calls attention to a strong reaction that has set in against vaccination, and points out that the opponents of the Jennerian method of preventing small-pox contend that vaccination is answerable for much of the spread of leprosy in recent times, and that this view, which has the support of men considered as high authorities on the subject, is of vital importance. The article concludes by observing that "The Leprosy Commission seem to have thrown away a fine opportunity in omitting to direct its researches into the alleged connection between vaccination and leprosy."

When similar charges have been made against vaccination in Europe, the usual course of the official propagandists is to ignore the terrible indictment as long as possible, and then, when questioned in Parliament, either to minimise its character and attribute the results to other causes, or to deny them altogether. Those who are concerned for the public well-being in India may study with profit the pages of the Third Report of the Royal Commission, to see what lengths the official supporters of vaccination are prepared to go in their advocacy of the Jennerian *cultus*. \*

\*On December 30, 1880, fifty-eight young recruits belonging to the 4th Regiment of Zouaves were vaccinated from a Spanish child at the Dey Hospital, Algiers. In a few weeks all the vaccinated developed syphilis, to which about one half subsequently succumbed. The Minister of War, General Farre, instituted an inquiry, but no report has been published. Five times questions were submitted in Parliament with a view of eliciting the facts. The President of the Local Government Board promised to institute inquiries through the Foreign Office, but, on receipt of a reply, excused himself from giving particulars by declaring that "the information was incomplete," and promised to make another application. Finally, on the 27th October, 1882, Mr. .C. H. Hopwood repeated his question, which was answered by Mr. Dodson (Lord Monk Bretton) by a categorical denial of the facts. At this time *the Local Government Board were in possession of full details of this vaccine tragedy (supplied by a Member of Parliament), including the names of the unfortunate sufferers, their grade, matriculation numbers, and nationality, as furnished by a medical witness, after a personal and painstaking investigation of the facts at the Hopital du Dey.*

A report of a " Scheme for obtaining a better knowledge of the Endemic Skin Diseases of India" has been prepared by Mr. Tilbury Fox, M.D., F.R.C.P., Fellow of University College, Physician of the Department for Diseases of the Skin at University College Hospital, London, etc., and Dr. F. Farquhar, Surgeon - Major, Bengal Medical Service. Under the title of Propagation these authors include inoculation and vaccination, and observe that there is by no means a slight body of facts which seem to show that the inoculation with matter from a leprosy sore—and this may occur in cohabitation and constant contact, and in vaccinations—may give rise to the disease. The authors propound a series of fifteen questions, with the view of elucidating the presence and cause of leprosy in different- districts and individuals. It is noticeable that, while they allow that vaccination is a cause of the propagation of leprosy, inquiry on this point is not demanded. The Secretary of the Leprosy Investigation Committee, in his address before the International Congress on Hygiene and

Demography, states that the cases of invaccinated leprosy are few in number. But, inasmuch as all the cases have cropped up accidentally and not as the result of research, it is impossible to estimate their number. An incalculable service to humanity will be performed when medical practitioners of high qualifications, not committed to any preconceived theory, will, in the interest of the public health, undertake this important investigation.

*The British Medical Journal*, Sept. 19th, 1891, reports an paper read at the meeting of the British Medical Association, on "Leprosy and Vaccination," by Dr. R. Pringle, surgeon-major, late of the Sanitary Department of the Bengal Army, who said "that of all charges which had been brought against vaccination, none approached in seriousness — especially as it related to India—the charge that the present admitted increase of leprosy in certain countries was due to the increase of vaccination, which was stated to be not infrequently in those countries little else than leprous inoculation." Dr. Pringle, in recording this statement, fully admitted that in the main it rested on the evidence of medical officers of the, highest rank and authority in the West Indies, and that one Indian medical officer (Surgeon-General C. R. Francis) distinctly admitted, in an important public document, that this was not only possible but probable. Surgeon-General Francis, in the *Journal of the Leprosy Investigation Committee*, No. 1, August, 1890, had written that leprosy may be propagated by inter – marriage and hereditary transmission is undoubted. I believe, too, in its propagation by vaccination or inoculation, but I am very sceptical as to mere contact being the cause. . . . I would advocate an investigation into the effects of vaccination, there being some who are still dubious on this point, though the statement made two or three years ago by Professor Gairdner on the subject would seem to be conclusive in favour of vaccination as a factor." The inoculation alluded to by Dr. Francis was stated by Dr. Pringle not to be inoculation by flies, as seen in ophthalmia—a fact which he remarked in passing was both recognised and dreaded by the Jews of old as one of the most certain and probable means of spreading leprosy—contact, as pointed out, being to them a Levitical uncleanness, and not, therefore, necessarily risking the consequences of contagion. The inoculation alluded to by Surgeon-General Francis was small-pox inoculation, as practised in the Himalayas as a preventive against spontaneous small-pox. Dr. Pringle severely criticised the circumstances attending vaccination in the case recorded by Professor Gairdner in the *British Medical Journal* June 11th, 1887. It was hardly to be expected that the opponents of vaccination would fail to take advantage to the full of such damaging statements regarding vaccination in India as recorded by Surgeon-General Francis; but Dr. Pringle stated that Surgeon-General - Francis' experience was entirely the reverse of his own. The main object of his paper was to point out the means available for subjecting these two conflicting experiences to the most searching investigation on the spot by the Leprosy Commission now in India."

Dr. Pringle proceeds to explain that for twenty years he had collected vaccine lymph in Tern, in the Himalayas, where leprosy was very gravely endemic, and used this lymph in districts where the population was 500 to the square mile. Over two millions of these vaccinations had been performed, and - he had never seen a case of leprosy traceable to vaccination. Dr. Pringle- omits to say whether he ever searched for such cases, or inspected the vaccinated subjects a year or two after the operation, or inquired whether those attacked with leprosy traced their affliction to vaccination. As Dr. Pringle urges upon the Leprosy Investigation Commission the importance of inquiry to test the validity of the charges now brought from all quarters, it would seem that he had not made this investigation himself.

Dr. Vandyke Carter, of Bombay, allowed to be one of the greatest authorities on the subject,

includes vaccination among the list of causations, of which he says he has found recorded a few affirmative examples, at least, of each one method or means.—*Report on Leprosy and Leper Asylums in Norway, with reference to India, p. 178.*

Mr. H. Brown, of Simla, writes to me Oct. 2, 1889:—"Experiments have proved - leprosy to be inoculable. There must necessarily be a dread of vaccination in India, since the subject from whom lymph is taken for the operation may be a leper. In India native village vaccinators are not over careful from whom they procure their lymph. In Malabar and various districts of the Madras Presidency, where I have lived hitherto, it has been no uncommon thing to see the lymph extracted from the arms of itchy native boys. Leprosy has increased- alarmingly since the introduction of vaccination. I know of some cases where perfectly healthy persons, whose parents also are healthy, and who have been accustomed to live in healthy localities, have been smitten with leprosy after vaccination. I can also quote cases similar where children have died, or have become very seriously ill, immediately after vaccination, from hideous eruptions and swellings. One lady, the wife of a respectable merchant in Cochin, assured me that *vaccination* and *nothing else* killed her baby. It was perfectly healthy until vaccination. The Surgeon-General, Dr. Brodie, in his report for last year on the 'Distribution of Diseases in the Presidency,' declared that syphilis was on the increase throughout. This increase is coincident with the introduction of compulsory vaccination in a large number of municipalities, and with the more energetic action on the part of vaccination officers in the Madras Presidency."

Dr Chunder Ghose, in medical charge of the Leper Asylum, Calcutta, in a communication to the Secretary of the District Charitable Society of Calcutta, dated August 2 1st, 1889, states his opinion that leprosy is increasing in India, that it is communicable by vaccination, and that there is a dread of the operation on this account.

Dr. Roger S. Chew, of Calcutta, who was for six years in the Medical Department of Her Majesty's Army in British India, and has devoted fourteen years to the study of leprosy in India and other countries, furnishes, in his pamphlet on leprosy, a table giving the results of his investigations into the causation of the 1034 cases which have come under his treatment. Of these, he says, insanitation is responsible for 105 cases, vaccination for 148, and 72 cases are due to other forms of inoculation. Dr. Chew has been kind enough to supply me with the following particulars from his case-book, in which, according to his diagnosis and careful inquiries, the disease is directly traceable to vaccination.

The cases here quoted are samples of a large number collected by Dr. Roger S. Chew, in which the connection between the onset of leprosy and a previous vaccination is well determined. With reference to this, I am advised by high medical authority that a secondary development of the results of an inoculation frequently coincides with a re-awakening of disturbance at the point of inoculation. *Also, that when a secondary and constitutional disease first indicates its existence at the scar of vaccination, it may be taken as conclusive evidence that it is consequential to that vaccination.* It will be noticed that, in almost all of these cases, the place of inoculation is first attacked, and in all of them it is affected.

Another point in the evidence adduced should be noted, namely, that it does not seem to matter whether the vaccination "took" or not for the secondary effects to be manifested in due course. The probability is that, if a vaccination is immediately "successful," a portion of the poison is

discharged, and the rest retained. If there is no immediate result, the poison may still lie dormant for a variable period, concerning which practically nothing is known.

*Extracts from Memoranda in case book by Dr. Roger S. Chew, Calcutta, showing connection between vaccination and the commencement of leprosy*

1.—"Jahoorie, aged twenty - eight. Married; no children. Duration of leprosy, twenty years.

"There is no history of syphilis, either with himself or his relatives. - When he was about seven years old, he was vaccinated on his right arm. About six months after he- noticed a white patch over vaccine site; a similar patch appeared on his right buttock, and he soon after lost sensation in his left foot. The marks gradually faded away, broke out afresh in - other portions of his body, and again disappeared to reappear, *et seq.*; but wherever these marks appeared, they were accompanied by loss of sensation, which remained permanent throughout. About sixteen years ago he suffered from enlarged spleen, for which he was fired (*i.e.*, burned with hot iron). Ten years ago the fingers of both hands began to be flexed on themselves.

"Present state :—Perpendicular of ankylosed fingers is 1/8 inch on right hand, and 7/8inch on left. Fingers and thumbs of both hands much ankylosed, discoloured, and anaesthetic. Dry ulcer at inner flexion of right thumb. Open and entirely painless ulcer on tip of nose, extending 1 1/4-inch inwards. Amesthetic discoloured patches all over chest and abdomen. Two large (burn) scars over splenic region. Right foot has three large open sinuses, freely discharging a viscous, stinking, purulent fluid. On inserting little finger into the largest of these three sinuses, free vent was obtained, and the finger, striking against the astragalus, not only caused the patient a great deal of pain, but also brought away a quantity of foetid caseous-looking matter, due to caries of the bone. There are three discharging sinuses — the largest one inch in diameter at the opening—in the left foot also. Raw, ulcerated, and entirely painless stump, marking where middle toe of left foot has recently fallen off. Second toe of same foot has also dropped off, and on outer side of little toe of same foot is a peculiar blistered surface. Both shins largely covered with scaly and desquamating cuticle, with absolute loss of sensation. Hacking cough, and great pain in left thorax, with frequent and bloody *sputa*, beginning some two years ago, but aggravated during the last month. Caseous degeneration at extreme apex of right lobe of left lung.

2.—"Daidas, a male, aged forty-three; a native palki bearer. Duration of leprosy, twenty years.

"There is no history whatever of syphilis or syphilitic or leprous hereditation, nor are any of his relatives similarly afflicted. He was forcibly vaccinated about twenty-one years ago. The operation was not successful, but a year afterwards the vaccine pock grew rough, lost sensation, and gave place to a small crop of *papillae*, which spread, grew larger, and became entirely anaesthetic. He never had fever of spleen. About four years ago he used to get peculiar cramping sensations all along the course of the right ulnar (nerve) accompanied by extremes of cold and heat in fourth and little fingers. Contractions began to supervene, and these two fingers, entirely losing sensation and their power of grip, became permanently flexed on themselves. At this time his brows began to protrude and his upper lip to get thick.

"Present condition :—Permanent and rigid ankylosis of fourth and little fingers of right hand, with total anaesthesia. Tumoid, discoloured, anaesthetic patches and papules all over hand and arm from finger tips to clavicular articulation. Large tumoid and anaesthetic patch, 5 X 4 in., on anterior

aspect of right shoulder; another, 3 x 1 in., over vaccination site; and a third, 3 X 2 1/2 in., on elbow of same side. Upper lips very tumoid with paralysis of left side and partial anaesthesia of right. Uvula elongated and anaemic; fauces very anaemic. Sense of smell and taste are unimpaired. Left inguinal glands are indurated and slightly enlarged. Scrotum and prepuce elephantoid and anaesthetic. Posterior portion of scrotum is ulcerated. There are a few white spots over buttocks, whitish mark over left second toe, with loss of feeling. Ears are rather swollen. Features leonine, the supraorbital ridges being very tumoid and perfectly anaesthetic.

3.—" 1. Chundar Ghoral, a male, aged forty-two; a- Brahmin, and farmer by occupation. Duration of leprosy, twelve years.

"There is no history whatever of heredity, syphilis, impure living, or irregular habits. He was vaccinated seventeen years ago (the operation did not take), and five years afterwards a small rash broke out on that portion of his right arm where he had been punctured. This rash spread, ulcerated, healed, and left behind a thick warty lump, 3 1/2 in. long and 1 3/4 in. broad, which was utterly devoid of feeling. Similar excrescences appeared on various parts of his body, and about seven years ago he noticed some peculiar white patches appear.

"Present condition ;—Open sinuses under ball of both great toes. Nodes all along course of lymphatics. Anaesthetic patches over several parts of body. Excoriation on left elbow. Leucoderma in patches of rather large areas in different parts of back and thorax. Features leonine and feet slightly swollen and oedematous. Knees swollen and marked with tubercular ridges. Complete loss of power and sensation in the fingers of both hands, but no ankylosis.

4.—" Rohim Bux, a male Mahomedan, aged twenty-five, a hackney carriage driver, stated on the 18th August, 1889, that, a fortnight after vaccination, which did not 'take,' eighteen years ago, his parents noticed whitish patches occupying the site where the vaccine pits should have appeared, and remaining persistent for two years, after which they increased in size, coalesced, and steadily kept increasing to their present extent . . . On his forehead, half of right arm and hand, and on his right shin, are pinkish-white patches that do not itch; leprosy ulcers on his right foot, implicating the great toe, the nail of which has sloughed off. A painless ulcer, 2 1/2 inches by 1 3/4 inches, occupies the surface of right hip joint. These ulcers are all perfectly anaesthetic. The ulcer on his hip joint is nearly three years old, scabbing, and breaking out afresh at irregular intervals.

5.—" Meer Mahomed, a Mahomedan male, aged thirty-four years, married, with eight children; a clerk by profession. His parents were quite healthy, and so are his wife and six of his children, but two daughters are lepers. On the 23rd August he showed bright silvery lines on the palmar surfaces of both hands, while on the dorsal surfaces were several small annular patches, together with three large crusted patches, the largest 1 in. by 3/4 in. First joint of left fourth finger had sloughed off, leaving a very angry stump. Running ulcers in right leg and thigh. Angles of mouth tough and thickened. Both ears nodular and tumoid (thickness, 1 1/4 in.). On chest and left arm were white patches, three of which formed a peculiar triangle which covered the vaccine pits, *in which the disease first appeared*. The lymph for the operation was taken from the arm of an apparently healthy native child. Patient has never had syphilis, nor does he know of any member of his family being afflicted with any blood disorder.

6.—" Bundaban Mullick, a Hindu male child of seven years, exhibited on the 27th August, 1889, several leprosy ulcers on left wrist and at the angle of his mouth. On left arm was an oblong

whitish-pink patch that entirely obliterated the vaccine pits. The boy's father, who is perfectly healthy, says that two and a half years ago the boy was vaccinated, and about four months after the operation he noticed the puncture sites occupied by three small white patches, which in the course of one year extended and coalesced to form the single patch now seen. The ulcers appeared about a year ago, and refused to heal up.

7.—" A Hindu male, Bhaleshur, aged ten years. Six months after vaccination, three and a half years ago, a white patch appeared over his left clavicle and on vaccine site. Half of the patch on clavicle ulcerated, and the ulcer, finch broad and  $\frac{3}{4}$  inch long, refused to yield to either arsenic or mercury, both of which he had taken for two years. The clavicle is denuded of flesh, and plainly visible to the naked eye, while the ulcer itself is of a leprosy type.

8.—" A Hindu female, Gowrah, aged nineteen, stated that she was vaccinated in her seventh year (as far as she remembers). The operation did not 'take,' and, five months after, three whitish spots appeared on her right arm, where the vaccine pits should have been. These spots extended, coalesced, and, spreading downwards, disfigured her arm as far as the wrist. Her lips thickened, menses became irregular, and obstinate sores, which are still open, broke out on her feet.

9.—" Vincent D'C., an East Indian clerk, aged thirty. A year after vaccination (six years ago) he felt a peculiar constant itching in the vaccine pits, and, a short time after, noticed on this left arm a curious rash, which subsequently gave place to obstinate ulcers, for which he was unsuccessfully treated by three different doctors. On his left arm are three irregular-margined annular patches, averaging  $1\frac{1}{2}$  inches in diameter.

10.—" Da Singh, a Hindu schoolboy, aged twelve, told me (Dr. Chew) on the 11th December, 1889, that he had been vaccinated in his seventh year. About eight months after the operation, the vaccine pits ulcerated, and the ulcers spread and coalesced, to form a large annular patch which has obstinately remained open. On same arm (right), a little above the elbow joint, appeared a long pinkish white patch, which gradually enlarged, and now occupies a space,  $9\frac{1}{2} \times 3\frac{1}{4}$  inches wide, running over flexor aspect of portions of both arm and forearm. .

11.—" Francis G—, an East Indian male child, aged three; admitted on 21st December, 1889, has eczema of the scalp of three months' duration. He was vaccinated when only eleven months old. The operation did not 'take,' and a month afterwards the whole of that left arm became perfectly anaesthetic. An annular patch of the size of a rupee occupies the left angle of his mouth, and close by this annular patch are two small anaesthetic tumoid ridges.

12.—" Ameer Hoosein, a Mahommedan lad, aged fifteen, was vaccinated in his seventh year. The operation 'took,' but in his eighth year the vaccine pits turned into little ulcers, which enlarged, scabbed, cleared, and finally coalesced to form one large annular patch on his left arm. Smaller annular patches exist on left shoulder, right hand, and right foot.

13.—" Doorie, a male, aged 18, is a leper, and attributes his disease, from which he has suffered for the past nine years, to impure vaccination. The vaccine pits are badly ulcerated, and he has an anaesthetic patch covering the entire elbow joint of the same arm. Both lungs are implicated.

14.—" Kasmini Bibi, a married Mahommedan female, the mother of two healthy children, deposed, on the 29th December, 1889, that she was vaccinated on her right arm in her thirteenth year. The operation 'took,' but five years afterwards the pits ulcerated, and these ulcers remained obstinately

open. At this time crops of *paapillae* accompanied by total anaesthesia, began to show themselves on her chin, right breast, right thigh, and right knee. About one and a half years ago a tiny white spot appeared in the centre of her forehead, and this spot has now increased to a circular patch the size of a shilling piece.

15.—" Goolburee, a married Mahomedan female, aged forty-seven, with pemphigus (five blotches on right foot) of one and a half years' and leprosy of thirteen years' standing. The latter disease she attributes to improper vaccination. She has been five times vaccinated—the last occasion when thirty years of age. Four years after this the leprosy manifested itself. There are nodosities in both ears, in her nose, on her left arm, and along the left sternocleido-mastoid; one ulcer, 1 1/2 x 1 1/4 inches, on right ankle, and another twice this size covers last vaccine site on right arm.

16.—" Mabel P—, a Scotch lassie, aged seventeen, and a leper for the last eight years, was brought by her mother, who stated that she was vaccinated when she was seven and a half years old. About six months after the operation, which was successful, symptoms of leprosy began to develop, and she flew here and there to every medical practitioner that money could procure to save her child, but to no avail, as the disease kept increasing. The girl's present condition is :—Ears tumefied, and 2 1/2 inches thick. Face marked with ridges like cooled lava (volcanic). Sores on hands and feet and angles of mouth. Eyesight impaired. . . Tonsils indurated. Uvula ulcerated.

Ankylosis of little and fourth, fingers of both hands. Ulcer in left nostril, the right being entirely blocked, arid external nares flattened out. Lips protruding, thick, and hardened. Slight contraction of right knee, and anaesthesia well marked everywhere.

17.—" M. T—, a Eurasian female, aged fifteen, whose father stated that three years ago—at the time of the great scare caused by an expected epidemic of small-pox—he had his daughter vaccinated. The operation "took," but a year after the pits ulcerated and refused to yield to treatment. 'At the same time a few white spots appeared on her back, her sides, the nape of her neck, and over her face.' Those on her face grew larger, till, impinging on each other, they finally coalesced to form one large blotch of pinky-white, which, contrasting against her olive brown complexion, terribly disfigured her.

18.—" A. A—n, a Chinese carpenter, aged forty-three, married, and the father of four healthy children, deposed on the 22nd December, 1890, that four months after vaccination, eleven years ago, the vaccine pits broke down into ulcers, which are still open. His ears are tumoid (1 1/4 inches) and perfectly anaesthetic. Tubercular deposit, and. welt marked anaesthesia in patches all over body.

19.—" Imrato J. Ghose, a Hindu male, aged twenty-eight years, stated, on 14th Feb., 1891, that he had been three times vaccinated, in infancy, at six years, and at twenty-one years of age, at each of which times the operation was very successful. Fifteen months after the last vaccination his leprosy showed itself. His body is covered with hypertrophied anaesthetic patches of various sizes and contiguous to each other. Mercurial foetor of breath. Ears tumoid., *Alae nasi* partially affected, and anaesthetic. Brows very slightly leonine; pains in loins in rising, and drawing up the legs; ulcer on ball of great toe of left foot, freely discharging serum. Vaccine pits are badly implicated in the hypertrophies on left arm.

20.—" Sibhoo, a Hindu male, aged forty, and a widower, stated on the 14th March, 1891, that he was vaccinated when thirty-six years old. A year afterwards the vaccine pits ulcerated (ulcers still open). He has never had syphilis in any stage; his people are healthy; his body is well nourished, with patches of discoloured (whitish) hypertrophied and anaesthetic cuticle—the smallest 4 x 5 inches—scattered all over. Black anaesthetic patch over surface of lower half of left "tensor vaginm femoris." Little toe of left foot has dropped off. Both ankles are much swollen and inflamed; there is entire loss of sensation in fingers, feet, and ulcers. Under the balls of both great toes are running ulcers.

"21.—William J. C—, an East Indian male, aged twenty-one, admitted on 31st August, 1891, was vaccinated three years ago, and a year afterwards noticed some pimples break out in vicinity of the pits, on back of hands, and on his back. These at first itched a great deal, but, breaking down into pustules, became devoid of feeling, and extended to various portions of his body. The left, fourth, and little fingers are also anaesthetic.

22.—" Khyroo, a Mahomedan male, aged fifty, applied for treatment on the 20th October, 1891. Has been married twenty years, and has four male and two female children, all healthy. Leprosy showed itself nearly a year after he was vaccinated. Prior to this he was always hale and hearty. Had small-pox eight years ago (*i.e.*, four years after he was a leper). Present condition :—Ears are slightly tubercular, their hypertrophy measuring about 1/32 inch, while their long and short diameters are normal, without sore or abrasion, and with slight anaesthesia. Face marked with small-pox pits, hypertrophy over malar ridges, angles of mouth and bridge of nose, the *aloe* of which are thickened, and tubercular anaesthesia is well marked. Arms covered with patches of tubercular deposit and vesicles, with well-marked anaesthesia.

"Hands—Thumb, ring and little finger of right hand permanently flexed; burn on thumb and forefinger, proving anaesthesia; nails deformed and splitting up; tubercular infiltration. Left forefinger much swollen, and a small ulcer on back of first joint, which is bent. Little finger also swollen and flexed on itself; fourth finger slightly flexed. Anaesthesia well marked in all the fingers, and in the palms and wrists. Small patches of tubercular growth all over wrists and dorsal surface of hands.

"Body, legs, and feet all show well-marked developments of tubercular leprosy, with anaesthesia.

23.—" G. D'R—, an East Indian of thirty years, admitted 3rd January, 1892, stated that one year after vaccination his disease appeared. Present condition :—Ears wrinkled and elongated, with irregular nodes. Features leonine. Brows tumoid and tubercular, malar ridges hypertrophied and anaesthetic. Tubercular deposit at angles of mouth; nose flattened out, anaesthetic, and depressed at bridge. Tubercular deposit and anaesthetic patches along the entire length of both arms. Fingers contracted, ulcerated, and anaesthetic. Body also affected. Right leg elephantoid; the left anaesthetic. Feet well marked with the disease, being ulcerated and mutilated.

24.—" R. B. M—, a Brahmin of thirty-eight years of age, stated that three years subsequent to vaccination the pits ulcerated and became anaesthetic. Features leonine, angles of mouth hypertrophied and anaesthetic. Arms ulcerated, with hypertrophied cuticle: ankylosis of elbow joint of left arm. Fingers of both hands badly ankylosed. A few patches of leucoderma on his back, and one on thorax. Large anaesthetic sinus under ball of great toe, of both feet.

25.—" Ishar Ghosal, a male Hindu, forty years of age, admitted 3rd January, 1892, deposed that he was vaccinated when twenty years of age, and five years afterwards the pits ulcerated. The ulcers healed, their site entirely lost feeling, and the anaesthesia spread till it implicated the entire length of right arm. Present condition :—Features slightly leonine; face shows scars of old sores; hypertrophy and anaesthesia of malar ridges and angles of mouth. Besides the anaesthesia of right arm, there is a large whitish patch (5 x 2 1/4 inches), just above elbow. Ankylosis of fourth and little finger of both hands. Large patches of leucoderma on back, and one large white patch covers the entire thorax. The interspaces are hypertrophied and anaesthetic. Feet badly ulcerated, the ulcers being anaesthetic and discharging freely."

Dr. A., Mitra, Chief Medical Officer, Kashmir, says:— "I have on three occasions searched for bacilli. In one instance I found them in lymph from a vaccinated leper."—*American Journal of Medical Sciences, July, 1891.*

In the year 1888 the Government of India adopted and issued a series of resolutions on the subject of leprosy, admitting the increase of the disease, and acknowledging the impossibility of dealing with it in any effective manner. No word of warning was then, or has been since, uttered as to the inoculability of the disease, now so generally admitted by medical authorities, and the consequent dangers of its dissemination at the hand of the public vaccinator, nor is it likely that this source of infection will be officially condemned until the people in India, as in many parts of England, stand upon their parental rights, and refuse at all costs to imperil the health and lives of their offspring by this irrational and disease-engendering rite.

Some medical authorities, while admitting that leprosy is inoculable, and disseminated by vaccination, insist, for the credit of the Jennerian practice, that such cases are very rare, and are due entirely to the carelessness of the operator, and that, therefore, it is unreasonable to throw discredit on so beneficent a discovery on this account. This mode of reasoning may satisfy, the unreflecting; but if it be once allowed that leprosy is transmissible by vaccination, who can estimate the extent of the resulting mischief? Vaccination is practised in all the colonies and dependencies of our empire, and in all countries -where leprosy prevails. The disease is usually of slow incubation, and, until external indications of the malady are exhibited, a child may be, and often is, used as a vaccinifer without inquiry. Here, then, in leprous countries, are all the conditions necessary for inoculating the germs of leprosy into the blood of present and future generations. The late Dr. George Hoggan, of Beaulieu, France, who devoted many years to the study of leprosy, has examined many lepers in Europe, and he attributes the disease in nearly all cases to vaccination.

The following letter explains Dr. Hoggan's view on this part of the subject :— .

Beaulieu, Alps Maritimes,  
December 29th, 1889

DEAR MR. TEBB—Upon the connection between vaccination and leprosy I hold a very strong opinion. Apart from the opportunities which I have had in Egypt, Palestine, and elsewhere of studying leprosy in the mass, I think that my extensive researches into the minute pathology of the disease, as evidenced by the papers published in the "Pathological Transactions" for 1879 and "Archives de Physiologie" for 1882, warrant me fully in expressing a firm conviction on the subject. At pages 88 and 90 of the latter work I refer to the relations between vaccination and leprous infection, only, however, to show the difficulty of connecting the two in the history of the case.

Taking all the factors into consideration, I hold that, in the cases of leprosy I was then investigating, the disease was conveyed through vaccination. I further believe that, in the majority of cases of leprosy developing in children, the leprosy infection is transmitted along with the vaccine virus. In adults, on the contrary, I have had evidence that leprosy is often conveyed along with syphilis; and this, taken in connection with vaccinal infection in the young, had led me to suggest the following explanation of infection in leprosy :—Hitherto all untainted evidence has shown that leprosy cannot be inoculated *per se* into a healthy body. \*

\*Dr. Hoggan, no doubt, refers to the negative results mentioned by Leloir in "De La Lépre," p. 237, where a doctor inoculated twenty healthy persons with leprosy pus, blood, and tubercle, and to Profeta's inoculations (p. 238) of twelve persons, including himself, with blood and pus from leprosy ulcers in wounds made by scarification and surfaces laid bare by blisters, and to his subcutaneous injections of matter from leprosy tubercle. He overlooks, however, the numerous- recorded cases of accidental leprosy inoculations. Failures in intentional inoculations in countries free from leprosy cannot be set against cases of inoculation through abrasions of the skin or when the leprosy poison is introduced into the blood by means of the vaccinators lancet.

Combined, however, with the virus of small-pox, syphilis, or other diseases, it seems to be easily transmissible into the system, and it is in this direction that future investigations should be pursued.—I am, dear sir, yours faithfully, GEORGE HOGGAN, M.B.

In page 74 of the "Report of the Royal College of Physicians on Leprosy," dated 1867, is the following important suggestion:—

"The question alluded to in the communications from Dr. Erasmus Wilson and Sir R. Martin (*vide* Appendix to Report) as to the transmission of leprosy disease by vaccination and wet-nursing, is one of special interest to Europeans resident in India and other tropical countries, and calls for searching examination."

The cases referred to are—Case 1, p. 235—*Elephantiasis tuberculosa*; duration of latent period, two years; total duration, five years; no pains; febrile attack, simulating rubeola; vaccinated from a native child:—

"A young gentleman, age 16, with fair hair and complexion, and somewhat more youthful in appearance than might be expected of his age, has been afflicted with the tubercular form of leprosy about five years. He was born in Ceylon, is the son of European parents, and one of six children, all of whom are healthy. His father and mother have always enjoyed good health, the father having resided in Ceylon for twenty years, the mother since her marriage. He was nursed by his mother, but vaccinated from a native child."—*College of Physicians' Report*.

Page 239, Case 9—*Elephantiasis anaesthetica* following vaccination (given in Dr. Erasmus Wilson's work, 1867, pp. 620-2):—

"A lady, aged 26, the wife of an officer in the Indian army, became affected with elephantiasis in 1861. She was born in Calcutta of European parents, and brought to England when two years old. She returned to India in 1853; was married in 1855; has been eight years married, and has now (1863) revisited England for medical treatment. In 1861, then being in Oudh, she, was vaccinated from a native child, and shortly after vaccination "a slight spot came on her cheek, and increased in size to the diameter of a shilling." It was hard to the touch, a little raised above the level of the surrounding skin, and of a dull red colour, without pain or tenderness. The swelling was painted with iodine, and afterwards blistered several times, and the blister kept open; but although

somewhat reduced in size, the prominence was not removed. About six months later dull red flat spots appeared, dispersed over the greater part of her body. Her hands and feet became swollen, and she had pains of some severity in her joints and feet."

The same author gives the following on p. 650 (p. 86 of the Leprosy Committee Report):--

"Dr. Bolton, of Mauritius, mentions the case of a boy of fourteen, afflicted with leprosy from the age of seven, the son of British parents, whose father ascribed the origin of the disease to vaccination. . . . Several medical men, who have had the opportunity of watching the disease closely, expressed their belief that leprosy may be conveyed to sound persons through the medium of the discharges of ulcers."

Referring to the series of papers which he reports, Dr. Erasmus Wilson says ("Royal College of Physicians' Report," 1867, p. 234) :—"Our cases also favour the suppositions of the existence of other modes of transmission (transmission by generation—supra), namely, by lactation, by vaccine inoculation, and by syphilitic inoculation. The first of these methods of contagion lies beyond the reach of remedy; the others are preventible."

In the December number of the *Nineteenth Century* for 1889, p. 929, Sir Morell Mackenzie, in an article entitled "The Dreadful Revival of Leprosy," says :—"There is, or was quite lately, a boy in a large public school, in whom there are the strongest grounds for suspecting the existence of leprosy in the early stage; the disease is supposed to have been communicated by vaccination in the West Indies. It is beyond question also that there are many other cases in this country at the present moment, which are carefully concealed from the knowledge of every one but the medical adviser. Nearly every skin specialist must be able to attest this fact."

Dr. Suzor, of Mauritius, stated in the *Progrès Medical*, No. 14, that "in one instance two children of healthy parents became lepers, apparently as the result of having been vaccinated with lymph taken from a child belonging to a leprous family," and he thought the cases furnished conclusive proof of the communicability of the disease by vaccination.

In the *British Medical Journal* for Nov. 29, 1890, there is given a tolerably full report of the discussion on "Vaccination Eruptions" at the annual meeting of the British Medical Association held in Birmingham.

The discussion was opened by Mr. Malcolm Morris, M.R.C.S. (Edin.), who presented a formidable classification of vaccinal eruptions, including constitutional diseases of the most serious character, amongst which he included leprosy.

Dr. A. M. Brown observes in his pamphlet on "Leprosy in its Contagio-Syphilitic and Vaccinal Aspects," 1888, pp. 12, 16, 17: "When we come to note a recent medical disclosure bearing on this point (inoculation of leprosy by vaccine virus) and which has been allowed to pass unheeded for the reason, I presume, that it tells against the Jennerian and Pasteurian theory and practice, the necessity for strictest caution will be obvious. Hypothesis and specific *bacilli* apart, the observations of Arning, and alas, of too many who do not care to confess it, prove that vaccination is capable of actually transmitting *lepra* from the leprous to the non-leprous. The fact is unmistakable, and our duty is to make mankind and the medical profession dearly comprehend what this implies. . . . The unanimity and persistency with which vaccination in markedly leprous countries is charged with propagating and disseminating the malady, the well confirmed coincidence of leprous centres with

vaccination centres, and the discovery of the specific *bacilli* in those leprously vaccinated, ought to satisfy all who are capable of weighing evidence, or of rational reflection, that controversy on the question must, and will, ere long, be silenced."

In a communication which I received from Dr. Brown, June, 1891, he refers to the communicability of leprosy by vaccination, and the attitude of the medical profession as a body towards the ever-increasing weight of evidence. "The fact of leprosy being communicable by inoculation is clearly shown by evidence to be beyond cavil or question. Medical men, seriously interested in their profession, who fail to see this are unfortunate, and their position must be charitably attributed to indifference to the whole question of leprosy, or a dread of the overthrow of some pathological doctrine to which they are practically pledged. The evidence of the fact that leprosy is communicable through vaccination is rapidly accumulating, and the force of its importance on the medical mind, as exhibited in its special journals, is anything but welcome. The fact of the exclusion of numerous well-known cases of invaccinated leprosy from the published papers of the Leprosy Investigation Committee, though most regrettable, is not surprising; the still ignoring of experimental data by inoculating bacillo grafters is quite as little so. It is certainly amazing to find that probably the chief factor in the dissemination of leprosy in the present day—Jennerian vaccination—should have been practically set aside by the Indian Commissioners. Considering the amount of conclusive evidence now before us, many, like myself, must have felt appalled to find that this was so. Still, we may feel perfectly assured that such a performance can no more score than the proverbial Hamlet-play where the leading role has been left out."

The *Hospital Gazette*, London, Oct. 1, 1890, contains the following, under the heading, "Leprosy and Vaccination":—"We know now that it is possible to transmit leprosy by inoculation, and it therefore behoves those who practise in countries where the disease is endemic to be very careful whence they take their vaccine. Leprosy is about as frightful a disease as any that poor man is exposed to, and beside it syphilis—the vaccinator's bugbear—sinks into comparative insignificance. A contemporary recalls the case of a native of the Sandwich Islands, who developed leprosy a year after vaccination, and seems disposed to raise the question as to whether the vaccination might not have been the means of conveying the infection."

Dr. Bechtinger, of Vienna, who has devoted thirty years to the study of leprosy in many countries, says:—"No scientific man will deny that leprosy, like all bacterial diseases, is inoculable;" and he attributes the present increase of leprosy to the vaccinator's lancet.

Dr. W. Munro says:—"I am decidedly of opinion that by careless vaccination, bloody matter being taken with the vaccine lymph, leprosy can and most certainly would be propagated. .... I decidedly consider that leprosy can be inoculated."—*Leprosy an Imperial Danger*, by Archdeacon Wright p. 72.

Referring to an alleged case of infection by means of vaccination, the *British Medical Journal*, October 25, 1890, says:—"Remembering Arning's important observations of leprosy bacilli in vaccine lymph taken from a leper, it is not to be denied that such inoculation may be occasionally possible." Perhaps this admission from the editor of a journal which has defended vaccination against all attacks and organised a powerful medical opposition against any modification of a most stringent and cruel law goes as far as could be expected. Mr. Ernest Hart has not thought it expedient, however, to submit the extraordinary statements in his "Truth Concerning Vaccination"

to the test of cross-examination before the Royal Commission.

"Chambers' Encyclopedia," 1891, vol. 6, page 585, says :—" Evidence has recently been adduced which seems to show that it (leprosy) may be communicated by vaccination from a leprosy child."

In the appendix to his work on "Leprosy," p. 274, Dr. George Thin has the following :—"In the 'Monats. f. Prakt. Derm.,' Vol. XIII., No. 1, the report of a case is extracted from the *Occidental Medical Times*, of a leper who was vaccinated in 1878, who a year afterwards became leprosy, and who at present has a large anaesthetic scar at the point of vaccination. This man had healthy parents, and of two brothers and three sisters, one had died of tubercular leprosy. He is twenty-five years of age, and has mixed with lepers all his life."

In his work of 280 pages on "Leprosy" (Percival & Co., .1891), Dr. Thin devotes four pages to "Vaccination in Relation to Leprosy," and refers to Dr. Gairdner's cases. "The presumption," says Dr. Thin, 'that the disease was conveyed to the second and third child in the vaccine lymph is strong, but the case is by no means proved.' Amongst others, Dr. Thin, p. 194, quotes the following from Dr. Daubler "Monats. f. Prakt. Derm.," Vol. VIII., p. 123), who 'relates two cases of leprosy at Robben Island, in South Africa, in which he believes it to be proven that the disease was conveyed by vaccination' :—

"The first case is that of a woman, H., thirty-six years old, married, and the mother of a healthy child of twelve. There was no leprosy in the family. Several years previously, on account of an epidemic of small-pox, she was re-vaccinated, the first vaccination having been effected when she was two years old. In the course of the two months following the re-vaccination, she experienced attacks of shivering and fever three to five times weekly, was frequently thirsty, but passed less urine than usual, and whilst the points of vaccination swelled and became brown, she grew dull and weak. She had been vaccinated on both arms over the insertion of the deltoid. No pustules formed, and when she saw the medical man two months after the vaccination, the parts were swollen. The swelling had begun three days after the insertion of the lymph, and reached its greatest extent eight days afterwards. At this time the parts became yellowish, and within fourteen days of the vaccination on each point there was a raised, discoloured skin, of a yellowish brown colour, and as large as a two-shilling piece. These swellings gradually increased, and, ten weeks after the vaccination, her physician found the skin of the arms and upper third of the forearm brown in colour and uneven. The brown spots extended lower down, when, after three more weeks, in which she was feverish and ill, the spots became swollen and smaller, but the skin did not resume its normal colour. In the fourteenth week after vaccination she had a violent rigor, repeated twice within the following week. Subsequent attacks of fever were at longer intervals, and not so severe. At and shortly after the severe rickors, brownish spots developed on the cheeks and forehead. Eighteen weeks after the vaccination leprosy tubercles developed on the brow and on the cheeks. Two years later the woman was sent to the leper asylum at Robben Island, where she was seen and photographed by Dr. Daubler, tubercular leprosy being fully developed.

"The other case was that of a girl, fifteen years old, who was re-vaccinated at the same time and by the same medical man who vaccinated the woman H. The same local appearances followed on the arms as those described in the woman.

"After two months there were maculae on the forehead and cheeks, and after three months more, leprosy tubercles on the forehead. When seen and photographed by Dr. Daubler, the disease had lasted three and a-half years. Inquiries made at the homes of both patients, and from the medical

man who vaccinated them, showed that the person from whom the lymph was taken had died of tubercular leprosy several months before, other members of the family being leprosy, . . . facts of which the practitioner was ignorant when he took the lymph with which he vaccinated the patients."

These cases have been carefully investigated, and their description in the "Monats. f. Prakt. Derm." is accompanied by photographs. On my visit to Robben Island, February 10th, 1892, I met Dr. P. Travers Stubbs, who is much interested in the leprosy question, and believes that the disease is inoculable and spread by vaccination. Dr. Stubbs was at that time acting as *locum tenens* for one of the medical officers at the Leper Settlement, and has since been kind enough to furnish me with the following further details concerning these remarkable cases of invaccinated leprosy :—

NOTES OF THE TWO CASES OF LEPROSY ON ROBBEN ISLAND,  
AS REPORTED BY DR. DAUBLER.

—————  
*Elizabeth Hart, aged 39.*

European. Born at Cape Town.

Date of admission—26th April, 1887.

Race—English. Came from Wynberg (*i.e.*, eight miles from Cape Town).

Disease—Tubercular leprosy.

When contracted—When small-pox was prevalent at the Cape in 1885.

Where—

Hereditary—No.

Complications—

*Particulars as taken from the Case-book, Medical Department, Robben Island.*

The patient says :—"I was quite healthy until vaccinated at Wynberg by Dr. Silke in 1885. I was living with my husband in good circumstances, and had never come in contact with leprosy. About a year after vaccination a large livid patch began to appear round the vaccination mark. A few months later a creeping sensation on both sides of the face, worse on the left. Soon after this the face gradually began to, swell."

*Present Condition, May 3rd, 1890.*

Tubercular condition of both sides of face and ears—the left more so; loss of eyebrows; some loss of hair. Tongue a little affected in front. Both hands rather swelled and tender. Infiltration of forearms and upper arms up to shoulders. Legs same as arms. Ulceration about both ankles. There is no marked anaesthesia. No special indication at seat of vaccination on left arm, which, patient says, ran its usual course.

Has been under treatment about six months. First, iodides; gurjun about four months. The appearance of patient has much improved; also general health.

*February 10, 1891.*

Elizabeth Hart, aged 39, married 16 years. Occupation, housewife. One son born one year after marriage. No miscarriages. Menstruation irregular. Last unwell three years ago. Her husband is still living; also the son; both at work. Her father died—the result of an accident. Mother died of phthisis, aged 40. No sisters. Three brothers—one living, healthy; two dead—one of dropsy, other found dead.

She states she was healthy until one year after vaccination, when her attention was drawn to a peculiar lividness of her left arm around the vaccination scar, which is still visible, and skin around quite healthy. There is no infiltration around the scar, which is of ordinary size and clearly visible. She consulted a doctor about this lividness, and then she went to the new Somerset Hospital, and attended for some six months, taking medicine all the time. She had

pains in her legs at this time. She had no rash over her body. No sore throat, tongue, etc. Her nose, fingers, and hands became affected two years ago, 1888. Her hair began to fall out before she went to the hospital; eyelashes before she was admitted to the Robben Island Leper Asylum.

At present she has very little hair—no eyelashes and eyebrows. Her nose is very much disfigured by old ulceration. Tongue— nothing abnormal seen. No affection of her shoulder or elbow joints. Both her wrist joints are swollen, painful, and infiltrated.

There are small ulcerated spots about the size of a threepenny—piece, which are beginning to discharge; are not deep, nor are the edges undermined. The palms of both hands were sound. The last phalanges of all the fingers ‘and thumbs were destroyed, and the finger nails are cracked and shrivelled. No anaesthesia of fingers. Her legs from her knees downwards were in a similar condition. No periostitis of tibia. No, enlargement of glands (occipital).

In my opinion, this woman has leprosy, plus evidences of syphilis, but I am unable to find out when the latter was contracted or how.

P.B. TRAVERS STUBBS.

---

*Ellen Wangell, 16 years.*

English.

Admitted November 1, 1889, from Old Somerset Hospital.

Disease—Tuberculated leprosy.

Has lived in Cape Town and Clairmont all her life.

Contracted about 1885 at Clairmont.

Parents and brother healthy.

Tertiary rupial sores.

Patient says :—" I was quite healthy till re-vaccinated at Clairmont in 1885 by Dr. Murray. I was living with my mother. We were in pretty comfortable circumstances. We were living by, ourselves. I had never seen anyone with leprosy to my knowledge. I first noticed my nose begin to swell, and afterwards the rest of my face. I was taken to New Somerset Hospital in July, 1889, for what, Dr. Eaton said, was leprosy in my legs. Afterwards to the Old Somerset Hospital ; then brought here." ‘

*Present Condition, 9th May, 1890.*

Symmetrical enlargement of face; right ear more than left; left cheek, large scar of ulceration, which broke out soon after admission, but soon healed; some infiltration and thickening of tongue; fingers of right hand numb, another contracted; left hand comparatively free; some remains of infiltration in forearms, but this has much diminished; some infiltration about the ankles, which are at present suppurating. Infiltration extends nearly as far as knees. Body free; no special indication at seat of vaccination. Has been under treatment since admission. First, iodide and oil gurgun from date of admission, then gurgun alone. General health much improved. Condition of arms and legs much improved.

*As copied from case-book.*

P.B. TRAVERS STUBBS.

Dr. S. P. Impey, Medical Superintendent, Leper Settlement, Robben Island, South Africa, says :—" I wish to draw your attention to one very serious matter in respect to the spread of leprosy. It is contagious, and can be communicated from one patient to another by inoculation. In South Africa the reprehensible practice of arm-to-arm vaccination is carried on to an enormous extent. I have always held very strong opinions on this subject, and consider that many loathsome diseases are spread by means of the vaccinator's lancet. No medical man would take lymph from a patient in whom the disease is visible; ‘but in how many of these cases is it not latent? For years I have not

vaccinated except with animal lymph, and, think that some means should be adopted to stop the dangerous practice of vaccinating with humanised lymph; rather allow the patients to have small-pox, where there is a chance of recovery, than force leprosy upon them. It is a noteworthy fact that, since the introduction of the art of vaccination, leprosy is spreading with rapidity. I am a firm believer in the efficacy of vaccine, but consider the arm-to-arm vaccination is a most dangerous practice and one which has led to untold misery."—*Extract from Special Report on Leprosy, from Robben Island, for 1891, in Reports presented to both Houses of Parliament by command of His Excellency the Governor of the Cape of Good Hope, Capetown.*

Dr. Alexander Abercromby, of Cape Colony, writing from Capetown, April 20th, 1892, says that, if a drop of blood gets mixed with the vaccine lymph in the operation of vaccination, then the disease (leprosy) may be transmitted in this way, but he is of opinion that, without the blood, there is no danger. So far as the transference of syphilis and other deadly diseases is concerned, we know that this can be done with lymph of unimpeachable quality and without admixture of blood. In the January (1890) number of the "Archives of Surgery" Mr. Jonathan Hutchinson records several fatal cases, and another fatal case in July, 1890 (p. 23), all following vaccination. Mr. Hutchinson observes :— " There is not the least reason to suspect any want of care in the vaccination or defect in the lymph." On July 6th, 1881, Dr. Robert Cory, Superintendent of the Calf Lymph Department, London, succeeded experimentally in transferring syphilis to himself with lymph free from admixture of blood.

Rev. Canon Baker, formerly. Chaplain at the Leper Colony, Robben Island, writes to me, June 1st, 1892:—"I have not met with any medical man who has been any considerable time in this Colony who affirmed that vaccination, from arm to arm especially, was not attended with danger in the direction of your inquiry."

Dr. P. Hellat, the leader of the movement for stamping out leprosy in the Baltic Provinces, Russia, writes to me from St. Petersburg, May 1st, 1892, that at the time when he published the result of his investigations into the spread of leprosy, he had omitted to take into account "what might be ascribed to the spread of vaccination." The matter "was of great importance, and one that cannot be considered an open question." Dr. Hellat says that in Russia no one is admitted to school without the marks of vaccination. Re-vaccination is resorted to on the occurrence of serious small - pox epidemics.

## CHAPTER 5: LEPROSY AND RE-VACCINATION

THOSE who have studied the literature relating to the remarkable recrudescence of leprosy in tropical countries, or made personal inquiries where the disease is prevalent, must have been struck with the number of cases of persons whose family history has been shown to have been entirely free from all taint of this disease. In some instances the afflicted persons state they have never seen or come in contact with a leper. It is usual amongst the well-to-do classes to keep the malady a profound secret as long as possible; but a time comes when the disease discloses itself to the family physician or casual observer, and the friends are then led to inquire as to how the disease originated. Close inquiries reveal the fact that with them it is not hereditary, and the afflicted member is free from sore or abrasion of the skin. How, then, could the dreadful leprosy poison have been contracted? The doctor then suggests the vague and much misunderstood word "contagion," or malaria, or diet, all of which theories are now rejected by leading leprosy authorities. The unfortunate patient remembers that during a smallpox scare by the advice of his doctor he was re-vaccinated. Inquiries are made as to the vaccinator, and it is not seldom discovered that the vaccine virus was taken from a subject in which the leprosy taint—then not discernible—has since fully disclosed the ulcerations of unmistakable tubercular leprosy. It will be said that this is a hypothetical case. From much conversation with intelligent observers in many countries where this disease prevails, including both English and native medical practitioners, public vaccinators, and army surgeons, I am convinced that this is by no means an uncommon experience. So strong is the belief in the existence of this danger, that soldiers in our tropical colonies, when subjected to vaccination, often resort to the practice of squeezing out the virus, if they can do so without observation, and use carbonate of soda, borax, and other disinfectants in order to neutralise the effects of the poison. This dread of vaccination is due to the knowledge amongst our troops, often born of bitter experience, that vaccination is not seldom the factor of disgusting and intractable diseases, the fatal cases of which are invariably registered under secondary causes, without disclosing the originating source of the malady. The leprosy taint is more common in the army than is generally supposed. In my various inquiries I have heard of several soldiers being so affected. In his work on "Leprosy" (p. 71), Dr. Munro refers to the case reported by Dr. Liveing of a private soldier, a leper, in British India, who had several brothers and sisters all older than himself and all healthy. The same authority cites "the case of an officer mentioned in the Report of the College of Physicians, p. 241. Landre speaks of Dutch private soldiers being affected, while ladies never are, they never being exposed to contagion" (p. 45). If Dr. Munro had explained that ladies are not exposed to compulsory re-vaccination, he would have touched the solution of one source of infection. Dr. Sutherland, of Patna, says :—" When serving with the native army, I found repeatedly that men who had in early life the character which I regard as a proof of the existence of a leprosy taint, which I have already described, frequently had to be invalided in after years for leprosy, and subsequent observation and inquiry have led me to the conclusion that the opinion I have formed regarding what I have named a leprosy taint was correct, and that this condition precedes the appearance of the disease in its aggravated form; and I think I am warranted in concluding, from the data given above, that this leprosy taint exists in one out of every ten of the adult rural population of this district. In stating this, I am aware that my views will probably astonish persons who have not given the subject the attention I have."—*Royal College of Physicians Report, p. 188.*

In a note, entitled, "Leprosy in Livonia," the *British Medical Journal* of August 20, 1887, p. 423, says:—" The disease (leprosy) was introduced by a discharged soldier from Southern Russia." The

same journal, in its issue of October 22, 1887, in a note on "The Spread of Leprosy," quotes M. Besnier, a member of the French Academy of Medicine, to the effect that, since the extension of the French Colonial possessions, soldiers, sailors, and missionaries, have fallen victims to leprosy in large numbers. The *British Medical Journal*, January 12, 1889, p. 93, in an article entitled "Transmission of Leprosy," mentions several cases of leprosy, including two young soldiers who became lepers. And the number for March 23, 1889, pp. 668-9, publishes the details of a case of mixed leprosy—tubercular and macular—reported by Dr. O. Carroll to the Royal Academy of Medicine in Ireland. The patient was an army pensioner, who had served in India and the Cape, "but he had not been, so far as he is aware, in contact with any leprosy person." Again, on April 13, 1889, the same journal publishes a letter on "Leprosy in the United Kingdom," in which the writer says :—"T. H., after a service of twenty-two years in India under the East India Company, returned home, and soon became a victim to tubercular leprosy." Another case of a soldier, formerly in India, who is now a leper in the wards of a large general hospital, is mentioned by Mr. C. S. Loch in the *British Medical Journal*, July 13, 1889. And in its issue of December 21, 1889, the same journal gives the fatal experience of this re-vaccinated part of the population, observing, on the authority of Dr. Olavide, of Madrid, that in the (leprosy) infected provinces of Spain—Jaen, Cordova, and Guadalura—"most of the sufferers are missionaries or soldiers."

Madhub Chunder Ghose, Medical Officer in charge of the Leper Asylum, Calcutta, in a communication to the Hon. H. Beverley, dated Calcutta, 27th August, 1889, says :—" It is well known that a distinguished officer of the Indian Medical Service became affected by leprosy during his residence in India."

These cases are too numerous to be explained by the theory of coincidence, and similar instances can be heard of by inquiry in every country where leprosy is endemic. In none of the foregoing instances does it appear that any inquiries were made as to re-vaccination being a possible source of the infection. No doubt the medical practitioners had their private opinions as to the causation of the cases examined, which, however, they have carefully withheld. In one of the cases a press reporter remarked on the reticence of the doctor, who, he said, "absolutely refused to give me any details beyond those which may be said to be available to any member of the public." He admitted, however, that the case was undoubtedly one of leprosy.

Soldiers, it should be observed, are picked men, living amidst healthy surroundings under superior hygienic conditions. They do not associate with lepers, but, on the contrary, carefully shun them. Nor can the disease in the instances I have cited be due to heredity. Re-vaccinated soldiers appear to be more liable to the disease than the European residents in countries where the disease prevails. However much opinions may differ as to other sources of causation, all authorities admit that leprosy is an inoculable disease and communicable by vaccination. Is it not probable, therefore, that the cases I have quoted are due to contamination at the point of the lancet in re-vaccination? Since the terrible disaster at Algiers in December, 1880, when 58 soldiers of the 4th Regiment of Zouaves were syphilitised by re-vaccination from a Spanish child "of remarkably healthy appearance," I have made it a practice in all tropical countries which I have visited to interview soldiers and question them on the results of vaccination in the army. I could fill a long chapter of this book with details of disastrous consequences where soldiers; have been invalided at hospital with tumours, abscesses, and sometimes intractable maladies directly due to vaccination. Some have had their arms amputated and been discharged from the service, and others have sustained lifelong injuries. It must be noted that soldiers, when quartered in tropical countries where leprosy and syphilis prevail, are

often obliged to submit to several re-vaccinations. In Capetown, a soldier belonging to the North Stafford Regiment, on duty near Government House, informed me (February 9th, 1892) that since he joined the army he had been vaccinated thirteen times. He was badly pitted with small-pox.

In an article on "Leprosy in the Baltic Provinces," by Dr. P. Hellat, dated St. Petersburg, in the *Journal of the Leprosy Investigation Committee*, December, 1891, the writer cites the following case which he considers speaks "very strongly for infection":—"A young man coming from a leprosy-free district is called for military service, through which he comes to the South of the Empire to a leprosy village, gets ill after two years with *lepra tuberosa*, returns home, lives with his mother, who after two years is attacked with *lepra anaesthetica*." Dr. Hellat omits here to note that the first danger to which the recruit is subjected on joining the army is that of being inoculated with contaminated virus in the process of vaccination. All other risks, unless he has sores or wounds on his body (very improbable in a recruit who has recently undergone medical examination), are comparatively infinitesimal. For the serious risks incurred by re-vaccination our troops receive no compensating advantage in the way of immunity from small-pox, either of a sporadic or epidemic nature. According to the army medical reports, we find that among troops in Egypt in 1889 there were 42 cases and 6 deaths from small-pox. In the Bengal army in 1889 there were 71 cases and 8 deaths. In the Bombay contingent there were 49 cases and 3 deaths; and among the troops in Madras 32 cases and 6 deaths. In all, there were, in 1889, among this picked body of healthy re-vaccinated men, 202 cases and 23 deaths. How many cases of erysipelas, eczema syphilis, tuberculosis, and leprosy were due to re-vaccination is not stated, but we know that after every general vaccination order, a number of soldiers are disabled for a time, some more or less seriously. I produced evidence before the Royal Commission on Vaccination (Vol. III., p. 116) that in 1882 the Federal Government of Switzerland, owing to re-vaccination disasters, rescinded the regulation in the army, and in 1883 M. Weitzel, the Minister, of War for Holland, for similar reasons, issued an order to the effect that re-vaccination was no longer obligatory in the army of that country.

[Index](#)

## CHAPTER 6: OTHER ALLEGED CAUSES OF LEPROSY

I CAN only refer very briefly to causes of leprosy other than those detailed in previous chapters. Next in importance to that of contagion is the question of heredity. The theory of heredity, as a factor in the propagation of leprosy, is rejected by leading authorities such as Hansen, Hjort, and Arning, and by many writers it is not even mentioned. Dr. Arning, while failing to discover evidence that the disease is congenital, is of opinion that a certain weakness to resist its attacks may be transmitted.

Dr. G. Armour Hansen, who discovered the *bacillus leproe* in 1873, has devoted much attention and research to the question of heredity, and failed to find a decided and indisputable proof of its influence in the United States, though hundreds of thousands of immigrants had leprous parents in Norway. — *Minnesota State Board of Health Report, 1889-90, p. 43.*

Dr. W. Munro says :—" I do not deny that leprosy may be occasionally hereditary, but only say that it has never been proved to be so."

Dealing with the subject of the alarming increase of leprosy in Hawaii, the victims amongst a clean nation multiplying faster as the years roll on, until it has invaded nearly every district in the Archipelago, Dr. W. Hillebrand observes :—" And, mark well, in all this, hereditary taint, from the nature of the case, has no share, or, if any, only a most subordinate one."—*Leprosy a Communicable Disease, by Dr. Macnamara, p. 59.*

The *Lancet*, March 3 1st, 1883, p. 555, observes "Morehead, as well as Lewis and Cunningham at Almora, came to the conclusion that heredity could not be a great factor in the increase of leprosy in a district, inasmuch as lepers have comparatively small families, who suffer a high rate of mortality, and therefore the survivors are only just numerous enough to replace their defunct progenitors."

Dr. George L. Fitch, in his report addressed to the president and members of the Board of Health, Honolulu, in 1884, says:—"Heredity plays but little figure in the spread of the disease, because we find that, after sending more than 2800 lepers, during a period of eighteen years, to Kalawao Leper Settlement, there are only twenty-six children alive, and only two of these children are lepers."—*Appendix to Report on Leprosy in Hawaii, 1886, p. 31.*

In a note to the Secretary of the State Board of Health,, Minnesota, U.S., December, 1888, Dr. Christian Gronvold observes:—" Our experience in the North-West has made it probable that the disease is not hereditary. Not a single case has been discovered, after forty years of immigration, where a child, born in these States of leprous parents, has inherited the disease."

The same authority concludes an article on "Leprosy in Minnesota" as follows:—" I cannot here relate all my observations in detail. I will only tell what I have found in regard to the occurrence, or rather the disappearance, of *lepra* in America (N.W. States). Of about 160 lepers who have immigrated into the three States named (Wisconsin, Iowa, Minnesota), thirteen are alive, whom I have seen myself, and perhaps three or four more. All the others are dead. Of all the descendants of lepers (and that includes the great-grandchildren of some of them), not a single one has become leprous. This is, in short, the result of my investigations."—*Lancet, March 26, 1892.*

*Report of the Select Committee on the Spread of Leprosy, Cape of Good Hope, July 15, 1889. Minutes of Evidence:--*

The Hon. Dr. Atherstone, M.L.C., who has practised in the Colony fifty years, chiefly in Graham's Town, where he was District Surgeon for twenty-six years, and who has always taken a great interest in the subject, said, in answer to Q. 352 concerning heredity, that "it is the constitutional diathesis, or cachexia, which, I consider, is inherited; not the dormant germs rendering the individual less able to resist its attacks and subsequent reproduction."

In an article on the "Cause of Leprosy," by Sir William Moore, K.C.I.E., Hon. Physician to the Queen, late Surgeon-General with the Government of Bombay, the author says :—"We are told that leprosy is caused by eating fish, and, therefore, cannot possibly be syphilis. Now, I lived and worked many years among the inhabitants of the semi-desert districts of Western India, who never see fish. The sea is hundreds of miles away, and there are no lakes or rivers. Even dried fish did not penetrate into those remote districts. Fish was practically unknown as an article of diet. Yet there is a considerable amount of leprosy in those countries. At recent meetings of the Medical and Physical Society of Bombay, the subject of leprosy was exhaustively discussed, and the members were unanimous in discrediting fish as a cause of leprosy. The members, being both native and European practitioners, private and in the public services, who are constantly seeing leprosy, are perhaps better qualified than any body of men to give an opinion on this matter. In the districts of Western India above referred to, salt is made from the earth at most villages. The people have as much salt as they want. Yet leprosy has been attributed to an absence of salt. It has always been ascribed to a vegetable diet, to new rice, and to diseased grain. But the kind of food does not appear to influence the disease further than, like insanitary conditions, insufficient food, and food deficient in required elements, that it induces a state of constitution rendering the subject more liable to almost any malady. Again, it has been advanced that leprosy is not, like syphilis, contagious. But the communication of leprosy has certainly been proved. Direct proof seems to have been afforded by the experiment on the criminal at Honolulu. In the case of Keanu, *bacilli* were found to have multiplied at the seat of inoculation.....Leprosy very frequently commences on the extremities. Natives in India do not generally wear shoes and stockings; their feet are thus very liable to become abraded or wounded; a leper's slippers may easily be taken by mistake, and conveyance of discharge is, I believe, thus frequently accomplished."

In an article in the Fourth Annual Report of the State Board of Health for Massachusetts, U.S., by Dr. Samuel W. Abbott, reprinted in the Hawaiian "Report on Leprosy in Foreign Countries," 1886, is the following, under the title of "Leprosy in its Relation to Public Health ":—"The questions which render leprosy a matter of special interest, as affecting public health, are those of etiology, modes of propagation, and the question of contagion.

"The causes of leprosy have been sought for in the peculiarities of climate, soil, diet, and habits of life. As regards climate and soil, the wide geographical distribution of the disease would seem to preclude them as elements or factors of causation. Opinions differ much as to the question of diet. The eating of tainted fish has been strongly urged as a cause. Leprosy is found in a most aggravated form among fish-eating people, as in Norway and Crete, and, on the other hand, it also prevails in inland districts where fish is but little used.

"Doubtless an improper diet and bad hygienic surroundings aggravate the disease.

"All these causes acting together for centuries did not produce the disease in the Hawaiian Islands, nor was it known until some time after the islands were open to foreign trade and commerce with

other nations."

Mr. Jonathan Hutchinson says :—" The suspicion that vaccination has been the means of spreading the disease in the case of the Sandwich Islands has been entertained." The spread of leprosy, according to this distinguished surgeon, is due to eating fish, a theory which finds very few supporters amongst those who have studied the disease in leprosy countries. The Parsees are great consumers of fish, and leprosy amongst them is of rare occurrence. With regard to the fish theory, which has obtained currency owing to the eminence of its author, I may observe that in my travels in leprosy countries I have hardly met with a single advocate of it, and those most practically conversant with the disease at leper institutions consider it both far-fetched and irrational. In an article on "Leprosy in Kashmir," by Dr. A. Mitra, Chief Medical Officer in that country, in the *American Journal of Medical Sciences*, Philadelphia, pp. 22 and 23, the author says :—"As to Hutchinson's fish theory, the Goojurs do not get fish. Since this theory first came to my notice in the pages of the *Lancet* I have always asked lepers if they have been fish-eating, and in the large majority of instances the reply was in the negative. The theory is untenable in India, where we do not find the disease more prevalent among fish-eating people than among abstainers from such food, as *vaisnabs*. The Kashmiris, among whom leprosy is rare, eat fish, fresh, dried, and salted. In India European sportsmen, planters, etc., use largely preserved fish, but there are no facts to show that fish-eating ever produced leprosy, among them. High-class Hindu widows are strictly prohibited from taking fish, but I have seen several cases of leprosy among them. But the fact that the leprosy is common among Goojurs completely disproves the fish theory." In "Notes on Leprosy in Norway," Dr. Hercules MacDonnell observes :—" Nowhere did I perceive that any credence was attached to the fish-origin theory. Dr. Kaurin's writings on this special subject are widely known abroad."—*Lancet*, August 31, 1889.

Dr. C. N. Macnamara says:—"Among the Norwegians putrid and dried fish are said to give rise to leprosy; others fancy that rice prepared in a particular way is at the root of the evil. We may be sure that the theory of bad and salted food being a cause of leprosy does not apply to many parts of India, for the natives, as a rule, do not eat salted food, and certainly are not in the habit of consuming putrid fish."— *Leprosy a Communicable Disease*, p. 48.

In a paper read before the New Brunswick Medical Society, July, 1889, by Dr. Murray MacLaren, M.R.C.S., on "Leprosy in New Brunswick," Mr. Jonathan Hutchinson's Fish and Food theory is dealt with. After quoting Mr. Hutchinson, the writer says:—" This view is not at all borne out by what can be observed, in our own affected district, which is only 45 miles in length, and of the 82 cases already mentioned, 58 have arisen in the parish of Tracadie alone, which has been the headquarters of the disease, while the remainder come from the other parishes: Niguac, 3; Pokemonde, 9; Shippegan, 6; Caraquette, 6. It does not seem possible that this district, and especially Tracadie, should have food in any way different from a large part of the extensive northern and eastern coast, which is quite similar to the leprosy district in soil, climate, food, including fish, and inhabited by a similar race of people' with the same manners of life. Besides this, the fact that no case is known to have occurred among the Indians dwelling within the affected area helps to disprove this theory."— *Maritime Medical News*, July, 1890, p. 50.

Dr. Julius Goldschmidt, in a communication on "The Madeira Leprosy," says :—" Those districts where mostly fish is consumed, and sometimes in an unhealthy state (coast villages), are freer from the disease than in other parts of the island."—*Journal of the Leprosy Investigation Committee*, No.

4, December 1891.

Dr. Max Sandreczki, Director of the Children's Hospital, Jerusalem, says :—"Leprosy in Palestine is developed by insanitary conditions, of which I will enumerate the chief: impure air; the tainted exhalations which prevail in the villages and unhealthy habitations of the fellaheen; the water supply, often stagnant and deteriorated; the oil and fat (used for food), rancid, or salted beyond measure; olives and cheese in a state of decomposition; meat rotten, or coming from animals diseased, or worse still. Add to all this extreme uncleanliness, the utter absence of skin action, and then one 'may easily explain derangements in the tissues of the skin, in the lymphatic and ganglionic systems, and, in a word, complete disorder of all the nutritive functions.'"— *The Lancet*, August 31st, 1889. -

The Hon., David Dayton, President of the Board of Health, Honolulu, says :—" I am not of the opinion that leprosy 'is always hereditary, so many cases proving to the contrary. By referring to tables in Mr. C. B. Reynolds' reports, it will be seen that a large proportion of the girls in the Kapeolani Home were children of leprous parents without becoming diseased themselves.'"—*Report, Board of Health, Honolulu, 1892, p. 42*

**CHAPTER 7: INADEQUACY OF MEDICAL THEORIES OF CAUSATION.**

IN conversation with lepra specialists in countries where leprosy is endemic, nothing is more common than the admission that the alleged exciting causes of the disease, such as contagion, heredity, or malaria, are quite inadequate to account for the rapid progress of leprosy over a wide area in recent years. Dr. Alzevedo Lima, chief medical officer of the hospital, Rio de Janeiro, observes:—" Even at the present time, in spite of the progress in sanitation, and the more favourable conditions of life among the Brazilians, there are still centres of contagion, whence we receive patients for the hospital in larger numbers than from other places. Throughout the whole country, in fact, this terrible disease is still rife. This being so, if we consider the differences in climate, the food, the habits of life, the sanitary conditions, etc., of the various regions of this vast country, it is difficult to believe that the etiological factors still given as determining causes of the disease can be in themselves a sufficient explanation. At the most, they can only act as favouring conditions, and explain the greater or less frequency of the malady, its predilection for certain places or for certain classes of the people."—*Journal of the Leprosy Investigation Committee, December 1891, p24*

Alluding to this subject, Dr. Alzevedo Lima, writing to me from Rio de Janeiro, May 20th, 1892, says :—"None of the ordinary etiological factors explains satisfactorily the spread of leprosy in this country, where one finds focuses in places altogether different in the climate-telluric conditions, and where, besides the sick people who live in bad conditions of feeding, etc., there are many others who live in luxury and belong and dwell amongst the best society. The inheritance also does not account for it in a very large scale. About this last point I always take very great care to inquire of the sick people who are taken to the Hospital dos Lazaros, where we have had 242 patients during these fourteen years past that it has been under my direction. . . ." Referring to the inoculation of leprosy by means of vaccine virus, Dr. Lima says :—" I believe in the possibility of the fact, not seldom, and I suspect this may have been. the cause of the spread of the disease amongst our people, specially in the country, where, with the absence of a doctor, the vaccination is done by someone not professional, and therefore incapable of distinguishing whether they are using the vaccine taken from a pure source or not. Moreover, to those who know how long it takes for the incubation of leprosy, and how difficult it is to diagnose it in its initial stages and in several of its forms and varieties, it is easy to know that even the professional man may have given rise to the spread of the disease in that way.

"Amongst 62 persons affected with this disease now in treatment in the Hospital dos Lazaros, in this city, 26 were vaccinated, being 8 in Rio de Janeiro, 8 in the State of St. Paul, 6 in the State of Minas, and 2 in Portugal; the remaining 36 have never been vaccinated. Abstracting the 10 of Rio de Janeiro, where the vaccination is gone through with every care and the vaccine taken directly from the cow, we have 8 come from St. Paul, either from the. country or from small villages where the vaccination is performed, as a rule, by people not competent, and with the lymph taken at random from any person amongst their own people, where leprosy prevails endemically. In any of these States, in the absence of a physician, any clever man undertakes the duty of vaccinating amongst the people, and this may very likely be one way of propagating the leprosy."

Dr. Alexander Abercromby, of Cape Colony, referring to the causation of leprosy, says :—"It is evidently dependent on some vitiated state of the blood, and that acquired in many instances, as has been clearly ascertained, by hereditary predisposition. In many cases, however, it occurs where no such predisposition can be traced, and in persons whose parents were perfectly healthy, and who

evinced during their lives no trace of the disease whatever. In these cases we are led, therefore, to seek for other causes to account for it."— *Thesis on Tubercular Leprosy*, p. 15.

In the Report on the Annual Returns of the Civic Hospitals and Dispensaries in Madras for 1888, p. 14, under the head of Vizagapatam, Surgeon-Major Sturmer says that leprosy is on the increase in the district, and observes :—" This year I have seen many fresh cases of leprosy in adults as well as in children, in whom no hereditary taint could be traced. They evidently had contracted the disease from some outside source, for in each case it was ascertained that no other member of the family was affected."

The "Report on Leprosy in New South Wales," May 13th, 1891, forcibly exhibits the unsatisfactory condition of modern inquiry into the etiology of the disease. No mention is made as to the chief factor of causation.

The Secretary of the Board of Health in New South Wales, Mr. Henry Sager, observes :—" The detailed history of the cases given in Appendix C., though of very considerable interest, does not furnish any grounds for definite conclusions as to the causation and spread of the disease. There are no data on which to advance a view of spontaneous, climatic, dietetic, mal-hygienic, or hereditary origin of the malady, and nothing of scientific accuracy to be adduced as to contagion, though the evidence in several cases points more or less strongly in this direction."—*Journal of the Leprosy Investigation Committee, No.4, December, 1891, p.50.*

The Report of the Inspector of Asylums for 1890, presented to both Houses of Parliament, Cape of Good Hope, under the head of "Female Leper Wards," p. 32, says :—" The fact which stands out most prominently in making these records is the absence of any history of direct contagion, or even with contact of a known source of the disease in almost all of the cases which have been investigated."

When, about a year later, Dr. S. P. Impey, the present medical superintendent of the asylum, Robben Island, unable to account for the spread of leprosy by popular medical theories, began a more careful and exhaustive investigation than his predecessors had ventured upon, and included vaccination, hitherto ignored, as one of the possible factors, he had no difficulty in tracing a number of cases directly to this source. Dr. Impey felt it his duty to warn the Government of this danger.

In concluding a second paper on "Notes on Acquired leprosy as observed in England," by Mr. Jonathan Hutchinson, in the *British Medical Journal*, July 6, 1889, this distinguished pathologist observes :—

"The twelve cases which I have quoted do not, I believe, comprise by any means all the examples of leprosy beginning in patients of British birth and descent which have come under my observation. They are all, however, of which I am able at present to find record in my note-books. One and the same criticism may be said to apply to all. They are the examples of the acquisition of a specific disease by healthy persons who had no inherited predisposition. In no single instance had the person so acquiring it been exposed to any degree of hardship, or deviated in any definite manner from the ordinary conditions of a cleanly and well-regulated life. In every case the acquisition of the disease had occurred in some country where it was known to be prevalent, the East and the West Indies being the chief localities. I submit—as, indeed, I have already suggested—that there are only two suppositions open to us by which to explain the *de novo* acquisition of such a disease in cases such

as these. The patients must either have received the specific contagion of leprosy on some part of the skin or mucous membrane, or they must have swallowed it in connection with food. Both these suppositions are possible. I may confess, however, that to my own mind one of them seems far more probable than the other. In no single instance had there been any known exposure to contagion. In no case had the patient associated with anyone suffering from leprosy, and in most instances the statement given was that they had but rarely seen lepers, and had certainly never come near them."

Amongst the possible sources of leprous contamination, Mr. Hutchinson, while inclining to what is known as "the fish theory," mentions "the perils of vaccination."

**CHAPTER 8: LEPROSY AND VACCINATION AT THE INTERNATIONAL HYGIENIC CONGRESS.**

IN the month of June, 1890, I presented before the Royal Commission on Vaccination certain facts tending to show the increase of leprosy in various countries which I had visited, and that this, increase was largely due to vaccination. In the following autumn I extended my inquiries to other countries, and discovered the same sinister results; and in the following April I published my conclusions in a pamphlet entitled "Leprosy and Vaccination," which has been widely circulated in the countries where the alleged cases of leprosy have occurred. But no attempt was made to reply to the allegations until August, 1891, when Dr. Phineas S. Abraham, the Secretary of the Leprosy Investigation Committee, read a paper on the subject before the International Congress of Hygiene and Demography in London. The following is the report of his address, from the *Lancet* of August 22, 1891 :—

*"On the Alleged Connection of Vaccination with Leprosy.*— Phineas S. Abraham, M.D., read a paper on this subject. Accepting the bacillary theory of leprosy, and believing that instances have occasionally been reasonably demonstrated of its communication from one infected person to another previously healthy, Dr. Abraham has sought for evidence as to every possible means of inoculation, vaccination included. In this paper he gave a short account of the principal inquiries bearing upon the subject, and discussed the facts which have been alleged to connect leprosy with vaccination. The statements, or supposed cases, of the following observers were among others alluded to :—Sir Erasmus Wilson, Sir R. Martin, Dr. Bakewell, Dr. Tilbury Fox, Dr. Castor, Dr. Ebdon, Mr. Malcolm Morris, Dr. Bemiss, Dr. Hildebrandt, Dr. Arning, Dr. Mouritz, Dr. Rake, Archdeacon Wright, Professor Gairdner, Dr. Black, Drs. Swift and Montgomery, Surgeon Brunt Dr. Piffard, Mr. Hillis, and Professor Leloir. It was pointed out that the question had been in the minds of inquirers for many years past, and that the supposed instances brought forward were comparatively few. Even the most suspicious cases, such as those adduced by Professor Gairdner, Mr. Hillis, and others, were open to the objection that there was nothing to show that the subjects had never been exposed to any other possible means of inoculation or contagion, had never been in contact with lepers, or had never had to do with food or anything else which might have become contaminated by lepers; in short, we could not be sure that, having been born, or having lived for some time in a leper land, they had not been exposed to other pathogenic conditions of the disease. Dr. Arning's and some of the other observations were quoted in full because they had been much twisted, and false deductions have been drawn from them. The evidence from Scandinavia was significant; vaccination had been compulsory in Norway for many years, and largely practised from arm to arm in the leprosy districts, and, as Dr. Hansen stated, no case of transferring leprosy therefrom had been hitherto known. Leprosy, indeed, was there steadily decreasing. In China, according to Dr. Manson, leprosy was common in the district where vaccination had been practised for the last sixty or seventy years; but, on the other hand, it was more common in districts where vaccination had only been recently introduced, and was practised to a very limited extent only. Some fresh facts and definite information on the subject were hoped for from Mr. William Tebb's late evidence before the Vaccination Commission. A great deal was, of course, made of the observations of Professor Gairdner, Dr. Arning, Dr. Castor, Mr. Hillis, and of some of the others alluded to above. One of them held the view that the spread of leprosy might be due to *syphilitic* vaccine lymph, and another had written a pamphlet on the subject which was full of inaccuracies. In point of fact, although *a priori* the possibility of an occasional accidental inoculation of the disease

by vaccination might be admitted, up to the present time no absolutely clear and incontrovertible evidence connecting vaccination with leprosy had been forthcoming; and, in Dr. Abraham's opinion, anyone who said that vaccination was to any extent responsible for the spread of leprosy talked arrant nonsense. Nevertheless, from what was known concerning the introduction of bacillary diseases in man and animals, it certainly behoved medical men to be extremely careful in the selection of their lymph for vaccination; and in a country where leprosy was rife it seemed to him that it would be advisable to exercise particular caution, and, if possible, avoid, as was now being done in Hawaii, an indiscriminate arm-to-arm vaccination among the natives. The question of the possibility of transmitting leprosy bacilli by vaccine is receiving attention on the part of the Indian Leprosy Commission, and a paper on the subject by Drs. Bevan Rake and Buckmaster will appear in the next number of the *Leprosy Journal*"

In answer to this statement I sent the following to the *Lancet*:—

### LEPROSY AND VACCINATION.

(To the Editor of the *Lancet*.)

SIR,—Dr. P. Abraham's address before the recent International Congress of Hygiene and Demography on the alleged connection of vaccination with leprosy, reported in the *Lancet* of 22nd August, is hardly calculated to allay public anxiety in our tropical colonies where the disease is endemic. As he has referred to the evidence which I gave on this subject before the Royal Commission, I shall be glad if you will kindly allow me a short space for explanation. Dr. Abraham has furnished a tolerably large list of authorities who have either pointed out this particular danger or supplied particulars of cases where leprosy has in their opinion been invaccinated, but he adds that these cases are comparatively few. Allow me to observe that Dr. Abraham has omitted to mention that, of the distinguished medical witnesses, some have adduced several cases of invaccinated leprosy, and others refer to a "prolific," "serious," "alarming" increase of leprosy due to vaccination. Some of the cases are introduced with reluctance by practitioners, who know the damaging effect of these allegations upon a prescription lauded as "the greatest discovery in the history of medicine." Dr. Abraham quotes Dr. Hansen as stating that in Norway no case had been hitherto known of the communication of leprosy by vaccination. Permit me to say that this well-known pathologist has given his emphatic opinion, which I quoted before the Royal Vaccination Commission, that the chief means of disseminating leprosy is by inoculation, and that in Norway the greatest possible care is observed to prevent lymph being taken from leprosy subjects. Dr. Abraham advises medical men to be "extremely careful" in the selection of their lymph, especially in countries where leprosy is rife, and to avoid arm-to-arm vaccination, "as is now being done in Hawaii." I beg to state that less than a year ago, as I know from personal inquiry, the bulk of the vaccinations in Hawaii were performed with humanised virus, it having been found that animal lymph produced excessive inflammation and many terrible cases of ulceration. In Ceylon, where leprosy is endemic, and, according to Dr. Kynsey, the Surgeon-General, increasing from some occult cause, arm-to-arm vaccination is principally in vogue, as it is also in the West Indies. If leprosy is spread chiefly by inoculation (and this source of infection is more generally accepted amongst dermatologists than any other), there is no mode of inoculation so widely prevalent as vaccination; and, having investigated the subject in all quarters of the globe, I attribute largely to this cause the alarming recrudescence of the disease which has taken place during the last thirty years in our colonies and most other leprosy countries., WILLIAM TEBB., Devonshire Club, St.

James's, London, 5th September, 1891

*This letter was refused insertion*

It is clear by Dr. Abraham's mode of argument that leprous vaccination, as an important factor in the increase of the disease, is the last thing he will admit. All other possible sources of dissemination must be excluded before a theory so fatal to medical prestige can be tolerated. Any other of the numerous theories promulgated to account for new centres of leprous contamination the doctor is ready to consider, but vaccination (to use a classic phrase) "must be preserved from reproach," and the reputations of its distinguished advocates maintained. His opinions, however, do not seem to meet universal approbation, even amongst the medical profession. Commenting upon Dr. Abraham's address, the *Hospital Gazette*, London, of August 22nd, 1891, observes :—" Dr. Abraham has gone to a great deal of trouble to prove, or attempt to prove, that, though leprosy is probably as susceptible of being conveyed by vaccination as is syphilis, there is no well authenticated case of the kind on record. It is admitted that quite a number of suspicious instances have been reported by competent observers, but Dr. Abraham rules them all out of court on the ground that other possible sources of infection have not been eliminated. This seems to be asking too much. Leprous vaccine is obviously only obtainable in countries where lepers are common, so that, theoretically, the victims must necessarily have been exposed to the special pathogenic influences. It has, we believe, been scientifically demonstrated that the disease can be conveyed by inoculation, and we shall require something more than this specious special pleading of Dr. Abraham before acquiescing in his conclusions."

[Index](#)

**CHAPTER 9: VACCINATION IGNORED IN OFFICIAL LEPROSY REPORTS.**

Now that evidence is accumulating in all directions regarding vaccine virus as a propagator of leprosy, attempts are made to minimise the effects of this evidence on public opinion, by alleging that the instances of such infection are few in number, and of no account when put in the scales against the enormous benefits arising out of the application of Jenner's great discovery. This is not the place to enter into the *pros* and *cons* of this much-vexed question, but those who wish to study the facts may do so advantageously in the reports of the Royal Commission on vaccination; in the article on vaccination by Dr. Charles Creighton in the ninth edition of the "Encyclopedia Britannica"; in the able monograph, "Jenner and Vaccination," by the same author, and in Professor Crookshank's instructive treatise, "The History and Pathology of Vaccination." My own views on this subject—the results of a lengthened experience—may be found in the *Westminster Review* for December, 1888, and January, 1889. While I do not admit with Dr. P. Abraham, Dr. George Thin, Dr. Beavan Rake, and others, that the cases of leprosy due to vaccination are few in number, it should be borne in mind that the subject has never been submitted to searching and impartial investigation. In 1862, by request of the Government, a Committee of the College of Physicians prepared a series of seventeen interrogatories which were sent to lepra specialists in all parts of the world, but all reference to vaccination as a possible or probable factor was strictly excluded.

In consequence of the rumours of the spread of leprosy, by means of vaccination, in the Island of Trinidad, Governor J. R. Longden felt it his duty to call the attention of the English Government to the subject, and on the 4th March, 1871, he addressed a dispatch to the Right Hon. the Earl of Kimberley, then Secretary of State to the Colonies. In confirmation of this serious charge against vaccination Governor Longden referred to the report of Dr. Bakewell, the Vaccinator-General of Trinidad, and to certain cases of invaccinated leprosy, and to Sir Ranald Martin and other eminent physicians as authorities for his statements, and added, "This part of Dr. Bakewell's report appears to me to be deserving of your Lordship's attention in connection with the increase of leprosy, which I fear must be admitted to have taken place in the last few years." In paragraph 13 of the dispatch Governor Longden says: "The danger of introducing disease into the system of a previously healthy child by vaccination is possibly a real one, and it is very important, as regards tropical colonies at least, that it should receive the attention of the medical profession." In paragraph 14, Governor Longden pertinently observes that the special danger of spreading broadcast the seeds of leprosy would be worse than the perpetuation of small-pox. Governor Longden's dispatch was referred by the Colonial Department to the Royal College of Physicians, who were anxious to get rid of the most damaging indictment yet preferred against vaccination. This they, sought to accomplish, as far as possible, by ignoring it altogether.

That learned body nominated, Dr. Gavin Milroy, F.R.C.S., who arrived at Georgetown, British Guiana, on the 22nd July, 1871, and prosecuted inquiries mainly as to the contagiousness of leprosy in that Colony, and on the 17th October, 1871, he submitted to the Earl of Kimberley a report confirming the conclusion of the College of Physicians, as given in p. xix. of their report as follows :—" The all but unanimous conclusion of the most experienced observers in different parts of the world is 'quite opposed to the belief that leprosy is contagious or communicable by proximity or contact with the diseased.'" Dr. Milroy adds :—" My personal observations and inquiries in the Colony all tend in the strongest manner to the same result" No question as to vaccination was submitted for consideration. On the 25th October, 1871, Dr. Milroy reached Barbados, and from thence proceeded to Antigua, and later on visited Trinidad, Dominica, and Jamaica. On reaching

Trinidad in November, 1871, he discovered that Dr. R. H. Bake-well in his report had given "countenance to the popular belief as to the transmissibility of leprosy by vaccination," and, with the consent of Governor Longden, inserted an additional question to the Interrogatories for circulation in that' Colony. This question, then submitted for the first time, elicited answers abundantly confirming Dr. Bakewell's contention. These answers will be found cited in the communication from Mr. Alexander Henry, and elsewhere, in this volume.

Dr. Milroy's report on this part of the subject is mainly directed to answer and, if possible, disprove Dr. Bakewell's allegation, which, if unanswered, might prejudice the continuance of vaccination. Dr. Milroy says, "What is contended for is, that pure, genuine, vaccine virus, unmixed with blood, cannot be the medium of any contagion but cow-pox:" conditions, as every public vaccinator knows, impossible of fulfilment. At this period the transference of syphilis by means of vaccination was publicly acknowledged, but Dr. de Verteuil of Trinidad, in his reply to Dr. Bakewell, observes: "It is an illogical deduction that, because syphilis is inoculable, leprosy is, or might be, inoculable, the diseases being essentially different." Dr. Browne of Barbados, one of the witnesses, has misgivings on the point, and writes to Governor Rawson, November 8th, 1871, as follows:

"It has been a general rule not to vaccinate from the apparently unhealthy, or those of leprosy taint, not so much from any opinion founded on fact of the possibility of conveying disease, as from a respect for the general prejudices prevailing." Public opinion, as shown by Dr. Bakewell's evidence, was even at that time in advance of medical opinion regarding the danger attending vaccination. Dr. Reade, the Colonial Surgeon of Singapore, cautiously observes (Dr. Gavin Milroy's report, p. 36):

"There is a possibility that the disease (leprosy) may be transmitted from children hereditarily tainted with leprosy, and I strongly advise the continuance of importing lymph from England by every mail, and carefully selecting only healthy children as vaccinifers."

The testimonies elicited by this inquiry as to the communicability of leprosy and syphilis seem to have had no practical effect on the College of Physicians. In a letter from that body on "Vaccination and Leprosy," dated London, August 17, 1871, and addressed to the Earl of Kimberley, it is stated that, while it is admitted that in a few instances syphilis has been transmitted by vaccination, "yet with reference to leprosy it must be observed that there is no evidence adduced beyond the merest presumption that this disease has ever been transmitted by vaccination." And so far from cautioning the public against this fearful danger, and petitioning Parliament to repeal a law which had been productive of so much mischief, the College of Physicians reaffirmed their belief in the benign character of vaccination, and declared "that they cannot press too strongly on your lordship the importance of enforcing the practice of vaccination for the protection of those who are too ignorant to protect themselves, and it would be a grievous wrong to forego so great a public benefit on the mere speculative grounds advanced by Dr. Bakewell."—*Report on Leprosy and Yaws*, p. 86.

The next inquiry emanated from the India office, and is entitled "Scheme for obtaining a better knowledge of the endemic skin diseases of India," prepared by Tilbury Fox, M.D., F.R.C.P., and T. Farquhar, M.D., 1872. Two chapters in the report of this inquiry are devoted to leprosy. The authors here furnish a list of twelve questions for elucidation in regard to the presence and cause of leprosy in different districts, and three questions for leprosy in individuals. In none of these is either inoculation or vaccination specified.

The alarming increase of leprosy in Hawaii, which took place after the introduction of vaccination by the missionaries, once more called public attention to the subject, not only in that group of islands, but throughout the civilised world. In 1885 the Department of Foreign Affairs in Honolulu instituted the most extensive inquiry made up to that time into the causation of leprosy, and the means of its treatment and prevention. The deplorable position of affairs is briefly stated in the introduction to the official report, entitled, "Leprosy in Foreign Countries: Summary of Reports furnished by Foreign Governments to His Hawaiian Majesty's Authorities, as to the prevalence of Leprosy in India and other Countries, and the measures adopted for the social and medical treatment of persons afflicted with the disease." . . . "It is about thirty years since leprosy first attracted any serious attention in the Hawaiian Islands. In the year 1866 the dread disease had gained such a deadly hold upon the native race, that the Hawaiian Government began to attempt to stamp out the scourge by segregation, for it had become a contest for the preservation or destruction of the aboriginal race. To judge by the number of cases in proportion to the population, the disease appears to be more virulent and malignant in the Hawaiian Archipelago than elsewhere on the face of the globe. What has been attempted and accomplished in this twenty years struggle with a great national calamity appears elsewhere."

"His Hawaiian Majesty's Government being anxious to provide every possible means for the treatment and understanding of the fearful malady, His Excellency Walter M. Gibson, His Majesty's Minister of Foreign Affairs and President of the Board of Health, addressed letters of inquiry to the Secretary of Legation at Ceylon and to the diplomatic and consular representatives of the Hawaiian kingdom in various parts of the world where leprosy was known to exist, making inquiry in respect to the character and treatment of the disease." It is stated that the response to these inquiries has been most generous, more especially from governments of dependencies of Her Majesty Queen Victoria. This interesting document gives reports from every section of the vast Empire of India and its dependencies, from Ceylon, Hong Kong, Siam, the Netherlands and their colonies, the Canary Islands, Norway, Spain, Mexico, Chili, and Guatemala, and an extremely interesting and valuable report from the famous Leper Institution of Tracadie, New Brunswick, Canada. The report from the Secretary to the Government of India being so comprehensive and voluminous, it has been considered expedient to separate it from the other reports.

"In grateful recognition of the sympathy of other afflicted nations, this collection of reports, together with the sad history of its own affliction, is presented to the world by the Hawaiian Government in the devout hope that the Almighty, in his great mercy, may ere long permit suffering humanity to find the means of mitigating the terrible scourge."

From this little known compilation I have made extracts on various matters dealt with in this volume.

In this important inquiry, although at that time the facts had become known throughout the Hawaiian Archipelago as to the spread of leprosy by vaccination, yet such was the reluctance to bring so grave a charge against a practice proclaimed far and wide as "the greatest discovery in the history of medicine," that it was thought expedient to make no mention of vaccination in the interrogatories, and to specify only those points drawn up by the Committee of the College of Physicians in 1862.

Owing to the increase of leprosy in South Africa, inquiries by Select Committees of the Legislative

Assembly were instituted in 1883 and 1889, but the interrogatories relate chiefly to the spread of the disease, and to its contagious or non - contagious character. The questions were submitted *viva voce*, and vaccination as a possible factor in the dissemination of leprosy is carefully ignored.

An important report by Dr. S. P. Impey, Medical Superintendent of the Leper Settlement, Robben Island, on the dangers of spreading leprosy by means of vaccination, was in June, 1891, sent to the Colonial Office, Capetown. Of this report I have attempted, by repeated personal applications at the Colonial Office, Capetown, and at the Stationery Department of the colony, to obtain a copy, but without success.\* (\*An extract from this report, through the intervention of a correspondent in South Africa, has since been obtained).

In the "Report of the Leprosy Inquiry Commission" for the Colony of Mauritius, published 26th October, 1888, I find the following request in the circular of instructions sent to medical practitioners :—"We would be glad to obtain any facts bearing upon the question of its heredity or contagiousness, upon the conditions favouring its diffusion, upon its treatment, and, finally, upon the best means of preventing its spread in the community.—T. LOVELL, Chief Medical Officer," etc.

Nothing is said as to the inoculability of the disease, nor is there any inquiry suggested as to vaccination, which has been the means of spreading leprosy in this colony.

The Royal College of Physicians published another report on leprosy in 1889, concerning which the *Lancet*, April 20th, 1889, says :—" A report from the Leprosy Committee was read. It stated that the documents forwarded by the Government on the subject of leprosy since 1887 did not contain much, if any, new information. In view of the fact that there is increasing evidence respecting the communicability of leprosy, the committee repeated 'with greater urgency' the recommendation made in 1887, that the Government should institute a full and careful scientific investigation, which would entail expense and require considerable time. The adoption of the report was moved by Dr. Symes Thompson, who said that the disease was spreading very much among communities in South Africa, and was seconded by Dr. Handfield Jones, who thought that the College should express more definitely its opinion of the contagiousness of the disease and the need for compulsory segregation. This view was not accepted by other speakers, but all concurred in the urgency for a thorough scientific investigation, and it was referred to the committee to draw up a statement respecting the scope of such inquiry, for submission to the Government."

This report was, founded upon official and other documents collected up to that date and forwarded by the Government to the College of Physicians. Of these documents I have been unable to obtain copies or even permission to inspect them. The report is signed, "James Risdon Bennett, Chairman," and is dated April 5th, 1889. It was then four years since the disastrous effects of vaccination in Hawaii had been published by Dr. Edward Arning, and two years since Professor Gairdner's remarkable cases of invaccinated leprosy had been made known in the *British Medical Journal*. These and other facts showing the danger of invaccinating leprosy had been laid before the Dermatological Congress of Europe by eminent specialists. And soon after the publication of Dr. Gairdner's cases, Sir William Robinson, Governor of Trinidad, issued a confidential circular to about 30 medical practitioners of that island, containing the question as to whether leprosy is communicable by vaccination, "lymph from healthy vesicles alone being used." Dr. A. S. Black, a well known practitioner, gave particulars of several cases in his own experience, and stated that leprosy was increasing in the island. In his report to the Surgeon General for 1890, p. 34, Dr.

Beavan Rake says :—" Some thirty or more Trinidad doctors to whom the same circular was addressed returned negative replies." Dr. Rake omits to state that those who doubt or deny the risk qualify their answers by remarks such as that there is no danger "if pure lymph only is used, and precautions taken in the selection of the vaccinifer and the examination of the pustule," "if there be no admixture of blood" and "healthy lymph is used," "provided the lymph is clear" and "the vaccinifer is free from hereditary taint," "if bovine virus is selected," "with perfect cleanliness of the lancet," etc. Dr. Woodlock mentions that he takes the precautions of constantly importing fresh certified lymph from England. Dr. D. de Montbrun "dreads vaccination on the ground that syphilis and other cutaneous diseases have been transmitted by it." He also states that nearly all the families in Trinidad strongly object to vaccination with lymph taken from the children of the island, from fear that leprosy may be thereby communicated. Dr. Chitterton says :—" Vaccination is performed in Trinidad in a very unsatisfactory way." It is obvious that the value of the answers is seriously vitiated by the form in which the question is worded. The use of clean lancets and healthy vaccinifers without hereditary taint, however much insisted upon, cannot be made compulsory; and the people are obliged under severe penalties to submit to whatever vaccination is offered, which is chiefly of the leprosy and syphilitic variety, collected from miscellaneous native vaccinifers by perfunctory public vaccinators. Indeed, as I have found by personal inquiries in the West Indies, South Africa, and Hawaii, all the precautions admitted to be indispensable for the safe performance of the official rite are habitually disregarded.

The latest inquiry is due to the extraordinary amount of public interest awakened by the published reports of the labours, devotion, and death of the late Father Damien in the Sandwich Islands, and to the accumulation of evidence from many English and French Colonies showing conclusively the increase of this frightful malady. The first meeting was held at Marlborough House, June 17th, 1889, under the presidency of H.R.H. The Prince of Wales; and a dinner in aid of the National Leprosy Fund was held at the Hotel Metropole, London, on the 13th January, 1890, at which also the Prince of Wales presided. A highly influential Committee was subsequently appointed, with Dr. Phineas S. Abraham as secretary. The following letter, with a view of eliciting suggestions, was published in the *Lancet* of the 31st May, 1890, also in the *British Medical Journal* and in the first number of the *Journal of the Leprosy Investigation Committee*:—

SIR,—With the object of eliciting by correspondence as much information as possible on the subject of leprosy, it is proposed as a preliminary investigation to address a series of questions to the officers of the various leper asylums and to others who may be able to throw some light upon the matter. I am requested to ask you to allow me to invite the co-operation in this inquiry of those of your readers who, from their knowledge of the disease, may be in a position to offer suggestions as to matters of, inquiry and as to points of elucidation. Any observations with which the Committee may be favoured will be gladly received and incorporated in the "Journal of the Leprosy Investigation Committee," of which the first number will be shortly published.—I am, sir, yours faithfully, P. S. ABRAHAM, Med. Sec. May 26th, 1890.

Dr. Abraham further explains that "although all information bearing on leprosy will be deemed of interest, it will be desirable for observers to direct particular attention to questions relating to the cause or causes and propagation of the disease, as well as to those referring to remedial measures." "It is to be noted that this 'Journal' is published for the purpose of obtaining reliable scientific information on the subject of leprosy, and that it will not be carried on in the interest of any one particular theory. Views from all sides will be admitted; and that the truth may be arrived at, full

and free discussion is invited."

Nothing could be fairer, more explicit, or more promising for establishing public confidence and support than these announcements. Realising the importance of the subject and the limitations laid down by Dr. Abraham, I addressed to him, as Secretary of this Inquiry, the following brief communication on the principal point referred to—the causation of leprosy :—

Rede Hall, Burstow, near Honey, Surrey,  
June 10th, 1890

SIR,—Observing your note in the *Lancet* of the 31st ult., requesting suggestions as to methods of inquiry, and as to points of elucidation, with regard to the remarkable spread of leprosy, I beg to point out that amongst the questions which it is proposed by your committee to issue to the superintendents of Leper Hospitals, dermatologists, and others, that of the connection of the disease with vaccination should be included. That there is a connection is now admitted by some of the most eminent authorities of the day, including Professor W. T. Gairdner, Dr. Liveing, Sir Morell Mackenzie, Dr. John D. Hillis, Dr. Edward Arning, Dr. Armaur Hansen, and others. Some of these writers admit that not only is leprosy communicable with the vaccine virus, but that new centres of contagion of this hideous disease have been created by vaccination, with most disastrous and far-reaching consequences. Trusting that this important feature of the question will not be overlooked by your committee, and awaiting the favour of a reply, I am, sir, yours faithfully,  
WILLIAM TEBB.

Dr. Phineas Abraham, National Leprosy Fund, Adam Street, W.C.

To this letter the following reply was received :—

2 Henrietta Street, Cavendish Square, W. July 2nd, 1890.

DEAR SIR,—I must apologise for not answering your letter before this. With regard to the alleged connection with leprosy, this question will certainly be one of the points to which special attention will be directed on the part of the committee, and an attempt will be made to sift the evidence in an impartial manner.—I am, dear sir, yours faithfully,  
PHIN. S. ABRAHAM, M.D.

W. Tebb, Esq.

This correspondence, implicating vaccination, and pointing out a much-neglected source of danger, is absolutely ignored in the *Journal of the Leprosy Investigation Committee*; while communications from all parts of the world, in which the most diverse and conflicting theories are advanced by persons whose opportunities for observation and inquiry have necessarily been of a very meagre description, have found insertion in its pages.

In a notice of a recent able work, "Leprosy," by G. Thin, M.D. (London: Percival & Co.), in No. 4 of the *Journal of the Leprosy Investigation Committee*, p. 71, no mention is made of the cases of invaccinated leprosy introduced by the author, which occupy several pages of the work. On the other hand, three articles against the theory that leprosy is spread by vaccination are inserted. It is also to be observed that, while numerous communications, pointing out the dangers of vaccination in countries where leprosy is prevalent, have, since the Leprosy Commission was appointed,

appeared both in the home and colonial press (some of the writers citing cases of the disease disseminated in this way, and others furnishing the results of their painstaking investigations), no notice of such communications has been taken in the *Journal of the Leprosy Investigation Committee*. Three pamphlets dealing with the subject—two of them by medical writers—have been treated in a similar fashion. What amount of confidence the public, who have subscribed largely to the National Leprosy Fund, will place on an inquiry so manifestly one-sided, remains to be seen. It is certain that those who have looked for the impartial treatment of this serious phase of the question at the hands of the Leprosy Investigation committee will be grievously disappointed. Counsel holding a brief for the perpetuation of the Jennerian *cultus* could hardly have exhibited a less judicial attitude than disclosed by the official documents relating to this latest leprosy inquiry.

**CHAPTER 10: OFFICIAL STATISTICS.**

## THE LEPER CENSUS IN INDIA, 1881, 1891.

MR. J. A. BAINES, Census Commissioner, India Office, has been kind enough to furnish me with the following Table showing the results of the Census in relation to Leprosy in the decades 1881 and 1891.

PROVINCE	Males 1881	Females 1881	Males 1891	Female 1891
1. Ajmir	23	6	20	7
2. Assam,	2,409	906	5,128	1,599
3. Bengal,	40,484	13,490	32,957	11,029
4. Berar	2,971	777	2,886	1,624
5. Bombay	7,259	2,559	7,558	2,419
6. Sindh	166	111	125	84
7. Aden	0	0	1	0
8. Upper Burmah	0	0	2,262	1,242
9. Lower Burmah	2,009	580	2,281	679
10. Central Provinces	4,430	2,013	3,575	1,780
11. Coorg	25	18	12	11
12. Madras and Small Feudatories	10,329	3,846	9,455	3,182
13. N. O. Prov. and Oudh	14,453	3,369	14,114	2,957
14. Punjaub	5,333	1,547	3,322	1,029
15. Quettah	0	0	2	0
16. Andaman	30	0	1	0
17. Hyderabad	2,117	872	2,261	716
18. Baroda	450	174	397	172
19. Mysore	340	193	536	266
20. Rájputána	0	0	1,314	394
21. Cent. Ind. Regs., etc.	7	6	59	21
22. Bombay States	1,681	606	1,907	641
23. Cawnpur State	0	0	4	2
24. Cochin & Perderkottal	143	0	313	138
25. Travancore	0	0	684	284
26. Central Prov. States	0	0	799	460

27. Bengal States	1,799	750	1,471	577
28. N.-W. Prov. States	339	94	312	67
29. Punjab States	2,241	613	1,462	458
	99,038	32,622	95,218	31,838
TOTAL	131,660		127,056	

*The general reader may perhaps be assisted in understanding the foregoing Tables by the following Analysis.*

\* Nos. 7, 15, and 16.

From the foregoing analysis, it appears that the number of male lepers has during the decade increased in fifteen places and decreased in fourteen. The number of female lepers has increased in thirteen places and decreased in thirteen: while in three places they are *in statu quo*. In seven places no returns are given for 1881.

The total number of lepers returned are as follows:--In the census for 1881, 131,660; in the census for 1891, 127,056.

It will be remembered that at a meeting held at Marlborough House on the 17th of June, 1889, His Royal Highness the Prince of Wales declared that there were 250,000 lepers in India, an estimate nearly double that which is indicated by the figures derived from the censuses of 1881 and 1891. That the estimate given by His Royal Highness is far nearer the mark than are the figures derived from the census, will appear probable from the following facts and considerations.

On the perusal of the census forms issued by the Indian Government, we find in Rule 14 that "white leprosy" is to be excluded from the infirmities to be returned by the enumerators. That rule is as follows:— "If any person be blind of both eyes, or deaf and dumb from birth, or insane, or suffering from corrosive leprosy, enter the name of the infirmity in this column. Do not enter those blind of one eye only, or who have become deaf and dumb after birth, or who are suffering from white leprosy only."

Mr. J. A. Baines, Census Commissioner, writing 21st June, 1892, says that in the recent census, "the instructions were clearer (as to leucoderma, or white leprosy), and the exclusion far more strict."

The census form also contains the following direction:

"You are to make all the entries as the person himself or his guardian, states, and not to dispute his statement."

Coupling this direction with the fact that now, for the first time within thirty years, the report has been widely circulated, that all lepers at large were to be segregated, that is, to be separated from their friends and from all they hold dear, we should infer that a large

number of cases of leprosy would be suppressed, and not returned to the census enumerators, who are much more in sympathy with the afflicted members of their own race than with their official chiefs, and would be slow to aid in the perpetual incarceration of their friends; and among the respectable classes no one will admit that he is a leper, as an admission of this kind would involve loss of caste and social ostracism.

Moreover, leprosy is an insidious disease, and in its early stages cannot be diagnosed and detected save by experienced medical practitioners accustomed to treat this particular malady. Of the enumerators, not one in a hundred could detect a case of leprosy if he saw it, except when presented in its most aggravated and repulsive form.

Mr. H. A. Ackworth, Municipal Commissioner, Bom— bay, in a communication to me, dated 29th July, 1891, says :—" I have plenty of lepers in my hospital here who could not be identified as such unless they were completely stripped and examined by a trained eye." And a correspondent of the *Calcutta Daily News*, October 20th, 1891, writes:—" To my personal knowledge there are at least twenty-three lepers in this town who are not entered as such in the census papers. And it is quite probable that there are many more who have not been numbered."

A medical correspondent connected with the Army Medical Department writes to me, January 27th, 1892, "that the census form used in the census of 1891 is an enigma that the enumerators could not properly explain; and the remuneration offered was so small that it failed to tempt any of the better educated classes to volunteer for the census work. Consequently the papers were handed over to men who, for the most part, were too devoid of understanding to enable them to ascertain facts or comprehend the nature of the information required for filling in the returns." My correspondent adds that the wide-spread belief in India, that leprosy is a disease of venereal origin, induces all but the lowest classes to carefully guard against it becoming known, either to officials or to others, that any member of the family is a leper, and "even the threat of prosecution would not frighten them into publishing their terrible secret for census information." For these and other reasons there can be no doubt that a considerable portion of the leper population in India has been omitted from these returns.

Without endorsing the accuracy of the leper census in India, which is clearly misleading, it may be incidentally remarked that the proportion of vaccinations to population in India, as a whole, is less than in any of our crown colonies and dependencies, but is increasing every year, and, unless arrested, will soon produce the calamitous consequences exhibited in tropical countries where vaccination is general.\*

\* The births in India in 1899-1 were officially estimated at 40 per cent. of the population, or 8,244,101, and the number of children under one year returned as vaccinated in 1890-1 was 2,268,922, being about 27 per cent. on the total number of births.

#### THE LEPER CENSUS IN THE LEEWARD ISLANDS, WEST INDIES, 1891.

A census has recently been taken for the Leeward Islands, which also minimises the number of lepers in a similar fashion. Referring to this, the St. Kitts *Lazaretto* of February 22nd, 1892, says:—"The census return for the Colony is at length out, and a copy may be seen at the Public Library. It is openly said all over the Colony that this particular census is utterly unreliable; indeed, Mr. Fred Evans, the Colonial Secretary, says as much of the returns from Dominica. A glance at the tables which pretend to show the number of lepers in the Colony satisfies us that, in this particular, the returns are worthless.

"Some time ago, the doctors here were called upon to send in returns of the lepers in their districts. They did so, and sent in a list of 51 lepers. That this list was necessarily incomplete we fully demonstrated at the time. Since then, we have heard of several other lepers of whose existence no one here knew, and a few have been committed to the Leper Asylum. But in the face of the reports from the doctors, the compiler of these precious returns sets down the number of lepers at large in St. Kitts as thirteen and in Nevis as five!! How could Mr. Fred Evans or his clerk have got these figures? The census forms that had to be filled in by each householder contained no space in which the number of lepers could be entered. Therefore, we are forced to the conclusion that the opportunity of misrepresenting the leprous condition of this Colony was seized by those who were on the look-out for such a chance, the doctors' reports disregarded, and that some one invented these figures. . .

"We guarantee to produce fully 50 (and perhaps 60) lepers who are now at large in this little island (St. Kitts).

"There are considerably more than 13 in Basseterre alone. As regards Nevis, the inaccuracy of the Colonial Secretary's figures is equally striking.

"We can give off-hand the names of a half-dozen lepers living there, and we have heard of many more, of whose existence we are assured by gentlemen who are above, lying, and who have no motive for suppressing the truth.

"The figures for the other islands are also palpably incorrect and misleading. In Antigua 34 lepers are said to be under restraint. This is not true as regards the restraint, for according to Dr. Freeland they cannot legally be restrained, and as a fact they go and come from the so-called Lazaretto as they please. Only last month we saw several of them promenading the streets of St. John's. Then to set down 11 lepers only as being at large is a gross misstatement, as every one in Antigua knows. We were up there quite recently, and satisfied ourselves that there are probably in all over a hundred lepers in that island.

"We accept the return of 3 lepers to about 500 people in Barbuda, but we confidently challenge the assertion that there are only 9 lepers in Montserrat and 3 in the Virgin Islands. .

"Anguilla, the Government says, contains 8 lepers. Will Mr. Fred Evans be surprised to hear that he has made the trifling error of only eighty per cent? We happen to know that if he had guessed 40 (for the whole thing is evidently pure guess work) he would have been pretty near the mark.

"The total for the Leeward Islands is, according to this eccentric statistician, 172. That for St. Kitts and Nevis is 98. We declare, speaking with a knowledge of the subject which is infinite compared to that possessed by Mr. Fred Evans, that there are at least 200 lepers in St. Kitts and Nevis; and that Sir William Haynes Smith knows. Taking St. Kitts, Nevis, and Anguilla, we would not be surprised if 250 free lepers could be ferretted out. Of Dominica and Montserrat we cannot speak so confidently, but we have interviewed many gentlemen from them, and the sum of our inquiries is that no one knows how many lepers there are in any one of them. It has been no one's business to find out, and therefore no one has given the least attention to the subject."

**CHAPTER 11: LEPROSY AND THE ABORIGINAL RACES.**

IN 1889, during a visit up the river Essequibo, in British Guiana, the British Commissioner and resident Magistrate, Mr. Michael M'Turk, of Kalacoon, informed me that he had not the slightest doubt that leprosy was disseminated with the vaccine virus. He was intimately acquainted with a healthy family, in which one of the children was affected with leprosy by means of lymph taken from a child afterwards proved to be tainted with leprosy. The unfortunate victim of the state-enforced operation was isolated in a small building at the end of the garden at the parents' house, and ultimately succumbed to the disease. As an explorer, Mr. M'Turk has been much among the Indians, all his servants and boatman belonging to that race, and he had never known or heard of a case of leprosy amongst them. The truth of this statement is confirmed by a communication to me from Mr. Herman Klein, Acting Assistant Medical Officer, H. M. P. 5., Potosi, British Guiana, dated June, 1891—" I have been about eleven years up the Essequibo, river, and have never seen an Indian afflicted with leprosy." I received similar testimony at Bartica Grove from Mr. John Bracey, an Indian trader of twenty-nine years' experience among the Macousi and Wapisiana tribes. Dr. John D. Hillis, F.R.C.S., formerly the Superintendent General of the Leper Asylum, Mahaica, in his work, entitled "Leprosy in British Guiana" (1881), says, p. 148:—"With regard to this country one important fact is the immunity from leprosy enjoyed by the aboriginal tribes of British Guiana." This immunity from the disease is attributed to the circumstance that no Indian will allow himself or his children to be vaccinated. Dr. T. C. Taché, Titulary Professor to the Laval University, writing from Ottawa, Canada, in reply to questions submitted by the Hawaiian Government, June, 1885, says:—"There never was any case of leprosy among the Indians, although one of their principal villages is located in the endemic section, being contiguous to the parish of Nigavrick." Professor T. C. White says that in Tracadie, New Brunswick, more than two lepers were received at the hospital between 1849 and 1882; nearly all the cases were of French descent, and no Indian had fallen a victim.

Dr. J. E. Graham, in a report from the Government of Hawaii as to leprosy in New Brunswick (1886, pp. 114 and 140), observes :—" That the Indians have been the only race, of those inhabiting these localities in any number, which have remained so far exempt from leprosy. . . . The places in which the Indians dwell bear precisely the same character as those inhabited by their neighbours among whom the ailment has exercised its ravages."

Dr. Miguel Valladores, physician to the Lazaretto, Guatemala, says, in his report to the Hawaiian Government, 1886, p. 174, "that it is almost an unheard of thing for an Indian to be afflicted with leprosy."

Drs. Vlagthoes and Mayrinck state that, previous to the discovery of Brazil, leprosy was unknown among the Indians.

Dr. Alzevedo Lima, in a letter on "The Leper Hospital of Rio de Janeiro," dated June 1st, 1891, Rio de Janeiro, says :—" On consulting all the documents and books written by travellers and missionaries in Brazil, we find no mention, either direct or indirect, of any prevalent complaint among the Indians which might be attributed to leprosy. Even nowadays those who live a savage life away from all contact with civilised society are not attacked by this disease, while those who have left their woods for peopled centres, together with their descendants, are, according to observations, occasional victims."— *Journal of the Leprosy Investigation Committee, December,*

*1891, p22.*

In a communication to me, dated Rio de Janeiro, May 20th, 1892, Dr. Lima says :—" Now, about the Indian races, those who live away altogether, without any interference or intercourse with civilisation, their freedom from leprosy can be explained not only by the absence of the Jennerian vaccination, but also by the non-intercourse with people capable of being the conductors of the germs of the disease." I have personally met with races of Indians in South America, amongst whom, though living amongst lepers up to this date, no cases of leprosy have occurred. This immunity is attributed by old residents, one a physician, to the circumstance that they will not allow themselves or their families to be vaccinated.

Dr. J. Z. Currie, secretary of the Provincial Board of Health, Fredericton, New Brunswick, in reply to a communication from me, dated January 2, 1892, as to the vaccination of Indians in New Brunswick, Canada, says :—" There has been no outbreak of small-pox among the Indians for some time. However, in almost all instances they object to vaccination. Four cases of small-pox occurred in this Province during the past year among white people."

The main object of this evidence is to show that in countries where leprosy is endemic, the Indian tribes who reject vaccination escape the plague. In New Brunswick it would appear that they also escaped smallpox, while vaccinated white persons have been attacked with the disease.

[Index](#)

**CHAPTER 12: VACCINAL DISEASES IN SOUTH AFRICA.**

VACCINATION was made compulsory in Cape colony by Act of the Legislature in 1882. Very soon the deleterious effects of the virus were exhibited. The London *Daily News*, March 5, 1884, says that owing to impure lymph there had been many cases of illness from vaccination; but, later on, the natives were vaccinated on an extensive scale. The Public Health Act, No. 4, Cape of Good Hope, dated September 6, 1883, contains the provisions of a vaccination law of a stringent and despotic character. Section 60 states—“No person who has not been vaccinated shall be appointed, or, if appointed prior to the taking effect of this Act, promoted to any office in the public service.” Section 60 provides that “Every child, admitted to any school which shall be maintained or aided by any grant from the public funds, shall be vaccinated by the District Surgeon or by a vaccinator specially appointed, unless such child shall have been previously vaccinated.” The penalty for non-vaccination is £2. The law contains other oppressive clauses, thus incorporating in one act the worst features of the English, American, and Continental vaccination enactments.

All this time, while the vaccine poison was being forced into the blood of the defenceless natives, laying the foundation for the disorders which speedily followed, nothing was said or done to remove the causes which developed the outbreaks of small-pox, the fearfully insanitary condition of the town in which the pestilence abounded, the fruit of long-continued filth and neglect, scarcity of water, foul, unkempt streets, seas of mud in the winter and hurricanes of dust in summer, and, worst of all, a population ignorant of the commonest instincts of decency.

The *Cape Times* reported that Cape Town was buying its experience at a heavy price. Within a short time of the introduction of compulsory vaccination, spreading with accelerated industry this tainted virus distilled from the bodies of a filthy population, we read of the spread of leprosy, and of the alarm created in the Colony among those who had observed its destructive progress. A not uncommon experience is to hear of cases of leprosy in families where there is no taint of the disease, and where the afflicted member has never come into contact with lepers. The late American Consul, Mr. James W. Siler, of Cape Town, in his official report to his Government, No. 79, June, 1887, records a case of this description; and, as vaccination is obligatory, the obvious causation is that the disease has been transferred in the vaccine virus. Mr. Suer says :—“ A case with which I am well acquainted will illustrate its seemingly mysterious power of propagation. In one of the oldest and wealthiest Dutch families in this Colony the mother is a confirmed leper, of the type described as ‘tubercular’ by Dr. Atherstone, before alluded to. The father and a large family of strong, healthy, grown-up sons and daughters show not the slightest taint. I have several times enjoyed the hospitality of this family, and availed myself of the opportunity thus afforded of inquiring into this melancholy case, with the view of a possible solution. I am assured that neither on the side of the father nor mother a case of leprosy had ever occurred in their families, and they are able to trace their genealogy back at least one hundred years.”\*

\*“The *British Medical Journal*, July 5, 1890, under the head of “Reports — Liverpool Workhouse Hospital,” communicated by Dr. Cunningham, Senior Medical Officer, gives particulars, with copy of photograph, of an “interesting case.” C — L —, aged 46, who has a husband and six children, all of whom are healthy, and, until she became affected with leprosy, had never suffered from any disease. “*She has never known or seen anybody with the same or similar disease.*” The italics are mine.

The conclusions of the Select Committee regarding the increase of leprosy in South Africa\* (\*Chap. I.; pp. 68 and 69 of this report.) derive confirmation from the individual reports of missionaries, clergy

travellers, and district surgeons in South Africa, and this increase is specially observable where vaccination has been extensively practised: Referring to the reports of district surgeons, published at the Colonial Office, Cape Town, and presented to both Houses of Parliament, I find the following relating to leprosy and to syphilis, a. disease, according to various authorities, pathologically allied to leprosy:—

The medical officer for *Herbert* (Report, 1885), says:—"During the year, small-pox, syphilis of a particular type, and leprosy, have been the prevailing epidemics. The two last named are still prevailing to an alarming extent." It would appear that vaccination, as usual, was resorted to on account of the smallpox, but the medical officer reports that "the difficulties in carrying out arm—to--arm vaccination seem insurmountable."

*Cala.*—The District Surgeon (Report, 1885), says:—"About two. years since, there were many cases of swollen arms, and some deaths after vaccination," and observes: "There is also the danger of inoculating syphilis."

*Aliwal North* (Report, 1885 ).—"Vaccination has been extensively performed amongst both Europeans and natives." In the following year (Report, 1886), the same officer remarks that "small-pox has raged," of which he has treated about 450 cases, and adds that "syphilis has made vast strides." Two years later (Report, 1888), we read :—" Syphilis is still very prevalent. I have frequently drawn the earnest attention of the Government to the sad havoc this disease is dealing amongst the inhabitants."

While showing the utter failure of the extensive vaccination practised in 1884 to prevent the serious epidemic of small-pox which occurred the following year, these three official reports show how the most loathsome of diseases are disseminated by the vaccinator's lancet. The District Surgeon urges the Government to appoint a Commission of Inquiry.

*Alexandria* (Report, 1887).—" Leprosy is certainly spreading rapidly." In 1890, the District Surgeon reports that the state of leprosy demands urgent attention.

*Port Elizabeth.*—The medical officer says (1887):—"There is a growing aversion to it (vaccination), partly due to an underlying current of belief in the possibility of obnoxious disease being propagated by it." The Report for 1891 states that during the year the presence of leprosy was gone into, and six cases reported to the Government.

*Caledon.*—The District Surgeon reports (1888) that he has vaccinated close upon 800. There are about twelve cases of leprosy in the district, and it appears that syphilis is so increasingly prevalent that an hospital is needed for syphilitic patients.

*Cape-Wynberg.*—(*Reports*, 1887-8). The medical officer says:—"Of the great increase of leprosy there can be no doubt; it is obvious to the casual observer that Europeans as well as natives are afflicted with it. . . . The number of cases vaccinated has been about 100." The following year (1889), the District Surgeon says :—" Leprosy is becoming far more frequent in the neighbourhood" . . and adds :—" The question of leprosy is one of the most serious the Government have to deal with. . . . Vaccination has been thoroughly carried out throughout the district."

*Malmesbury* (Report, 1888).—" Leprosy is slowly but surely gaining ground." This officer reports that he does not think it advisable to vaccinate in the district.

*Cradock* (Report, 1887).—" Fifteen cases of leprosy have occurred, all in an early stage."

*Paarl* (Report, 1887).—" Leprosy is on the increase." Report, 1890.—" Leprosy is spreading."

*Glen Grey* (Report, 1889).—The District Surgeon says:—" I have incidentally about a dozen cases of leprosy, some of these of quite recent origin." . . . "A centrally situated leper hospital is imperatively required."

*Kokstad* (Report, 1886).—" Vaccination during the past year has been in several districts well carried out." Two years later (Report, 1888).—The Medical Officer for this district writes as follows :—" Leprosy is still very much on the increase. There are at least fifty cases in Kokstad itself." . . . "It is deplorable to see these wretched victims dependent on the public charity for a bite, whilst the Government will do nothing for their alleviation."

*Stellenbosch*.—The District Surgeon (Report, 1889) remarks that he has just vaccinated two hundred children. He reports 20 cases of syphilis and six cases of leprosy. In 1890 the same officer returns nine cases of leprosy, and adds "but no doubt there are a few more unknown to me."

*Stockenstrom*.—Referring to leprosy (Report, 1890) "I have seen persons without hands paying their quit rents, holding the money on the stumps of their arms."

*Somerset East* (Report, 1890).—" We have a good few lepers here, as already reported."

One experienced district surgeon told me that he had, again and again, year after year, called the attention of the Board of Health to proofs of this terrible havoc wrought by arm-to-arm vaccination, and had advocated its suppression in the interests of public health. A careful examination of the official documents would show that the facts incriminating vaccination have not been allowed to appear.

When making inquiries regarding etiology and spread of leprosy in South Africa, I was generally referred to the Rev. Canon Baker, of Kalk Bay, Cape Colony, as a high authority on the subject, and one who had probably devoted more attention to it than any other resident in the Colony. Canon Baker had in 1883 given evidence before the Select Committee of the House of Assembly, Cape Town, and presented a statement of his views, which appeared in Appendix A, pp. 1-9. Since then he has continued his investigations and accumulated a considerable body of facts bearing on the subject. Vaccination, he says, is carried out in the Colonies in a most careless and perfunctory manner. He has seen the operator pass his lancet from one arm to another without the smallest attempt to disinfect the instrument or discriminate between the diseased and the healthy, in districts where both leprosy and syphilis are endemic. From other reliable sources I am satisfied that this is the rule rather than the exception. Canon Baker believes that leprosy is chiefly communicated by means of inoculation, and that arm-to-arm vaccination is a prolific cause of the spread of this fearful plague in South Africa.

The Colony of Natal passed Vaccination Law No. 3 in 1882, and Law No. 10 in 1885. Penalties for non-vaccination £5. In a communication from Archdeacon Colley, dated Natal, August 25, 1885, I learn that hundreds of summonses were issued in vain upon the colonists, but the natives were vaccinated by thousands; one operator would get through two hundred a day.

While the vaccination laws for several years have not been enforced against the white population in

Natal, all the natives are vaccinated either under persuasion or threats, the operation being carried out in the usual careless manner, with arm-to-arm virus taken from native children without previous examination, and not the slightest attempt is made to clean or disinfect the lancets after each operation. Hundreds of natives, as I am informed on unimpeachable authority, have died of blood-poisoning and of inoculated diseases.

A member of the Legislative Council, Sir John Bisset, reported in Parliament that many were "blood poisoned, presenting a horrible sight, and dying masses of corruption." In January, 1891, leprosy disseminated in this way was discovered in fifty kraals in one electoral division alone. The natives in their simplicity submit to vaccination, being told that it was the "Incosi" (King) that ordered it, and this was the way the white man secured himself against the plague of small-pox.

As the Government of Natal does not publish reports from the District Surgeons, and appears to be indifferent as to the suffering and mischief caused by the vaccinators, I found it difficult to obtain further details.

**CHAPTER 13: A VISIT TO THE LAZARETTO, ROBBEN ISLAND, SOUTH AFRICA**

ON the 9th of February, 1892, after obtaining a permit from the Colonial Office, I took passage in the small but stoutly-built little tri-weekly steamer "Tiger," from Dock Basin, Cape Town, for Robben Island. Amongst our fellow-passengers were visitors, merchants, a clergyman, a singing lunatic in the custody of a warder, and officials connected with the island. Our cargo consisted of fruit, poultry, beef, and other stores for a population of about 700 persons. In less than an hour after starting, we cast anchor opposite the island; and, there being no landing-stage or jetty, we found small-boats, managed by convicts clad and numbered in penal costume, awaiting our arrival.

These singular-looking boatmen rowed us near the shore, and then carried the male passengers on their backs and the women in chairs through the surf on to *terra firma*. The convicts on the island, about one hundred in number, are said to be chiefly murderers and diamond stealers. There is a strong current between the island and the mainland. Only one attempt has ever been made by a convict to escape by swimming, and the attempt cost him his life.

The first building I entered for the purpose of making inquiries proved to be the female ward of the lunatic asylum. Here I was referred by the attendant to the office of the medical superintendent for another permit, which was granted. Dr. S. P. Impey has medical charge of the convicts, lunatics, lepers, and attendants, comprising the entire population of the island. I found him busily occupied with one caller after another, examining and signing papers from different departments; and, instead of engaging his attention at the moment, I expressed a hope that, as I was interested in what is popularly known as the leprosy question, he would be able to see me later in the day. He readily agreed to see me for this purpose at two o'clock.

On my way to the leper wards I looked in at the little church, a rather pretty edifice, adorned with scripture mottoes disposed in large letters around the galleries, where the Rev. W. W. Watkins, the successor to the late Mr. Wiltshire, ministers to his singular congregation. I then proceeded to the male leper wards, meeting with convicts and lunatics on my way. The sun was scorchingly hot, but there was a good breeze blowing, and the ozonised air from the ocean was gratefully invigorating. I should think that the island, although only a sandbank of about 1200 acres in extent arid almost devoid of vegetation during the hot season, would be very salubrious if the conditions for health were observed. The water supply is excellent.

The first lazaretto building I entered—one of the old wards devoted to male lepers—was by no means an inviting structure. It was a large shed with low-studded walls containing a double row of beds, upon which the lepers were reclining in every variety of posture. The air was close and noisome with the evil effluvia of decaying living bodies—death in life—supplemented by the odour of influenza, which at this time was raging throughout the island. Of one hundred male lepers, no fewer than eighty, on the day of my visit, were down with this distressing disease. It has been said that a leper hospital, with its handless, footless, ulcerated, feature-swollen, and distorted patients, is as horrible a sight as a field of battle; and to the misery inseparable from a repulsive and incurable disease were now added the effects of a depressing epidemic—a most heart-breaking spectacle surely. Investigation as to the causation of leprosy under such circumstances was not a promising outlook. The majority of the inmates belong to the poorer classes of the native or mixed races, and are unable to speak English. In some cases the destructive disease had invaded the larynx, and they could only converse in a whisper. It was as painful to hear as to look at them. I must add that a new

and much more spacious and suitable hospital, substantially built of stone, has been erected and is now used for the accommodation of fifty patients. Here I found a better state of things. Another building of like character is in course of erection; so it is evident that the authorities, while apathetic as to the causation of leprosy, have begun to realise the importance of doing what they can to render the condition of these helpless patients as tolerable as possible.

I shall make no attempt to describe the state of the sufferers. I have seen more repulsive cases in lazarettos in other countries, and have seen them both under more favourable and under less favourable conditions. I am of opinion that the lepers and lunatics should be removed to separate quarters, and this barren island should be used exclusively for convicts. Leprosy and lunacy are not criminal, though the former is often caused by the criminal conduct of those responsible for vaccination and for insanitary neglect, and the latter by the temptations of the dram shops, where the vilest and most health - destroying liquors are regularly dispensed. The sufferings of these unfortunate people are sufficiently severe without their being compelled to associate and spend their unhappy lives with convicts. Notwithstanding these difficulties, I was able to hold a brief converse with about fourteen of the inmates who were well enough, amidst their complicated maladies, to understand and reply to a few simple questions. One of the three leper cooks of the establishment kindly acted as my conductor, and pointed out to me those who could speak English. Several were at work as shoemakers and tailors, but the rest had no employment—and, I was informed, did not want any—to relieve the terrible monotony of their painful existence. Some of the inmates were suffering acutely, and needed tender nursing and such devotion as the Moravian Brothers and Dominican Sisters bestow upon lepers in other hospitals. Several of the patients make pets of a harmless snake, a variety of python common to the island, which they keep in cages near their beds.

After I had been introduced by my conductor, and had exchanged salutations with a few words of inquiry, my interrogatories were as follows :—Where were you born? How long have you been a leper? When did you come to Robben Island? Have you had the smallpox? Have you been vaccinated? How long after vaccination did the leprosy appear?

The cook, Christian Choutsee, a native of Cape Town, said he had been a leper four years, and the leprosy broke out "two years after the doctor stuck me in the arms." The answers to the last question were "two years," "three years," "a few years," "two or three years," "after the second vaccination." "Was vaccinated in 1879; leprosy appeared in 1883." "Vaccinated three times, last vaccination during small-pox epidemic in 1878; leprosy attacked me in 1887." "Vaccinated twice, first when twenty years of age. Leprosy appeared between first and second vaccination." "Vaccinated during small-pox epidemic of 1878. Leprosy broke out on me about a year after." "Vaccinated when a boy of between eight and nine years of age; have been a leper fourteen years; present age, twenty-six."

After going through the several male wards, I took an opportunity of making calls upon several persons, including the clergyman, the superintendent of the male wards, and other officials. No one seemed to doubt that leprosy was spread by vaccination. The superintendent of the dispensary, who requested me not to publish his name, gave me particulars of the case of Augustus Lewis, of Cape Colony, who died of leprosy at Robben Island, the disease having been induced by vaccination. I had now been pursuing my inquiries several hours, and as the female leper ward was about a mile distant, and approached only by a rough, stony track, I was obliged, in order to keep my appointment with Dr. Impey, to forego my intended inspection of this department.

Dr. Impey is deeply interested in the pathological side of the leprosy question, and his position as superintendent of the largest leper institution in Africa affords him ample opportunity of pursuing his investigations. He has practised twelve years in South Africa as a District surgeon and Physician, and apart from his clinical experience gained through observations, and the medical care of the population of the island, he has found time to study the literature of the subject. He regards Dr. John D. Hillis's "Leprosy in British Guiana" as the most valuable and important work he has read. I called his attention to the cases of invaccinated leprosy cited by Dr. Hillis in the volume referred to, and he expressed no surprise at this, having come to a similar conclusion through his own personal researches in different parts of the Colony. Dr. Impey informed me that after careful investigation he had clearly traced to vaccination four out of twenty-eight cases of leprosy, which he had examined in the female ward. One of these still shows leprosy discolourations at the point of vaccine inoculation, the disease having exhibited itself two years after vaccination. Dr. Impey will continue his investigations as to the causation of leprosy amongst the remainder of the patients; a procedure, let me observe, almost unknown at similar institutions. It is needless to say that the report of these investigations will be awaited with much interest. Although a believer in the protective value of vaccination as a mitigator of small-pox, Dr. Impey has met with so many cases of invaccinated syphilis and leprosy that he has felt it his duty in his reports, extending over a period of eleven years, to point out the mischief already perpetrated by this mistaken procedure; and he has called upon the Government to legislate for the immediate and total suppression of arm-to-arm vaccination. Dr. Impey considers that leprosy is contagious by actual inoculation, cases of which had occurred at Robben Island, and that to a certain limited extent it is hereditary.

**CHAPTER 14: THE SEGREGATION OF LEPERS.**

So far, I have said nothing concerning the growing demand for compulsory segregation of lepers. It is admitted on all sides that the forcible deportation and confinement of well-to-do lepers would be impracticable, and already there are too many laws which are cruel and oppressive to the poor, but which, by the wealthy, are easily evaded. So far as the well-to-do are concerned, the law of enforcing segregation of lepers at Molokai, as I have already shown, is an admitted failure, and the act of separation of the poor from their friends is the most heart-rending and painful experience which, in a tolerably long life, I have ever witnessed.

In the "Report on Leprosy by the Royal College of Physicians, 1862," I find the following:—"The Committee, having carefully considered the replies already received, are of the opinion that the weight and value of the evidence they furnish is very greatly in favour of the non-contagiousness of leprosy. The Committee can only repeat the statement made in their former report to the College, that the replies already received contained no evidence which, in their opinion, justified any measure for the compulsory segregation of lepers." Acting on this opinion, the Duke of Newcastle issued a circular to the Governors of the Colonies, stating "that any laws affecting the personal liberty of lepers ought to be repealed, and any action of the Executive Government in enforcement of them, which is merely authorised and not enjoined by the law, ought to cease."

Dr. George L. Fitch, formerly Medical Superintendent, Leper Settlement, Molokai, Hawaii, says :—"Segregation began in 1866 in Hawaii, and since that time has been followed out with a really brutal severity. At no time since the inauguration of the system has the proportion of cases segregated fallen as low as one-half, so far as I could find out, and I had the fullest opportunity to know of any one. The white population there are terribly in earnest, and, as they control the policy of the country, they have exercised every ingenuity in this matter, so that it may be considered certain that an average of two-thirds, at least, have been for the entire period under a restraint much more pronounced than is the case in Norway. Yet there is not the slightest evidence that the disease has decreased; at least, I know of no such evidence. From all I hear from there, the proportion of lepers continues as great, if not greater, than it has been for years. That the disease does not manifest as severe symptoms as formerly is certain, but I know of no reason to believe that the percentage of those afflicted has lessened at all. On the contrary, both the total number, and the proportionate number of cases, would seem to have steadily increased. . . . Of late years, so bitter a feeling has grown up among them in opposition to segregation, that in quite a number of instances the lepers and their friends have risen in arms to resist the officers sent to apprehend them. . . . Bring these three facts together. In India, up to 1815, lepers were buried alive to get rid of them; and still the disease persists. In Norway the disease is disappearing without segregation, for putting two cases out of five into hospitals, where they are allowed to carry on their handicrafts, and selling the products to those outside, cannot be called segregation. In Hawaii, where as thorough segregation as the Government, aided by public opinion, can enforce, is carried out, the disease steadily increases." — *New York Medical Record, September 10, 1892. Art., "Etiology of Leprosy," p. 301.*

Dr. George Thin, in his recent work on "Leprosy," though an advocate for the seclusion of lepers, shows himself alive to the difficulties of compulsion. In pp. 257-8 he says :—"A law enforcing the compulsory isolation of lepers can only be effective in any country where leprosy is common, if it is strongly supported by public opinion. Those who have little practical experience of lepers and leprosy must not forget that for a considerable time, and often for years, the stricken member of a

family suffers comparatively little, requires little attention, is not specially repulsive in appearance, is as full of love for his parents and brothers and sisters, and in return is as much loved by them, as if he were not afflicted by the disease. To realise what compulsory isolation in an asylum of all the lepers in a country would mean, when such cases are considered, it is only necessary to apply in imagination the same law to consumptives when their disease runs a slow insidious course. What would the consequences be in England if a law were passed that every husband, or wife, or child, who developed a slight cough, attended with weakness, and in whom slight physical changes were detected in the apex of one lung, should, on the strength of what his probable fate would be several years afterwards, be immediately and forcibly conveyed from his family with no, or scarcely any, hope of ever again rejoining them? Imagine the evasion, concealment, and subterfuge that would be practised, and the difficulty, if not impossibility, of passing a law which would be effective! As a matter of fact, already, and with no compulsory isolation, in all but the very poor, leprosy is in most countries concealed as long as it is possible."

A medical practitioner who has resided several years at Honolulu and Molokai informed me that he personally knew of a number of well-to-do lepers, some occupying prominent positions, including several Europeans, who from political and other influences with officials of the Government were allowed to be at large, and it was not intended to disturb them. Nor is it considered possible to amend this partial method of dealing with the difficulty, especially as the natives do not believe in contagion. At the Leper Asylum in Ceylon, as also in the West Indies, I found that only the poor were segregated in the lazarettos, and in every country I have visited, the compulsory segregation of *all* lepers is considered impracticable. Moreover, the experience in Hawaii has been the reverse of encouraging. Mr. R. W. Meyer, agent of the Board of Health at the Leper Settlement, Molokai, in his report dated April, 1886, observes that segregation has now been practised for twenty years, and the result is that there are as many lepers as ever; more than at the commencement.

In an article in *The Lancet*, August 26, 1882, p. 318, commenting on a report on leprosy in Hawaii, and referring to the segregation of lepers, the writer says: "Nothing can, we think, call for action such as is described in certain parts of the report, and which has also called forth a protest by the Assistant Attorney-General of the kingdom. This gentleman describes how people supposed to have leprosy have been taken summarily from their houses by the police authorities, and have, without a moment's preparation, been ordered into boats, and conveyed across to one of the island settlements, where, as he says, they, are practically doomed to death."

That compulsory segregation cannot be carried out save by setting aside every humane feeling is admitted by those who are familiar with its operation. Thus, in his official report to the Board of Health, Honolulu, Mr. R. W. Meyer observes: "After the most careful consideration, I find that this is a question which involves a great principle, and which duty to oneself and his fellow-men alone should decide; a question which demands the absolute setting aside of every influence resulting from a feeling of sympathy with the unfortunate sufferers."

In the "Report of the Select Committee on the Spread of Leprosy in South Africa" I find the following:--

Q. 52. "Do you believe there will be much difficulty in compulsorily removing these people?"—"Yes, there will be great difficulty They will do what they can to conceal cases. They will steadily deny that any one in the house is affected by the disease I have found the most undoubted

and notorious cases denied. They have a great aversion to remove. Most of them are married, and, in addition to the natural repugnance at parting from their wives, their sexual passions are particularly strong—in fact, they become, both mentally and physically, a lower type."— *Witness*, Dr. H. C. Wright, June 27th, 1889, District Surgeon at Wynberg.

Q. 92. "Take the case of a respectable man, educated and intelligent, would you separate him from his wife and family and remove him from his home?"—" I am afraid there is no help for it."— *Witness*, Dr. Simons, District Surgeon of Malmesbury, July 4th, 1889.

Q. 192. "I think that husband and wife should be separated, and that is a hard case, but necessary."— *Witness*, Dr. Beck, of Roudebosch, July 4th, 1889.

### LEPROSY REPRESSION ACT.

Under this heading, the *Cape Times* of April 22, 1892, gives the following :—

#### ACT OF 1884 TO BE ENFORCED.

The Government have decided to promulgate the Leprosy Repression Act of 1884, and as at present decided the enforcement of the provisions of the Act will take place during the ensuing month. This action has doubtless been suggested by the disclosures of the census of a year ago, when the number of lepers in the Colony and the Transkei was shown to be 625—at least double the number casually reported from the various districts of the Colony. Since the taking of the census the number of known lepers has been increased to 664, and the promulgation of the Act will therefore necessitate the immediate provision of accommodation for the large number of sufferers who are still at large. The following will show the distribution of lepers in and out of hospital at the date of the census, in April, 1891 :—

#### IN HOSPITAL.

The Colony proper, as constituted in 1875: European or white, 21 —14 males and 7 females; other than European, 97 ;—77 males and 20 females.

#### OUT OF HOSPITAL.

The Colony, as constituted in 1875: Europeans, 30 ;—15 males and 15 females; other than Europeans, 256 ;—130 males and 126 females. Province of Griqualand West: Europeans, nil; other than Europeans, 17 ;—males, 12; females, 5. Transkeian Territories: Europeans, nil; other than Europeans, 204 ;—118 males and 86 females.

#### ROBBEN ISLAND.

A special report upon the lepers and accommodation for such upon Robben Island shows that, excluding the 54 coloured sufferers recently received from the Orange Free State, the number now on the Island is 162, of whom 16 are Europeans and 146 coloured persons. There are therefore over 500 lepers in the Colony, Griqualand West, and the Transkei still to be provided for. It is interesting in this connection to note that during the past year no fewer than 139 persons have voluntarily sought refuge within the leper wards of Robben Island Hospital. Of these 85 were males, 6 being European and 79 coloured persons. The European females admitted number 3 and the coloured females 51. During the same period 1 coloured male and 1 coloured female have been discharged from the island, whilst there have been 29 deaths, viz. Five European males and 16 coloured males, and 8 females, 1 white and 7 coloured. In view of the demand for accommodation, which will arise upon the promulgation of the Leprosy Repression Act, the wards at Robben Island are being largely extended, and we are informed that by the end of May the leper hospital will be completed and provision made for all the lepers known to exist in the Colony and the Province of Griqualand West. The Transkeian lepers, all of whom are coloured, will be centred at Engoobo, where a large asylum is now in course of construction.

The Leprosy Repression Act has since been promulgated in Cape Colony, and a systematic hunt for lepers has been carried on with the usual distressing concomitants—separation of parents from

children, husbands from wives, friend from friend. A considerable number of lepers are in close concealment, carefully hidden by their friends. The well - to - do lepers have not been molested.

[Index](#)

## CHAPTER 15: SELF-DEVOTION TO LEPERS

HEROISM and self-sacrifice in the interest of humanity, like that displayed by the brave Father Damien, are, happily for the human race, by no means of unusual occurrence, as is shown by the devotion of the Dominican Sisters at the Leper Hospital, Port of Spain, Trinidad; that of the Franciscan Sisters, from Syracuse, United States, at Molokai, Hawaii; and the Sisters from Montreal, who tend the lepers at Tracadie, New Brunswick.

Dr. M'Laren, Nova Scotia, in a paper on "Leprosy in New Brunswick," read before the Medical Society of that Province, says:—" In 1868 a community of nuns from the Hotel Dieu, Montreal, most unselfishly took charge of the nursing of the sick, and the work is done faithfully and cheerfully under the Sister-Superior Mother, Saint Jean, and the lepers are much better attended to 'than formerly. The patients have plenty of freedom with grounds of eleven acres to garden, fish, etc." —*Maritime Medical News, Halifax, Nova Scotia, July, 1890.*

Of another hero, the *St. James's Gazette*, London, September 30, 1891, says :—" The last mail from Japan brings news of the death of Father Testevuide, a Japanese Father Damien. He was a member of one of the French congregations, and was sent to work in the Japan mission field. In 1886, during his labours in the interior, he came across a case of leprosy, which so aroused his feelings that he determined to give himself up to the task of ameliorating the condition of Japanese lepers. A woman of about thirty years of age, having developed leprosy, was abandoned by her husband, and, as the disease advanced rapidly, she was placed in solitude in a loft over a rice mill. In course of time the ravages of the disease rapidly increased, and she lost her sight. In this condition she was found by Father Testevuide, who was working in the district. He visited her constantly and by reading and conversation sought to alleviate her misery; but he soon came to the conclusion that in her then condition she could receive but little relief unless she were placed in a hospital. There was no leper hospital in Japan, and the ordinary hospitals were naturally, for the most part, closed to such cases. From that time he devoted all his energies to the establishment and organisation of a leper hospital. Having succeeded in awakening public sympathy in the country, he collected sufficient money to build on the lower slopes of Mount Fujii a hospital which has for some years past been in full working order. His example was followed by some native philanthropists, and there are now three leper hospitals in the country. Father Testevuide's labours had undermined his health, which a visit to Hong Kong failed to restore, and he died there on the 3rd of August"

The Moravian Brothers have been sending missionaries of both sexes to live with and work among the lepers in the West Indies, in South Africa, and in Syria, devoting themselves sedulously but unostentatiously to this noble service during the past half-century. They were the pioneers in the effort to ameliorate the condition of these unfortunate sufferers. The Moravians have a leper asylum in Jerusalem, founded, managed, and largely supported by themselves.

The *Yorkshire Post* (Leeds), January 7, 1892, briefly refers to the death of an Anglo-Indian Father Damien reported from India. The victim was the Rev. W. D. Dalrymple, a Presbyterian missionary, who, having gone on a mission to lepers, contracted the disease some two years ago, and died last month at Rampur Beaulah, Bengal. Although his sufferings were indescribably great, he is said to have borne them with fortitude and resignation, and never once turned from the task he had set himself. Truly the age of martyrs is not past.

In the description of a visit to the Leper Hospital at Maracaibo, Venezuela, Consul Plumacher, of

the American Legation, in a recent report to his Government, says :—"It was truly a sad sight to see deformed, mutilated trunks, with scarcely vestiges of extremities, seated before the camera; and there was something pathetic in the almost universal request to be supplied with pictures of themselves, which could only be constant reminders of their hopeless afflictions. In addition to the individual photographs, various large groups were taken, with an effect both sad and grotesque. There is one bright spot, however, in the dark picture of misery; this being the devotion and self-abnegation displayed by the near relatives of many of the sufferers, who, although enjoying themselves the blessings of health and strength, cheerfully submit to perpetual imprisonment, in order to minister to the wants of their husbands, mothers, and other relatives, thus alleviating their woes by their companionship and care. Many examples of this are seen to-day on the lazaretto island, and it speaks well for human affection that, even when the loved one has become a loathsome mass, conjugal ties and the claims of blood rise superior to the fear of contagion and the repulsive surroundings."

Miss Kate Marsden's labours among the Maories in New Zealand, and her extraordinary journeys through Russia, and among the wild tribes in remote parts of Siberia, with a view of learning the condition of the outcast lepers in districts where the disease is prevalent, are well known through the reports in the *Times* and *Pall Mall Gazette*, which have been extensively copied in English and colonial journals. Miss Marsden's object is to learn by personal observation the condition of the lepers; to discover, if possible, methods of mitigating their sufferings, and to collect funds for the establishment of leper hospitals. Some time ago, Miss Marsden consulted M. Pasteur to see whether inoculation as a cure of the disease might not be resorted to. M. Pasteur held out no hopes of amelioration in that direction, nor did he suggest any other. It does not appear that Miss Marsden has made any inquiries regarding the effect of vaccine inoculation in disseminating the scourge, although, in districts like Dorpat in the Baltic provinces, the lepers are reported to be rapidly increasing, and already form as large a portion of the population as 17 per thousand. The growth of the disease has been co-incident with the development of the Jennerian practice. Miss Marsden's knowledge of the Russian language, and her earnest desire to get at the root of the evil, would enable her to break through official apathy, so obstructive of truthful research, should she be induced to undertake such a mission. It is surely as laudable to arrest one admitted source of the mischief as to prosecute an almost hopeless search for remedies.

Another lady, Mrs. Alice Hayes, has also done much to direct public attention to the neglected condition of the lepers in India, particularly the Europeans and Eurasians of Calcutta, who hide themselves and their sufferings from the public in the large cities, and refuse to consort with native inmates of existing institutions.

**CHAPTER 16: THE LEPROSY INVESTIGATION COMMITTEE.**

By reason of the reports of the serious increase of leprosy in various countries, and the public interest excited by the self-sacrificing labours and death of Father Damien, an influential committee was convened for the purpose of investigating the causes of this recrudescence.

The first meeting was held on the 17th June, 1889, at Marlborough House, under the presidency of the Prince of Wales. On the 13th January, 1890, a subscription dinner was held at the Hotel Metropole, London, at which more than a hundred persons interested in the project sat down, and subscriptions amounting to over £2500 were announced.

This fund ultimately reached about £7000. The following resolutions were adopted at a meeting of the General Committee held at Marlborough House on the 30th June, 1889:—

- (1) That a sum of £500 be appropriated to a memorial to be erected to Father Damien in some public place in the Hawaiian Islands.
- (2) (a) That a fund be formed, the interest of which shall be devoted to the medical treatment and care of indigent British lepers in the United Kingdom. (b) And that a sum of money be set apart and placed under the control of trustees for the endowment of two student-ships, one student to make the United Kingdom and the remainder of Europe his field of investigation, and the other to go abroad and study the disease in China, the Colonies, and elsewhere. The studentships to be held for a period of three years, to be renewed by the trustees if thought desirable.
- (3) That a Commission be appointed, for not less than one year, consisting of three members, one to be named by the Royal College of Physicians, one by the Royal College of Surgeons, and one by the General Committee of the National Leprosy Fund, to go out to India for the purpose of investigating the disease of leprosy there, and that the Indian Auxiliary Committee be requested to add two members to this Commission.

The following Commissioners were appointed :— *Nominated by the Royal College of Physicians*—

BEAVEN NEAVE RAKE, Esq., M.D. (London), M.R.C.S. (England), L.R.C.P. (London), Government Medical Officer and Medical Superintendent of the Trinidad Leper Asylum.

*Nominated by the Executive Committee of the National Leprosy Fund*— GEORGE ALFRED BUCKMASTER, Esq., M.A., B.Ch., M.D. (Oxford), D.P.H. (Diploma of Public Health, Oxford), M.R.C.S., L.R.C.P. (London), formerly Radcliffe Fellow Magdalen College, Oxford, Lecturer on Physiology, St. George's Hospital, London.

*Nominated by the Royal College of Surgeons*— ALFRED ANTUNES KANTHACK, Esq., B.A., B.Sc., M.B., B. S. (London), F. R. C. S. (England), and L. R. C. P. (London), late Clinical Assistant Royal Ophthalmic Hospital, London, and Midwifery Assistant, St. Bartholomew's Hospital, London.

*Appointed by the Viceroy of India*—

(The late) Surgeon-Major BARCLAY, Secretary to the Surgeon-General to the Government of India. Surgeon-Major S. J. THOMSON, Deputy Sanitary Commissioner of the Second Circle in the North - West Provinces and Oudh.

The following order appeared in the *Indian Government Gazette* of the 21st November, 1890:—  
EXTRACT from the Proceedings of the Government of India in the Home Department (Medical), under date, Calcutta, the 21st November, 1890.

## RESOLUTION.

The Executive Committee of the National Leprosy Fund having determined to appoint a Commission for the purpose of investigating the disease of leprosy in India, it is notified for general information that Dr. Beaven Rake, Mr. Kanthack, and Dr. Buckmaster (their full titles and qualifications are set out in the resolution) have been appointed

Commissioners. These gentlemen have now arrived at Bombay, and have been joined there by Surgeon-Major A. Barclay, M.D., Secretary to the Surgeon-General with the Government of India, and Surgeon-Major S.J. Thompson, Deputy Sanitary Commissioner, North-Western Provinces and Oudh, who have been appointed by the Government of India to co-operate with them. The Governor-General in Council will feel obliged if public bodies and individuals desirous of producing evidence before the Commissioners will address the Local Government of the Province to which they may belong, in order that arrangements may be made for the presentation of such evidence before the Commissioners. Each Local Government has already been requested to depute an officer to assist the Commission in collecting and arranging the evidence that may be procurable in the territories under its control, and instructions should be given to all the civil and medical officers to give to the Commissioners any aid which they may ask for in the course of their inquiries. The Government of India will, on learning from the Commissioners the programme which they intend to follow, notify it for public information.

#### ORDER

Ordered, that a copy of this resolution be forwarded to Local-Governments and Administrations, in continuation of the communication from this office, No. 11 Medical, 596-605, dated 15th September, 1890, to the Surgeon-General with the Government of India, and to the Members of the Leprosy Commission for information. It will be convenient if the Commissioners will address the Surgeon-General with the Government of India on any point on which they may desire to receive further assistance or information.

Also, that the resolution be published in the supplement to the "Gazette of India." (True Extract). (Signed) C. J. YALL, *Officiating Secretary to the Government of India.*

The Leprosy Commissioners, who left England for India on the 23rd October, 1890, completed their inquiries in the autumn of 1891, and prepared their report; but its publication has been delayed, ostensibly on the ground that the Committee of the National Leprosy Fund were waiting the issue of the Indian census returns as regards leprosy. It appears, however, from the facts disclosed in the following circular, issued in June, 1892, that several of the most important conclusions arrived at by the Commission are strongly objected to.

#### NATIONAL LEPROSY FUND.

##### *Memorandum on the Report of the Leprosy Commissioners.*

Your Committee, having been instructed to consider and report to you upon the publication of the Report of the Leprosy Commissioners in India, in 1890-91, beg to submit the following considerations :—

- I. They desire to place on record their sense of the ability with which the Commissioners conducted their investigations while in India, and of the comprehensive and valuable nature of their Report.
- II. The conclusions at which the Commissioners arrived have been summarised by them at the end of their report as follows—the evidence upon which these conclusions rest being displayed at length in the earlier pages of the Report :—

(1) "Leprosy is a disease *sui generis*; it is not a form of syphilis or tuberculosis, but has striking aetiological analogies with the latter."

(2) "Leprosy is not diffused by hereditary transmission ; and for this reason, and the established amount of sterility among lepers, the disease has a natural tendency to die out."

(3) "Though, in a scientific classification of diseases, leprosy must be regarded as contagious, and also inoculable, yet the extent to which it is propagated by these means is exceedingly small."

(4) Leprosy is not directly originated by the use of any particular article of food, nor by any climatic or telluric conditions, nor by insanitary surroundings; neither does it-peculiarly affect any race or caste."

(5) "Leprosy is indirectly influenced by insanitary surroundings, such as poverty, bad food, or deficient drainage or ventilation; for these, by causing a predisposition, increase the susceptibility of the individual to the disease."

(6) "Leprosy, in the great majority of cases, originates *de novo*, that is, from a sequence or concurrence of causes and conditions, dealt with in the report, and which are related to each other in ways at present imperfectly known."

III. Thirdly, the Commissioners having been instructed to report upon the practical measures to be taken for the control or restriction of the disease in India, have suggested the regulation of lepers and leprosy by means of bye-laws framed by the various municipalities, which point they write as follows :—

(a) "The Commission are of opinion that the sale of articles of food and drink by lepers should be prohibited, and that they should be prevented from practising prostitution, and from following such occupations as those of barber and washerman, which concern the food, drink, and clothing of the people generally, quite apart from the dread a possible infection."

(b) "The Commission consider that the best policy in dealing with the concentration of lepers in towns and cities is to discourage it, and to this end would suggest that municipal authorities be empowered to pass bye-laws preventing vagrants suffering from leprosy from begging on or frequenting places of public resort, or using public conveyances."

(c) "The large presidency towns and the capitals of provinces in many cases already possess leper asylums, which might be enlarged by municipal funds or private subscriptions. Asylums should be built near towns where they do not already exist, and the authorities should have of ordering lepers infringing the regulations either return to their homes or to enter an asylum."

(d) "Competent medical authority should always be consulted before action is taken under such bye-laws."

IV. Upon the afore-mentioned conclusions of Commissioners, numbered 1, 2, 3, 4, 5, and 6, your Committee offer the following remarks :—

They desire to express their disagreement with the concluding words of No. 3—

"That the extent to which leprosy is propagated by contagion and inoculation is exceedingly small"—  
not being satisfied with the evidence offered by the Commissioners for this opinion.

They cannot concur in the views expressed in No. 6,— namely, that

\* "Leprosy, in the majority of cases, originates *de novo*, that is, from a sequence or concurrence of causes and conditions, dealt with in the report, and which are related to each other in ways at present imperfectly known,"

[\\* See page 304](#)

being of opinion that the evidence adduced does not justify such conclusions.

V. The Commissioners, in the section of their Report entitled "Practical Suggestions," pp. 45 2-7, as also in other parts of the Report, have expressed opinions strongly adverse to compulsory segregation, either complete or partial. For instance, they say on p. 258—

"No legislation is called for on the lines either of segregation or of interdiction of marriages with lepers."

And on p. 453— "For India, complete compulsory segregation of lepers may be considered to be absolutely impracticable. Neither do the conclusions given before as to the nature of the disease

justify any recommendation for absolute segregation."

And on p. 454— "It is impossible, for the same reasons, to advise compulsory partial isolation. Voluntary isolation is therefore the only measure left for consideration."

And on p. 456—

"In no case would the Commissioners suggest an Imperial Act especially directed against lepers as such."

And again on p. 456—

\*\* "In conclusion, the Commissioners believe, from the considerations and arguments adduced in the foregoing report, neither compulsory nor voluntary segregation would at pro effectually stamp out the disease, or even markedly diminish leper population, under the existing conditions of life in India."

[\\* \\*see page 304](#)

Your Committee, having already expressed inability to accept the reasoning upon which Commissioners have based the above conclusions, equally unable to accept the corollary that in any case of leprosy in India is either impracticable or undesirable. They entertain a precisely opposite opinion, and would be sorry if the Government of India encouraged by the report of the Commissioners to from taking the necessary steps in the direction of such segregation of lepers as may be found possible. opinions upon segregation are in accord with expressed in the following extract from a by Dr. Vandyke Carter :—

#### MODES OF SEGREGATION.

I. "By erecting plain asylums at certain centres, each of which would be a refuge common to several districts, and a place detention, tinder due management and supervision."

II. "By founding leper colonies, or village communities of the affected, who, while allowed more liberty of movement, should yet be prevented from mingling with the peasantry around: hence still the need of strict supervision. Many spots would serve—such as deserted forts, decayed villages, and places waste, yet not far from other sources of supply, or not without resources easily resuscitated."

III. "By requiring the strict isolation of leprous subjects retained in their homes at express wish of friends. Suitable separate lodgment would be indispensable; unsuitable shelter is even now sometimes supplied. Joining of such home-isolation with more public measures should not be overlooked, for to it experience in Norway seems to point as a means essential to complete success within a moderate period of time; and in India it would have to be still more largely resorted to."

IV. "For carrying out the above, in addition to funds, legislative authority is needed to take up the vagrant sick, to remove the sorely diseased who is insufficiently guarded at home, and at times to enforce continued isolation of the infected until medical sanction of liberty be granted."

VI. Reserving their opinions as expressed in the foregoing paragraph and extract, your Committee give a general approval to the minor recommendations of the Commissioners, numbered above as (a) (b) (c) (d), for the regulation of lepers and leprosy in India, which they consider might with advantage be carried out; though they do not concur in the opinion that municipalities will be necessarily or universally the best means of effecting that object.

*Nominated by the Executive Committee of the National Leprosy Fund—*  
GEORGE N. CUEZON (Under-Secretary for India), *Chairman.*  
EDWARD CLIFFORD.

*Nominated by the Royal College of Physicians—*

DYCE DUCKWORTH, M.D., LL.D.

G. A. HERON, M.D., F.R.C.P.

*Nominated by the Royal College of Surgeons—*

JONATHAN HUTCHINSON, LL.D., F.R.S. (*With the exceptions noted below.*)

N.C. MACNAMARA, F.R.C.S.

\* Upon this paragraph Mr. Hutchinson appends a dissentient opinion, as follows :—

"I understand the Commissioners to mean by the expression '*de novo*' in reference to the origin of leprosy, that they believe that the disease may begin independently of personal contagion and in connection with climatic and dietetic causes. In that belief I entirely share. I also agree in the main with the rest of the statements in the Commissioners' Report to which exception has been taken in our Committee. I feel convinced that if leprosy be contagious at all, it depends but to an almost infinitesimal extent upon contagion for its spread." JONATHAN HUTCHINSON, LL.D., F.R.S.

\*\* Upon this paragraph of the Report, Sir Dyce Duckworth and Mr. Hutchinson append independent or dissentient opinions, as follows :—

"I am in agreement generally with the recommendations of the Commission respecting *voluntary isolation*, and the issue of *Municipal Bye-Laws* regulating the habits of lepers. I know of no trustworthy evidence to prove that a leper in any community is a source of greater danger than is a consumptive patient, and I know that a person suffering from syphilis is a real and very positive source of danger anywhere. It would therefore be absurd on the face of it to adopt stringent laws for the leper and to let the syphilitic person go free.

"The intelligent layman now imagines that because bacilli are an essential feature of leprosy, therefore the disease *must* be readily contagious. This is simply quite contrary to fact. The same thing holds good exactly for consumption.

"I think a well-empowered and vigorously-supported Government Medical Executive Officer should be appointed in every large town, and in certain districts, to supervise the leprous populations and report regularly upon them. It should be his business to see that the local regulations are fully carried out, and on his requisition only should any action be taken when necessary.

"Suitable asylums should be provided, and those now existing be sufficiently enlarged to meet the needs that will arise under suitable bye-laws.

"The project of leper-farms is, I think, a good one. More than this is, I believe, not within any practical scheme for amending the condition of lepers, and for diminishing the spread of the malady." DYCE DUCKWORTH, M.D., LL.D.

"I am strongly in favour of the maintenance (by Government or otherwise) of voluntary homes for lepers, but do not believe that segregation would effect anything in diminishing the prevalence of the disease. Compulsory segregation would I think involve injustice and entail much social misery. I believe that our Commissioners Report well expresses not alone the opinions of those who have signed it, but, in a general way, those of the educated classes of the present day throughout India." JONATHAN HUTCHINSON, LL.D., F.R.S.

#### ADDITIONAL REPORT.

"Your Committee having also been instructed to report upon the disposal of the balance of £800 still remaining to the account of the Executive Committee, recommend that a sum of £250 should be set apart for the prosecution of further investigations and the continued half-yearly publication of the journal for a period of five years, or until such time as this sum is exhausted; and that the remaining £550 should be devoted to the encouragement of local research in countries where there is reasonable evidence for believing that leprosy has recently originated, or where it exists under very exceptional circumstances—with the view of tracing the disease to its alleged origin."

It may be observed that for the Commissioners to have allowed that leprosy is easily inoculable (as is shown in this volume upon the evidence of accepted authorities in all parts of the world) would

have been equivalent to the admission of the danger in all leprosy countries of the invaccination of leprosy. Such an avowal would have been inconsistent with the course adopted by the Commissioners and by the Committee of the National Leprosy Fund during the whole of this important inquiry, both of whom have practically ignored the evidence bearing upon the subject. When visiting Calcutta, for example, nothing would have been easier than for the Commissioners to have investigated the cases circumstantially reported by Dr. Roger S. Chew, which will be found in another chapter of this book. Having ignored these cases, one of the Commissioners, Dr. Beaven Rake, immediately on his return from India, gave evidence before the Royal Commission on Vaccination to show that leprosy was not communicable by vaccination, or, if so, only to so slight a degree that the danger might be disregarded. How far Dr. Rake's testimony has stood the test of cross-examination will be gathered by reference to the evidence in the Blue Book which had not been issued at the time of this writing.

On the subject of inoculation, the Commissioners conclude :—" The extent to which leprosy is propagated by contagion and inoculation is exceedingly small." It is a pity that the Commission should have bundled these two dissimilar sources of alleged causation together, as they cannot consistently be so treated. Nor have they defined the word "contagion," which many authorities, as I have shown, habitually use to cover inoculation. The dissemination of leprosy by *contagion*, using the word in its proper sense—i.e., by simple contact—has been disproved by eminent authorities, including superintendents of leper asylums of wide experience in all countries, as will be seen by reference to the chapter in this book entitled "Is Leprosy Contagious?" On the other hand it is conclusively established by a similar weight of evidence that leprosy is inoculable, and like other transmissible diseases can be propagated through a cut, sore, wound, or abraded surface, or be inoculated by flies and mosquitos, or spread by vaccination. Another point in which the Committee dissent from the views of the Commissioners is that of compulsory segregation or compulsory isolation, which they consider uncalled for by the evidence collected during their tours of investigation, or by the nature of the disease, and are of opinion that it would be impossible to stamp out the disease by either voluntary or compulsory segregation. The Committee of the National Leprosy Fund do not accept either the reasoning or conclusions upon which these recommendations of the Commissioners are founded. On the contrary, they are of the opinion that the segregation of lepers should be encouraged as far as possible in the interest both of the lepers and of the public. The Committee conclude by declaring that they can give only "a general 'approval to the minor recommendations of the Commissioners" on this point. Both the Committee and the Commissioners accept the important fact that leprosy is not diffused by hereditary transmission.

Setting aside the alleged leading causes of leprosy, such as heredity, contagion, and inoculation, as contributing little or nothing to the spread of this disease, the Commissioners resort to a theory which, up to the present time, has received but little countenance from the medical profession, that "leprosy in the great majority of cases originates *de novo*, that is from a sequence or concurrence of causes and conditions, dealt with in the Report." The present writer considers it highly probable that leprosy as well as other diseases may in numerous instances be accounted for in this way, but it must be observed that the factors, which are various forms of insanitation, have been in operation time out of mind, and do not in any way account for the remarkable recrudescence of the disease shown in this volume. On the contrary the danger from malaria, overcrowding, impure water, unwholesome food, filthy deposits, has, under the instructive teachings of the late Dr. Southwood

Smith, Sir Edwin Chadwick, and their followers, been gradually and sensibly diminishing, and it is triumphantly claimed that various diseases due to these causes have been decreasing also. It is obvious, therefore, that some other factor or factors, peculiar to this century and previously unknown, are at work. This factor, as high authorities now reluctantly avow, has been omitted by the Commission from the list of causations in their summary of conclusions—the latest and most daring official effort, to use a classic phrase, "to preserve vaccination from reproach."

Amidst this divergence of opinion between the conclusions of the Leprosy Commissioners and those of the Committee, the public will want to know what useful object has been realised by the large expenditure of time and money in promoting this lengthened inquiry. Will the authorities accept the conclusions of the Leprosy Commission, when they affirm that "the extent to which leprosy is propagated by contagion and inoculation is exceedingly small ;" or the opposite views entertained by the eminent members of the Committee of the National Leprosy Fund, who declare their disagreement with these amongst others of their conclusions?

The Leprosy Commissioners (all ardent supporters of the Jennerian practice) have searched far and wide for a rational theory that will account for the recent spread of leprosy in certain countries, but have utterly failed to discover one, and are almost driven to the conclusion that touches closely upon the facts collected in this volume. Under the head of "Transmission through an Intermediary Host," one of their number, Dr. Beaven Rake, says :—" There is at present no direct evidence to support this hypothesis, but it seems that some such theory might explain the alleged rapid increase of leprosy in Hawaii and New Caledonia."—*Journal of the Leprosy Investigation Committee*,. No. 1, Aug., 1890, pp. 50,51.

To the present writer, vaccination seems to be the only intermediary host that passes direct into the blood (except in rare instances of accidental inoculation), and which covers all the facts of the case.

It appears that of the £7000 collected £800 remains, part of which it is suggested should be devoted to further investigation. It is to be hoped, if this is adopted, that less prejudiced and more competent inquirers will be appointed, and that in the future numbers of the *Journal* the accumulation of evidence, so shamefully ignored, showing how leprosy has been spread at the point of the vaccinator's lancet will find a place.

[Index](#)

**CHAPTER 17: LEPROSY INCURABLE—HYGIENE THE ONLY PALLIATIVE.**

LEPROSY has been regarded in every age and in every country as an incurable disease.

In the *Encyclopedia Britannica*, leprosy is described as an incurable constitutional disease, marked externally by discoloured patches and nodules on the skin, and deeply implicating the structure and function of the peripheral nervous system.

How improbable was all hope of cure of leprosy may be inferred from ancient customs in various countries, notably in France.

Dr. Macnamara in his work on "Leprosy," p. 36, cites authorities to show that the leper was expelled from society, and looked upon as dead.

He observes :—" The leper was not looked upon in the eye of the law alone as defunct, for the Church also took the same view, and performed the solemn ceremonials of the burial of the dead over him on the day on which he was separated from his fellow-creatures and consigned to a lazar-house. He was from that moment regarded as a man dead amongst the living, and legally buried, though still breathing and alive. The ritual of the French Church retained till a late period the various forms and ceremonies to which the leper was subjected on the day of his living funeral. Ogee and Ploucquet have both described them.

"A priest robed with surplice and stole went with the cross to the house of the doomed leper. The minister of the church began the necessary ceremonies by exhorting him to suffer, with a patient and penitent spirit, the incurable plague with which God had stricken him. He then sprinkled the unfortunate leper with holy water, and afterwards conducted him to the church, the usual burial verses being sung during their march thither. In the church the ordinary habiliments of the leper were removed; he was clothed in a funeral pall; and while placed before the altar between two trestles, the *Libera* was sung, and the mass for the dead celebrated over him. After this service he was again sprinkled with holy water, and led from the church, to the house or hospital destined for his future abode. A pair of clappers, a barrel, a stick, cowl, and dress, etc., etc., were given to him. Before leaving the leper, the priest solemnly interdicted him from appearing in public without his leper's garb; from entering inns, churches, mills, and bake-houses; from touching children, or giving them aught he had touched; from washing his hands, or anything pertaining to him, in the common fountains and streams; from touching in the markets the goods he wished to buy with anything except his stick; from eating or drinking with others than lepers; and he especially forbade him from walking in narrow paths, or from answering those who spoke to him in the roads and streets unless in a whisper, that they might not be annoyed with his pestilent breath, and with the infectious odour which exhaled from his body; and last of all, before taking his departure and leaving the leper for ever to the seclusion of the lazar-house, the official of the church terminated the ceremony of his separation from his living fellow-creatures, by throwing upon the body of the poor outcast a shovelful of earth, in imitation of the closure of the grave."

Referring to more recent events, I find that in the report of the Special Sanitary Committee on the state of the Leper Settlement at Kalawao, Hawaii, 1878, addressed to the Hon. G. Rhodes, President of the Legislative Assembly, so little expectation of cure was there, "that lepers have to pay for their own coffins, and have formed a coffin association in order to provide a common fund for their proper interment, and these sad creatures get up, as shown by the register of the Hospital, 'Coffin

Feasts,' on which occasion money is contributed to provide for a decent termination of their woes."

Alluding to the disappearance of leprosy in England, Gilbert White observes in a letter to Mr. Barrington

"This happy change perhaps may have originated and been continued from the much smaller quantity of salt meat and fish now eaten in these kingdoms; from the use of linen next the skin; from the plenty of better bread; and from the profusion of fruits, roots, legumes, and greens, so common in every family." It may also be added that, at the time when leprosy disappeared from this country, the practice of inoculation and vaccination was unknown, otherwise there is little doubt that leprosy would have been perpetuated in England by the empoisoned lancet, as it is now in the West Indies, British Guiana, India, New Caledonia, the United States of Colombia, Venezuela, and Hawaii.

Commenting upon the Royal College of Physicians' Report, Drs. Tilbury Fox and Farquhar observe that:

"The cause of leprosy is as obscure as ever, and upon this particular matter the leprosy report gives us very little satisfactory explanation, beyond illustrations of the general statement that leprosy disappears *pan passu* with an improvement in the hygienic condition and diet of a people, and the cultivation of land in districts where it has abounded."—*India Office Report, London, 1872, p. 28.*

Sir Erasmus Wilson, in his article on "Leprosy" in Quain's "Dictionary of Medicine," refers to the various drugs which are recommended and used by one physician or another—quinine, strychnine, phosphates, nitric acid, acetic and carbolic acid, iodine, arsenic, perchloride of mercury, *asclepias gigantea*, *hydrocotyle asiatica*, *veronica quinquefolia*, *plumbago rosea*, acid nitrate of mercury, *potassa fusa*, acrid irritating oil of the shell of the cashew nut, chloride of zinc, etc. In no case is it mentioned that a cure is effected, or even to be expected, but rather the other way. "Hope," he says, "will gleam in the mind of the physician and patient; but cure, alas! is as distant as ever."

Dr. P. Abraham, the Secretary of the Leprosy Investigation Committee, who is familiar with all medical literature on the subject, gave his opinion at a discussion "On the Cure of Leprosy" before the Royal Medical and Chirurgical Society, May 27, 1890, that "the disease was probably not curable; though it might abort and die out."—(*British Medical Journal* May 31st, 1890.) And on another occasion he observed that therapeutic agents had proved failures and that there was no specific for the disease.

In a report of the Paris Congress of Dermatology, 1889, printed in the *Journal d Hygiène*, October 23rd, 1890, the subject of leprosy was discussed.

M. Cornil observed: "We must not confound a passing amelioration, a diminution or attenuation of the malady, more or less prolonged, with cure properly so called."

Consul-General Abbott, in a letter dated June 8th, 1891, Rio de Janeiro, says: "I do not think any radical cure for leprosy has yet been discovered."—*Journal of the Leprosy Investigation Committee, No. 4., December 1891i, p. 18.*

## HAWAII.

The health authorities in Hawaii, as well as the most experienced medical residents elsewhere, consider leprosy as practically incurable, though they acknowledge that life may be prolonged by

good food, pure water, healthy habitations, and other favourable sanitary conditions. On one occasion, referring to the reports of certain medical practitioners as to their alleged and officially reported cures, I was told by one of the responsible officials that the cures were mythical, the particular cases cited having since exhibited further development of the disease.,

It is alleged that the external manifestations of leprosy, like those of some other maladies, disappear for a time, either with or without treatment, and cures are noised abroad; but the disease invariably reappears, and shows itself when least expected.

In the year 1866, the disease had begun to assume alarming proportions in the Sandwich Islands, and the people strongly suspected that the increase was partly, if not largely, due to vaccination. I am unable, however, to find any medical admission of the fact, until some years later. A law was passed in 1868, declaring the disease to be contagious, and requiring all lepers to be removed to the Island of Molokai, where the Government had set aside a piece of land on the northern side for a leper settlement. The preparations for the reception of these unfortunate people were, at first, of the rudest description. The patients were lodged in the cottages of the few Kamaainas, or freeholders on the estate, and were without any appropriate nursing or attendance; and, according to the evidence of Mr. Ambrose Hutchinson, who in 1884 was Under-Superintendent, as the disease was considered incurable, it was the custom to send along with each patient, by the same conveyance, the coffin he was soon to occupy.

The report of the Honolulu Board of Health to the Minister of the Interior for 1876 states (page 77) that the Legislature of 1874 made an appropriation of six thousand dollars towards the expenses (for curing leprosy) of Drs. Powell and Akana, who were offered every facility to try their skill. Six patients were experimented upon with various drugs. Dr. Akana claimed to have cured one, who was subsequently examined by a number of physicians and sent to Kalawao as a confirmed leper. The Board reported that all attempts to cure any patient afflicted with leprosy had failed.

In an address delivered by Mr. Dole on the subject of "Leprosy in the Hawaiian Islands," which the *Boston Medical and Surgical Journal* of May 15, 1884, commends to the attention of the National Board of Health, United States, is the following description of this malady :— "Leprosy is the worst known disease of the present and historic times. It has successfully defied medical skill. Physicians have not been able to say whence it comes, or to explain its laws. It has always and every where been found to be incurable. It attacks all races and all classes; no rank in life is safe—adults and children are alike exposed to its ravages. Medical skill can , make no limit; no assurance can be given from the lessons of experience against this most terrible, most loathsome, and most hopeless of all human diseases."

Dr. A. W. Saxe, in a card published in the *Hawaiian Gazette* of May 23, 1883, says that for leprosy there is no known cure.

In a paper on "Leprosy in Hawaii," published in the *Occidental Medical Times*, April, 1889, Dr. F. B. Sutliff, the writer, sums up the results of his experience in the Island of Maui, Hawaii. "Treatment," he observes, 'of any kind had, so far, proved useless. Improvement which has been noted in many cases is only temporary;" and again, p. 208, "The disease is hopelessly incurable, and certainly fatal."

In the biennial period ending 1881, the report of the Board of Health states that an appropriation of

\$20,000 was made by the Legislature of Honolulu for the cure of lepers, or \$200 each; but no cures were effected, though numberless experiments on these unfortunates were tried, causing much suffering, and in one case the suicide of the victim experimented upon.

In his report to the Board of Health, dated November 14, 1885, and addressed to His Excellency W. M. Gibson, Dr. Edward Arning observes :—" There is scarcely a drug in the pharmacopoeia, at least scarcely a class of drugs, that has not been most systematically tried in the treatment of leprosy. Over and over again men of sanguine temperament have found what they called, a specific cure, but in every instance calm and unbiased judgment has afterwards pronounced a verdict of uselessness."

This distinguished authority also observes :—" I am fully satisfied that Dr. Unna has as yet not succeeded in perfecting a cure of leprosy in a single case. He himself has told me that one of the published cases of complete cure has since suffered a relapse."—*Biennial Report, Board of Health, Honolulu, 1892, p. 5.*

Leprosy is not confined, as many suppose, to native Hawaiians. Dr. E. Arning says :—" Among the white population, numbering 17,935, I knew of thirty-five leprosy cases."

Dr. N. B. Emerson, a lepra specialist of Hawaii, says:—" In spite of a number of claims to the contrary, we believe it safe to say. that no one has been able to prove, to the satisfaction of the medical profession, that a single case of this disease has been definitely cured."

In a volume entitled "Leprosy in Hawaii," published by the Hawaiian Government at Honolulu, 1886, p. 73, it is said :—" Experiments are carried on constantly on patients at Kalihi, and on very incipient, or rather doubtful cases, at their own homes. Though some patients have certainly improved a .great deal under careful treatment, we cannot, for the present, state one case of cure."

Dr. Prince A. Morrow, of New York, in "Personal Observations of Leprosy in Mexico and the Sandwich Islands," says, p.5:—" We know that leprosy has a prolonged, but somewhat indefinite, period of incubation, a slow and irregular course of development, a characteristic and well-defined symptomatology rendering its diagnosis easy, and that its prognostic significance' is most grave. It progresses almost invariably to a fatal termination."

Dr. Hoffman, of Honolulu, alluding to the Leper Hospital at Kalihi, of which he had charge for some years, reports that generally fifty cases were under treatment from time to time, these being 'equally divided between the tubercular and the anaesthetic. He says :—"I found no permanent benefit from treatment; better food and cleanliness, medicine suited to improve the general health of the leper, ameliorated the disease temporarily."—*Report on Leprosy, Honolulu, 1886 p 75.*

Dr. Arthur Mounitz, Resident Physician and Medical Superintendent of the Leper Settlement, Molokai, in his Report, dated Molokai, February, 1886, says of the Kalawao Hospital, where the worst cases are supposed to be accommodated :—"Of course, there are no cases of cure, and those who enter its portals remain until death releases them ;" and under the head of "Treatment," says:

"This is the briefest question of any to deal, with, but the most disheartening to a physician; for, so far, no remedy has been found beneficial." Dr. E. Cook Webb physician to a branch hospital at Kakaoko, in his report, dated March 1st, 1886, says:—" As regards the treatment of leprosy, I have but little to say. Notwithstanding any treatment which I have used, or seen used,. 'I cannot see any change in any single case.' I am fully convinced, after considerable study and experience, that

personal cleanliness, good nourishing food, and regular habits have done more towards the relief of these unfortunates than all the medicines that have ever been prescribed for them in the past. In all the cases of leprosy. I have seen, the disease has steadily progressed to a fatal termination, notwithstanding all treatment. I am aware that I am taking strong ground against the many so-called 'cures' that have been devised, but in so doing I am not basing my opinion on my own study and experience alone, but on the medical opinions of those who for years have been in daily contact with the disease, and have made it a special study, and they 'have come to the conclusion that it is a disease *sui generis*, and incurable."

In the report of the President of the Board of Health, addressed to the Legislative Assembly, Honolulu, 1886, p. 49, in reply to the question, "Is Leprosy Curable?" Mr. F. W. Hutchinson says :—" To this question we are constrained to answer 'No!' At least not under any' known treatment."

Dr. Sidney Bourne Swift, late Resident Physician of the Leper Settlement, Kalawao, Molokai, Hawaii, in his report to the President of the Board of Health, refers to the failure of medical treatment and the numerous alleged cures reported by experimental bacteriologists. "What has become of the cases cured by Fitch, by Arning, by Goto, and by Lutz? Come to the Settlement and you will see them in their graves."—*Biennial Report of the President of the Board of Health to the Legislature of the Hawaiian Kingdom, Honolulu, 1892, p. 87.*

#### THE WEST INDIES AND BRITISH GUIANA.

Dr. Gavin Milroy, in the "Report on Leprosy and Yaws in the West Indies," published in 1873, p. 43, observes:—" We have already seen that in the Barbados Asylum several of the patients had been benefited when no medicinal remedies whatever had been used, the good results being attributed solely to the more regular mode of life, better supply of food, and better housing since their admission, and to their withdrawal from all occasions of intemperance on the one hand, and of destitution on the other. Like effects have been 'observed in the asylums of other Colonies."

On pages 99 and 100, Dr. Milroy says :—" There is a unanimous accord of opinion that the greatest benefit is derived from the adoption of hygienic measures, and that by improving the general conditions, physical and moral, of the leprosy poor, very much may be done to retard or arrest the malady in its early stages, and also to mitigate its severity when more fully developed. Medicinal treatment is universally admitted to be, of no avail, unless combined with the regular use of a nutritive, unstimulating diet, suitable clothing, protection against the vicissitudes of weather, personal cleanliness, and exercise in the open air. There. is certainly no medicinal substance, vegetable or mineral, which exerts anything like a direct or specific effect on the malady.....

"The evidence is all but unanimous that leprosy very rarely, if ever, manifests any tendency to a spontaneous cure. When fully developed, a complete recovery is not to be looked for. It is quite apparent, however, that the progress of the disease may often experience a marked retardation of arrest when the patient is maintained in a favourable hygienic condition."

Dr. J. F. Donovan, Superintendent, Leper Home, Jamaica, in his annual report for 1891, says :—" For curative purposes, I think most authorities will acknowledge that we must look for some other method besides. the administration of medicinal remedies, as drugs have been tried extensively and persistently, and have so far signally failed of effecting a cure of this formidable pest." — *Supplement to Jamaica Gazette, 18th June, 1891.*

In the same report, Dr. Donovan makes the following' statement as to the condition of patient No. 5, afflicted with tubercular leprosy :—" After medical treatment, the scaly eruption about the flexor aspect of joints has. disappeared, the plagues of tubercle on face, forehead, etc., and the enlarged inguinal glands are in *statu quo* after a month's steady use of the inunction and mixture. Symptoms of pulmonary phthisis set in when the gurjun oil was discontinued, as it caused nausea, and subsequently diarrhoea ensued, which the patient attributed to the medicine. A variety of drugs were used to combat the hyper-pyrexia, but without effect."— *Supplement to the Jamaica Gazette, June 18th, 1891, page 81.*

Under the head of "Cure," Dr. J. F. Donovan observes in the same report :—" In some cases the tubercles decrease for a time; in a few years, it may however' be mentioned, that the tubercles have been known to subside spontaneously in some patients for a time, who. have been taking no medicines; so too the tubercles may enlarge and increase in numbers during the administration of the drug, as was evidenced in three of our most prominent cases at the 'Home."

"There are few diseases which are less amenable to treatment than leprosy; the entire armoury of known drugs has been tried," says this medical superintendent, and found ineffective."

I may here observe that Dr. Koch's much vaunted tuberculin has been tried in almost every leprosy country on the globe, and found worse than useless. Much suffering has been caused by its use. The *Madras Times*, October 28, 1891, reports the visit of His Excellency Lord Wenlock to the leper hospital in this city, when his lordship had pointed out to him several patients upon whom Dr. Koch's lymph treatment had been tried. One of the patients complained that the experiment had subjected him to excruciating pain.

Dr. W. V. M. Koch, Acting Medical Superintendent, Leper Asylum, Trinidad, says :—" During the past year there has been scarcely any advance made in the treatment of this disease (leprosy) and it continues to baffle 'the most skilful physician. Various new remedies have been tried, but without success."

"No drug has yet been used which exerts a specific action on leprosy."—*Appendix to Report on Leprosy and the Trinidad Leper Asylum, 1891, pp. 72, 73.*

In the appendix to Dr. Beaven Rake's report on Leprosy and the Trinidad Leper Asylum," dated Maraval, February 4th, 1890, it is admitted that the inoculation of animals has proved a failure, and human beings are required as clinical material for experimental purposes. Dr. Rake, p. 36, says :—" If the Home 'Government could see its way to sanction the inoculation with leprosy of two or three condemned criminals in Trinidad, and the commutation of their capital sentences to imprisonment for life, important additions could be made to our present knowledge of the pathology and proper treatment (by segregation or otherwise) of the disease. I can safely predict that many criminals would gladly accede to such an alternative, on having the case clearly stated to them."

Dr. Beaven Rake, himself a great experimenter, says:—"Campana inoculated lepers with erysipelas, with the result that nearly all the patients in the ward got erysipelas, and the ward had to be closed. No effect was produced on the progress of the leprosy."—*Report on Leprosy in Trinidad for 1890, p. 37.*

Dr. John D. Hillis, of Demerara, observes in his work, *Leprosy in British Guiana*," p. 209 :—" The

treatment of leprosy has hitherto been attended with such very poor results that the disease is now regarded as incurable. Drug after drug—so-called specifics—have been tried, only to be laid aside as useless, the disease after a time returning with greater violence than ever." The writer 'then proceeds to describe some of the experiments to which the unfortunate lepers have been subjected. Out of seventy cases treated by Dr. Danielssen at the Lungeguard's Hospital, Bergen, only one was reported cured.

It appeared to me, however," says Dr. Danielssen (page 210), "if I could infect the leprosy patients with constitutional syphilis, it might follow that the syphilitic poison might prove superior to that of leprosy, and that thus the system might be brought to that of a person labouring under constitutional syphilis, and might so become subject to the ordinary process of syphilisation." "This ingenious theory, however," remarks Dr. Hillis, "failed in practice, the leprosy remaining unchanged, whilst the syphilitic process went on."

Under the head of " Palliative Treatment," p. 215, Dr. Hillis says:—" Improving the sanitary condition of the leper, it is well known, has great influence in mitigating the disease; and the satisfactory results which have been realised in this direction at the General Leper Asylum may be seen in the following figures, taken from my official report for 1878, when the percentage of deaths to strength for the past four years was stated to be :—

1875.	1876.	1877.	1878.
17.36 per cent.	16.33 per cent.	11.49 per cent.	9.19 per cent.

In the appendix to the report of the Medical Officer of the Leper Asylum, Mahaica, British Guiana, for 1880, printed by order of the Court of Policy, Dr. Oscar D. Honiball, Acting Medical Officer to the Leper Asylum, after alluding to the prominent physiological action of gurgun oil, which are purging and vomiting, considers it would be a fatal mistake to administer it in advanced cases. Dr. Honiball records with considerable regret and disappointment his failure to discern its alleged beneficial results. He has also made careful inquiries of the inmates, and the answer as to the beneficial results have been either of a negative nature or strongly adverse. Some say, 'I am not worse than when I came in.' On the other hand, very many bitterly complain of the deleterious qualities, attributing to its administration a rapid and violent increase of the disease. It is so nauseous, and the results following so very often serious, and at all times disagreeable and inconvenient, that the assumption of its curative properties should be based upon a surer basis than hypothesis."

Dr. Castor, Medical Director, Leper Hospital, Demerara (who acknowledges that vaccination is a certain mode of spreading leprosy) says that no therapeutic agent is of any avail as a cure.

Referring to Dr. Castor's report to the Surgeon-General, British Guiana, for 1888, the *Lancet*, March 8, 1890, p. 566, observes :—"Although every remedy reported successful elsewhere has been tried, no beneficial result has been obtained. Dr. Castor holds the opinion that the most that can be done in the way either of cure or prevention is 'by proper diet, dwellings, and sanitary surroundings to ameliorate the symptoms, and often thereby control them.'"

#### AMERICA AND CANADA.

In a chemical lecture on "Anaesthetic Leprosy," by Professor James Nevins Hyde, in the *American*

*Practitioner*, February, 1879, the author says :—" Needless to say that mercury, iodine, quinia, arsenic, and a long list of other remedies, have utterly failed to eradicate the disease. A careful study of the results said to have been obtained by the use of gurjun oil, employed in the Beauperthuy method by Dougal, and of the cashew-nut by De Valence, will lead ,to the conviction that the benefit was largely due to the improved hygienic condition of the patients submitted to experiment. ' Where we are ignorant it is best to admit the fact; for we thus show that we have at least learned the alphabet of wisdom."

Dr. J. E. Graham, of Toronto, in reply to a communication from the Hawaiian Government regarding leprosy in New Brunswick says, that he has experienced ." no good results from medical treatment. Much may be done by attending to the general health of the patients." *Leprosy in Foreign Countries, Honolulu, 1886, p. 158.*

Dr. H. S. Orme, President of the State Board of Health, California, in his valuable papers on "Leprosy, its extent and control," says :—"The general testimony is to the effect that any mode of treatment is disappointing. Arrest of progress is only temporary, being usually followed by suspension of treatment. Indeed it is not certain that long perseverance would be 'attended by permanent relief. At the Tracadie Hospital, patients have been discharged apparently cured, but they generally returned to die. The results are even less encouraging than the treatment of pulmonary consumption. The Health Authorities of the Hawaiian Islands consider leprosy practically incurable, though they acknowledge that life may be prolonged by certain medical treatment, by good food, and by favourable sanitary conditions."

Dr. James H. Dunn, Professor of Dermatology, Mineapolis, in a chemical lecture reported in the *North- Western Lancet*, March 1, 1888, says :—" The treatment of leprosy is accordingly largely palliative. Of course, cures— popular, medical, and secret—have not been wanting; but their unreliability has been repeatedly demonstrated. Of prime importance, if possible, is the removal of the patient to a country or part of the country in which the disease is not endemic, preferably a healthy mountainous district with good air, nourishing food, and every hygienic appointment, and the use of baths and electricity in proper cases."

In reply to a communication addressed by me to the Superintendent of the Lazaretto, Tracadie, New Brunswick, Mr. J. A. Babineau, November 12, 1889, writes :—" Leprosy is considered incurable here, as elsewhere, for all attempts to cure the disease have failed."

Dr. J. C. Tache, Visiting Physician to the Tracadie Lazaretto, in p. 150, "Leprosy in Foreign Countries," says :—" The various and multiplied attempts made at different times in New Brunswick by medical men, or under medical guidance, to cure the disease have all failed."

Dr. A. C. Smith, writing from New Brunswick to the Hawaiian Government, says :—" I have never observed more than a temporary amelioration from any medical treatment, and only such as might be attributed to the effect of mind over body. My predecessor used coloured water, accompanied by strong assurances of benefit therefrom, and in every instance found a temporary improvement equal in degree to any apparent benefit to be found from the use of medicinal agents." "Leprosy in Foreign Countries," p. 156.

United States Consul James W. Siler, of Cape Town, South Africa, in the report to his Government, after referring to various so-called remedies,, observes :—" After all, these and other remedies only

tend to prolong the disease; for, once affected with the leprous taint, the victim is doomed to slowly but surely rot away, until mercifully released by death."— *United States Consular Report for 1887*, p. 565.

Owing to the remarkable spread of leprosy in Venezuela, the United States Consul, Mr. E. H. Plumacher, has paid much attention to the treatment of that disease; and he reports to his Government (No. 119, for 1890, pp. 695-6) as follows :—"Various methods of treatment have been tested at the Maracaibo Lazaretto, especially the administration of the oil of chaulmoogra, which apparently gives encouraging results at first, but produces no lasting benefit. Its use is also attended with grave physical inconvenience, such as a morbid state of the liver; intestinal irritations, accompanied with a slimy and waxy diarrhoea; wandering pains in various parts of the body; eruptions upon the skin, principally attacking the hands, and various other unpleasant attendant symptoms, making the use of chaulmoogra at times intolerable." . . . This treatment has always been entirely voluntary, but no one has been able to persevere in its use. The iodides and mercurial preparations have also been tested, as well as the tincture of cantharides; but all of these remedies produced more or less identical effects— that of a temporary amelioration of the condition of the patient, but without well-founded hopes of anything approaching a genuine cure. . . . As already stated, temporary alleviation has frequently been obtained by various methods, as, in a disease like leprosy, any remedy which tends to improve the state of the blood and the general health will, no doubt, have its temporary ameliorating effect upon the malady itself. So many years of careful study, and of patient and conscientious application of all methods of treatment, have, in my opinion, satisfactorily demonstrated the incurability of the disease; and the most that can be done is to alleviate, as far as possible, the physical suffering and mental distress."

Miguel Valladores, Physician of the Lazaretto, Guatemala, says :—" I have observed that mercurial treatment aggravates the disease of leprosy in a patient."—*Leprosy in Foreign Countries: Honolulu, 1886*, p. 174.

### INDIA AND OTHER COUNTRIES.

In a report to His Hawaiian Majesty, dated August 12, 1885, by Surgeon-General W. J. Moore, of Bombay, the author says:—" If leprosy is not what I hold it to be, we have still sufficient evidence that the great prophylaxis is sanitation. In sanitation I include the prevention as much as possible of whatever entails a state of human system below par, such as the cheapening of salt (an article of the greatest importance in the human economy), plentiful food, good clothing, suitable and, above all, dry lodging, drainage, conservancy—in short, everything tending to improve the condition of the population of a country. Leper asylums are good and charitable, but will not cure, eradicate, or prevent leprosy. There is no known cure for leprosy when once contracted. Lepers taken into an asylum and well cared for often apparently recover; but the apparent recovery is this: The cachectic debilitated leper becomes temporarily a robust leper, but he remains a leper still, and the disease eventually breaks out again. Apart from charitable motives, therefore, I would not recommend the Government spending large sums on leper asylums—such, for instance, as would be entailed by a 'State Leper Asylum,' as mentioned in Government Resolution No. 2009, dated 11th June, 1883. A more certain, albeit slow, progress will result from sanitation in the broadest sense of the term, which comprises the moral and amelioration of the condition of the people" And in a letter to the *British Medical Journal*, December 14, 1889, p. 1371, Sir William J. Moore observes :—" I feel most confidence in the diminution of leprosy in India, and in the prevention of leprosy in this

country, from the influence and progress of sanitation in the most extended sense of the term, in which I include the cleansing generally of villages and towns, drainage, ventilation, good water supply, the cheapening of salt, the prevention of scarcity, opposition to imprudent marriages, and measures for the prevention of specific disease."

Mr. W. Walker, Inspector-General of Civil Hospitals, North-West Province of Oudh, in his report of June 26, 1885, to the Government, observes :—" I may say that medical treatment, in the sense of attempting a cure of the disease, has been abandoned, not only in these provinces, but all over India. Extensive experiments were made in 1875, 1876, and 1887, with regard to the efficacy of certain systems of treatment, and were found to be equally unsatisfactory. If the Government will refer to proceedings in the Medical Department, Nos. 20 and 23, dated March 10, 1887, there will be found the result of a fair trial given to gurjun oil, once a vaunted cure for leprosy. The results of this experiment may be taken as a fair example of the conclusions which have been forced on all trustworthy observers—namely, that good nourishing diet, cleanliness, and friction of the skin with any oil, are the only satisfactory means of retarding the progress of the disease. No other specific treatment is now attempted in any of our asylums. The patients are regarded as incurable, and are only subjected to medical treatment when attacked by complications which may be hopefully dealt with."

J. Fairweather, Brigade-Surgeon, Inspector-General of Civil Hospitals, Punjaub, says :—" All attempts at specific treatment have been abandoned for some years as useless."

Dr. W. R. Kynsey, Chief of the Medical Department, Colombo, Ceylon, in reply to a communication from His Hawaiian Majesty's authorities as to leprosy in India, writes :—" No treatment has yet been found of any permanent benefit. The best results have been obtained from hygienic and dietetic treatment alone." "Lepers," he says, "are chiefly found among the poorer natives, whose dwellings are small thatched huts, crowded, ill-ventilated, filthy, and strewn with mouldy and rotten vegetables and excremental deposits.— *Leprosy in Foreign Countries, Honolulu, 1886, p. 164.*

Mr. H. A. Acworth, Municipal Commissioner, Bombay, says :—" Who ever heard of a case of cure?"

Dr. R. J. Wright, Civil Surgeon, Jessore, India, says:—" Six hundred and nineteen lepers are reported in the Jessore district. The sex is not distinguished; but it appears that only fifty-four inherited leprosy, while six hundred and sixty-five have no idea of its cause. They believe the disease incurable, so it is difficult to persuade them to submit to treatment, and twenty who were treated with gurjun oil derived no benefit."—*Leprosy in Foreign Countries, Honolulu, 1886, p. 34.*

Dr. H. V. Carter, of Bombay, in a communication to the Hawaiian Government, relative to leprosy in India and Norway, dated 1884, says:—" *In limine*, I should state that the cure of leprosy by purely medical treatment has not practically contributed anything towards the obliterating of the disease. To rely, therefore, for a general amendment, upon any of the varied remedial measures often confidently put forward, would be to indulge in fallacies, hurtful as well as deceptive, and to encourage a kind of anticipation hitherto shown by experience to be futile."

Again, the same writer, in part II. of the same paper, observes :—" Nor has purely medical treatment ever proved curative; and, so far from leprosy in Norway showing a natural tendency to

subside, there is ample evidence of a present activity, equal to that displayed by the disease twenty - five years ago." — *Leprosy in Foreign Countries*, p. 96, Honolulu, 1886.

In a summary of his work for 1890, in the Leper Asylum at Dehra Dun, India, Dr. M'Laren, the Medical Superintendent, gives the result of the treatment with resorcin ichthyol and gurgun oil, which were used a short time ago, but are now, apparently, abandoned. He says :—" There is not the least appearance of permanent benefit, or of any amelioration of the actual disease."— *Calcutta Englishman*, March 7, 1891.

In his "Remarks on Leprosy," the same authority observes:—"It may not be out of place here to mention that, since 1875, I have given the most careful attention to the treatment of leprosy; tried most conscientiously all the various drugs that have from time to time been recommended, and used unsparingly, and for prolonged periods, all outward applications that have been brought to notice, and must frankly admit that I have not witnessed the least *permanent* benefit from any one of these. . . . Once a leper, always a leper, is the sad outcome of my many years' close observation, let the treatment be what it may."—*My Leper Friends*, by Mrs. Hayes, London, 1891. pp. 125-6.

Under the head of "Treatment," the chief medical officer of Kashmir, Dr. A. Mitra, after alluding to the use of arsenic, chaulmoogra oil, and gurgun oil, observes that they have little or no power in arresting the progress .of the disease. And as regards nerve-stretching, which, in the early stages of the anaesthetic variety, produces very satisfactory results in a large majority of cases, he remarks "the result is not lasting."—*The American Journal of Medical Sciences*, July, 1891.

*The Bombay Gazette*, 17th July, 1891, reports the opening of the New Leper Asylum at Sehore, Bhopal, towards which Her Highness the Begum of Bhopal has contributed munificently, and has promised an annual grant of 4500 Rs. for the expenses of maintenance. The building will accommodate about 160 lepers. In his address, Surgeon-Major Dane frankly said, "We do not expect to cure these unfortunate people, as, notwithstanding the praises which are repeatedly being bestowed on some vaunted 'certain cures' there is no doubt that a cure for leprosy has still to be discovered." This benevolent lady, the Begum of Bhopal, Nawab Shahjeham, has been persuaded to extend vaccinations in her province, upon which she spends 5000 rupees yearly, employing 35 vaccinators, who performed 38,000 vaccinations last year, thus unwittingly spreading the fell disease at the point of the lancet, and helping to fill the wards of the hospital which her benevolence has established.

Babu Prosurmo Coomar Sein, Gurbetta, India, in reply to questions from the Hawaiian Government, reports as follows :—" After taking charge of this dispensary, I have treated twenty lepers. To some of them this disease was hereditary, to some it was owing to the contagion, and to others it was the effect of using mercurial medicines."

Surgeon W. D. Stewart, Civil Surgeon of Cuttack,. says :—" There is a belief that excessive use of mercury tends to develop the disease, by causing a deteriorated state of the blood and tissues."

Babu Jaggo Mohoun Roy, Orissa, reports :—" In the generality of the cases, especially among the Hindus,. venereal diseases, and perhaps administrations of mercury for their cure, have, I believe, been the cause of leprosy.'—*Leprosy in Foreign Countries*, Honolulu, 1886, pp. 33,.37,39.

Surgeon-Major Geoffry C. Hall, Allahabad, in a communication to the *Indian Medical Record*, says :—" Is there any cure for leprosy? I reply, No. Can leprosy be mitigated? I say decidedly, Yes. But

the fact remains, 'once a leper, always a leper.' .

With regard to the vexed question of contagion, I am of opinion that leprosy is inoculable. . . . There is the fact that leprosy sores do heal in a great many cases without any treatment whatever. . . . But these sores healing do not, as so many people imagine, mean that the leprosy is cured, but merely that a local manifestation has been cured; the leper remains a leper, and sores will certainly occur at some future period.

All the remedies seemed to be equally inefficient. Nerve remedies had, I presume, altered nerve tissue to deal with, therefore they could not act in their usual way. The much bepraised resorcin and ichthyolin were as useless as all the others, and the conclusions I have come to are :—(1) Lepers should be well fed; (2) kept scrupulously clean; (3) have some inunction to keep the skin soft; (4) have their sores treated on rational principles. Then their lives are made less burdensome to them, and they are comparatively happy. The remedies used were strychnine, phosphorus, arsenic, mercury, potassium iodide, chaulmoogra oil, resorcin and ichthyolin, gurjun oil, neem oil, and strychnia, and sweet oil with chaulmoogra oil and gurjun oil internally. I made sketches of some of the patients I treated, with remarks made during the course of treatment. I treated in all fifty patients, with in no case any marked benefit as regards the cure of the disease."—*Calcutta Daily News*,. November 3, 1891.

In an article on "Leprosy in Kashmir," by Ernest F. Neve, M.D., F.R.C.S., Ed., I find that, "as treatment, iodoform, iodide of potassium, mercury, arsenic, quinine, phosphate of soda, and mudar root, have been tried internally; while balsam of Peru and gurjun oil have been rubbed on externally. Carbolic acid and iodine has been used for wounds. Nerve stretching has been adopted for anaesthesia and trophic ulcers. None of these is a specific."—*Lancet*, 16th November, 1889, p. 1000.

The *British Medical Journal*, August 10, 1889, contains an article, entitled, "Clinical Notes on Leprosy," by James J. L. Donnet, M.D., Inspector-General of Hospitals and Fleets, Honorary-Surgeon to the Queen. Under the head of "Treatment" is the following (p. 304):—"In the treatment of this disease the hygienic, the dietetic, and the palliative had more influence than the therapeutic. Where the cleansing of the skin by baths could be effected; where soothing or stimulating applications were made to ulcerated surfaces and to skin, to delay the distressing symptom of prurigo; where good and abundant food was given, fresh air obtained, and exercise without fatigue, taken, with attention to full ventilation of inhabited rooms; where measures were adopted to afford recreation and gentle excitement, and thus divert the mind from the disease itself, a marked difference and a decided improvement, were the consequence. Under these influences the disease made little advance. But it is one that follows a determined course, rapid in some, more dilatory and seemingly stationary in others, but never retrogressing, always advancing."

"Where drugs are administered internally, I remarked that only those possessed of dietetic properties—as, for example, cod-liver oil—were of any value. Mercury, arsenic, iodide of potassium, assacil (obtained by incisions into the bark of the *hura braziliensis*), ammonia, and other preparations, each acted on the system, *modo suo*, but not in the measure or way hoped for."

Dr. Max Sandreczki, in an article entitled "A Study on Leprosy," in the *Lancet*, August 31, 1889, p. 424, says:—"As to the possibility of cure, one may say without fear of contradiction that among adults it is excluded." . . .

"The discovery of the bacillus has not hitherto advanced the curing of leprosy. Neither the transmissibility nor the mode of propagation has been demonstrated. Unfortunately, we are not permitted here to make dissections, and it is almost impossible to procure objects for the microscope. In conclusion, I would remark that if the bacilli cause leprosy, and propagate it from one person to another, how can we explain the long latent period—the repose of the bacillus for years? Is it not probable that the human body, more and more degenerated by years of misery and by every sort of hurtful influence, becomes the soil favourable for the development and culture of the bacillus?"

In a discussion at the Royal Medical and Chirurgical Society on the cure of leprosy, Mr. Macnamara, the author of "Leprosy a 'Communicable Disease,'" observed that "he had never seen a case which he could regard as being even relieved by treatment." — *The Lancet*, May 31, 1890.

Dr. Thin, under the head of "Treatment," p. 203 *et seq.*, observes that iodide of potassium has been experimented with by Danielssen on a large scale. It always produces a more or less violent eruption of nodules with feverish symptoms. Dr. Thin adds: "It affects patients both as a powerful poison and as a means of cure." After devoting several pages to recording experiments in drug medications by Dr. Unna, which must have caused much suffering to the hapless patients, Dr. Thin observes :—"Alas, that strenuous exertions directed with such intelligence and experience, should after all have turned out fruitless! The bacillus, however, remains apparently uninjured; and, although the treatment does not save the patient from his inevitable fate, Dr.. Unna has done good service in making such an exhaustive experiment with strong drugs that had not been sufficiently tested previously."—*Leprosy*, by Dr. George Thin, 1891, p214.

Dr. Andres Navarro Torrens, Physician-in-Charge of the Provincial Hospital, Las Palmas, Canary Islands, writes to me, 1889:—" I have not up to this day seen any positive and evident cure by medicinal treatment."

A communication from the Superior Council of Health, Mexico, says :—" In the medicinal treatment there have been employed, successively and without result, mercurials, hydrocotila sciatica, guano, yodadurados, arsenic, sarsaparilla, and tarantula, as diaphoretic measures."

"The therapeutic as well as the dipterocarpic methods of treating the disease have been hitherto ineffectual."— *Leprosy in Foreign Countries*, 1886, Honolulu, p. 186.

Dr. K. Yamamoto, surgeon on board His Imperial Japanese Majesty's ship "Rinjio," in a communication to the Honolulu *Press*, June 19, 1883, describes leprosy as an incurable disease.

A communication to the Hawaiian Government from the Faculty," Barcelona, Spain, in reply to an inquiry as to the results of medical treatment, says :—" A great number of medicines have been tried to combat this disease, but, in almost all cases, without result."—*Leprosy in Foreign Countries*, Honolulu, 1886, p. 194.

Dr. Kaurin, Medical Superintendent, Leper Asylum, Molde, Norway, says that "hitherto no specific remedy for leprosy has been found. At an early stage the disease may be cured by good 'diet and regimen; by careful nursing of the skin, baths, and symptomatic 'treatment.'"—*Journal of the Leprosy Investigation Committee*, January, 1891.

After much careful reading, and inquiring into alleged cures in various countries, including those of Dr. Beauperthuy, of Venezuela; the remarkable results, reported by Colonel Chrystie and Father Muller in the Indian journals, \*

\*The latest communication I have seen from Father Aug-Muller, St Joseph's Leper Asylum, Mangalore, S.C., where the Mattel treatment has been tried, appears in the *Calcutta Daily News*, October 30, 1891, and the writer only claims "amelioration in the health of the inmates," but no case of cure. This is no more than the natural result of hygiene without medicine at all.

of Count Mattei's treatment the cures officially reported by certain foreign medical experts in recent Government reports of Hawaii; Dr. Koch's tubercular inoculation; and the nerve stretching and ulcer perforation at the Mucurapo Asylum, Trinidad, I find no evidence to warrant the belief in their ability to cure this disease. In every case the alleged benefit is only transitory, the tubercles and abscesses reappearing, often with increased malignity.

### TUBERCULIN IN LEPROSY.

Dr. P. Ferrari, in an article on "Koch's Tuberculin in Leprosy," says :—" Dr. Ferrari gives the conclusions of several observers who have experimented with the tuberculin in leprosy. Dr. Danielssen considers (1) that tuberculin in leprosy gives general and local reactions, the former generally coming on four to six hours after the first injection, but sometimes in twelve hours, and rarely in two to three days—the local reaction is more tardy; (2) that unfavourable consequences ensue to the patient, the disease being aggravated, and that the reactions have some similarity to those produced by the preparations of iodine in lepers; (3) that the lymph does not kill the bacilli, but seems instead to give them nutriment and favours their reproduction and circulation in the blood; (4) that when immunity to the remedy is established the disease is in no way arrested, nor the bacilli destroyed. Dr. Ferrari has himself come to the conclusion, from the consideration of the above cases and of those of other observers, that tuberculin exhibits no direct useful action on the leper. As in tuberculosis, it may act on the torpid condition of the tissue, not so much by any specific effect as on account of the small resistance of the diseased tissue. He remarks particularly on the outburst of new tubercles during the paroxysms of fever."—*Journal of the Leprosy Investigation Committee, No. 4, December, 1891, pp. 46-47.*

Dr. J. L. Bidentkap, Physician to the Department for Skin Diseases, Rig's Hospital, and Lecturer on Dermatology at the University of Christiania, Norway, says, under the title of "Curative Treatment:"—" There has been searched in vain for remedies which have a direct favourable influence on the disease, or specifics. Mercurial preparations have, of course, been tried to a considerable extent. They have, however, but little or no influence on the disease, and often do harm. The reported few favourable results, or even recoveries, of the employment of these agents have possibly been due to accident, or in some cases to an erroneous diagnosis, the disease having been confounded with syphilis. The same is also the case with iodine preparations, which, according to the experience of Danielssen, are liable to evoke acute outbreaks, and on the whole are hardly advantageous, any more than bromine combinations. Antimonial preparations, and particularly tartar emetic, have, among others, been tried by Danielssen in increasing doses for long periods, but, it seems, without notable effect. Arsenic seems to have little or no influence, and this applies to most remedies of the same class. Of vegetable drugs there are a great many which have been vaunted as specifics at the places where the people understood to gather and to use them. In the European hospitals, however, these remedies have proved more or less inert. I have used salicylic

acid for long periods of time; but, contrary to the experience of others, I have seen more harm than benefit from the use of it."

"Of therapeutic remedies it is mainly baths, tepid tub and steam baths, which seem to act favourably, and the general health of the patients often improves greatly by their methodic employment."—*Abstract of Lectures on Leprosy, 1886, pp. 65-67.*

In a Report on Leprosy in New South Wales, Mr. Edmund Sager, the Secretary to the Board of Health, Sydney, says :—" In adopting the system of segregating cases of leprosy, the Board has had before it the fact that the disease is, so far as at present known, incurable, and that its efforts must be directed to prevent its reproduction or spread."

The Report of the Inspector of Asylums, Cape of Good Hope, presented to both Houses of Parliament, 1891, referring to leprosy, p. 30, says :—" There is no reason to believe that specific treatment has in any case effected a cure. Gurjun oil, arsenic, potassium iodide, and ichthyol have been tried without any result beyond what would be expected of healthy surroundings and good diet."

In the Report of the Select Committee on the Spread of Leprosy, Cape of Good Hope, under the head of "Minutes of Evidence," July 1889, I find the following:--

Dr. W. H. Ross, Police Surgeon at Cape Town for twenty-two years, under examination—

Q. 323. "During your stay at Robben Island has it ever been seriously attempted to treat leprosy as a disease in the same way, as any other disease would be treated at a public hospital or asylum?"—"We endeavour to alleviate their sufferings, but very little can be done, except to treat symptoms and complications as they arise in this incurable and hopeless malady."

Dr. H. C. Wright testified—

Q. 21. "Leprosy is a disease for which as yet we have found no cure."

Q. 33. " Have you had any experience of the remedies tried for the cure of leprosy? "—"I do not know of any cure."

Q. 36. "You are, however, of opinion that leprosy is incurable ? "—" I do not think that we have found any specific for it. I think all authorities are agreed as to that."

Dr. Beck testified—

Q. 176. "Leprosy cannot be cured, the disease must run its course, and the patient dies."

Dr. J. H. Cox testified—

Q 227. "I believe that it (leprosy) is not curable."

The Report (page ix.) says :—" In the anaesthetic form of the disease there is not much actual physical pain, but in that as well as in the tubercular form the patient undergoes a gradual physical and often moral decay which renders him an object peculiarly deserving of the compassionate care of the State."—*Cape of Good Hope, Report of the Select Committee on the Spread of Leprosy, July, 1889.*

As to therapeutic means, Dr. Alexander Abercromby observes :—" The animal, the mineral, and the vegetable kingdoms may be said to have been ransacked. By some the chloride of mercury and the bichloride, in combination with sarsaparilla, have been highly extolled; whilst others, relying more upon antimony as a curative means, have given it as their opinion that mercury is positively injurious. In large doses all seem to agree that it aggravates the disease."—*Thesis on Tubercular Leprosy, p. 20.*

The same authority, writing April 20, 1892, from Cape Town, in a letter to myself, says :—" After more than thirty years experience as regards the treatment of the disease 'medicine makes no impression upon it even in the earlier stages.'" "

In a Special Report on Leprosy from Robben Island for 1891, Dr. S. P. Impey, Medical Superintendent, says :—" A good deal is said and done when small-pox threatens our country, but how much more dreadful is leprosy than small-pox. Small-pox may kill hundreds in a few days, but all who suffer do not die. Leprosy is fatal in all cases, and all who once catch it, after lingering for a few years a life worse than death, shunned by all, they become outcasts, with no hope of cure before them, and die objects of abhorrence and pity."—*Reports presented to both Houses of Parliament by Command of His Excellency the Governor of the Cape of Good Hope, Cape Town.*

The *Lancet*, of April 16, 1892, has a leading article on the results of this mode of treatment of leprosy Referring to the experiments of Dr. Danielssen (of Norway), it says :—

"The injections were made daily, unless the reactions were severe, when an interval of several days was allowed. In some of the cases the treatment had to be stopped even when only small doses had been reached, because the eruptions in the tuberculated and in the anaesthetic cases became so intense that the disease was evidently aggravated." . . . Drs. Babes and Kalindero, of Bucharest, treated seven patients with inoculations of the same material. Upon these the *Lancet* observes: "Unfortunately the conclusion drawn was that tuberculin aggravated the disease considerably, and, by setting free the bacilli, started fresh *foci* of the disease, and made the whole process more active.

As in lupus and phthisis, the patients became tolerant of the tuberculin after a time; but the disease progressed all the same, and fresh symptoms were frequently excited, lesions became red and sensitive In the anaesthetic form the patches enlarged, became redder and more sensitive, and new patches appeared" Dr Colcott Fox's patient, treated by Mr Cheyne at King's College Hospital, seems to have fared no better. The Injections (of tuberculin) "were followed by severe pains in the ulnar nerves, and in the calves and knees, with a temperature of 103° F. After the fourth injection extreme dangerous collapse followed the reaction, the eruption more prominent and large blebs formed on both feet, and t were other unpleasant symptoms. . a purely non-tuberculated case of long standing which was almost quiescent, obscure pains at intervals being the only symptoms left; the injections therefore had obviously excited a neuritis and revived the typical macular eruption which had faded away." . . . In one case (treated by Dr. Goldschmidt, of Madeira), "intense and prolonged reaction ensued, followed by blebs and new swellings of skin and mucous membrane, while on the lower limbs absorption of the leprous infiltration was produced." . . ., "Mr. Cantlie, of Hong Kong, used it (tuberculin) in seven cases, and he also found bacilli in the blood after injection, there having been none there before." . . . "In Dr. Radcliffe Crocker's case a single injection of two milligrammes excited an attack of leprous fever, which lasted three weeks. Scores of new tubercles came out all over the body, but under gurjun oil inunctions they all disappeared again, and there was a little less

infiltration in some parts. The patient, a tuberculated leper, had previously improved considerably with large doses of chaulmoogra oil, and had had no febrile exacerbation for two years prior to the injection. As an ultimate result he was not really any worse; but three weeks' fever was a long price to pay for a single injection, and he did not care to have it repeated."

"The above cases do not exhaust the list of experiments, but they are sufficient to show that tuberculin is very uncertain in its immediate effects on leprosy; that while in some it produces no reaction or effect at all, in others, even with small doses, considerable and prolonged reaction may ensue; and that therefore not more than one milligramme should be given at first, and cautiously increased according to the patient's toleration of the fluid. Secondly, that it revives the activity of cases which have been quiescent for a long time, producing neuritis, bringing fading rashes into prominence, exciting bullae, and setting free the bacilli; these may get into the circulation and produce fresh cutaneous and other lesions. In the ultimate effect, while some patients have shown improvement that has not been proved to be permanent, and in some was certainly only temporary, on the whole the position may be summed up by stating that, as far as the results hitherto obtained are concerned, the improvement which may result is too uncertain, too limited in character and time, and purchased at too great a risk of aggravation of the disease by the dissemination of new foci, for it to be recommended as a treatment for leprosy; and although some of Dr. Hunter's or similar modifications of tuberculin might lessen the immediate disagreeable effects, the fact of its action being to set free bacilli rather than to destroy them should make us seek in another direction for remedial agents for the relief of victims of this much-dreaded disease."

It is admitted that lepers suffer acutely from neuralgic pains, which Dr. Sidney Bourne Swift says "are common amongst lepers of all types;" and the wretchedness of their condition is intensified by the drastic treatment adopted at many of the hospitals and lazarettos. The application of Koch's tuberculin is often attended with excruciating pains.

Under the head of "Cantharidin Treatment in Leprosy," the *British Medical Journal*, September 5, 1891, says:—"The injections caused severe pain, but no local reaction; they were, however, always followed by a rise of temperature in the leprosy cases."

The writer, when visiting a leper hospital a short time ago, was witness of the fashionable inoculative experimental treatment. The poor creatures were brought into the surgery one after another, some brave and others with a timid, appealing look in their eyes. To enable them to bear the pain of the hypodermic syringe, thrust by the operating physician deep into the flesh, they had a handkerchief between the teeth while held by the hospital nurse or attendant. The puncture of the instrument is usually the least painful part of the experimental process. The treatment, which is often continued for months, produces sickness, acute headaches, and fever.

The rage for experimental research has long since passed the bounds of decent humanity, and many who have investigated the facts are of opinion that legislation ought to be specially invoked in the interest of these, the most hapless members of the human family. It is a common experience for lepers in hospitals to attribute the aggravation of their maladies to therapeutic treatment in the hospitals, and this is confirmed by high medical authority.

In the report on "Leprosy and Yaws in the West Indies," by Dr. Gavin Milroy, London, 1873 (c. 729), the author observes:—"It struck me forcibly, on observing the persistency of the an-mic condition of so many patients at Kaow Island (the Leper Settlement of British Guiana), and still

more of Dr. Beauperthuy's three private patients at Bartica, that this symptom was in part due to the prolonged use of a medicine, which is found to be notably injurious in like conditions of the system in European practice." From the foregoing testimonials (and others which I have not space to adduce), confirmed by my own observations and inquiries, it appears to be the general experience that leprosy attacks most readily those whose vitality is reduced by malarial fever, syphilis or insanitary conditions—i.e., unwholesome food, and impure water, and is most speedily fatal to those unfortunates at the hospitals who have been selected as subjects for inoculation experiments, mercurial treatment, and other drug medication. Whatever benefit patients have obtained is admitted, by the highest authorities in all the countries I have visited, to have been due solely to improved sanitary conditions and hygienic treatment. One thing is certain, the unfortunate patients dread the experimental treatment to which they are subjected by lepra experts, often escaping from lazarettos and secreting themselves in the gullies and fastnesses of the hilly regions and in the jungle to avoid the terrible ordeal to which they would probably be subjected.\*

\*Dr. George L. Fitch, formerly Medical Superintendent, Leper Settlement, Kalawao, Hawaii, says:—"On November 14, 1883, I inoculated six lepers with the virus of syphilis, by taking ivory vaccine points, and scraping off the surface of a mucous patch on the inner side of the lower lip of a native woman. The points were then allowed to dry, and three hours afterwards I transferred the virus to the arms of six leper girls under twelve years of age. December 14 following I repeated the experiment, taking the virus from a hard chancre on a Portuguese who came to my office. I saw this man in March, 1884, three months later, in the office of a brother physician, and found he was suffering from secondary syphilis. The last time I used fourteen points and inoculated fourteen lepers therefrom, but no result followed in any of the twenty experiments."—*New York Medical Record*, September 10, 1892, p. 297.

It is acknowledged that there is no specific for leprosy, nor is there any drug which has permanently ameliorated the condition of the patient. Where gurjun, chaulmoogra, or other oils have been used externally there is a temporary alleviation, probably due to the massage or friction employed, but the disease, when it once has taken hold of the system, is absolutely unamenable to therapeutic treatment. On the other hand, there appears to be a consensus of opinion that, in the majority of cases, the condition of the lepers may be improved, and life rendered more tolerable, by their removal to a salubrious locality, with wholesome food, cleanly and orderly habits, cheerful recreation and employment for body and mind, and that under these conditions the disease may in rare instances die out. The worst picture of concentrated and hopeless misery I have ever seen was in 1884 in the Lazaretto of Damascus, where all these essentials were wanting. In view of these experiences, which can be multiplied to any extent, and on the ground of humanity, is it not time to put a stop to the torture to which the incurable sick lepers are subjected by drug medication and inoculation, and let these miserable creatures be made as comfortable as tender nursing, varied occupations, and amusements will allow, and permit them to die in peace? Not a few of them are the victims of the Jennerian system, and these are the smallest compensations we can make for the irreparable injury done to them.

Above all, we can cease to propagate this fell disease. We can discontinue the enforcement of a medical practice which experience has shown to be a potent factor in its dissemination. This is the most terrible count in the long indictment against vaccination; but, as I have shown, it is amply sustained by the testimony, often unwilling testimony, of unimpeachable witnesses of the highest credit and authority. It may perhaps be thought that what I have quoted is only *ex parte* evidence, that possibly an equal array of high authorities may be cited on the other side. This, however, is not the case. There is here no conflict of testimony, so far at least as inoculation is concerned, and vaccination is one and the chief means by which inoculation is effected. If there are authorities of

equal weight to be thrown into the opposite scale, in my careful personal inquiries and patient investigation into the subject I have not discovered them.

[Index](#)

## SUMMARY.

The results arrived at in this volume may be briefly summarised as follows :— (1) That leprosy has greatly increased during the last half century, and that it is prevalent in many places where it was formerly unknown.

(2.) That whilst the opinion of medical authorities and experts varies considerably on the subject of the contagiousness of leprosy, the preponderance of authority is in favour of the theory that it is not contagious in the ordinary sense of the term, but is communicable by means of a cut, sore, or abraded surface; and this view is confirmed by my own personal investigations.

(3.) That other alleged factors such as malaria, a fish diet, syphilitic cachexia, heredity, and insanitation are admittedly unequal to explain the rapid growth of the disease in certain of our crown colonies and dependencies, as well as in other countries.

(4.) That on one point there is much agreement and hardly any dissent, namely, the inoculability of leprosy; and that the view of leprosy as an inoculable disease, while it is most clear to those who take the malady to be due to a bacillus, is older than the bacteriological evidence, and is not dependent thereon.

(5) That the most frequent opportunities of inoculating the virus of leprosy are afforded in the practice of inoculating vaccine, which is the only inoculation that is habitual and imposed by law; and that the evidence here adduced is calculated to show that vaccination is a true cause of the diffusion of leprosy.

(6.) That the official information, collected by interrogatores and otherwise, has not been hitherto of a kind to show how far vaccination has determined the amount of leprosy in recent times; and that any interrogatories that may be sent out in future should not be limited to ascertaining the effects, as regards leprosy, of hypothetically "pure" lymph. When on very rare occasions interrogatories have been submitted, they have been framed to ascertain the results of a purely hypothetical system of vaccination which is not anywhere discoverable in practice, and alleged to be unattainable (*i.e.*, with pure lymph, and free from hereditary taints, and the replies are therefore futile and misleading.

(7.) That with the exception of two groups of cases— those adduced by Dr. Roger S. Chew, of Calcutta, and Dr. S. P. Impey, of Robben Island—those reported in this volume have not been the result of special investigation, but have cropped up accidentally in the course of medical practice, and in some instances have been published by practitioners with apologies to the profession for presenting such unwelcome disclosures.

(8.) That the increase of leprosy in the Sandwich Islands, the West Indies, the United States of Colombia, British Guiana, South Africa, and New Caledonia, has followed *pari passu* with the introduction and extension of vaccination, which in nearly all these places, without previous inquiry or demand from the inhabitants, has been made compulsory.

(9.) That as leprosy is a disease of slow incubation, often taking years to declare itself, and in its incipient stages can be detected only by practitioners of large experience, it follows that, in countries where leprosy exists, there is great danger of extending the disease by arm-to-arm

vaccination.

(10) Leprosy being one of the most loathsome diseases to which the human race is subject, and being practically incurable, it behoves all interested in the public well-being to do their best to *prevent* its diffusion, and, as a means thereto, to discourage the practice of vaccination on that ground, if on no other.

**APPENDIX** (to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

THE following items relate only incidentally to the main object of this volume, but may be useful to the reader as illustrating the methods by which vaccination has been fostered and made obligatory in some of our possessions.

These appendices refer briefly to the mischievous consequences of vaccination, and demonstrate its failure from its inception either to mitigate or to prevent smallpox, with facts showing the growing opposition to this form of State medicine, and the necessity of substituting sanitary amelioration.

Some particulars are also furnished of a medical vaccination census carried out in the year 1883 by a committee of vaccine experts, with the object of reinstating in public favour a practice which had been discredited by numerous vaccination fatalities, and notably by the Misterton, Sudbury, and Norwich vaccine disasters. Particulars of the more recent disastrous results of vaccination will be found in the third report of the Royal Commission on Vaccination. London: Eyre & Spottiswoode, 1890 (c. 6192).

## VACCINATION FRAUDS.

(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

The following is taken from the "Life of Jenner," by Baron, a warm partisan of vaccination, published in 1827, vol. i., pp.

557-559 :— "On the introduction of vaccine inoculation into India, it was found that the practice was much opposed by the natives. In order to overcome their prejudices, the late Mr. Ellis, of Madras, who was well versed in Sanscrit literature, actually composed a short poem in that language on the subject of vaccination. This poem was inscribed on old paper, and said to have been *found*, that the impression of its antiquity might assist the effect intended to be produced on the minds of the Brahmins while tracing the preventive to their sacred cow. The late Dr. Anderson, of Madras, adopted the very same expedient in order to deceive the Hindoos into a belief that vaccination was an ancient practice of their own.

"Shortly after the introduction of vaccination into Bengal, similar attempts were made to prove that the practice was previously known there also. . . A native physician of Bareilly put into the hands of Mr. Gillman, who was surgeon at that station, some leaves purporting to contain an extract of a Sanscrit work on medicine. This work is said to be entitled Sud'ha Sangreha, written by a physician named Mahadeva, under the patronage of Raja Rájusin'ha. It contained a chapter on Masurica or Chicken-pock. Towards the close, the author appears to have introduced other topics; and immediately after directing leeches to be applied to relieve bad sores he proceeds thus: 'Taking the matter of pustules, which are naturally produced on the teats of cows, carefully preserve it, and, before the breaking out of small-pox, make with a fine instrument a small puncture (like that made by a gnat) in a child's limb, and introduce into the blood as much of that matter as is measured by a quarter of a ratti. Thus the wise physician renders the child secure from the eruption of the small-pox.' This communication was shown to Mr. Colebrooke and Mr. Blaquiere, both eminent Sanscrit scholars, and they both suspected that it was an interpolation. . . . . I believe I may further add that Mr. Colebrooke made inquiries whilst in India, which fully satisfied him that no original work of the kind ever had existence. Sir John Malcolm has also been kind enough to ascertain that no such book is to be found in the library of the East India Company. From these statements it must be apparent, that the wellmeant devices of those who attempted to propagate vaccination in India have led to the belief that the practice was known to the Hindoos in earlier times."

It may be added that Dr. Anderson, above referred to, is congratulated by Jenner's biographer on his "unceasing exertions at Fort St. George."

[Appendix](#) [Index](#)

**COMPULSORY VACCINATION IN BOMBAY----THE DANGER OF TUBERCULOSIS.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

Notwithstanding the proofs laid before the Royal Commission on Vaccination regarding the futility of the practice as a prophylactic against small-pox, its injurious consequences in spreading inoculable diseases, and the cruelty and injustice attending its enforcement, there are not wanting those who are continually plotting to extend the system, by means of coercive legislation, amongst populations who are known to entertain a widespread repugnance to vaccination, but who are without representative institutions. At a meeting of the Bombay Legislative Council (reported in the *Times of India*, February 24, 1892) held for the purpose of hearing the second reading of the bill to prohibit the practice of inoculation, and to make vaccination compulsory in certain districts of the Bombay Presidency, the Honourable Mr. Javerilal U. Yajnick moved certain amendments to the law. In the course of his argument, in which he points out the danger of transmitting leprosy and syphilis by means of arm to arm vaccination, he quotes the opinion of "an able and experienced medical gentleman," Dr. Bahadurjee, who in reply to an inquiry writes :—

"In answer to your letter in which you ask me my personal opinion on the arm-to-arm vaccination method which is intended to be enforced by the new Vaccination Bill, I have no hesitation in saying that, besides its being not suited to the peculiar conditions which obtain in this country, on professional grounds the method is objectionable, and for these reasons :—

1. Arm-to-arm vaccination obviously acts as a channel for the transference of some skin diseases, and affords a ready means for propagating such inherited constitutional taints as those of syphilis and leprosy. No doubt, special rules, with full details, will be framed for the guidance of the operators in their selection of proper subjects, with a view to avoid these mishaps; but, having regard to the class of men from whom the supply of district vaccinators is to be obtained, the detailed rules will be of as much use to them as the paper on which they are printed.
2. Syphilitic taint does not necessarily show itself in ill-health at the early age at which vaccination is practised and demanded by law. A child may be in fair health, and yet have inherited syphilis. Moreover, syphilis does not stamp itself on the face and arms, so much as on the back and legs—parts not generally examined by the vaccinator, and thus apt to be overlooked. Only yesterday I was asked to see a case of skin disease in a child. On stripping the child bare, I found him fairly healthy to look at, and could see no skin blemish on his person. But closer examination of the hidden parts revealed the presence of unmistakable condylomata (syphilitic). These condylomata unnoticed, I should have passed the child as a very fair specimen of average health, and a fit subject to take the lymph from. Syphilis, as betrayed in obtrusive signs, is not difficult to recognise, but when concealed, as is more often the case, it is by no means easy to detect it.
3. In the case of leprosy it is still worse. There is no such thing as a leper child or infant. The leper heir does not put on its inherited exterior till youth is reached. And it is by no means possible by any close observation or examination of a child to say that it is free from the leprous taint. Surely arm-to-arm vaccination will not help to stamp out leprosy. On the contrary, it has been asserted, and not without good reasons, that it has favoured the propagation of the hideous disease.
4. It is acknowledged that extreme care is required in taking out lymph from the vesicles to avoid drawing any blood, for blood contains the germs of disease. Extreme care means great delicacy of

manipulation, and delicacy of manipulation with children is not an easy task, and requires some experience and training. Is this to be expected from the class of men who are going to act as public vaccinators in the districts? Supposing a district vaccinator to acquire it to some extent after considerable practice, what about the delicacy of manipulation of one newly put on?

5 Puncturing a vesicle with such delicacy as not to wound its floor and draw blood is one great difficulty. But the selection of a 'proper' vesicle is another as great if not a greater difficulty. Products of inflammation are charged with the germs of disease, the contagion or contamination media, as much as the blood itself is. And the contents of an inflamed vesicle are quite as contaminating as the blood itself of a subject who, though charged with the poison of (inherited) syphilis or leprosy, has none of the obtrusive signs of the taint for identification. And out here inflamed, *i.e.*, angry-looking vesicles are not the exception but the rule, as can be easily told by personal observation and experience, and equally easily surmised if the habits of our poor be duly considered. Thus, even if no blood be drawn, the danger of transferring constitutional taints by the arm-to-arm method is by no means small; remembering that leprosy which claims India, and not England, for one of its homes, does not admit of any detection on the person of a subject from whose arm lymph may be taken, and that syphilis is more often difficult to detect than otherwise, and remembering, also, that both these are often met with largely in some districts."

With regard to tuberculosis, the most deadly of all diseases in Europe, the following extracts from the translation of an article in the *Gazette Hebdomadaire des Sciences Medicales*, by Dr. Perron, *Officier de la Legion d'Honneur*, which appeared in the *Vaccination Inquirer and Health Review* of December, 1890, may arrest the attention of the reflective reader. Dr. Perron says

"The possibility of conveying tuberculosis to man in the act of vaccination was long ago pointed out. Tuberculosis has, in fact, a special predilection for the bovine race which yields us our vaccine. There are few of these animals that escape its attacks; the calf, the heifer sometimes bear traces of it but a few weeks after their birth. It would then appear quite natural to suppose that the vaccine, taken from a bovine animal and inoculated by the skin, might thus convey tuberculosis to the vaccinated subject. It is by no means so, however; for it is demonstrated that the inoculation of tuberculosis by way of the skin is extremely difficult in itself, and that there is not the slightest fear of doing so by way of the vaccinal punctures. The direct conveyance of the tuberculosis contagion in this manner need not, then, be taken into account. If vaccination renders man more prone to contract tuberculosis, it is, in our opinion, by a method altogether different.

"We hold that we must, in this case, arrange our facts in accordance with the new theories of which we have spoken above; that we must, that is to say, consider, with respect to vaccination and the possibility of a tuberculous contagion due to it, the part which can be played in the organism by nocivity, or receptivity, in relation to micro-organisms.

"The cow, as we have said, is the tuberculous animal *par excellence*. She is often the bearer of specific granulations, sometimes even along with the appearance of ordinary health. She is, therefore, a soil eminently favourable, and therefore very receptive, for the bacillus of Koch. But along with tuberculosis there is another acute malady specially attaching to bovines, for it possesses the property of arising spontaneously among them, namely, the vaccinal disease, which, as we all know, shows itself locally by the appearance, on the teats and on the udder, of pustules, whereof we avail ourselves for human vaccination. Thus, then, two acute diseases, tuberculosis and vaccinia,

find always in the cow the soil most favourable for their evolution; and that clearly because the medium of cultivation is propitious both to the bacillus of Koch and to the micrococcus of vaccine.

"If, as announced by Professor Bouchard, the medium created by a vaccination can be destructive to one or several microbic species, we may add that, by the law of reciprocity, a medium of cultivation may at the same time be favourable to one or several microbes. That is exactly what happens with the cow in respect of tuberculosis and vaccinia, diseases between which the soil of cultivation establishes, as we see, a striking connection.

"This is the time to examine what happens when we inoculate a human subject with cow-vaccine. By that act we bring the human organism into a state of immunity, which is certainly bactericidal as against the microbe of variola; that is the benefit we seek, and which constitutes the vaccinal immunity. But here is the important point; at the very time when we have created in the man the vaccinal soil, we run the risk of having, *ipso facto*, established that humoral state (*terrain humoral*) which is favourable to the tuberculous genesis, that is, the medium of culture which is receptive for the bacillus of Koch.

"The first and the most grave result which follows from this interpretation is, then, that vaccination, besides the advantages which it offers us in our contest with variola, presents the danger of opening the way for the invasion of tubercle.

"If we now turn back and examine the events of the last century or so, we can show a constant increase of tuberculosis, a fact never hitherto satisfactorily explained. There was a time when this malady existed only as an exceptional thing; now, actually, in spite of the incessant progress in public and private hygiene, in spite of all the material improvements that have been made, it tends more and more to rise to the rank of a pestilence. It should be remarked that it strikes by preference at the young lives, that is, those who are, nevertheless, at the age when the physical resistance to morbid causes is the strongest. Now, a malady which originates in exhaustion, in vital poverty, should display its power in the inverse order, and should fall most heavily on the old. We are, then, compelled to believe that young folk offer, for some quite special reason, an exceptionally favourable soil for the implanting of Koch's bacillus.

"Side by side with this growing extension of tuberculosis, we see developing, *pan passu*, and in the same period of time, that is to say, since the beginning of the century, the practice of vaccination. We may ask ourselves whether in this double simultaneous evolution there is not a hidden oneness? If tuberculosis, in spite of all sanitary precautions, has multiplied its attacks during the last hundred years, it is, we submit, because vaccination has come to create for it a propitious soil. That would explain, not only its advancing growth in all civilised countries, but also its special influence over the young subjects who are always more or less recently vaccinated, and consequently more receptive than the others in the presence of the bacillus.

"In all European armies, vaccination is the order of the day. On their arrival with their corps, the young soldiers are forthwith carefully revaccinated. Now, the military statistics of all countries show an enormous proportion of various forms of tuberculosis among soldiers, especially during the first and second year after their enlistment. Divers causes have been invoked for the explanation of the facts. First, the moral decline produced amongst young soldiers by their separation from their families. That might have been possible formerly, but it is not probable in our day when facility of communications generally permits the young soldier to remain in touch with his native country.

Besides, in the army afloat, which is less favoured in this respect, we find no more cases of phthisis than in the army ashore. Nor can a bad hygiene be any longer pleaded, nor an inferior dietary, for the European States take the greatest pains to secure for their soldiers the best of material conditions, and succeed in doing so to a very satisfactory extent. Nor can over-work be alleged, for in time of peace the routine of the service requires, save under very exceptional circumstances, just as much exercise as goes to make up a healthy amount of daily exercise. To sum up, the young soldiers find with their corps material conditions of life, which, for a very large number, are superior to those of their native surroundings. Their life in the great towns, though evidently having an injurious effect, cannot by itself explain the numerous cases of tuberculosis of which we are speaking, for the barracks are in general well situated and looked after in accordance with the rules of health. Whence then can come these attacks of tuberculosis, so sudden, so numerous, upon subjects that, but a few months before, the council of revision rightly declared to be fit for service. Tuberculosis of the lungs, of the organs, of the joints, of the bones, etc., all these fatal evils show themselves in the garrisons of all countries with a frequency before which one might well despair. We believe that we must simply seek the reason for these facts in the revaccination which awaits the recruits upon their arrival at their corps, and which transforms them forthwith into a medium which is receptive towards those germs of tubercle which swarm in centres of population. This revaccination immediately upon enlistment is all the more regrettable and inopportune since just at that moment the young man, separated from his-family, his country, his familiar conditions of life, undergoes, without any period of transition, total and radical changes in his manner of life, and thereby finds himself less well equipped for resistance."

Referring to the efforts made by the Indian health authorities to escape the dangers of inoculated diseases by the introduction of animal lymph, the *Calcutta Daily News* of 9th February, 1892, says :—" In trying to avoid the Scylla of leprosy, syphilis, and kindred evils, they fall into the Charybdis of tuberculosis and other equally fatal maladies. When doctors disagree, patients usually have the reverse of a comfortable time, and in the present situation the public may well look around in alarm, and cry to be saved from the dangers with which the whole subject of vaccination seems to be beset."

[Appendix](#) [Index](#)

**THE REVOLT AGAINST COMPULSORY VACCINATION IN INDIA.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

The first triennial report of the working of the vaccination department in Bengal has been recently published, and the Commissioner says that the Acts in the rural districts are practically a dead letter; vaccination is rejected by all the higher class of Hindus—the Brahmins, Marwaries, Rajputs, and Burmahs—while, among the Mahommedans, the Ferazis display the utmost repugnance to the Jennerian rite. In nearly every village, reports the Commissioner, there are families who persistently refuse vaccination, and secrete their offspring to escape the vaccinators. The *Madras Mail* of July 2nd, 1890, says that vaccination is very unpopular with many classes; and the *Madras Times*, April 16th, 1891, reports that summonses were issued against fifty-two recalcitrants for nonvaccination. At Midnapur, Bengal, where the vaccinations formerly averaged three thousand annually, the number fell to nine hundred last year.

The *Allahabad Pioneer*, September 23rd, 1891, says:—

"The Civil Surgeon of Coconada, in his report on vaccination in that town, says that it is a common occurrence for parents to wash out the vaccine virus immediately after vaccination; and the vaccinators further assured him that the natives are in the habit of rubbing in chalk, chunam, or flour, with a view, if possible, of preventing the vesicles rising on their children's arms."

The *Times of India*, July 14th, 1892, says :—

"The prejudice against vaccination in Burmah seems to be growing to quite a remarkable extent. The report for 1891-92 shows that in Lower Burmah the number of cases was only 129,509, or 10,812 less than in the previous year. In one district alone, Henzada, there has been a fall in two years from 10,134 to 5180, while in the Toungoo district the figures have declined from 8905 to 3069. The Prome, Thongwa, and Thayetmyo districts are also among those which exhibit a considerable decrease, and in most cases no explanation of the decline seems to be forthcoming; while such explanations as are offered the officiating Chief Commissioner 'cannot regard with any satisfaction.' In Upper Burmah there was an increase of some 20,000 cases, but this seems mainly due to the extension of the Act. In Upper Chindwin there was a great and unexplained decrease, and five other districts also show a decline, while in some of these and a number of other districts the people put every possible obstacle in the way of vaccination. *At Katha, Mohayon, and Mobin so strong is the prejudice against arm-to-arm vaccination that the vaccinators appear to have, narrowly escaped violence at the hands of the villagers, who organised an open resistance to the system.*"

The *Civil and Military Gazette*, Lahore, August 8th, 1892, says :— "It appears that the natives of Lahore are opposed to compulsory vaccination. The inhabitants of several *mohallas* in the city have drawn up memorials to the local Government asking that the resolution of the Municipal Committee for the introduction of compulsory vaccination in Lahore be cancelled."

The *Allahabad Pioneer Mail*, 6th October, 1892, under the head of Vaccination in Bengal, says :— "There has been a falling off of nearly two hundred thousand, or about 11 per cent, in the number of vaccination operations performed during the past year in Bengal, as compared with the record for 1890-91. The number of operators has meanwhile increased by nearly one hundred; and an analysis shows an average decrease of about 107 cases per operator."

And in a leading article the editor observes:---

"If anti-vaccinationists can be numbered in their thousands in England, it is small wonder that they can be numbered in their millions in India."

Those familiar with the social condition of India are aware that every effort has been made to remove this dread of the operation which exists more or less all over the country. New lancets and scarifiers have been introduced, and various viruses have been experimented with, one after another—cow, calf, sheep, goat, lamb, buffalo, and donkey lymph — the last, the discovery of Surgeon O'Hara, having been specially urged upon the attention of District Boards and municipalities by the Government. Surgeon-Major W. G. King writes to the Indian *Medical Record* that he is using *vesicle pulp* or "lanoline vaccine," which is applied by stretching the scarifications and "alternately dabbing and rubbing in the paste." Buffaloes, he observes, appear likely to yield very much more vesicle pulp than calves, but they exhale an "abominable odour," which renders the work of collecting the pulp most repulsive. The Commissioners state that only the lowest and most ignorant classes readily submit. The law enforcing vaccination in British India, which are unparalleled for their severity, were passed without the consent and against the wishes of the people, whose objection to vaccination arises from a knowledge often gained by sad and bitter experience. They know that the fearful spread of leprosy in India and other countries is coincident with and, as they believe, due to the extension of vaccination, and they prefer to face the severities of the law, with its ruinous judicial penalties, or even to risk the dangers of the jungle, where they are sometimes compelled to seek refuge for their little ones, to the risks of this hideous and destructive scourge. That leprosy, confessed to be incurable, is inoculated by vaccination (a fact once vehemently denied) is now reluctantly admitted by the leading dermatologists of all countries, and by the most experienced chiefs of the leper asylums and public health departments in the West Indies, in South America, South Africa, and in the Sandwich Islands

The *Madras Times*, May 18th, 1892, says :—

"Every effort is probably made to obtain pure and healthy lymph, but if the causation of leprosy has not yet been satisfactorily traced, no guarantee can be provided against the presence of the germs of the disease in the lymph used for purposes of vaccination."

[Appendix](#) [Index](#)

## VACCINATION IN THE WEST INDIES.

(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

### BARBADOS.

There is no compulsory vaccination in this island. The editor of one of the leading journals writes, 2nd May, 1890, that the feeling in the island is so strong against vaccination, that the advocates of vaccination are afraid to move in the matter, and any attempt to enforce it would probably create a riot.

In conversation with all classes and conditions of men (from December to February, 1888-9), from the Chief Justice, Sir Conrad Reeves, to the poorest boatman or sugar plantation labourer, from one end of the island to the other, I failed to discover a single advocate of compulsion. "Let those have it who want it, but don't force it upon me and mine," was the general reply. The police and postmen also get along admirably without re-vaccination. Epidemics are considered less frequent than in other well vaccinated districts, notably Jamaica, Martinique, Guadaloupe, and Hayti.

The natives are, a proud, independent, and more intelligent coloured population than any I met with in the West Indies, and rather look down upon other islanders who are without political representation, and are subject to enforced vaccination. The population in April, 1891, was 182,206, or 1096 to the square mile---one of the densest in the world.

### GRENADA.

In marked contrast to the parental freedom enjoyed by the inhabitants of Barbados, with its popular constitution and representative government, is the position of Grenada. I copy the following from the *Grenada People*, June 9th, 1892,-concerning the oppressive legislation in one of the most beautiful islands in our West Indian possessions, administered as a Crown Colony :— "During this week, upwards of thirty or forty of the peasants have been hauled before the police magistrate of the Southern District for alleged violation of the Vaccination Act. In nearly every case fines of half-a-crown' have been imposed, representing almost half of the week's wages which these unfortunates, if they are employed, can hope to earn. In face of the Royal Commission on Vaccination, we do not see why the law making vaccination compulsory should be still enforced. At most, it is of doubtful benefit; and doctors differ as to the positive good or injury which it does. The advocates of Jenner's specific can quote very few cases, if any, in its support; whilst its opponents point with force and truth to the positive injury it has inflicted. Here, in Grenada, pure lymph is seldom employed. As a consequence, many of the children submitted to the process of vaccination contract therefrom fatal diseases. The lymph, in many cases, is collected from children inheriting a taint of the scrofulous disease which prevails amongst the peasantry; and many an otherwise healthy child, after the process of vaccination, presents the appearance of a disgustingly yawsey patient.<sup>1</sup> As eminent medical men differ as to the value and utility of vaccination, we think it ought not to be made an offence punishable by fine or imprisonment if parents refuse to vaccinate their children; but that the law should be amended in the direction suggested by the Royal Commission in their recent report, *i.e.* it should be optional with the parent whether the child should be vaccinated or not."

[Appendix](#) [Index](#)

**VACCINATION A FAILURE AND A DANGER TO HEALTH FROM ITS INCEPTION.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

Early in the century, when cases of injury were first charged to vaccination by either the suffering victims or their relatives, they were met by emphatic denials on the part of the supporters of Jenner. Proofs of the failures and mischievous results of vaccination, as shown by Dr. Creighton in his remarkable historical work, "Jenner and Vaccination," accumulated from all quarters, but still the vaccinators held on to their creed, Jenner having supplied them with a theory broad enough to meet any contingency. He says there were some varieties of spontaneous eruption, all of which produced sores on the milkers, but only one of these was the *true* cow-pox, all the others being spurious and exerting no specific protective power over the constitution.

On the 18th June, 1890, evidence was adduced by me before the Royal Commission concerning the early failures of vaccinators and the mischievous effects of vaccination (See Third Report of the Royal Commission on Vaccination, pp. 150-151.) In the year 1806 the College of Surgeons instituted an inquiry into the results of vaccination. The results of this inquiry have been overlooked by all the advocates of compulsory vaccination, and notably omitted from Sir John Simon's remarkable "Papers relating to the History and Practice of Vaccination, presented to both Houses of Parliament," London, 1857. (The report of the Royal College of Physicians, which was favourable to vaccination, was included by Sir John Simon in these 'Papers.' The corresponding report of the College of Surgeons, which appeared in the same publication, but was adverse to vaccination, was ignored — an important historical omission.)

This report states that on the 15th December, 1806, a circular was drafted and referred to the Board of Curators, and, having received their approval, was despatched to 1100 members of the College in the United Kingdom, submitting the following questions

"1st. How many persons have you vaccinated?"

".2nd. Have any of your patients had small-pox after vaccination?"

"3rd. Have any bad effects occurred in your experience in consequence of vaccination? and, if so, what were they?"

"4th. Is the practice of vaccination increasing or decreasing in your neighbourhood? if increasing, to what cause do you impute it?"

To the 1100 circulars only 426 replies were received. Why nearly two-thirds of the members kept silent, when at the outset they were converted in multitude to vaccination, was left unexplained. The replies were thus summarised by the Board on, 17th March, 1807— "The number of persons stated in such letters to have been vaccinated is 164,381.

"The number of cases in which small-pox had followed vaccination is 56.

"The Board think it proper to remark under this head that, in the enumeration of cases in which small-pox has succeeded vaccination, they have included none but those in which the subject was vaccinated by the surgeon reporting the facts.

"The bad consequences which have arisen from vaccination are— 66 cases of eruption of the skin, 24 of inflammation of the arm, whereof

3 proved fatal."

A copy of the original report containing these remarkable admissions was produced by me before the Royal Commission and examined by the president and each member of the Commission then present.

I have before me a copy of Volume VIII. of the *Medical Observer*,. an ably conducted Metropolitan journal published in 1810 (produced also before the Royal Vaccination Commission), and on pp. 183 to 197 I find recorded (with chapter and verse for reference to the authorities) the particulars of 535 cases of persons having small-pox after vaccination ; also similar details of 97 fatal cases of small-pox after vaccination and of 150 cases of injury, together with the addresses of ten medical men, including two professors of anatomy, who had suffered in their own families from vaccination.

Concerning these remarkable evidences a leading physician, Dr. Maclean, observes :— -

"Although numerous, they are nothing to what might be produced. It will be thought incumbent on the vaccinators to come forward and dispute the numerous facts decisive against vaccination here stated on unimpeachable authorities, or make the *amende honorable* by a manly recantation. But experience forbids us to expect any such fair and magnanimous proceeding, and we may be assured that under no circumstances will they abandon so lucrative a practice until the practice abandons them."

We commend these prophetic words, uttered years ago, to those who look for the impartial treatment of this question at the hands of professional propagandists at the present day.

[Appendix](#) [Index](#)

**VACCINATION FAILURES IN 1817.**

(APPENDIX to [LEPROSY AND VACCINATION by WILLIAM TEBB](#))

"However painful the duty, we feel ourselves called upon to notice the numerous and accumulating failures of cow-pox in preventing small-pox, whether in the natural way or by inoculation. Our communications on the subject have been numerous, and some of the cases do not appear to have been modified by the previous disease. It is not easy to account for these distressing occurrences, but were we to hazard a conjecture, we would venture to suggest that it is possible the virus may have become so modified by being confined altogether to the human subject that its powers of producing the necessary affection of the constitution, which only can be regarded as the test of security, may be so nearly worn out as to be no longer a certain preventive. Hence the necessity of frequently renewing the efficacy of vaccination by procuring the virus directly from its original source.

"Variola continues and spreads a devastating contagion. However painful, yet it is a duty we owe to the public and the profession to apprise them that the number of all ranks suffering under small-pox, who have previously undergone vaccination by the most skilful practitioners, is at present alarmingly great."-*London Medical Repository*, pp 57 and 95. Edited by George Burrows, M.D., F.L.S., etc, etc., and Anthony Todd Thompson, F.L.S., M.R.C.S., etc. -

[Appendix](#) [Index](#)

**ARM-TO-ARM versus CALF-LYMPH VACCINATION.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

As the relative merits and demerits of animal and arm-to-arm vaccination are being discussed in the Indian press, I would here call attention to a few facts which appear to have escaped the attention of those who are urging the adoption of new compulsory laws in various districts. It is generally admitted that there is a growing discontent with vaccination in all quarters. In England household censuses have been made in nearly one hundred towns and districts, with the result that eighty-seven per cent. of the signatories are opposed to compulsory vaccination and sixty-eight per cent. certify that they do not believe in vaccination at all. In about ninety towns and poor-law unions the acts are a dead letter; and, owing to the sinister results of the practice, in many of our Colonies the authorities have ceased prosecuting vaccine recusants. In India, Sir John Gorst (*Times*, 17th July, 1891) informed Parliament that compulsory vaccination exists in four districts in Bengal and in 183 municipal cities and towns in different provinces. But the results cannot be considered encouraging even by the most ardent vaccine optimist. The Blue-Books of "Sanitary Measures in India" state the total vaccinations during the years 1886-89 inclusive as follows

1886-87,	5,265,024
1887-88,	5,552,710
1888-89,	6,099,733
1889-90,	6,161,407

The statistical abstract relating to British India gives the smallpox mortality during the same period, viz. :—

1886,	51,112
1887,	65,757
1888,	138,509
1889,	125,453

This increase of small-pox, co-incident with the rapid extension of vaccination, shows that it is a disease governed by causes entirely outside and independent of vaccination. And this opinion is confirmed by the highest authorities. Thus, in a memorandum of the "Army Sanitary Commission," published in the *Bombay Government Gazette*, Dec. 17th, 1885, the Commissioners say

"The first disease in the list—namely, small-pox, which yielded an increase of 1369 deaths, or nearly sixteen-fold that of the previous year's death-rate—had assumed an epidemic state in nearly all the districts of the city; yet Bombay has an effective vaccination service, with the use of calf-lymph." In vol. xviii. of "Sanitary Measures in India," page 203, in reference to the smallpox epidemic of 1884, it is stated :—" We are thus brought face to face with the fact that, notwithstanding the existence of an active vaccination service, small-pox swept over the provinces just as if there had been none." In the same volume, referring to Madras, the Commissioners -say:—" No less than seventy-four per cent. of the small-pox deaths in Madras town occurred among children under three years of age." In Punjab, "the Compulsory Act was in force in the Amritsar municipality, but here the deaths from small-pox were far more numerous than in any other town of the province." In vol. xix., page 113, is the following candid admission :—" Ten years' statistics afford no evidence that vaccination affects the usual epidemic course of the disease,

and hence-this fact, in the face of the extensive vaccination work of the present and past years, appears to lead to the conclusion that in its epidemic form small-pox must be met by improving the sanitary condition of the people."

On page 10 of the Report on the Annual Returns of the Civil Hospitals and Dispensaries in Madras for 1888, under the head of Canara, South, I find that while vaccination is making satisfactory progress, the number of vaccinations having increased by 8053 cases, yet "small-pox was more prevalent than usual in the district, and was epidemic in the town of Mangalore." On pp. 9 and 10, under the head of Arcot, North, it is stated that small-pox was prevalent, and that vaccination "was performed in a careless and perfunctory manner." This careless performance of the Jennerian rite is the rule in our Crown Colonies where leprosy is prevalent, as I have found by personal investigation.

According to Sir Edwin Chadwick, Dr. B. W. Richardson, and all other sanitarians of repute, small-pox is a disease due to insanitary conditions, impure water, bad drainage, dirty living, and particularly to overcrowding; and, instead of removing these conditions, the Governments of India during the past thirty years have been spending their energies, and large sums of money, in extending vaccination. Now that the arm-to-arm system has been thoroughly discredited and shown to be futile as a preventive of small-pox and fertile as a disseminator of eczema, syphilis, and leprosy, the cry of the official vaccinator is not the sensible one of "do away with vaccination," but, let us change front and resort to the calf, sheep, buffalo, donkey, or to lanoline lymph—or anything, rather than confess that the Jennerian system is a humiliating failure. It is well known that animal lymph has been a fruitful cause of the spread of disease in Europe. On June 17, 1885, an official re-vaccination with "re-generated" lymph at the Island of Rügen, North Germany, caused an infection of a loathsome eruptive skin disease (*Impetigo Contagiosa*) of 320 children and adults. The details of this sinister affair, from Dr. Koehler, of the Imperial Medical Department, are in my possession, and have been brought before the Royal Commission on Vaccination now sitting. This disaster was due to the use of virus obtained from the Government calf-lymph establishment, Stettin. In December, 1891, when in Launceston, Tasmania, I learnt that from 200 to 300 children and adults had been afflicted with ulcerative swellings and acute *septicæmia*, caused through animal vaccination in 1887, and that the law in that colony had been suspended. Animal vaccination has no claim to public attention by reason either of its safety or of its novelty. Mr. Farn, the Government Inspector of vaccine lymph, has declared before the Royal Vaccination Commission that he cannot tell by microscopic examination whether lymph is pure or not; and Dr. Robert Cory says that the admixture of lymph with blood, which occurs in the majority of cases, does not prevent its being used.

Perhaps the most remarkable official pronouncement on this subject ever made in England is that of the late President of the Local Government Board, during the debate in Parliament on Supply, July 22nd, 1887, at which the writer was present. The object of the declaration was to allay public anxiety as to the safety of the lymph supplied by the Government. Mr. Ritchie, in the course of his speech, said:—"The honourable member for East Donegal (Mr. Arthur O'Connor) said something about lymph. He said, I think, that it was the virus of modified small-pox. I cannot agree with the honourable member in his definition as to that point. I am informed that no lymph which is used for vaccination of any kind has ever, within the memory of man, passed through the human body. Dr. Jenner's first lymph was derived from an animal source; and the lymph which is now sent out is calf-lymph. None of the lymph, I say—at all events in historic times—has passed through the

human body; therefore I cannot think that the honourable gentleman is in any way justified in calling the lymph modified small-pox."

Mr. Arthur O'Connor :—" What is it, then?"

Mr. Ritchie :—" I am afraid I am not qualified to give the honourable gentleman a medical opinion of what lymph is. I have told him whence it is derived, and he will see there is no ground for calling it modified small-pox."—*Hansard's Debates, 3rd Series, vol. 317, p. 1803. July 22nd, 1887.*

The chief of the Public Health Department was clearly not aware that until a comparatively recent period arm-to-arm vaccination was practically the *only method in vogue*; and at the time Mr. Ritchie's declaration was made, to the effect that none of the lymph in use had passed through the human body, at least three-fourths of the lymph in use in the United Kingdom was the variety known as arm-to-arm vaccination virus.

[Appendix](#) [Index](#)

**DR. R. H. BAKEWELL ON THE RISKS OF VACCINATION.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

In a paper read before the Auckland (New Zealand) Institute, 20th July, 1891, and printed in vol. xxix. of the "Transactions of the New Zealand Institute," Dr. R. Hall Bakewell, formerly Vaccinator-General and Medical Officer of Health for the Colony of Trinidad; author of the "Pathology and Treatment of Smallpox;" Fellow of the Royal Medical and Chirurgical Society of London, etc., says :—" The permanent change in the blood is quite another matter. I commenced, but have never completed, some microscopical investigations into the conditions of the infant's blood before, during, and after vaccination. It is evident that a fertile field for inquiry is open here; and without a series of well-conducted examinations, extending over children of different races, and in different climates, no positive conclusions could be arrived at. But of one thing we are quite certain, as it does not need the aid of a microscope; there is a large destruction of the red corpuscles during the febrile stage of vaccinia, followed by an anaemic condition. How long this anaemic condition lasts we have no trustworthy observations to tell us; and how far it extends—that is, what is the actual loss of red corpuscles—is, as far as I know, in the same state of uncertainty. Of course, we often find parents complaining that children who were perfectly healthy before vaccination have lost colour, strength, and flesh after it, and have never recovered their previous good health. But these complaints, tinged as they evidently are by a strong prejudice against compulsory vaccination, must be received with caution. Still, there is such a mass of evidence of this kind that it ought to be allowed some weight.

So much for the inevitable results of vaccination. The accidents of vaccination may be roughly classified under the following heads:--

1. Inflammatory: including erysipelas and other septicaemic diseases; glandular swellings; phagedaena, sloughing, or mortification at the points vaccinated.
2. Eruptive diseases, mostly of a pustular character, occurring with or immediately after the vaccine eruption; eczema, herpetic eruptions, ecthyma, and impetigo.
3. The inoculation of constitutional diseases—syphilis, leprosy, tubercle.

Now, as regards the inflammatory diseases, there are some vaccinators of large experience who assert that they have never seen any ill-results of this kind arising from vaccination. Well, some people are very lucky, but they have no right to argue from their limited experience that such accidents never occur. I have been very fortunate in my midwifery cases; I have never lost a case in my own practice for thirty-five years; but for all that I do not deny that women die in childbirth. I have seen erysipelas more than once or twice, or a dozen times. In the West Indies it used to be common. The inflammation that followed the vaccination of coloured children was very intense, and the number of insects attacking the unfortunate children no doubt contributed to carry the germs of erysipelas to them. Glandular swellings, particularly in scrofulous children, are not rare. I had myself a case in which each vaccine vesicle was followed by mortification of the skin beneath it, and a phagedaenic ulceration which required very vigorous measures to stop it. This was in a young woman during the epidemic period in Trinidad. I am not sure whether it was a primary vaccination or a re-vaccination. The latter, as is well known, causes very severe inflammation, pain, glandular irritation, and erysipelas in the majority of adults, besides severe and most oppressive febrile

disturbance; at least, this is the case at the time of epidemics, when re-vaccination is most practised.

*Post vaccinal eruptions* are so very common amongst the children of the poorer classes in England that they form one of the stock arguments against vaccination.

*The inoculation of constitutional diseases* used to be laughed to scorn in my younger days. It was said in my hearing by Sir John Simon, K.C.B., then Mr. Simon, the Medical Officer of the Privy Council, that no such inoculation could take place without gross carelessness or unskilfulness on the part of the vaccinator. I used to be of the same opinion ; but a case I saw some sixteen or seventeen years ago convinced me that an infant might look perfectly healthy, and yet be the subject of unmistakable hereditary syphilis. The evidence that syphilis has been communicated by vaccination is simply overwhelming. I may refer to the report of the Committee of the House of Commons on compulsory vaccination; the third report of the Royal Commission on vaccination now sitting in London; the work of Mr. Jonathan Hutchinson, F.R.S., late President of the Royal College of Surgeons of England, on syphilis, in which he devotes a chapter to the description of vaccinal syphilis; and my own experience in this colony and elsewhere. I have seen three cases in this colony alone.

"On my return to Trinidad I had to encounter an epidemic of small-pox which spurred us on to vaccinate right and left, and to revaccinate all who would submit to the operation. But so firmly fixed was the belief of the people that vaccination from a child of a leprous family would be a possible cause of the vaccinated persons becoming leprous, that not even the fear of such a terrible epidemic of small-pox as was then going on would induce them to allow themselves or their children to be vaccinated from any vaccinifer in whose family any member was a leper. And then, to my astonishment and dismay, I found that there was hardly a Creole family in the island—white, coloured, or black—free from the taint of leprosy."

**SIR JAMES PAGET ON SURGICAL PATHOLOGY.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

"After the vaccine and other infectious or inoculable diseases, it is, most probably, not the tissues alone, but the blood as much as or more than they, in which the altered state is maintained; and in many cases it would seem that, whatever materials are added to the blood, the stamp once impressed by one of these specific diseases is retained; the blood, by its own formative power, exactly assimilating to itself, its altered self, the materials derived from the food.

"And this, surely, must be the explanation of many of the most inveterate diseases; that they persist because of the assimilative formation of the blood. Syphilis, lepra, eczema, gout, and many more, seem thus to be perpetuated: in some form or other and in varying quantity, whether it manifests itself externally or not, the material they depend on is still in the blood; because the blood constantly makes it afresh out of the materials that are added to it, let those materials be almost what they may. The tissues affected may (and often do) in these cases recover; they may have gained their right or perfect composition; but the blood, by assimilation, still retains its taint, though it may have in it not one of the particles on which the taint first passed; and hence, after many years of seeming health, the disease may break out again from the blood, and affect a part which was never before diseased."—*Lectures on Surgical Pathology, 4th ed.*, pg. 39. 1876.

**DR. M. D. MAKUNA'S MEDICAL VACCINATION CENSUS.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

Prior to the appointment of the Royal Commission on Vaccination in 1889, the latest professional examination of the vaccination question was in the form of a medical inquiry, initiated by Dr. Montague Makuna, late superintendent of the Fulham Small-pox Hospital. Its object was to remove, if possible, the widespread feeling of mistrust prevalent, in various parts of the United Kingdom, as to the benefits and safety of vaccination, which had been discredited in public estimation by reason of the failures and mischiefs of the operation, with details of which the press was flooded. The inquiry was made by a committee of thirty medical gentlemen, most of whom were vaccine specialists. The meetings were held in the Council Chamber of Exeter Hall, London, under the presidency of Dr. C. R. Drysdale, senior physician of the Metropolitan Free Hospital, a gentleman who has devoted much time to this important question. Dr. Drysdale promised the Committee to read a paper on the results of the inquiry. The proceedings were reported in the *Midland Medical Miscellany* and in the *Medical Press and Circular*. A circular letter, with copy of the report of the first meeting of the Committee, was sent to members of both Houses of Parliament.

At the first meeting of the Committee, held on 15th February, 1883, Dr. Makuna, in explaining the objects of the proposed inquiry, referred to the opposition to vaccination; an opposition which has become intensified since vaccination has been made compulsory. A medical inquiry was, therefore, considered indispensable, and it was anticipated that the evidence disclosed in favour of vaccination would be so unanimous and conclusive, as to effectually restore public confidence in the practice, and to put an end to all opposition. The chairman, Dr. Drysdale, said he considered the proposed inquiry would be of great value to the profession and to the public, and expressed a desire that the Local Government Board and other authorities should be requested to co-operate.

The attention of the Local Government Board, the British Medical Association, the Epidemiological Society, the Medical Officers of Health, the Royal College of Physicians, as well as ambassadors, consuls, etc., was specially called to the inquiry, and they were requested to contribute facts and information from all parts of the world.

A circular was drawn up and approved by the Council, and sent to 4000 medical practitioners, a considerable portion of whom were public vaccinators, medical officers of health, and vaccine specialists. The circular elicited 384 answers, and the results were published in a pamphlet entitled "Transactions of the Vaccination Inquiry."

An analysis of the answers (made by Mr. Thomas Baker, Barrister-at-Law) shows that the seven questions submitted have been answered by 384 medical men, of whom 102 are public vaccinators, vaccine specialists, medical officers of health, or officials.

The following is the third, and one of the most important, submitted to this medical inquisition, viz. :— *What diseases have you in your experience known to be conveyed or occasioned or intensified by vaccination* . To this question 13 give no answer, and 139 answer "None,"\*

\* No. 17 says: "Two deaths from erysipelas occurred after vaccination in my practice, both commencing on the ninth day." Therefore, that so many answer, "None," may be accounted for by the fact that public vaccinators commonly do not see the vaccinated child after the eighth day.

but many qualify this reply by the words, "in my own practice," "direct," "not serious," "personal," etc. On the other hand, the list of mischiefs (many fatal) includes the following, as recorded by 232 medical witnesses. (This enumeration has been checked by the Rev. Isaac Doxsey, F.S.S., and Mr. J. H. Lynn :—)

	Witnesses		Witnesses.
Abdominal phthisis	1	Boils	8

Abscesses	11	Bronchitis	1
Angeioleucitis	2	Bullae	1
Arm disease needing amputation	1	Cancer	1
Axillary Bubo	1	Cellulitis	5
Axillary gland, enlargement of	1	Convulsions	4
Blindness	1	Diarrhoea	4
Blood poisoning (fatal)	1	"Died"	1
Diseased Bones	1	Phagedsenic action	1
Diseased Joints	1	Phlegmon	2

Ecthyma	1	Pneumonia	1
Eczema	60	Prurigo	3
Eruptions	5	Psoriasis	1
Erysipelas	120	Pynmia	7
Erythema	22	Pyrexia	1
Gangrenosa	3	Ricketts	1
General Debility	1	Scald head	1
Herpes	3	Scarlatina	3
Impetigo	7	Scrofula	9
Inflammation	10	Septicimea	1
Latent diseases developed	2	Skin disease	21
Lichen	2	Struma intensified	4
Marasmus	1	Syphilis	43
Meningitis	2	Tuberculosis	1
Mesenteric disease	1	Ulceration	6
OEdema	2	Varioloid	1
Paralysis	1		

--	--	--	--

The following *qualified* admissions are also made, viz.

Eczema	4	Nettle rash	1
Esysipelas	6	Syphilis	10

On the 19th of April, 1886, the results of this medical census were laid before the Right Hon. James Stansfeld, then President of the Local Government Board, and in May a copy of the analysis was sent to him at his request. And on the 25th June, and on the 2nd July, 1890, I called the attention of the Royal Commission on Vaccination to this important inquiry, and presented an analysis of the results for its, consideration. The facts ought, in the interest of the public safety, to be widely disseminated through the press, and made known to magistrates, boards of guardians, and others concerned with the enforcement of the Vaccination Acts.

It has, I think, been clearly proved on the evidence of medical specialists, that to the long catalogue of diseases conveyed at the point of the lancet in vaccination must now be added that of leprosy. This terrible indictment has been denied again and again by those who have not taken the trouble to investigate the facts for themselves, and have shut their eyes to the facts revealed by others. Is it reasonable to suppose that negative statements, however confidently made, can destroy the positive testimony of careful investigators such as Dr. John D. Hillis, Professor W. T. Gairdner, Dr. Edward Arning, and Dr. S. P. Impey? The fact that syphilis is communicable by vaccination was emphatically repudiated by a President of the Local Government Board not long ago, and the terrible Algiers vaccine disaster in 1880 was officially proclaimed an impossible occurrence. The fact that leprosy may be communicated by vaccination is now reluctantly admitted even by those who are most anxious to clear the rite from this reproach. In concluding a defence of vaccination from the charge referred to in No. 4 of the *Journal of The Leprosy investigation Committee*, Dr. Beaven Rake says: "It is evident that the risk of transmission of leprosy by vaccination is so small that, for all practical purposes, it may be disregarded." Dr. P. Abraham says: "The possibility of an occasional accidental inoculation of the disease by vaccination might be admitted;" and Dr. C. F. Castor, in a paper defending vaccination from this stigma, observes: "The opinion expressed that vaccination from a tainted source will produce the disease (leprosy) is, I believe, a true one."

[Appendix](#) [Index](#)

**MEDICAL DENIALS AND ADMISSIONS.**

(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

The four numbers of the *Journal* issued by the Leprosy Investigation Committee contain a large amount of testimony from authorities in every part of the globe. A conspicuous feature, and one which has been commented upon in the press, is the confusion and contradiction of medical opinion, and this confusion is not restricted to theorists who have never visited countries where leprosy prevails, but is exhibited amongst superintendents of leper hospitals, well-known dermatologists, and eminent general practitioners. Most of the theorists are able to cite facts in support of their several beliefs, and maintain their conflicting opinions with equal confidence. Some of the most prominent of these views have been dealt with, but it would be beside the scope of this work to refer to them all. Beyond the general admission of the alarming increase of the disease, there is but one point upon which there is any approach to a consensus of opinion, and that is, that leprosy is a disease communicable by inoculation. Conversing with directors of leper institutions, experienced practitioners, and careful observers in countries where leprosy prevails, whatever their particular theories about it, I have found no one who denies that it is inoculable. In some instances, when pressing the logical issue of these answers I have said, "Then the disease is also communicable by vaccination," this has often been admitted, though sometimes with hesitation and reserve, and generally accompanied with the proviso that leprosy cannot be invaccinated if pure lymph only is employed and the operation be skilfully performed. Even if this were true, how pure lymph can be selected in tropical countries where the disease is generally of slow incubation, and does not manifest itself for years, and where the vaccinifer is never properly examined, is a mystery not explained. Moreover, while the State can enforce vaccination, it cannot compel the use of healthy vaccinifers, nor enforce careful operation. In nearly all leprosy countries arm-to-arm vaccination still furnishes the chief sources of supply. The perennial cry of public vaccinators is that the lymph is "unsatisfactory." Animal lymph is often attended with excessive inflammation, and the practitioner is obliged to dilute it with glycerine, lanoline, and other substances, and its use is much more expensive. Moreover, a good deal of the so-called animal lymph in vogue is really only arm-to-arm vaccine, inoculated into calves, buffaloes, sheep, and donkeys, and partakes of the diseases both of man and of animals. Of the many cases of ulcerative and of fatal vaccination which have come under my notice during the past twenty years not a few have been due to the use of carefully-selected animal vaccine.

Dr. Robert Cory, Medical Director of the Government Calf Lymph Establishment, London, testified before the Royal Commission, November 17, 1889 (Q. 4390), that out of 32,000 cases there were 260 returned with sore arms, and 38 with eruptions. Then there were 16 cases of erysipelas, and nine of axillary abscesses, and (Q. 4392) eight deaths were reported to the Station of children who had been vaccinated with animal lymph. The same witness testified (Q. 4369) that lymph taken from the cow leads to greater inflammation, and has a greater tendency to produce ulceration, than lymph which has been humanised.

[Appendix](#) [Index](#)

**HOW LEICESTER DEALS WITH VARIOLOUS OUTBREAKS.**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

The success of what is known as the "Leicester Experiment" has created considerable public interest both at home and abroad, and, in response to repeated inquiries, I am able to furnish the following particulars from the pen of Mr. Councillor Biggs, of Leicester. Mr. Biggs was for several years a member of the Board of Guardians, and is now a member of both the Sanitary and SmallPox Hospital Committees. He has had much to do with the substitution of sanitary amelioration and isolation for the now discarded system (so far as Leicester is concerned) of vaccination.

Our procedure in the notification of a case of small-pox may (he says) be described in the words of our Chief Sanitary Inspector, Mr. F. Braley : —"When a case is reported, I at once go to the infected house, and try to ascertain where the disease was contracted, where the patient has been working, where he has been visiting, and his movements generally for the last ten or twelve days. I also make a point of seeing all persons who have visited the infected house during the time stated; in addition, I visit all factories and workshops where other members of the family have been employed; and by this-means have been able to get cases removed when the first symptoms of the disease appeared.

"Immediately on the removal of the patient, I superintend the fumigation of the house with sulphur; liquid disinfectants are used freely in the drains and about the yard, and the ashpit is emptied and disinfected; the next day the bedding is taken to the disinfecting chamber and subjected to the hot-air process.

"Up to the present time I have succeeded in getting almost every person connected with the infected houses into quarantine. In a very few cases I have experienced opposition.

"The above represents practically all we do of a special character beyond the ordinary treatment in cases of supposed infection. Those who are prevailed upon to go into quarantine usually remain for fourteen days, the period within which small-pox is supposed to incubate after infection. So far from the authorities having to resort to harsh measures to enforce quarantine, this period of rest is made to be of so pleasant and agreeable a character that, at its expiration, many have been reluctant to leave the hospital.

**VACCINATION OPTIONAL.**

"This fact disposes of an accusation which is constantly being hurled at Leicester, namely, that we not only forcibly seize those who have been in contact with small-pox cases, and compulsorily detain them in quarantine, but that, whilst they are there, we compel them to submit to vaccination or re-vaccination.

"Let us examine as to how far this favourite theory of our opponents has any foundation in fact.

"Of fifty-five persons who voluntarily went into quarantine during the three years 1886-88, only twelve were vaccinated or re-vaccinated whilst in quarantine. If to these twelve we add three others who underwent the operation immediately before entering the hospital, there remain forty persons, or, 72.7 per cent, of the above fifty-five, who were neither vaccinated nor re-vaccinated during the quarantine period.

"Applying the same percentage to the 128 persons quarantined before a 1886, we find a further number of thirty-five persons who voluntarily submitted to the operation, who, when added to the other fifteen, make only fifty for the extended period. Thus, out of a total number of 183 persons who have passed through the quarantine wards .since the introduction of this system in 1877, no fewer than 133 were neither vaccinated nor re-vaccinated whilst in the hospital.

"During this period from fifteen to twenty persons absolutely refused to go into quarantine at all, and we had no power to compel them.

"Nearly all those who were quarantined belonged to the poorest classes, and to these a fortnight's holiday with free board and good, if not comparatively luxurious, living, would prove to be no mean attraction. Those who had good homes remained there in preference to going to the hospital. Thus no infringement whatever of personal liberty has taken place against those who have put themselves for a time under the 'Leicester Method' of treatment; unless indeed, the gastronomic allurements above referred to might have proved an inducement to some to voluntarily yield up their personal liberty for a time.

### SUCCESS OF THE LEICESTER METHOD

"After the subsidence of the great small-pox epidemic of 1871-73, which caused 360 small-pox deaths, when the town was thoroughly well vaccinated, up to the year 1889, which was the last year for which I could prepare statistics for the Royal Commission on Vaccination—that is, during the sixteen years from 1874 to 1889, inclusive—no fewer than thirty-three importations—mostly from well-vaccinated districts—and a large number of successive outbreaks of small-pox, were successfully stamped out. The town was thus saved from the further spread of the disease, with its possible ravages, by the 'Leicester Method' of treatment, *without recourse to vaccination*, and also without the slightest approach to arbitrariness on the part of the authorities, or any infringement of personal liberty.

### ECONOMY OF THE "LEICESTER METHOD."

"It is sometimes assumed that this 'Leicester Method' of isolation, quarantine, disinfection, and sanitation is so expensive as to be practically prohibitive.

"On the contrary, our 'Leicester Method' is extremely economical as well as effective. Besides, it is now well-known that, however thoroughly a community is vaccinated, so little reliance is placed upon this supposed safeguard, that on the outbreak of small-pox recourse is at once had to the very measures which have been so persistently decried when used to the salvation of unvaccinated Leicester.

"From 1874 to 1889 the cost of public and private vaccination at Leicester was not far short of £10,000 (being about £9,818 2s. 11d.). During the same period the cost of quarantine, including compensation for destruction of infected clothes, bedding, disinfectants, etc., was under the modest sum of £500 (or about £488 11s. 2d.). This represents a saving in favour of our Leicester method, as against vaccination, of over £9000 in the course of sixteen years. This £9000 was completely thrown away, to say nothing of the impaired vitality and spread of disease which vaccination necessarily implies. The £500 cost of quarantine, etc., did all the effectual work of saving the town from the ravages of small-pox threatened by the thirty-three importations, and absolutely averted the real danger implied by the occurrence of 116 small-pox cases in the midst of our crowded

population.

### JUSTIFIED BY RESULTS.

"Perhaps it will not now be out of place to briefly enumerate the substantial reasons which justify the Leicester people in the course they have pursued in respect to vaccination, and in adopting sanitation as their defence in the conflict with zymotic disease.

"Taking the groups of years dealt with by me before the Royal Commission on Vaccination, our average annual small-pox death-rate during 1853-57, with a moderate amount of vaccination, was only 91 per million population. But when vaccination had been continually and largely practised for a quarter of a century, and had reached over 90 per cent. to the annual births, and when, of course, its assumed protective power should have been greatest, our small-pox death-rate had progressively risen to an annual average of 773 per million population in 1868-72. Since that time vaccination has rapidly declined in the Borough, now being only about 2 per cent. Of the births, and small-pox mortality has disappeared from our midst.

### SAVING OF LIFE IN LEICESTER.

"Our death-rate from the seven principal zymotic diseases, namely, small-pox, measles, scarlet fever, diphtheria, whooping-cough, common fevers (typhus, typhoid, and continued fever), and diarrhea, averaged annually for the five years 1868-72 no fewer than 6852 per million living, with over 90 per cent, of primary vaccinations to births. This is the highest vaccination rate and zymotic death-rate we have ever had recorded for Leicester. In 1888-89, when primary vaccinations were only about 5 per cent, of the births, the zymotic death-rate had fallen to only 2304 per million. On our Leicester population alone this would mean a saving of nearly 680 lives each year.

"Without going into unnecessary details, I may observe that the improvement in our general death-rate amongst children shows equally remarkable results. With over 90 per cent, of primary vaccinations to births in 1868-72, our death-rate from all causes, of children under five years of age, was 107; under ten years, was 61 ; and under fifteen years was 45 per 1000 living under each of those ages respectively. While in 1888-89, with only about 5 per cent. of primary vaccinations to births, each of these death-rates had fallen enormously. The death-rate under five years had declined to 63, that under ten years to 35, and that under fifteen years to 25 per 1000 living at each of the given ages respectively.

"This would represent a saving of about 880 lives under five years, of about 988 lives under ten years, and of about 1080 lives under fifteen years of age, inclusive and respectively for each year in Leicester.

"When it is remembered that the claim put forward for vaccination is its preservation of the younger lives, especially those under five years of age, the life-saving result of the 'Leicester method,' as shown above, is particularly striking. And it proves, unmistakably, that our watchword, 'Sanitation,' carries with it far more potency to deal with zymotic disease and with small-pox than the now discredited cry of 'Vaccination.'

### THE GENERAL HEALTH OF LEICESTER.

"Once more our general death-rate, that is, our death-rate from *all causes* and at *all ages*, gives

results no less important. In 1868-72, when vaccination had reached its climax in Leicester, our death-rate was about 27 per 1000 of the living population, being nearly 5 per 1000 above the general death-rate for all England and Wales. In 1888-89, when vaccination had virtually ceased to be practised in the town, notwithstanding our disadvantageous geological and geographical position, in a valley, with one of the most sluggish rivers in England and a clayey and impervious water-logged subsoil, our incomplete, and therefore inadequate, drainage, our death-rate had fallen so rapidly, with declining vaccination, that it had actually fallen below the general death-rate of England and Wales. The death-rate for England and Wales was 17.9 for 1888-89, and that for Leicester 17.5, or 5.1 gain in favour of Leicester in less than twenty years.

These figures as compared with times of high vaccination mean an additional saving of about 1400 lives each year in Leicester alone, above the normal rate of saving in England and Wales. If this extra gain could be similarly achieved by the cessation of vaccination in the population of the whole country, other things being equal, it would mean an enormous saving of life beyond that which has actually been effected. The population of the United Kingdom for 1888-89 was estimated by the Registrar-General to be over 37,000,000. On this population an annual saving of about 189,000 lives would be effected. Even allowing an ample margin for possible errors in the calculations of the Registrar-General, these figures are sufficiently momentous to claim serious consideration.

"When it is borne in mind that England and Wales include all the rural districts, where the death-rate is very low, and that here our people are chiefly an artizan and manufacturing population whose circumstances are ever inimical to the health of the younger lives, Leicester's progress from being one of the unhealthiest of towns to its present proud position must be acknowledged to be marvellous.

"With such remarkable results before us, the Leicester people can calmly await the verdict of thoughtful minds, assured that their course of action in rejecting vaccination, and their reliance upon sanitation, will in the long run break down existing prejudice, and that it will ultimately receive general approval and adoption."

It need only be added that a full report of the Leicester system has been presented by Mr. Biggs before the Royal Commission on Vaccination, which will be found in the fourth report of the evidence.

[Appendix](#) [Index](#)

## COW-POX AND VACCINAL SYPHILIS.

(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

The following extracts from Dr. [Creighton](#)'s "Natural History of Cowpox and Vaccinal Syphilis" (London, 1887) express the conclusions of his historical inquiry—namely, that cow-pox is a disease resembling small-pox only in name, but resembling the great pox both in name and in reality, and that so-called vaccinal syphilis is only cow-pox in its original form, as the milkers used to experience it:---

"The real affinity of cow-pox is not to the small-pox but to the great pox. The vaccinal roseola is not only very like the syphilitic roseola, but it means the same sort of thing. The vaccinal ulcer of every-day practice is, to all intents and purposes, a chancre. It is apt to be an indurated sore when excavated under the scab; when the scab does not adhere, it often shows an unmistakable tendency to phagedaena. There are doubtless many cases of it where constitutional symptoms are either in abeyance or too slight to attract notice. But in other instances, to judge from the groups of cases to which inquiry has been mostly directed, the degeneration of the vesicle to an indurated or phagedaenic sore (all in its day's work) has been followed by roseola, or by scaly and even pemphigoid eruptions, by iritis, by raised patches or sores on the tonsils and other parts of the mouth or throat, and by condylomata (mucous tubercles) elsewhere." (Page 155)

"The first duty of everyone is once for all to disabuse his mind of Jenner's invention of the name *variolae vaccinae* for cow-pox. The affection of the cow's udder was long recognised by common folk as a pox in the original and classical English sense of the word the name of it in Norfolk was pap pox. No one had dreamt of discovering any resemblance in it to the pustules of the foreign contagious skin disease which came to be called the small pox until Jenner by a masterstroke of boldness and cunning, placed the Latin name *variolae vaccinae* first on his title page as if he were merely expressing in scientific form the universally accepted meaning of the colloquial name. There was no candid or overt attempt in the body of his essay to justify that daring innovation; most of his readers from that time to this have hardly realised that it was an innovation at all, for the reason that Jenner adroitly left his title page to justify itself. His trumped-up name somehow passed without challenge, except for a grammatical objection on the part of Pearson, and a general criticism by Moseley; and although the want of likeness, still more in circumstances than in form, between the pustules of small-pox and even the modified kind of inoculated cow-pox vesicle, has been pointed out in elaborate detail by several writers, and ought, indeed, to be so obvious to any one as not to need pointing out at all, yet the Jennerian fable of *variolae vaccinae* continues to be the creed of the medical profession." (Page 157.)

"The rational theory of the Morbihan disaster (of vaccinal syphilis in 1866) is that ulceration, followed by induration and (or) phagedaena, is part of the natural history of cow pox infection that it is nearly always latent or kept in check; that in some circumstances it may be brought reverted to; that these circumstances, in the particular epidemic, date and number of the vesicles raised on the vaccinifer, and the draining of their lymph to the last drop, so as to vaccinate an enormous number; and lastly, that a continuous reproduction of lymph from that stock tended to confirm and even to intensify the reawakened powers of the cow-pox matter, as evidenced by the more decided 'syphilitic' character of the secondaries (mucous patches on the tonsils) in two cases of the last group." (Page 140.)

"The origin of vaccinal syphilis remains, as Bohn says, 'shrouded in mystery.' Readers who have followed my argument hitherto will not be surprised if now I claim the phenomena of so-called vaccinal 'syphilis' as in no respect of venereal origin, but as due to the inherent, although mostly dormant *natural history characters of cow-pox itself.*" (Page 124)

[Appendix](#) [Index](#)

**THE AUTHOR'S PERSONAL STATEMENT OF THE RESULTS OF VACCINATION**(APPENDIX to [LEPROSY AND VACCINATION](#) by [WILLIAM TEBB](#))

During the past twenty-two years it has been my experience to travel in all parts of the United Kingdom, from Land's End to the Shetland Islands, and in almost every state in Europe, from the Mediterranean to the North Cape, in countries intervening between the Tagus in the west, and the Volga, Danube, and Bosphorus, in the east; also in Morocco, Algeria, Upper and Lower Egypt, Asia Minor, Upper and Lower Canada, Nova Scotia, and most of the states and territories of North America; also in Venezuela and British Guiana, South America, in the Windward and Leeward Islands, the French and Danish West Indies, in the archipelagoes of Greece and Hawaii, the Island of Ceylon, in Tasmania, New Zealand, the colonies of Australia, and in South Africa.

In nearly all these countries I have made it my business to inquire into the methods and results of vaccination, procuring information from public officials and from intelligent private individuals, and I have hardly ever inquired without hearing of injuries, fatalities, and sometimes wholesale disasters, to people in every position in life, and these have occurred from the use of every variety of vaccine virus in use. My informants have included governors, chief magistrates, consuls, professors of medicine and surgery in Continental universities, members of legislative assemblies, superintendents of leper asylums, editors of medical and hygienic journals, chiefs of military and general hospitals, presidents and medical officers of state and colonial health departments, superintendents of small-pox hospitals, clergymen of all denominations, missionaries, heads of educational establishments, and the best informed amongst old residents in the places visited.

In one country it was my privilege to be furnished with a general letter of introduction from a minister of State (since Prime Minister), which gave me access to all the official and medical authorities. Often the fatality described to me has befallen the infant of a poor mother, who with dread forebodings in her mind has tried to shield her offspring from the vaccinator's lancet as long as she could, and, like a fugitive slave, only surrendered to the minister of the law when overtaken in pursuit or her place of refuge discovered, or, like that of a distinguished Moslem (Suffey Bey Adem), my travelling companion in 1884 from Damascus to Beyrout, who had lost a daughter, a nephew, and a niece (vaccinated together about a year before our interview), all of whom died of the operation, after the most acute suffering. At other times I have seen stalwart soldiers and post office officials seriously injured, and in more than one instance crippled and ruined for life, by compulsory revaccination. I have personally investigated vaccine disasters at two military hospitals, one in Europe and the other in Africa, where, in one case, three, and in another case thirty soldiers ultimately died of the operation, and more than twice this number were seriously, and, in most cases, permanently injured. In Australasia I have personally inquired into a case of wholesale disaster— of acute septicemia, exhibited by terrible ulcerations following vaccination with calf lymph—to several hundred persons, and have seen the sad consequences in permanently ruined health. I have received several thousand written statements from parents, who allege that their children have been seriously or fatally injured by vaccination. I have proved beyond doubt, by personal inquiries in various countries where leprosy is increasing, that the increase is due to vaccination, and have furnished the testimonies of numerous medical authorities, and of official reports (all mention of which has been omitted from our leading medical journals), in support of these incriminating allegations. These facts have been detailed by me in the *Times*, *Nonconformist*, *Echo*, *Leeds Mercury*, *Manchester Guardian* and *Examiner and Times*, *Leicester Post*, *Newcastle*

*Leader, Scottish Leader, Cardiff Daily News, Gloucester Citizen, Hospital Gazette, The Tocsin, Journal d' Hygiene (Paris), Birmingham Gazette, The Vaccination Inquirer,* and other influential and well-known English, American, and Colonial journals; and some of them were quoted by me, with chapter and verse, before the Royal Commission on Vaccination, now taking evidence in London, and will be found in the third official report of the proceedings.

I may also mention that numerous facts of a sinister character were contributed by many of the delegates representing the leading European States at the International Anti-Vaccination Congresses held in Paris, Cologne, Berne, and Charleroi, the reports of which have been published and presented to the chiefs of Governments, and of Public Health Departments in all countries. Not only have the facts been submitted to Continental Ministers of State, and to successive Presidents of the Local Government Board in England, but in December, 1890, I laid them before Mr. Langridge, Chief Secretary to the Government of Victoria, Australia, and before leading officials in other Colonies. It seems to me, therefore, that, in view of these experiences, and in the presence of such unimpeachable facts, the opposition which has arisen, and is growing daily in nearly all countries, is a commendable and patriotic struggle, which should be encouraged in every possible way. The laws (often cruelly enforced), which compel the parents of this and other countries to put the health and lives of their offspring into the hands of irresponsible State officials, with the alternative of severe and not seldom ignominious punishments, are a grave national blunder, and constitute a species of tyranny wholly indefensible; and it behoves every good citizen to endeavour, by every constitutional means, in the interests alike of justice, of individual and parental rights, and in defence of the public health, and of our helpless children, to get these laws completely and permanently extinguished.

At an early age John Raymond Christopher knew he wanted to be a doctor. His goal, however, was to heal people without surgery, "the natural way." What started as a childhood dream became his life's work and passion.

By overcoming many health problems as a young child, Christopher learned to help others by first helping himself. Through crippling arthritis, chronic pain, and severe allergies, he fought his way to health by eating raw fruits, grains, vegetables, nuts, and seeds. He lectured for a time, teaching others about his path to wellness until he was drafted as a soldier in World War II.

At 35 years of age, Christopher enlisted in the United States Army as a conscientious objector. He served at Fort Lewis and became the only practicing herbalist in the service during the war. One of the proudest moments in his military career was with a young recruit that all the doctors had given up on. The soldier's head was literally covered with severe impetigo infection. They decided to let Private Christopher try his herbal formulas on the case. After a few days of soaking the area in a preparation of black walnut hulls, the impetigo cleared up without a sign of infection. Upon seeing this "miracle" senior officers allowed him to carry on a regular practice of herbal healing.

Besides using black walnut tincture to cure everything from impetigo to jungle rot, he created many herbal formulas that did wonders for the soldiers who were stationed in Fort Lewis. These same formulas are still widely used today. As stories spread among the soldiers, the lines in front of Private Christopher's office became longer and longer. Something was different about the way he treated patients- many of his prescriptions directed his patients to the mess sergeant instead of the pharmacy. The same kind of diet that helped him through his crippling arthritis was used by many soldiers with great success. His unconventional treatment of disease made sense. It was simple and it worked.

After the war John Christopher's talent became legendary. He studied herbology in Canada with the hopes of opening a clinic of his own in the United States. He started his first practice in Wyoming and then shortly thereafter moved to Utah and opened another practice. His clinic was the only one of its kind in the country. People came from virtually every state to be treated by him and his staff. He specialized in treating so called "incurable diseases" that the regular medical doctors had given up on. After many years of healing and practicing herbal medicine, legislation was passed barring Dr. Christopher from prescribing or seeing patients.

Over his long career as a natural healer, Dr. Christopher saw one thing in common with almost every sick person that came into his office, in most cases the person's own body was capable of healing itself. He would recommend nutritious herbs and food be taken, and soon the patient would be on the road to recovery. Dr. Christopher said, "There are no incurable diseases only incurable patients." In other words, he believed that everyone had the ability to bounce back to health after a sickness or injury. With this philosophy in mind he developed a full line of herbal products that are still manufactured in Springville, Utah, and founded The School of Natural Healing also in Springville. The school has carried on Dr. Christopher's tradition by teaching the same healing methods he used so successfully in his practice to students around the world.

Dr. Christopher used herbs to heal in thousands of cases. In one case a young girl had cut her foot on the jagged edge of a shell while clam hunting at the beach. Oblivious to the pain or the wound, she had continued to run in the sand for the rest of the afternoon, wading with friends in the shallow pools that lingered as the tide ebbed out to sea. By morning, the foot and leg were swollen and feverish, and an angry red streak crept up her leg. When her anxious mother phoned Dr. Christopher, he told her about the healing powers of a common weed called Plantain. He explained how to prepare a poultice of the herb to draw out infection. The next day, the child skipped into his office as if nothing had ever happened.

Dr. Christopher's specialty was using common weeds and plants that everyone had in their yards to effect incredible healings. He used Parsley tea to help a young boy who had not urinated for days finally feel relief. He gathered Black Walnut hulls to treat skin infections and Dandelion to use for liver problems. Dr. Christopher developed herbal formulas for his patients for a variety of different ailments including heart disease, diabetes, and arthritis. He used whole herbs for his remedies, and looked for the cause of disease rather than treating the symptoms in each case that came to him.

This is a sharp contrast to today's medicine where chemical drugs are given to hide pain and strong antibiotics are given before the body has a chance to heal itself. Dr. Christopher, through a years of clinical experience, came to realize that standard medical techniques were often dangerous and

unnecessary and that herbs and natural therapies could treat the same health problems without side effects.

After the legislation was passed barring Dr. Christopher from prescribing or seeing patients, Dr. Christopher found a new way of imparting his unique philosophy of natural healing. He used his years of experience and knowledge to instruct students all over the world. In one of his busiest years he taught in more than 120 cities! This is when Dr. Christopher founded The School of Natural Healing to teach people about the healing power of nature.

In 1972 he founded The School and made the lofty goal of putting an herbalist in every home. He continued lecturing and running the school until his death. In 1983 he slipped on a patch of ice in front of his home damaging his head in what became a fatal accident. He was 73 years old when he died, and healthier than he had been in his 20s. In his life he had authored 9 books and hundreds of papers, newsletters and developed numerous herbal formulas that are still popular today. In his life's work he helped thousands of people find their way to wellness through natural medicine.

Dr. Christopher's son David has continued in his father's footsteps. David Christopher directs The School of Natural Healing today with the same enthusiasm and commitment as his father. Students learn by correspondence from many well known experts in the herbal field.

"We are very excited about the next few years." Said David Christopher in a recent interview. "The School is becoming more visible and our message is being heard by a lot of people that need to hear it. We want to continue with Dr. Christopher's goal by teaching an Herbalist in every home and a Master Herbalist in every community. With diseases on the rise, people are becoming disenchanted with modern medicine and turning toward a more traditional form of health care. I think that is where our school comes in. We teach about herbs and nutrition- none of the therapies we talk about have any of the terrible side effects that drugs do. That is the kind of medicine that people want, that's the kind of medicine people want to learn about."

Dr. Christopher's daughter, Ruth, and her husband, Norman Bacalla, continue to manufacture the complete line of Dr. Christopher's original formulas in Springville, Utah, plus many newer combination formulas developed by David Christopher, M.H., And a complete line of single herbs.

Dr. Christopher left us with a legacy. His philosophy of simple foods, common herbs, and healthy living are still as valuable today as they ever have been, maybe even more so. His life's work has touched thousands of people and continues to touch people today.

Here at The Herb Shop Connection, we live by The Dr. Christopher philosophy. Please browse the shop and choose a few herbal formulas that will become your life long friends.

### WHAT IS A PREFERRED CUSTOMER?

A preferred customer is a person who receives a 25% discount on all products sold thru the HERB SHOP CONNECTION.

### WHAT DOES IT COST TO BECOME A PREFERRED CUSTOMER?

There is an initial membership fee of \$49.95 and an annual fee of \$25.00

### ARE THERE ANY OTHER BENEFITS TO BECOMING A PREFERRED CUSTOMER?

Yes, in addition to receiving the 25% discount, a preferred customer may receive additional discounts offered via email, phone or direct mail. Currently we are offering a REFERRAL BONUS PLAN, wherein preferred customers are given \$30.00 CREDIT each time when they refer a friend or family member who becomes a preferred customer.

### ONCE I BECOME A PREFERRED CUSTOMER CAN I CHANGE BACK TO A REGULAR CUSTOMER?

Yes, however the annual membership is not refundable after it has been used.

### TYPICALLY WHAT ARE THE SAVINGS?

Assuming the average retail customers spends about \$80.00 per month, the annual savings is approximately \$240.00 per year.

### HOW DO I SIGN UP?

It's easy just call 1-888-235-3265 and talk to one of our friendly representatives.

"WHAT DOCTORS WON'T TELL YOU THAT YOU NEED TO KNOW!"

**What would it cost you to go to your local doctor and have 14 tests performed in his office and take up an hour of your doctors time? The cost would be prohibitive for the average person.**

DR. ROBERT JONES in conjunction with CHRISTOPHER'S ORIGINAL FORMULAS INC. has developed an affordable, reusable detailed home test kit that will allow you to find out exactly what your body needs to be in balance. KNOWLEDGE IS POWER-Once you have taken the tests you can send your results to Dr. Jones for a FREE DETAILED EVALUATION. The Doctor will examine your test results and then suggest the correct products and diet you need to take to get your body back into balance. You may send your new results again and again to chart your progress.

**TEST YOUR WHOLE FAMILY TOO!**

Doctor Jones says "This effective testing was originally developed by and for the medical profession. It does not diagnosis disease, but it identifies which organs in the body are not functioning properly which allows the body to become diseased".

Dr Robert Jones realized that with the rising health care and insurance costs the average American does not seek medical advise until symptoms appear to be somewhat out of control. The Herb Shop Connection was the first to release this kit to the public. Hundreds of our customers have purchased this HOME TEST KIT and are now taking the correct herbal products. The kit removes the guesswork.

If you would like more information and a free cassette tape explaining the kit, please send an email with your name and mailing address to the address below. If you would like to order a kit today, you may do so by clicking on the [Shopping](#) link.

Send an email for your free tape.
